The company then sought to collect three-fourths of the amount of the tax from the city. More court action ensued. Judgment finally was returned in favor of the company. Since the financial condition of the municipal railway was precarious the City Council obtained an agreement with the power company to pay the tax money in five installments beginning next May. Councilmen had this tax debt in mind recently when they passed an ordinance loaning $550,000 to the railway from the light department.

Receivers for Michigan Property

The Southern Michigan Railway, operating an interurban service between South Bend, Ind., and Benton Harbor, Mich., passed into the hands of receivers in the federal district court of Grand Rapids on Feb. 3, when suit was brought by the Harris Trust & Savings Bank, Chicago, to foreclose a mortgage for $750,000, of which $536,000 with interest has been due and unpaid since Oct. 1 last. Haddon McLean, of the Harris Trust & Savings Bank, and the Michigan Trust Company were appointed receivers and trustees by Federal Judge Fred M. Raymond.

The property will be operated by the Chicago, South Bend & Northern Indiana Railway, owner of the common stock. Through the lines of the Northern Indiana Company it has physical connections with a number of electric railways radiating from South Bend. The Chicago, South Bend & Northern Indiana Railway was placed in the hands of R. R. Smith, formerly general manager, as receiver.

Taxes Paid in St. Louis

Taxes to the amount of $2,065,489 were paid by the St. Louis Public Service Company, St. Louis, Mo., to the city, county and state during 1927. On Feb. 2 the company paid the city mill tax for the last quarter of 1927 amounting to $62,698.

Personal Items

J. J. Schweitzer Promoted in Cincinnati

John J. Schweitzer has been named assistant superintendent of shops and equipment of the Cincinnati Street Railway, Cincinnati, Ohio, and will be actively in charge of the work in the large new shops which the company is building in Winton Place, a suburb. When a boy he observed the electrification of Cincinnati cable cars. At the age of 17 he entered the employ of the company in Cincinnati. He became foreman of the armature department of the Cincinnati Car Company in 1905, a foreman of the Cincinnati Traction Company in 1908, and a superintendent of that company in 1917.

Change in Offices in Oklahoma City

At the recent election of officers of the Oklahoma Railway, Oklahoma City, Okla., G. A. Nichols was elected vice-president and William Mee, president of the Security National Bank, was elected treasurer. The vice-presidency has been vacant for several months, but Miss Reba Zimmerman had been holding the post of treasurer, and may continue to handle the detail of the treasurer's office.

H. O. Crews Supervisor of Public Relations

Halbert O. Crews, supervisor of publicity for the Chicago Surface Lines, has been made supervisor of public relations. All publicity, advertising, public speaking and similar work is under his direction.

H. U. Wallace in New York

H. U. Wallace, former general manager of the Department of Street Railways at Detroit, Mich., is now engaged as a consultant, with offices in New York. He will handle operating surveys, financial reports, appraisals, reorganization and management detail in the bus, truck and railway fields.

The work which will come under Mr. Wallace's personal supervision will have the benefit of an enriched background in the railway field and the deft handling of a capable manager. Thirty years of engineering and railroad experience he brought to Detroit when in June, 1925, he took over the management of the Detroit municipal property. He had previously served with the Knoxville Power & Light Company, the Illinois Central, the Chicago, Lake Shore & South Bend Railway and the Fort Dodge, Des Moines & Southern Railway. And these affiliations cover only part of his active career in the fields of engineering and management.

Colonel Wallace was born in Rock Island, Ill., in 1872. He was graduated from Purdue University. During the World War he was commissioned as major of engineers and assigned to the construction division as supervising construction officer of a large number of important ordnance plants. The career of Mr. Wallace has been reviewed at length previously in the ELECTRIC RAILWAY JOURNAL.

C.E.R.A. Headed by Detroit United Official

W. S. Rodger, general traffic manager of the Detroit United Lines, Highland Park, Mich., is the new president of the Central Electric Railway Association. All his business life Mr. Rodger has been connected with railways in the Central West, first in steam railroad work and since 1916 with the Detroit United.

W. S. Rodger

The Detroit suburban and interurban system furnished a fertile field for a man of his talents, since its service approximated in character that of the steam lines with which he had long been associated. This was true before the lines of the company in Detroit passed to the ownership of the city, but it has been particularly true since that time. The need has grown for intensive operation of the property under the direction of the receiver, and in the work of stimulating business and in mechandising the service Mr. Rodger has played his part well.

Mr. Rodger was educated in the public schools of Chicago. He entered steam railroad work in the operating department of the Michigan Central Railroad in that city, went from Chicago to Joliet in the same service but returned to Chicago as traveling freight agent. Thence he went to Toledo as general agent in the traffic department of the Michigan Central Railroad, and from that post was advanced to assistant of the general manager at Detroit. On Aug. 1, 1916, he resigned from the Michigan Central to accept the post with the Detroit United Lines which he now occupies.

Robert Jagoe Advanced in Bridgeport

Robert Jagoe has been appointed superintendent of transportation of the Bridgeport lines of the Connecticut Company. In this capacity he succeeds F. L. Kibling, who was recently made general manager of the Bridgeport division.

Mr. Jagoe joined the Bridgeport Traction Company in 1895. Three years later he became inspector, serving in this capacity with the Bridgeport Traction Company, the Connecticut Railway & Lighting Company and the Connecticut Company. In 1912 he was made chief motorman and has served in that capacity since. Mr. Jagoe is succeeded as chief motorman by Wilfred Norman, who has been starter since 1914.

Obituary

JOHN H. TRUETT, former safety director and former chairman of the safety committee of the United Railways & Electric Company, Baltimore, Md., died on Feb. 5. Mr. Truett took over safety work in Baltimore in July, 1919, and resigned in 1925 to accept the position of director of the Baltimore Safety Council. During the World War Mr. Truett served overseas as a battalion adjutant. He was 47 years old.

WILLIAM T. GUNNISON, chairman of the New Hampshire Public Service Commission, died recently. Mr. Gunnison had practiced law in Rochester since his graduation from the Harvard Law School in 1895 and was a law partner of former Gov. Samuel D. Felker. He was born in Greenville, Miss., in 1869 and attended Phillips Exeter Academy and Dartmouth College. At one time he was judge of the Municipal Court in Rochester.

ANGELO VANCE FAWCETT, four times mayor of Tacoma, Wash., died there on Jan. 22, at the age of 81 years. During his entire political life Mr. Fawcett opposed the utilities, even going so far during his last term in office as to encourage an extensive use of jitneys to compete with the railway lines of the Tacoma Railway & Power Company. He finally went down to political defeat in a campaign in which the voters were convinced that his tactics were only hampering Tacoma's growth.

O. M. CARTER, one of the organizers in the building of the first electric railway in Houston, Tex., died on Jan. 6. During his 38 years in Houston he was active in public utility and civic improvement projects.

Manufactures and the Markets

Who Pays the Cost of Price Cutting?

A frank discussion of the warfare now being waged between the purchasing agents and the sellers in this buyers' market

By Earl Whitehorne
Commercial Editor "Electrical World"

WITHIN the memory of this generation there has never been a time when business men were talking more about the ethics and the economics of price cutting. It is an engrossing subject of conservation in the electrical industry right now. It concerns the power companies because they are large buyers. It concerns the electrical manufacturers because they are selling to these large buyers. It concerns them in the same way that the same conditions are involving other large buyers and sellers in numerous other industries. But the fact that these conditions are general does not make them any less particularly a problem which the electrical industry must face in its own field and work out for itself.

In a Buyers' Market

We are of course in a buyers' market. There is excess capacity and overproduction in manufactured products and an intense competition for orders. But that is not all. We have had other periods when the buyer was in the saddle, riding the salesman whip and spur, just as we have had sellers' markets, when demand exceeds supply and the pressure has been upon the purchaser—during the war, for instance. And whereas then the salesman was playing one buyer against another for a better price, the purchasing agent today is juggling one seller against another for a lower figure. It is not unnatural. The purchasing agent feels that it is now his time to be the wolf. It is his night to howl. But times have changed and what was once considered a fair game of bartering has come to be a matter of the economics of an industry.

There has been much progress in the thinking of American business. The pack peddler and the patent medicine man have gone their way with their wooden nutmegs and fake nostrums. The days of barter in the village store have given place to a one-price policy in retail trade. Modern business ethics have purged the manufacturing field of many practices that once were looked upon as quite legitimate but now are recognized as unfair either to the customer or the competitor. And now a new advance in the evolutionary process has introduced another idea—the responsibility of business men to protect the economic health of the industry in which they are engaged.

In other words the growth of American industry has brought with it an extremely complex inter-relationship among manufacturers and between buyers and sellers throughout the land. Specialized production has developed a tremendous volume of inter-industry trade in materials, equipment and services, and also large concentrations of capital and industry have resulted in a degree of interdependence between the buyer and the seller in such an industry as ours as has never been known before. And the present discussion of the prevalence of price cutting by manufacturers and profiteering by large purchasers has to deal with these new conditions.

Obviously it is poor business to be a party to a transaction in which either side is going to lose money. That is just common sense. For it usually costs more to win a new customer than the profit on the first order he gives. It is the continuing business from the account that pays, and it costs money also for a large buyer to take on a new supplier and establish an understanding of special needs and a dependable service. Usually it costs more than is gained by changing to another line just to seize a slight price advantage on the initial order—too often offered as a bait.

But there is more to it than that today. For so vast is the flow of goods and so greatly is the modern buyer sustained in his own business by his suppliers, that a large industrial organization has come to be vitally concerned with the prosperity of the other organizations from which it draws. Put a manufacturer out of business by rendering it impossible for him to make money and you must look elsewhere for your next shipment of whatever it is you need. Let him live and he will continue to help you make more money. And that is precisely the philosophy that has dominated in those much heralded cases where a large buyer has examined into a seller's costs and refused to accept cut prices that netted him a loss, knowing that either this seller must hereafter skimp on quality or service or ultimately go to the wall—unless the price level is restored.

Some Experiences in Price Cutting

The purchasing agents of large buyers are being accused of profiteering. The complaining manufacturers are being charged with lack of price courage. What is it all about?

In this article Mr. Whitehorne arrays the major factors in the situation. There will follow a further discussion of "Some Experiences in Price Cutting" in which the methods that are at present demoralizing the market for electrical apparatus will be described. The editors will welcome a frank expression from our readers on this important and much disputed issue.

Engineering Development Sponsored By Manufacturers

In the electrical industry where an expensive engineering type of equipment is involved the buyer also relies upon the manufacturer for another vital resource. He looks to the manufacturer to advance the art, to conduct expensive research, to carry forward the progress of engineering development. And if the manufacturer is denied profits that are adequate to finance the cost of this, then this will gradually cease and the industry must sacrifice one of its most priceless assets, unless the buyer assumes the burden.

Samuel Insull stated it well for electrical men, in a much quoted address in Chicago not so long ago. He said:

> You men who are in branches of the business other than central station business—you have problems of your own. But the interdependence of the industry makes your problems ours, as it makes our problems yours. Central station development creates the market for you and keeps it expanding. Development on your side assists our efficiency and facilitates use of our product.
>
> If competition in the sale of turbo-generators or cables or transformers is so keen as to hamper research work and threaten the quality or the rate of development; if too narrow margins restrict the wholesaler's ability to carry adequate stocks, supply sales service and extend credit to the retailer; if the keenness of competition between contractors impairs the adequacy or quality of wiring; if construction is hampered or not properly remunerated on account of policies in other branches of the business—if any of these things happen, the central station companies, which use those materials and services, finally suffer the most.
>
> And last of all the paramount responsibility, imposed upon all of us by our common interests, is to see to it that no obstacles are placed in the way of general electrical development—a development that is not yet nearly completed but has already done so much to make our country the envy of all the world.

Digitized by Google

Coming down to cases—Just what is the situation in the electrical industry? Two things are happening:

1. Purchasing agents of large buyers are rigorously applying the thumbscrews to the manufacturers' salesmen and beating down price levels by ingenious methods of induced competition.

2. Manufacturers in their eagerness for volume are weakly submitting to this pressure and cutting prices to get orders that net a loss and demoralize their market.

The first reaction is to just say: "Well, under the circumstances the purchasing agents are smart and the manufacturers are not. Why worry?" But when you look ahead and ask yourself what the consequences may well be within this highly interdependent community of business interests if this condition should continue very long, you realize that in the end the buyer would suffer with the seller, and the entire industry would be the loser by it all. Large scale profiteering by purchasers, widespread price cutting by manufacturers in this day and age soon become a common problem.

What is to be done? It would seem that the burden of reform would rest upon the manufacturers who possess the right to accept an order or decline it as they wish. But as every manufacturer knows, the demand for volume is a remorseless pressure upon the sales department that must feed orders into the hungry hopper of a modern factory. And since the Sherman law forbids competing manufacturers to organize for mutual protection against the snares and pitfalls of a buyer's market, each one must take his chances in the open strife, and the price that can be charged depends upon the level of the market for competing lines. Let one sales manager weaken in the face of a persistent price-squeezer and let a second fall in line and no other bidder can hope to hold to his figure and secure the business.

Apparently there remains but one legal and practical defense to which the manufacturer may have recourse. That is the organizing of industry opinion, to correct uneconomic practices and improve the standard of executive policy among both the buyers and the sellers. In other words, he must broaden the vision of the purchasing agent and stiffen the spinal structure of the sales manager.

Too Much Secrecy

The seat of the present trouble, it would appear, lies in the old tradition of the secrecy of bids, for here is the keenest weapon that the buyer is employing at the moment. A group of manufacturers are invited to submit bids on equipment to be purchased. The bids are in. The salesmen call. The purchasing agent thereupon proceeds privately to play each man against the others, telling each that he is high, inciting each to telephone the factory, whipsawing them with fear and hope until the last price cut has been exacted and the last unhappy concession wrested from the profit margin on the goods. Too often he who was the low man at the outset is the low man at the end but minus profit. Too often also the order was all the time intended for him for some good consideration of the quality or service offered, in return for which he has been mulcted of his company's earning power on that sale. Because of the traditional sanctity of bids, he has been unable to demand a showdown when the bids are in, a chance to see whose price is really high. For there are lying purchasing agents as well as lying salesmen, and the temptation to play tricks with truth is sometimes great in buying.

Clearly, therefore, there are three things to be done as an approach to a remedy:

1. Secrecy should be eliminated on bids for standard listed apparatus. Bids are published on government orders. Bids to private purchasers should be open to examination by any manufacturer who is called back and asked for a revision of his price. At present it is not supposed to be morally right to show a bid to a competitor. Where the bid entails a large element of engineering or other variables this secrecy will undoubtedly continue. But on standard listed apparatus—and this covers the major volume of the sales of industry—the buyer should show the bids when asking any bidder to reduce his price.

2. Salesmen should demand this frank showdown—whenever called upon to cut a price after the bids are in. He should expect it as an evidence of good faith on the part of the buyer. Manufacturers should refuse to consider a concession without this evidence.

3. The holding of post mortems on competitive bids should be made standard practice among all electrical manufacturers, so that losers may analyze all bids and understand their lost business. This is lawful and already is being done to some extent, the exchange of bids being made by the bidders. The National Electrical Manufacturers Association is actively promoting this idea and serving as clearing house for its members. The practice should be general.

Of course, this would not end all cutting of prices. It would simply bring the practice out into the open and improve its morals. It would be a step toward an eventual one-price system.

But the seller should not be made to fight for this reform unaided. Purchasing agents individually and as nationally organized should also become the exponents of this idea. It is another step to be taken in the de-bunking of business, the banishing of deceit and trickery from trade. In this era of economic intelligence the gentle art of profiteering by purchasers should be laid away in shrouds along with the wooden nutmeg and that once popular commercial slogan—*caveat emptor!*

For men do not buy for price alone. Price is important. But other factors are equally important because they themselves constitute the value, for which the price is paid. The chief concern of the buyer should be to see that he obtains a value proportionate with the price. The chief concern of the seller should be to see that he obtains a price commensurate with the value. And these two ideals are not antagonistic. They go together like the well known words—*E pluribus unum*—to use more Latin.

Who pays the cost of price cutting, then? Both the buyer and the seller pay it. And in the end the entire industry suffers.

Three Recommendations

1. That bids on standard listed apparatus should be offered for examination by any bidder who is called back and asked for a reduction of his price.

2. That salesmen should demand this as evidence of good faith on the part of the buyer whenever asked to cut a price after bids are in.

3. That post mortems on competitive bids should be made standard practice among all manufacturers so that losers may understand their lost business.

Track and Terminal Work Planned by C., A. & E.

The Chicago, Aurora & Elgin Railroad, Aurora, Ill., has been granted authority to relocate its tracks in that city, along the river bank from New York Street north to the point where the track turns into Broadway. The Dellinburg block at the intersection of Broadway and New York Street is to be remodeled and used as a new terminal. It is reported that the relocation will relieve much of the Broadway traffic congestion through removal of the third rail cars from that thoroughfare. Col. Edward Blair, general manager of the traction line, estimates that the new construction work will require eight months and will be started as soon as final rights-of-way are obtained.

Westinghouse Manufacturing Executives Promoted

Announcement has been made by J. M. Hipple, works manager of the East Pittsburgh works, of the appointment of E. C. Brandt and F. J. Shiring as assistant works managers, and of J. E. Webster as chief plant engineer.

Changes simultaneously announced by E. R. Norris, general works manager, are the appointment of A. E. Kaiser as director of production for all works and S. C. Hoey as works manager of the Homewood renewal parts works.

London Plans Extensive Car Overhaul

Further particulars of the program of the London Underground electric group of railways, costing $12,500,000, are now available. The work intended to be carried out is expected to take about two years to finish and to include a complete overhaul and renewal of the old rolling stock and equipment, so as to bring it up to the standard of efficiency represented by cars recently put in operation. Temporary shops for the purpose have been constructed at Feltham, and the existing shop at Acton has been considerably enlarged.

The new equipment to be purchased includes motors, control, door equipment and cars. The new cars on the tube railways will have pneumatically-operated doors, but the District cars will retain the present hand-operated doors.

Economic Situation to Be Surveyed by Hoover Committee

Secretary Hoover has announced the personnel of the committee which is to make a survey of recent economic changes in the United States as follows:

John J. Raskob, vice-president General Motors Corporation, New York; Owen D. Young, chairman General Electric Company, New York; Daniel Willard, president Baltimore & Ohio Railroad, Baltimore; A. W. Shaw, president A. W. Shaw Company, Chicago; Lewis E. Pierson, president United States Chamber of Commerce; William Green, president American Federation of Labor; John Lawrence, president New England Trade Council; Adolph C. Millert of the Federal Reserve Board; Max Mason, president University of Chicago; George McFadden, Philadelphia; Louis J. Taber, master National Grange; Clarence M. Wooley, chairman American Radiator Company, New York; Walter F. Brown, Assistant Secretary of Commerce, and Secretary Hoover, chairman of the committee.

The committee will meet in New York on Feb. 21, to start its inquiry in conjunction with the National Bureau of Economic Research.

When he announced on Jan. 26 his determination to appoint such a committee, Secretary Hoover stated that the committee will "supervise a far-reaching inquiry into the changes in economic currents in the country."

Copper Prices Fairly Steady

Business has not been brisk in any of the metals, although the cut in lead stimulated some buying.

After ruling at 6.50 cents for two and one-half months, the price of New York lead has been cut; tin continues its downward course; zinc has eased slightly; but copper prices are pretty well maintained, with "primary" producers firm at 14.125 cents. On the other hand, sales at various prices between 14.00 and 14.10 cents, have been made, the lowest being reached Feb. 15, when one lot was sold for 14 cents.

Last Friday, Feb. 10, the American Smelting & Refining Company cut its contract price from 6½ cents, New York, at which level it had held since Dec. 1, to 6.35 cents. The St. Louis market has also weakened, lead having been sold on Feb. 14 and 15 at various prices between 6 and 6.15 cents.

Straits tin for prompt delivery sold Feb. 15 at 51¼ cents.

Dullness has pervaded the zinc market and prices have softened. Metal was to be had Feb. 15 at as low as 5.575 cents.

Stark Electric Program Includes Three New Cars

The purchase of three new one-man interurban cars from the Cincinnati Car Company is the major item in the improvement program costing about $70,000 to be carried out by the Stark Electric Company, Alliance, Ohio. These improvements are to be made to increase service between Alliance and Canton, and between Canton and Louisville, Ohio, the latter a distance of 5 miles.

Other work proposed is construction of three sidings and a loop between Canton and Louisville, and installing an automatic block signal system from Alliance to Canton. The new construction will cost about $10,000 and the signal system about $15,000, according to E. W. Sweezy, general manager of the company.

Two Cars for Fitchburg Road

An additional sales agreement between the Fitchburg & Leominster Street Railway, Fitchburg, Mass., and the Wason Manufacturing Company, Springfield, Mass., covering the purchase of two light-weight double-truck cars has been approved by the Massachusetts Department of Public Utilities.

ROLLING STOCK

FORT DODGE, DES MOINES & SOUTHERN TRANSPORTATION COMPANY, subsidiary of the Fort Dodge, Des Moines & Southern Railroad, Boone, Ia., has accepted delivery on two 27-passenger A.C.F. parlor coaches.

SHOPS AND BUILDINGS

BRITISH COLUMBIA ELECTRIC RAILWAY, Vancouver, B. C., it is reported, will expend $70,000 in construction of two large substations as already planned, and plans are under way for several others. The two planned will be undertaken at once.

ADVERTISING LITERATURE

OHIO BRASS COMPANY, Mansfield, Ohio, is sending out in folder form the reprint of an article which appeared in the ELECTRIC RAILWAY JOURNAL for Dec. 17, 1927, entitled "Catenary with Unusual Pole Spacing Withstands Cyclone," by L. W. Birch, line material engineer of that company.

MITCHELL-RAND MANUFACTURING COMPANY, New York, is mailing a card directing attention to the advantages of its "E.B." Insulating Paint and "2098" black paint.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued a loose leaf folder, entitled C R 3110 drum controllers.

ELECTRIC RAILWAY MATERIAL PRICES—FEB. 14, 1928

Metals—New York

Copper, electrolytic, cents per lb.	13.85
Lead, cents per lb.	6.325
Nickel, cents per lb.	35.00
Zinc, cents per lb.	5.95
Tin, Straits, cents per lb.	52.00
Aluminum, 98 or 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Franklin, Ill., screenings, Chicago	1.825
Central, Ill., screenings, Chicago	1.575
Kansas screenings, Kansas City	2.125

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.75
Tie plates (flat type), cents per lb.	2.25
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.85
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (24 gage), cents per lb.	2.90
Sheet iron, galvanized (24 gage), cents per lb.	3.65
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	16–20
Waste, cotton (100 lb. bale), cents per lb.:	
White	16–19.50
Colored	11–16

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.2
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal.	$0.65
Putty, 100 lb. tins, cents per lb.	5.25–5.50

Wire—New York

Copper wire, cents per lb.	16.125
Rubber-covered wire, No. 14, per 1,000 ft.	5.30
Weatherproof wire base, cents per lb.	16.50

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.875
Light copper, cents per lb.	10.25
Heavy yellow brass, cents per lb.	7.25
Zinc, old scrap, cents per lb.	3.50
Lead, cents per lb. (heavy)	5.25
Steel car axles, Chicago, net ton	$16.25
Cast iron car wheels, Chicago, gross ton	14.25
Rails (short), Chicago, gross ton	15.50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.50

Cause for Congratulation but Not for Rejoicing

SENATOR WALSH'S proposal for a senatorial inquiry into the public utility and closely allied corporations has been denied. Instead the Federal Trade Commission will act in the matter. While the trade commission will be under pressure, the case will be conducted along judicial lines and not along the lines of prosecution. As *Electrical World* sees it, the outcome of the matter should be an occasion for congratulation but not for rejoicing, for the desire of the commission to bring out all the facts will inevitably elicit much irrelevant, biased and misleading testimony which will be read by many who will not read that on the other side.

For three days the Senate debated, without eliciting one constructive thought or any good reason, for that matter, why there should be any investigation. During this time passion instead of reason marked the consideration of the resolution and Senator George's amendment to it. Those who sought to place the investigation in the hands of the Federal Trade Commission were accused by inference of being bought by utility money; the Trade Commission itself was charged with incompetency and said to represent "big business" only, and as for the executives and others of the utility industries involved, they were all lobbyists. Obviously, from a public utility angle the situation was anything but reassuring, and the Senate did well, in vindication of itself as well as in justice to the utilities, to turn the matter over to the Federal Trade Commission. There the complete story may be told—and the record can speak for itself.

The utility companies of this country are entitled to a fair hearing, and the submission of their case to the Federal Trade Commission would indicate that the Senate of the United States means that the utilities shall have it. When the case will end and what the final judgment is to be will be revealed in due season. The verdict should be one of exculpation and reassurance. If the case of the utilities is properly presented, no other outcome is thinkable.

Little Things That Make Friends

"WAIT FOR PASSENGERS," a wise edict of an even wiser management, issued recently during a persistent stretch of cold weather in Omaha, had telling effect as letters to the newspapers of that city testify. In this instance motormen and conductors were instructed to hold cars for those hurrying to catch them and were told that under the unusual circumstances prevailing "a few seconds lost in schedule time in this way are compensated by the appreciation the passenger shows for the friendly act." Not long before this order was issued the same railway opened a bureau to receive patrons' complaints and suggestions for the improvement of service and gave proof of its good faith by co-operating with a worthy idea—that of supplying extra railway service for the convenience of workers in a packing plant.

There are, of course, many companies with officials sufficiently progressive and far-seeing to evaluate highly the countless little acts of service and courtesy that make the patron feel the company is something more than a machine. And these little acts are bound up with the personal equation, so that if John Jones and Mary Brown benefit today and not on some future day, perhaps after a franchise ordinance has passed through its various stages, necessarily some advantage accrues to the railway. Even if the letter of the law is observed in matters of physical equipment and other details, the spirit must be present in that railway management whose chief concern is winning riders and making friends.

When the motorman who has passed up a passenger becomes to the man left waiting in the street a fiend laughing in ghoulish glee at his discomfiture, then a potential friend of the company all too often becomes irascible and articulate in his condemnation of the public servant and of the entire system. Here then is a liability that even the newly upholstered seat in the modern car can not convert into an asset. Even the request of the company to inspect new facilities may bring something of a reproach rather than approval. To bring back the esteem of persons whose friendship has been lost is far more difficult than to establish good repute in the first place, for it is infinitely easier to make friends than to convert enemies into friends.

The Railway Leads the Way in Milwaukee

CONFIDENCE in the future of electric railway transportation stands out strongly in the program of rehabilitation and improvement which the Milwaukee Electric Railway & Light Company has been resolutely pushing forward during the past several years. This company's "service first" slogan, emblazoned in gleaming electric signs, meets the eye in many locations throughout Milwaukee. But a slogan is merely a promise; one must look to more concrete things for its full significance—to the major rapid transit program undertaken to anticipate the city's needs despite public inertia; to improved city service, rehabilitated cars and track, and new equipment offering modern convenience and increased safety; to the comprehensive motor bus system, co-ordinated with the rail lines both within the city and in the surrounding territory throughout the southeastern section of Wisconsin. To these things one must look for a demonstration and interpretation of what the "service first" slogan means in Milwaukee.

It is obviously impossible to finance with private funds a complete rapid transit service for a city like Milwaukee. Nevertheless, the Milwaukee Electric Railway & Light Company has undertaken to provide a high-speed line from the center of the city to the west, connecting with

Digitized by Google

interurban lines leading to Watertown, Burlington and East Troy. In doing this it is endeavoring to demonstrate the value of efficient public transportation. The meteoric rise in popularity of the automobile has for the moment caused the public in Milwaukee, as in many other communities, to overlook the importance of adequate rail transportation. Although heavy expenditures of public funds have been made on street and highway improvement projects, there has been no general policy of planning for mass transportation routes into and within the city. By making heavy investments of private funds to acquire rights-of-way for such routes, the Milwaukee company is endeavoring to bring about adoption of an intelligent community plan before building development in outlying sections cuts off the opportunity of providing such facilities at reasonable cost.

It would have been far easier to have permitted the interurban lines running into the city to have dried up and disappeared through neglect than to have spent millions of dollars in rebuilding and extending them as high-speed railway arteries. But the company was convinced of the value of these lines to the community. It is confident that public co-operation in working out a complete transit plan can be won by demonstrating the company's own faith in the value of rail transportation. In thus undertaking to lead the way toward a sound community transportation policy, the Milwaukee management is putting into concrete practice the promise contained in its "service first" slogan.

Chasing the Ambulance Chaser Out of Business

EFFORTS to drive ambulance chasers out of business have been renewed recently, and there is every reason to believe that they will meet with considerable success. Following closely on the heels of the successful campaign by the Lawyers Club in Milwaukee, a sweeping investigation of ambulance chasing attorneys and activities of casualty agencies has been ordered by the Supreme Court of New York.

The investigation in Milwaukee disclosed that the activities of the ambulance chasers were not only unethical but actually illegal. The courts went over their records and in many instances where there was evidence of malpractice, the cases were either thrown out or the plaintiffs were required to employ new counsel. So great was the publicity given to these proceedings that the practice now has virtually ceased to exist.

Action in New York has been taken in response to a petition of the bar associations presented by no less a person that Charles Evans Hughes, former Chief Justice of the United States Supreme Court. The petition points out that ambulance chasing lawyers have so systemized their business that they are enabled through the help of hospital employees, ambulance and taxicab drivers and others, to obtain immediate information of accidents. Claims involving large amounts have got into the control of unscrupulous lawyers who have proceeded to settle them for their own benefit rather than that of their clients. Many poor and ignorant people have been victimized. To help them to relieve court congestion, and to aid the good name of the legal profession, the New York bar associations hope to have the practice stamped out. If this is done the local transportation companies will also benefit greatly.

The investigation has already been formally opened. The Supreme Court has appointed one of its justices to conduct the inquiry and has armed him with power to summon witnesses, compel testimony, and investigate the books of attorneys and accident insurance companies. This proceeding is based on the right of the Supreme Court to exercise control over attorneys and counsellors at law. Many prominent lawyers in New York City have volunteered to give their time to further the purposes of this investigation. Owing to the well intrenched position of the ambulance chasers it is expected that the campaign against them will meet with strenuous opposition and may require as long as a year for its completion. No doubt exists, however, concerning the final outcome. In the end the practice will be stamped out as effectively in New York as it has been in Milwaukee.

Bus Fare Must Be Made Adequate to the Service

GENERALIZATIONS are always dangerous, but D. E. Druen, superintendent of bus maintenance of the Kansas City Public Service Company, was right when he said at the recent meeting of the Midwest Electric Railway Association that the average fare now charged on bus operation throughout the country is not only inadequate but is not consistent with the value received. He was also right when he said that a fixed fare is not in keeping with the flexibility of bus operation and will surely work a hardship on both the public and the operator. These points cannot be reiterated too often. There is no disposition at this time to go into the economics of the matter. Neither is there any disposition to upbraid the electric railways for errors of the past. It is to be expected that in a development of this kind conditions arise over which management has little control. The important point now is that past errors should be avoided, particularly in pending franchise negotiations in which the use of the bus seems likely to play a large part.

As pointed out in the JOURNAL for Feb. 11, the fixed fare was always an anomaly, but particularly so in the case of the bus.

Often the presence of jitney competition or the threat of independent bus operation by groups with more enthusiasm than actual knowledge of bus economies, forced the railways to install buses at rates of fare known to be insufficient. The real difficulty in such situations is caused by the inertia of the public mind once a rate of fare has been set. For that reason it is particularly important that the danger of fixed fares be emphasized at every opportunity. As operating experience grows, inadequate fares prove a serious burden to taking full advantage of the new vehicle. It is inevitable where there is an inadequate fare that the service should seek the level of the fare.

Bus operation by the railways has not been more uniformly successful because too much has been attempted. The place of the bus physically under railway auspices has been pretty definitely defined, but there is need for greater insistence on the right to adjust fares to particular conditions, with a reservation of a variable fare consistent with the nature of the service furnished and its class. And in all this discussion the place of the bus in de luxe city and suburban service should not be overlooked. These are merely some considerations that will help to put an end to the period of trial and error with the bus from the standpoint of the ability of that vehicle to pay its way.

Will the Public Pay for Good Transportation?

RECENTLY the Port of New York Authority took a "commuter census" of inbound railway traffic from Long Island, Westchester County and Staten Island into New York City as a step toward planning better transportation in the metropolitan area. Although too early at this time to report on the figures of this survey, it is expected that further evidence will be found that commuters are willing to pay higher fares for better service.

Any such evidence will strengthen the "better service" theory revealed by a similar census taken two years ago by the North Jersey Transit Commission. Figures from the questionnaires returned at that time showed that 57 per cent of the passengers arriving at one terminus pay from 6 to 10 cents extra fare on the Hudson & Manhattan tubes when they could have traveled without extra charge on the ferries. For what did they make the extra expenditure? The question is answered in two words—better service—which, as the New York *Herald-Tribune* remarked, "is an interesting commentary on the dogma that the public won't pay a cent or two extra for good service."

Experience with Upper Decks on Cars and Buses Should Not Differ Greatly

UPPER decks on buses have largely the same advantages and disadvantages as those on electric cars. There is every reason to believe that, relatively speaking, the use of double-deck buses will decrease.

Where transportation for pleasure is not involved, experience has shown that the single decker is superior in many respects. The principal claim for the double-deck type is large seating capacity. However, the space limitations made it impossible to include entrances and stairways of sufficient width and with low enough pitch to make access easy and loading and unloading rapid. Where stops are frequent and there is any considerable passenger interchange, the standing time is increased seriously and the schedule speed is reduced. Further, the standing vehicles in the street increase the traffic congestion. From the traffic standpoint no really satisfactory one-man double-deck vehicle, either car or bus, has yet been designed.

Where sightseeing is a considerable part of the service, with passengers riding for long distances and desiring a good vantage point above the traffic, there are more reasons for the use of the upper deck. Still another use is on a very heavy traffic route, such as ordinarily would call for two-car trains on a street railway. If relatively few stops were made, as in express service, the double-deck vehicle would not be at such a disadvantage, as operating expenses per seat-mile could be held down.

The latest city in this country to go to single-deck design for its buses is Atlanta. The cost per bus-mile with the original double-deckers was so high that the base service is now being given with much lighter, one-man single-deck buses. The double-deckers are used in special and rush-hour service only.

In Europe, outside of Great Britain, the single-deck bus, like the single-deck car, is the rule. The principal exception is in Berlin, where double-deck buses are employed along with single-deck cars, although in Berlin, as in New York, the bus service is small as compared with that given with surface cars.

In several of the largest cities in this country, such as New York, Chicago, St. Louis and Philadelphia, double-deck buses still are used in large number. But for general service, at least in the smaller cities, the single-deck bus offers the opportunity of a lighter vehicle, one-man operation, fewer passengers per bus, fewer stops, and more frequent service.

If Theory and Practice Could Be Brought Into Accord

ONE does not have to agree with all that the Maryland Commission said in its recent fare decision in the Baltimore case to realize that its suggestions about the advisability of revamping the financial structure of the United Railways & Electric Company have merit. The question is how best to do it. There is no doubt that the fare change authorized, although it fell short of what the company desired, will help toward restoring the credit of the company, but no fare change that could be made is a panacea sufficient by and of itself to correct a condition in a financial structure that appears to be inherently clumsy.

Naturally, the commission frowned on the idea of a forced receivership. How the proponents of this idea thought receivership could be forced or what they thought could be gained by it, almost passes understanding. Rightly, the commission held that any such proceeding would mean no good, but only harm for the car rider. The United Railways is anything but insolvent, and the property cannot be confiscated. Until recently the company has been able to pay dividends.

Theoretically the amount of securities which the company has outstanding has nothing to do with the matter, since the value has been fixed upon which the company is permitted to earn a return and the commission has attempted to set a fare that will permit the company to earn on it. Practically, however, it has a very important bearing, particularly on the basis of the relative percentage of one form of securities to another. As the matter stands now, the company has outstanding securities in par value $12,637,000 in excess of the value fixed by the commission, but in the ratio of funded debt to total capitalization and to value upon which the company is permitted to earn lies the most potent factor at work against the company. The first ratio is approximately 76 per cent, while the ratio of funded debt to the value of the property found by the commission is approximately 90 per cent. The commission believes that the ratio of funded debt to the stock ought not to be greater than 67 to 33 in a company of this sort. Such a structure would of course be fairly comparable to that suggested by the committee of finance of the A.E.R.A. Standing in the way of further financing at reasonable terms to the United Railways is a closed mortgage. In consequence the company has resorted to securing money through the Maryland Electric Railway, which leases its property to the United for a sum sufficient to pay interest on the bonds and provide for their retirement at maturity.

The presentation of the matter in the commission's findings is very interesting. The management at Baltimore may be assumed to be no less cognizant than the commission of the theoretical considerations that ought to be made to apply to this case. Matters for them would be helped greatly if things could be so readjusted as to bring about an approximation of the real and the theoretical considerations.

The high-speed lines that are being developed north, west and south from Milwaukee center in the Public Service Building

Service First

Is Milwaukee's Transportation Slogan

PART I

By Charles Gordon

The Milwaukee Electric Railway & Light Company is making heavy investments in improved facilities to anticipate the transportation needs of its community. Adequate high-speed service is considered vital to the city's present and future development

IT IS more than probable that a full realization of what its transportation company's foresight is doing for the progress and future prosperity of Milwaukee, will not be fully recognized for many years to come. That foresight is being backed with the courage to make large investments in improved transportation facilities within the city and in anticipating the community's expansion and future needs. While many cities in the country are wrestling with the problem of providing fast and adequate public transportation, the lack of which is threatening to stifle their development, the Milwaukee Electric Railway & Light Company is taking the initiative in providing for Milwaukee the backbone for a comprehensive rapid transportation system for the city and contiguous territory.

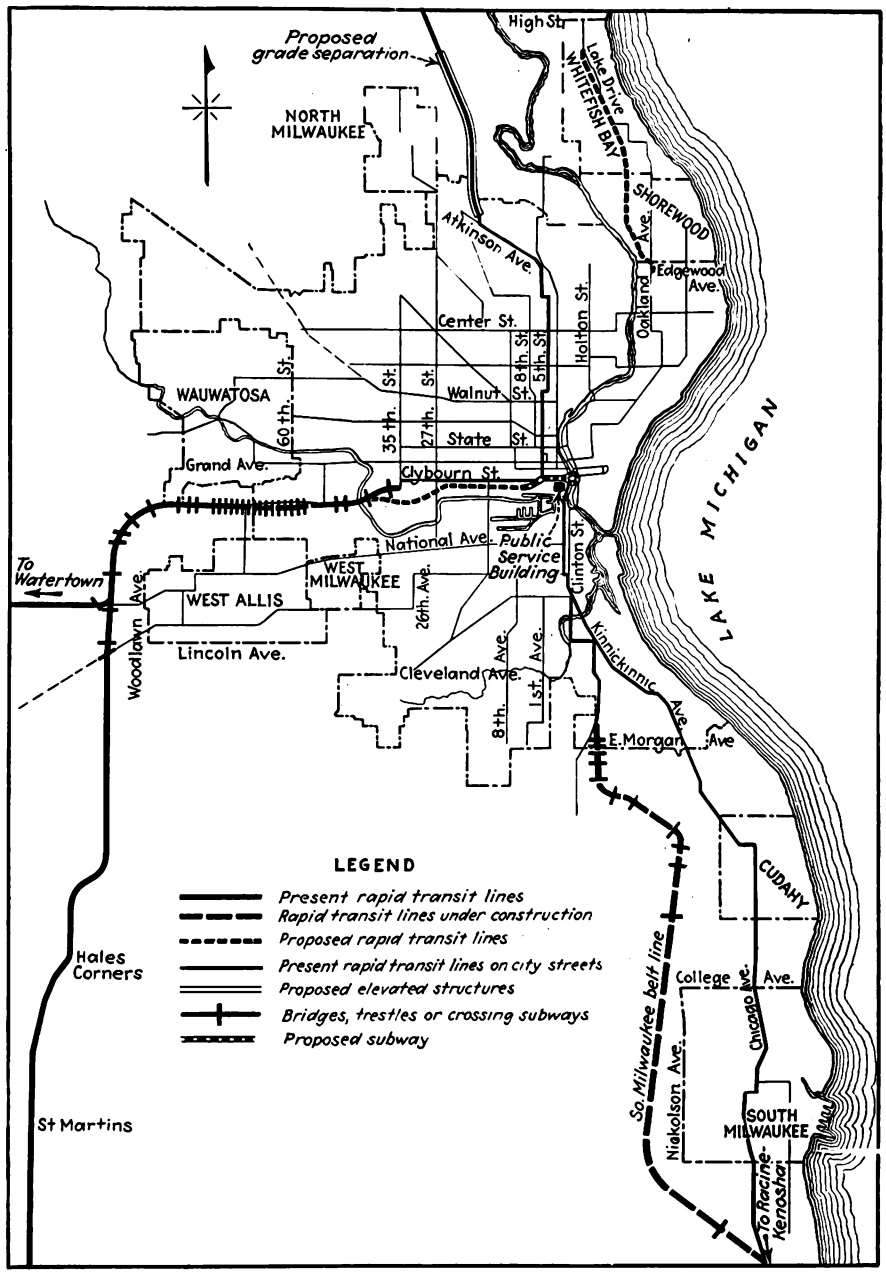
Millions of dollars have been expended in providing rights-of-way for the conversion of former interurban lines into grade-separated, high-speed, rapid transit lines that constitute arteries for the expansion of the city and for linking the present city area with the prosperous and attractive surrounding communities and countryside that are logically within the Milwaukee metropolitan district. Milwaukee's transportation company is looking ahead to the part which these attractive suburban towns and the land of lakes that surrounds the city proper may be expected to play in the development of a greater city. It is anticipating, likewise, the needs of the growing industrial district that lies to the south. On the railway lines within the city heavy expenditures have been made during the past several years for improved street cars and for putting surface track in good condition. There has been built up a comprehensive bus service both within the city and between Milwaukee and other communities in the south-

Digitized by Google

eastern section of the state. All this is being done in the face of public inertia and despite a discouraging financial showing on present transportation operations.

Although Milwaukee County has been liberal in the expenditure of public money for highway improvements, continued increase in road congestion threatens to choke off the city's activities just as growing congestion is doing in practically every large city in the country. Though both the city and county of Milwaukee have a progressive zoning and planning policy looking to future growth and expansion, there has been a tendency, just as there has been in other cities, to overlook the importance of making adequate provision for rapid public transportation. Blinded by the popularity of the automobile, public planning bodies in Milwaukee have failed to recognize the futility of depending upon highway construction for a growing city's transportation requirements.

Milwaukee is fortunate, however, in that its transportation company has had the foresight and courage to go ahead on its own initiative and at its own expense, to provide for present needs and to reserve other important transit routes before the city's growth makes this extremely costly, if not impossible. The company is leading the way in the hope of bringing about ultimately the adoption of a sounder community policy toward transportation. It is proceeding with the construction of rapid transit lines on a scale sufficient to demonstrate the advantages of rapid transportation to the public in the hope that this will win the necessary public co-operation to make a city-wide system possible.

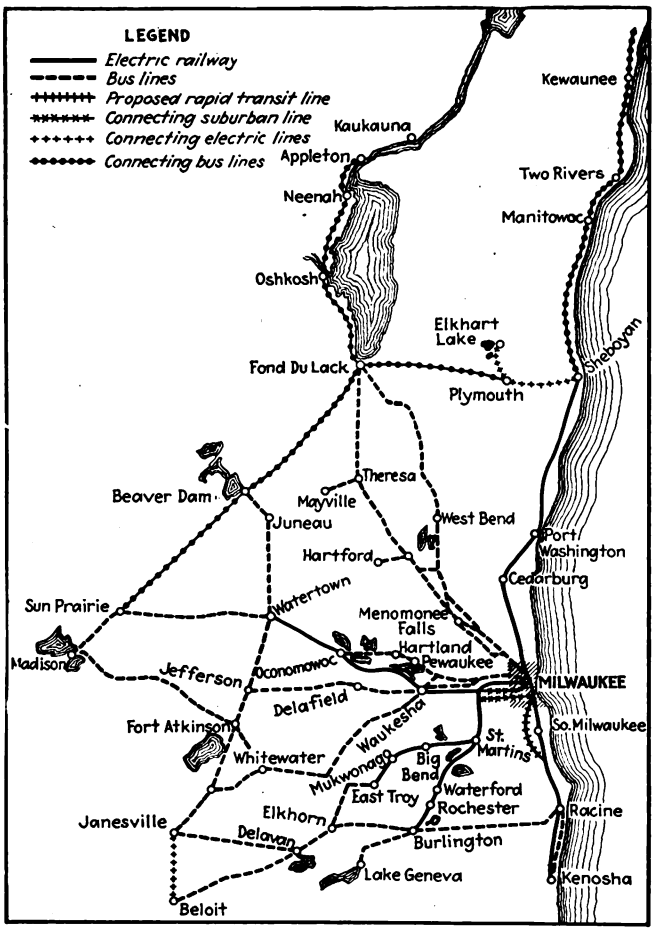


Map of Milwaukee's city and rapid transit lines. A right-of-way is being acquired to bring the western line to the Public Service Building. Improvements on the north and south routes will insure high-speed service

Extensive construction work is under way both west and south of the city and is awaiting only final approval of plans for starting grade separation to the north. The program has been developed as part of a comprehensive plan to cover the transportation needs of the entire Milwaukee metropolitan district. The first stage of construction is to provide adequate high-speed outlets for the city's population so as to make available for residential sites the attractive surrounding countryside, which, due to the time required to reach the heart of the city, has hitherto been unavailable for all-year residential purposes. There has already been expended nearly $5,000,000 in this work. It will take additional heavy expenditures to complete the work now contemplated, and all of this is only the first step in a major program, which, if the city extends the degree of co-operation needed to work out the full plan, will give Milwaukee a comprehensive rapid transit system leading in three directions from the heart of the city through its suburbs to high-speed rehabilitated interurban lines serving outlying cities and towns within a great semicirclce of 30 or 40 miles radius. From rail heads in these cities there is now a network of luxurious bus lines on the highways throughout the southeastern section of the state.

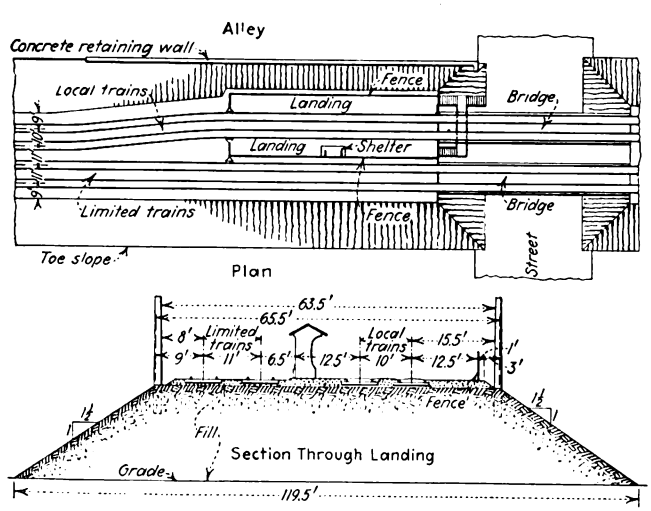
The program being carried out in Milwaukee with respect to the development of former interurban routes into rapid transit lines is of major magnitude and is in striking contrast to that followed with respect to interurban lines in other locations, particularly those which radiate out from a city into surrounding territory. There has been a general tendency to permit such lines to dry up with neglect. It would have required far less courage and risk to have permitted this to happen to the interurbans operating out of Milwaukee, for their revenues had dropped to discouraging proportions. As they wound their way haltingly over tortuous track they, like similar lines in other sections of the country, were hopelessly at a disadvantage in competition with fleet and attractive automobiles. There would have been ample justification for permitting these lines, which at one time

Digitized by Google



Lines of the Milwaukee Electric Railway & Light Company, Milwaukee Northern Railway and Wisconsin Motor Bus Lines serve the entire southeastern section of Wisconsin

played so important a part in the development of Milwaukee, to have eked out a miserable existence until their abandonment was ultimately authorized on the basis of lack of patronage. This would have been the easiest course for the management to have pursued. The growing use of automobiles would have been adequate explanation for the demise of the lines. There would have been adequate precedent for such a policy in that followed with respect to interurbans in other locations. But



Typical section and plan of station landing showing type of construction on western rapid transit line to Watertown, East Troy and Burlington. These are taken between Hawley Road and 68th Street, where the last link in the line west of 35th Street is now being completed

the Milwaukee Company did not choose to follow such a policy. It took real courage to follow the one adopted. If the public ever really understands the full value of this program to the city, the management's "Service First" slogan will take on new significance.

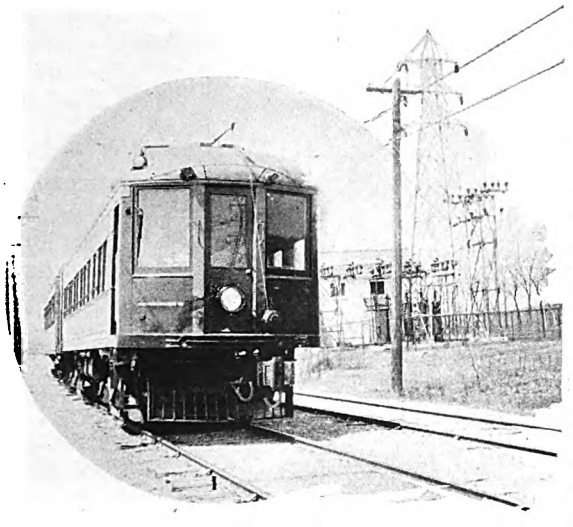
So much, then, for the background of what is being done in Milwaukee. The actual construction work which is completed, under way or authorized, will bring the lines from Watertown, East Troy and Burlington, located west and southwest from the city, into a downtown terminal in the Public Service Building over a high-speed, grade-separated, private right-of-way to a point within a few blocks of the terminal, and thence through a short subway into the terminal itself. A loop is to be constructed under adjacent property owned by the company so as to provide terminal facilities ample to turn trains around without stub-ending and to avoid terminal congestion.

The first step in the construction of this western rapid transit line was the building of a line on private right-of-way from 35th Street west to West Junction, connecting with the Watertown interurban line. This work, together with a connecting line about a mile long between West Junction and the Burlington line, which was described in the June 18, 1927, issue of ELECTRIC RAILWAY JOURNAL, involved long bridges, high embankments, deep cuts and expensive trestle and bridge work. All of the construction from 35th Street west has been completed with the exception of a stretch from Soldiers Home to 70th Street. When this is completed, cars from Watertown, East Troy and Burlington will be brought 6 miles into the city on high-speed line with no grade crossings.

The construction work which is now under way from Soldiers Home west to 70th Street consists of track relocation on private right-of-way, grade separation at all important intersecting streets, and closing unimportant streets and alleys crossing the right-of-way. East of Hawley Road a depression starts which passes under Hawley Road and 60th Street, emerging at grade between 61st and 62nd Streets. From this point the line becomes elevated as it continues west, and finally connects with the present completed embankment structure now located west of 70th Street. This section between Soldiers Home and 70th Street will provide a four-track, grade-separated line, two tracks being for local service of the Wells-West Allis car line, and two tracks for high-speed express operation. The construction involves the moving of 100,000 yards of material for cuts and fills. West of Hawley Road the line is built on solid embankment with steel deck and through girder bridges over street crossings. Where the line passes under streets in cuts, concrete bridges are used to provide grade separation.

High operating speed with adequate safety is the primary object in all new construction and rehabilitation work. Heavier rail has been put in on the Watertown interurban line which connects with the rapid transit line at West Junction and extends to Watertown on private right-of-way. All 56-lb. rail was replaced with 80-lb. steel. The line has also been reballasted with crushed stone and gravel which will ultimately be all stone to insure alignment and freedom from frost trouble. A reballasting program is likewise being undertaken on the East Troy and Burlington interurban line, which, instead of having a tortuous entrance to the city over city streets, was connected to the rapid transit line last spring by the new cut-off mentioned above. New terminal stations

Digitized by Google



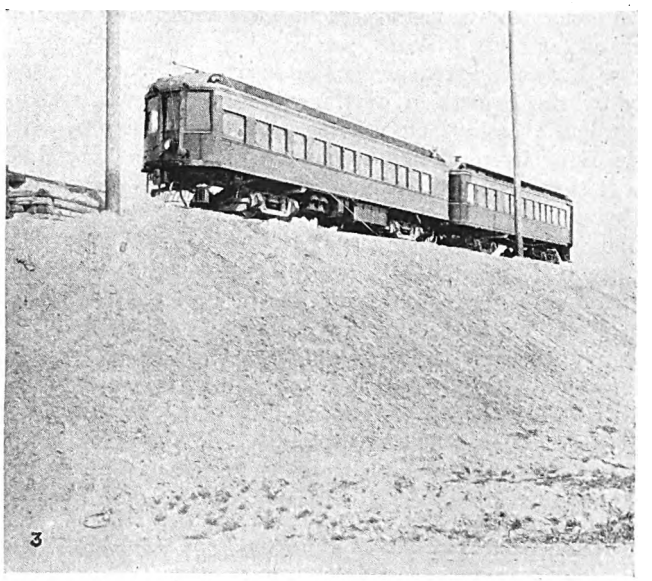
have been built in Watertown, Burlington and East Troy. These are arranged so that passengers can transfer directly under cover between buses and cars.

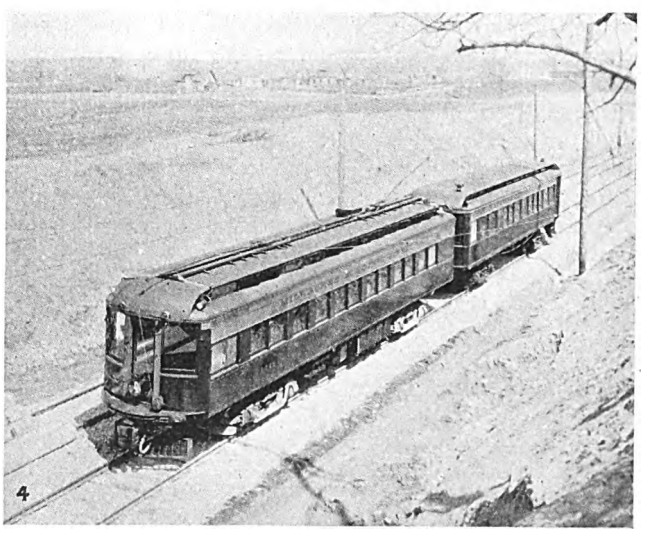
To complete the western rapid transit line from 35th Street east into the Milwaukee Public Service Building, property has been purchased to a point within a short distance of the terminal. Application is being made for permission to build a short subway to complete the connection which will give Milwaukee a complete rapid transit outlet from the city to the west and southwest. The final stage of construction awaits only completion of negotiations with the city and Railroad Commission.

South from the city there is under way the construction of a belt line around South Milwaukee and Cudahy, approximately 10½ miles long from Howell Avenue and Wieben Street to the Ryan Road crossing on the interurban line to Racine. A 3-mile industrial electric railway from the Chicago, Milwaukee, St. Paul and Pacific Railroad to the Lakeside power plant is also under construction south of the city.

This southern belt line will cut out the present slow running section of the Milwaukee-Racine railway along the highway and in the streets through South Milwaukee and Cudahy. It is estimated that this improvement will decrease the present running time to Racine by approximately thirty minutes. The belt line will consist of about 1½ miles of double track south from Howell Avenue together with a double-track running siding about midway on the line. The balance of the construction will be single track.

The double-track section will be elevated or depressed from grade on private right-of-way with steel bridges for highway crossings. The single-track part of the line will be at grade on private right-of-way and will be depressed under the Chicago Avenue crossing. Wherever practicable, on the remaining line, highways will be elevated over the track on highway bridges. The elevated section of the line will be on solid embankment. It will require eight steel bridges for the section from the beginning of the private right-of-way southbound, to the depression under Chicago Avenue. The track will be laid with 100-lb. A.R.A.-A rail, with continuous joints, heat-treated bolts and tie plates throughout. The entire line will be rock ballasted and will be laid on cedar ties on tangent track with creosoted oak ties on curves. Adequate provision will be made for future local station platforms and waiting shelters at car stop intervals of about one mile.





Construction on the Rapid Transit Line to Watertown is designed for high speed operation

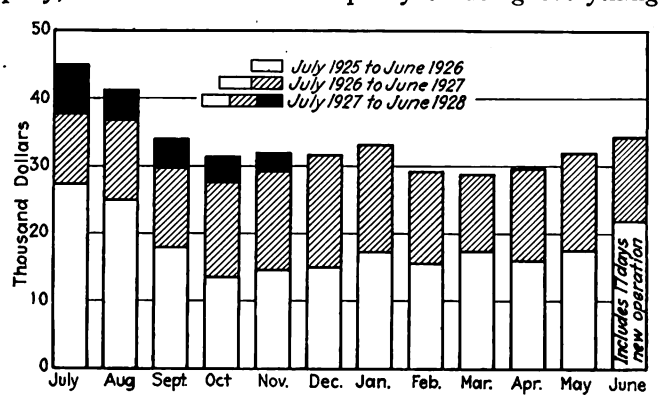
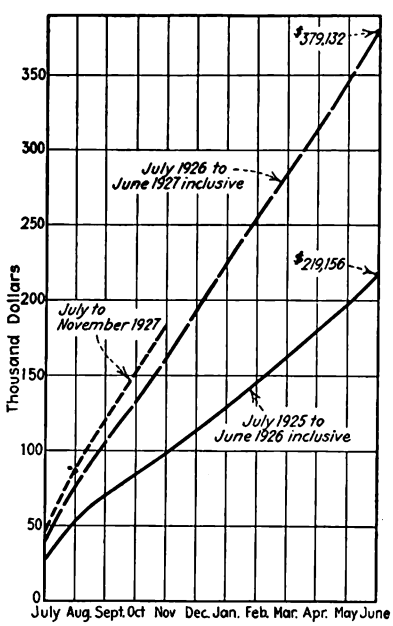
Steel bridges are being provided over all principal street crossings on Milwaukee Rapid Transit Line. Construction shown is on new work between Soldiers' Home and 70th Street

To the north of the city steps are under way to insure an outlet for Milwaukee's future rapid transit system over the present Milwaukee Northern line, which now comes into the outskirts of the city on a double-track private right-of-way and reaches the heart of the city over city streets. Work projected for the immediate future involves extensive grade separation made necessary by the expansion of the city to the north, which has taken in additional territory that has been plotted for subdivision and home construction. Plans for this subdivision work would have relegated the rail lines now on private right-of-way to a position in the center of a public street. For that reason immediate expenditures for grade separation work are to be undertaken in order to preserve a high-speed outlet to the north. The work which will be done immediately includes about 3 miles of combined track depression and elevation to give grade separation. Application has been made to the State Railroad Commission for approval of this work, and conferences are being held with county and city officials to agree upon a final plan that will be satisfactory.

Another example of the Milwaukee company's progressive policy in making every possible effort to anticipate the city's needs in transportation is afforded by the plan proposed in the northeast section of the city, in a very high grade residential district. Here a line of the Northwestern Railroad, part of its Manitowoc division running through the towns of Shorewood, Whitefish Bay and the southern end of Fox Point, is to be abandoned through an agreement with the villages. Abandonment of the railroad would cause some titles on the right-of-way to revert, and would result in cutting off this available route for present and future transportation.

Realizing that if this is permitted to occur, these communities would cut themselves off from all possibility of rapid transportation to the center of the city, the company, in accordance with its policy of doing everything possible to insure the preservation of routes for future transportation requirements, has offered to electrify this abandoned line and to operate service over it to preserve the right-of-way. It has offered, further, to undertake expensive grade separation work at important cross streets. This project has been placed squarely before the officials of the communities involved.





Improved service on the Watertown line almost doubled the riding the first year. The second year's operation is showing further increases

High-Speed Cars Provided

The conversion of old interurban lines running out of Milwaukee into a network of high-speed lines serving the entire metropolitan area surrounding the city and outlying sections tributary to it, has been accompanied by improvements in rolling stock in keeping with the changed standards of operation. The rapid spread of competing interurban bus lines and the increased competition of the private automobile led to the conclusion that the interurban lines under the old operating standards were either doomed to early abandonment or that they must be promptly brought to a new standard of service and comfort.

Improvement of interurban equipment was started in 1922 with changes in seats and experiments with parlor car service. In 1924-1925, seven cars for the Milwaukee-Racine-Kenosha line were rebuilt with improved seating, and four cars were converted for parlor car service. With the introduction of parlor cars, limited service was started. This soon gave evidence of the advantages of increased speed, but quickly showed the limitations of street running and the cross-

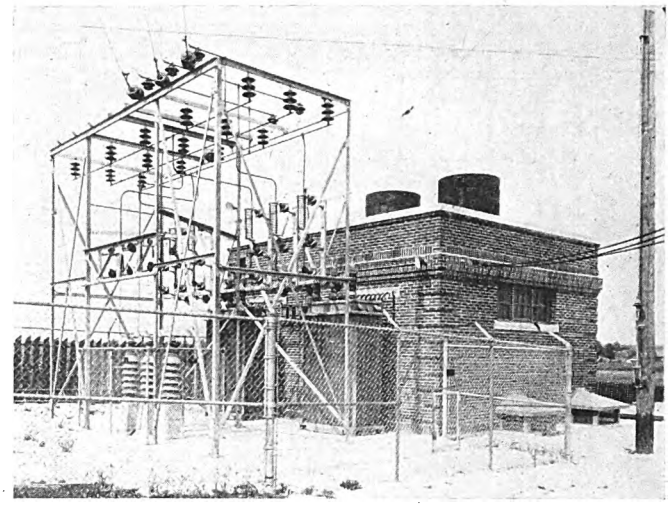
Digitized by Google

ing of many streets and highways at grade. It was this early experience in the effort to give a better service out of Milwaukee that ultimately led to the present major program of building high-speed lines on private rights-of-way with equipment designed to permit fast running with comfort and safety to passengers.

A number of existing interurban cars that had the necessary structural strength were rebuilt for the new service. They were completely refurnished and equipped with new trucks and motors suitable for high-speed running, and with multiple-unit control and modern air brake equipment to permit the operation of more than one motor car in a train. In all, 31 motor cars and ten trailers have been rebuilt for high-speed rapid transit service, and four entirely new motor cars have been purchased. A new articulated unit for service on the Milwaukee-Watertown line has been built in the company's shop. This is a combination dining car, passenger unit with two bodies and three trucks, providing communication between the dining and passenger compartments. It was placed in service between Milwaukee and Watertown, on Jan. 16, and makes direct connections at Watertown with parlor coaches to Madison, the state capital.

The rebuilding of interurban cars consisted of reinforcement of the bodies, insulation against noise, improvement of the lines and general appearance, new interior finish, installation of improved lighting equipment and de luxe leather upholstered bucket type air-cushioned seats. New standard steel, M.C.B. trucks of 7-ft. wheelbase, in which special attention was given to riding qualities, were purchased. Old GE-205 motors were replaced with GE-254, 140-hp. motors and Westinghouse 548, 105-hp. motors. The gear ratios and field control that are provided permit operation with a trailer at free running speeds of 60 m.p.h. M.C.B. couplers and A.M.U. air brakes are used.

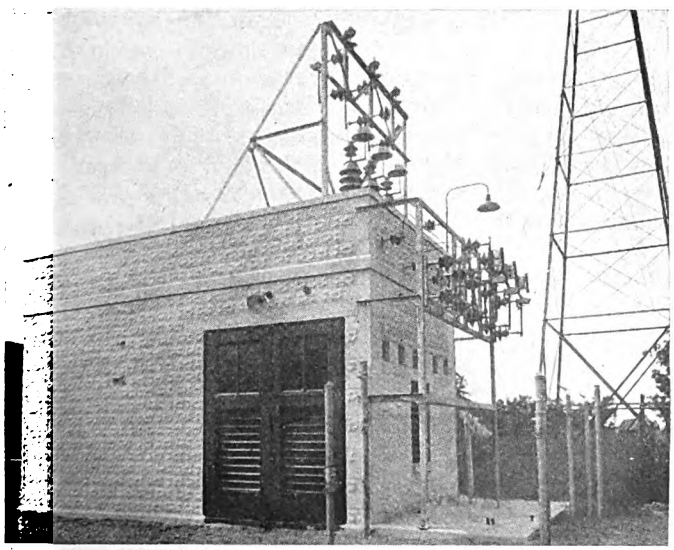
Before the rehabilitation of the lines to Watertown, Burlington and East Troy, operation had been on 1,200 volts direct current from manual substations located at West Allis, Waukesha, Waukesha Beach and Watertown on the Watertown line, and at Burlington and East Troy on the Burlington and East Troy lines. There were substations only at the ends of these three divisions, with intermediate stations on the Watertown line at Waukesha and Waukesha Beach. The West Allis station fed to all three lines from a common point near their entrance to the city.

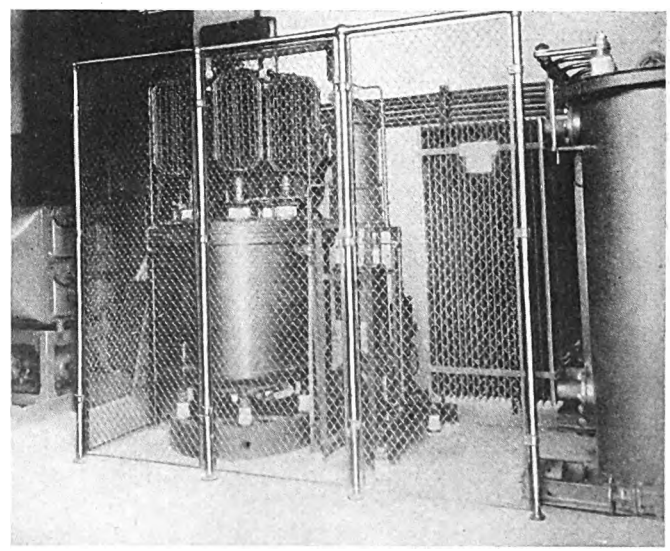


The St. Martins rotary substation is a two-unit installation with full automatic control

The new power supply is 600-volt direct current from substations, spaced at frequent intervals to insure adequate trolley voltage with minimum line drop for high-speed trains. The former 1,200-volt substation at West Allis was converted to 600-volt operation and contains one 2,000-kw. rotary, one 1,000-kw. machine and one of 500-kw. capacity. This station is manually operated and feeds both to the Watertown line and the Burlington-East Troy line from a point in the outskirts of the city near the junction point of these routes. The power supply is from the high-tension transmission lines of T.M.E.R. & L. Co., some of which use the railway rights-of-way for power transmission to points in the state west and southwest of Milwaukee. At West Allis the railway power supply is received at 66,000 volts, 25 cycles. This same condition exists at the other old stations which have been changed over from 1,200 to 600-volt operation; namely Waukesha, Waukesha Beach, Watertown and at stations on the Burlington-East Troy line.

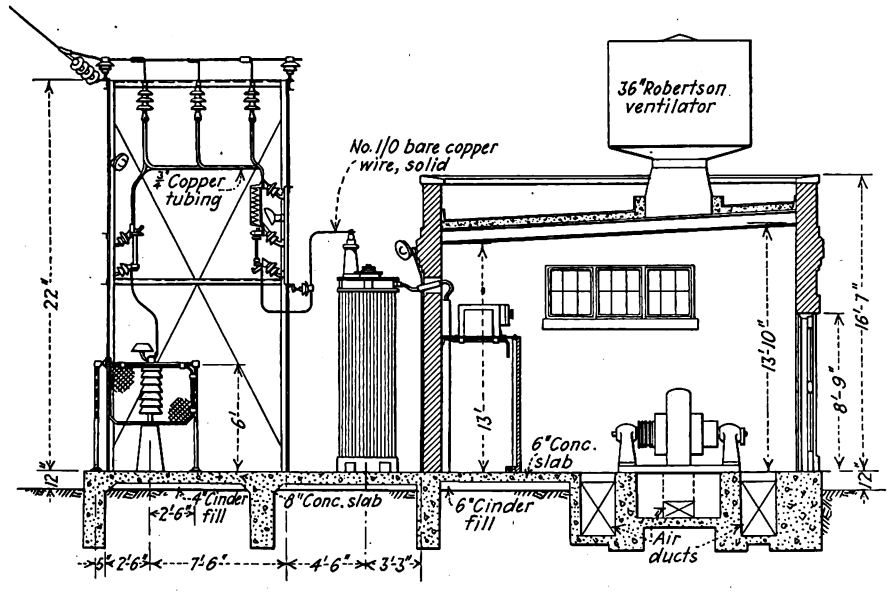
The Waukesha station on the Watertown line is a full automatic station with two 500-kw. Westinghouse,





Three of the new substations on the Watertown Line are equipped with mercury arc rectifiers. The exterior of the Nemahbin and interior of Pipersville stations are shown

Digitized by Google



Section through typical new automatic rotary substation. This drawing shows arrangement of St. Martins, two-unit station

25-cycle rotaries and Westinghouse automatic control equipment. The next station on this line, Waukesha Beach, is a manual station with three 500-kw., 25-cycle G.E. rotaries. The next three stations on the Watertown line, namely Nemahbin, Oconomowoc and Pipersville, are all mercury arc stations with automatic control, each containing one 550-kw. Brown Boveri mercury arc rectifier. Simple and compact concrete block buildings house these stations, which have outdoor switching equipment. An interesting feature of the installations is the recirculation of cooling water, using fan cooling, due to the lack of a water supply for cooling the rectifier units. The general appearance and arrangement of these stations is shown in accompanying illustrations. The last station on the Watertown line is at the terminal. This again is a converted, former 1,200-volt station and contains four 300-kw. 25-cycle G.E. rotaries operated manually.

On the Burlington-East Troy line, a new full automatic substation was built at the junction point of the Burlington and the East Troy divisions at St. Martins. This station contains two 500-kw. Westinghouse rotaries with Westinghouse control equipment. From this point on the Burlington division, new stations were built at Wind Lake and at Waterford. Each of these contains one 500-kw. G.E. rotary with Westinghouse full automatic control. At the end of the Burlington division the Burlington station, which was converted from 1,200-volt operation, is manually operated and contains three 500-kw., 25-cycle G.E. rotaries.

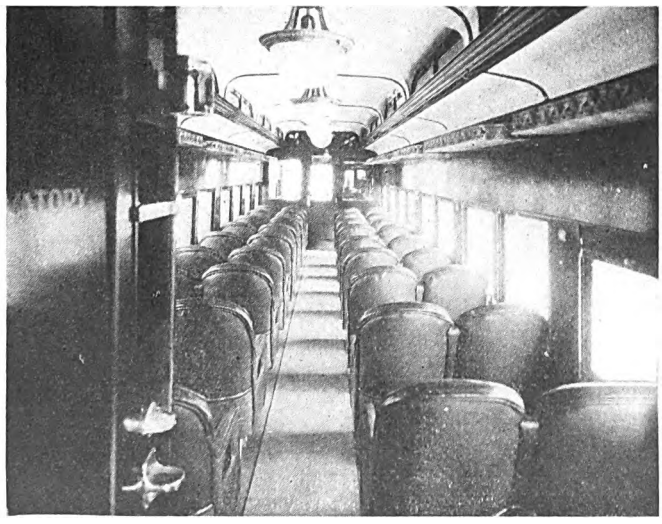
Leaving St. Martins on the East Troy division, there are two new automatic stations of similar design at Chamberlain and Mukwonago respectively, each containing one 500-kw. Westinghouse rotary with Westinghouse control equipment. At East Troy the station was formerly operated at 1,200 volts. It has been converted to deliver trolley current at 600 volts, and contains two 300-kw., 25-cycle G.E. rotaries with full G.E. automatic control equipment, and two 300-kw., 25-cycle G.E. machines operated manually.

The two-unit automatic substation at St. Martins is typical of the type of construction used for the new rotary stations. As shown in an accompanying illustration the building is of simple design in pressed brick, with one large central door. On the interior, a slate panel switchboard occupies practically the entire wall opposite the door. This carries the conventional equipment of meters and automatic control relays. Two 500-kva., three to six-phase transformers are located outside the building. Here also, are grouped a bank of auto valve lightning arresters, the disconnects, fuses, choke coils and framework for the high-tension circuits. All the outdoor apparatus is inclosed with a sturdy cyclone wire fence. Several light units are mounted at different levels on the switch framework to provide illumination for emergency night work.

A number of windows placed in either end of the station admit light, but circulation of air for ventilation is cared for by special air inlets and two 36-in. Robertson ventilators on the roof. Particular consideration was given to the problem of circulating cool air through the rotaries. For each machine two ducts bring in air from the outside near the ground level of the building and deliver it to the machines through gratings directly alongside the bearing pedestals. Protective horizontal hoods and fine screens completely covering the three exposed sides of the air inlets shield them from surface dirt, rodents, etc. Another set of gratings located in the station floor in line with the field frame, serve as vents to prevent trapping of hot air in the frame pits. In general, the trolley wires are paralleled by 500,000-cir.mil copper or equivalent aluminum auxiliary feeders.

All single track on the Watertown line, on the Southern Belt line and on the Milwaukee Northern line, is protected by Nachod block signals. Similar protection is provided on the Burlington-East Troy line south to St. Martins. At all important highway crossings on the interurban lines of the company, there have been installed either wigwag or flashing light type of highway crossing protection signals.

The Milwaukee company's "service first" slogan as reflected by improvements in city service and the development of a comprehensive co-ordinated bus service will be discussed next week.



Comfortable seats, easy riding at high speeds and cheerful illumination feature the cars used on the rapid transit lines out of Milwaukee

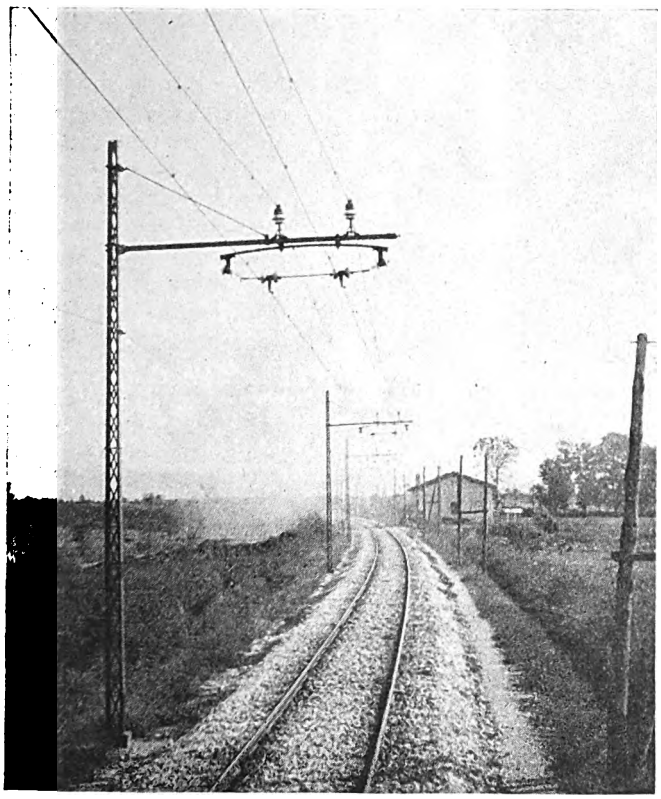
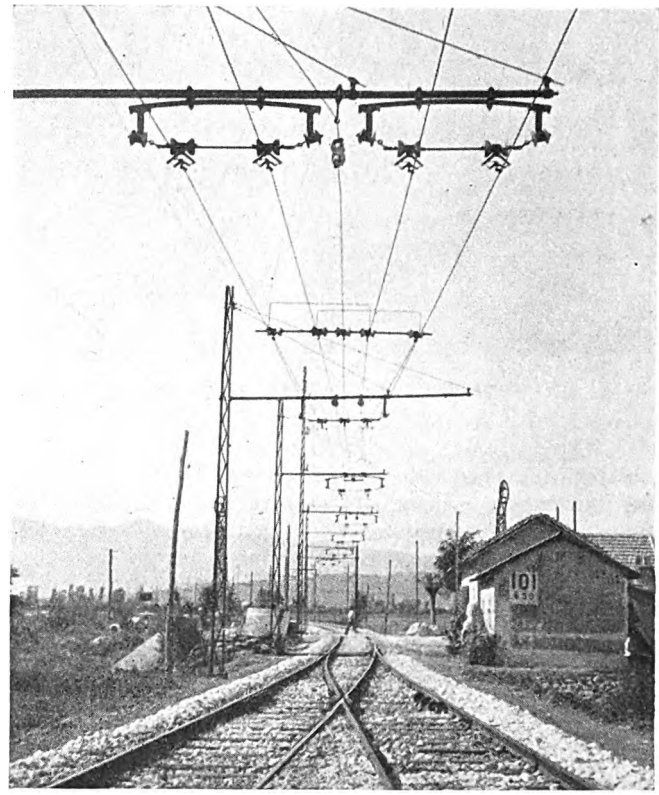
High-Voltage A. C. System in Italy

Three-phase alternating current at 42 cycles and 10,000 volts between the two overhead contact conductors employed by the Italian State Railways on an experimental line

By Kent T. Healy
Research Associate Yale University, New Haven, Conn.



Semi-rigid ears fastened to insulators on a transverse rod support the contact wires on curves



Main line switch for 10,000-volt, three-phase distribution system of the Italian State Railways

CERTAIN conversion disadvantages of the low-voltage three-phase system have caused the Italian State Railways to experiment with two new systems of electrification. The first of these, high-tension direct-current, is being tried near Naples. The second, a three-phase alternating current system at a frequency of 42 cycles and 10,000 volts between the two contact line conductors over each track, is being tested on the 107-mile line from Rome to Sulmona. This article treats of the construction of the second-named experimental system of electrification. It had not been put in operation at the time of the writer's visit to the property last October.

Energy is received at 60,000 volts and stepped down to 10,000 volts at the substations for distribution. Use of the higher voltage and frequency demanded a different type of locomotive.

The substations are of the indoor type with one room for high-voltage switches, another for the transformers and a third for feeder switches. The transformer equipment includes six 800-kva. single-phase units and one spare. They are protected by an unusual number of choke coils, which are shown in an accompanying illustration. The feeder switches are of a truck type of high capacity.

Four Types of Overhead

The contact system is interesting in that four types of construction are used. The simplest consists of two No. 0000 copper conductors, directly supported from brackets at 100-ft. intervals by hard-spot eliminating ears. It is used in the yards, at the stations and on some sections of the main line where speeds are restricted. One of the illustrations shows the use of this type in the yards.

For heavy grade sections of the main line a second pair of feeder conductors is added. The insulation used is below the American electric railway standards for the voltage used and the sectionalization switches, as illustrated, are very close together for horn gap switches. The third type of contact system is the usual catenary with a copper messenger supported by pin insulators and a copper contact wire, pulled to either side by a Hewlett type

Digitized by Google

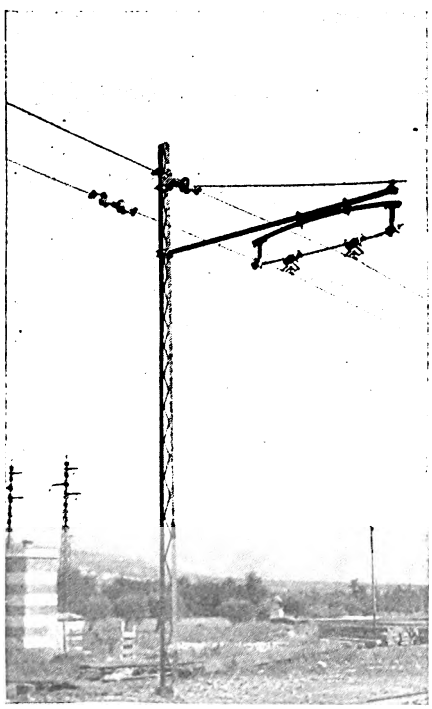
insulator, in series with a special through type insulator. The fourth type of support is a catenary with a messenger on pin insulators and the contact wire pulled off by semi-rigid ears fastened to through insulators on a transverse rod.

Switches are all made with direct suspension whether in main line or yard service because the addition of a catenary messenger would complicate the construction, making it difficult to get satisfactory clearances and insulation.

In conjunction with all direct suspension sections a hard-spot eliminating ear has been developed which allows the contact wire to be lifted by the pantograph as it goes under the suspension point. This adds no appreciable weight to the trolley as it passes beneath. A device similar to this was in use on the low-voltage three-



Direct suspension yard construction using two solid No. 0000 copper conductors

Tangent catenary suspension for high-speed main line, using Hewlett-type insulators

Digitized by Google

phase lines, having been developed to reduce trolley failure at suspension points.

Fourteen freight and passenger locomotives have been built for this service. Each has two induction motors, with a combined rating of 2,000 kw. By means of pole changing and parallel or cascade connection four running speeds are available on the passenger locomotive up to 62 m.p.h. and three speeds on the freight locomotive up to 47 m.p.h. The wheelbase is of the 1-D-1 type, the motors driving jackshafts through gears and coupled through a Scotch yoke to the four driving axles. The 10,000-volt trolley potential is transformed to 1,000 volts for the motors. Current limitation in starting is effected by liquid rheostats in the wound rotor circuit. The electrical design has been made with a view to changing to 3,600 volts, 16-17-cycle operation if necessary. The diameter of driving wheels of the passenger locomotive is 64 in. and of the freight locomotives 53 in. The diameter of the idling wheels is 44 in. The total weights are 200,000 lb. and 208,000 lb., respectively, with 143,000 lb. on drivers in each.

Many obstacles were overcome in the design of this overhead system for distributing three-phase alternating current at a potential of 10,000 volts. Another problem was the design of the high-frequency motors and their driving system, to go along with the commercial frequency.

Sell Rides on Low Cost

By H. E. Jordan
Assistant Engineer Los Angeles Railway, Los Angeles, Cal.

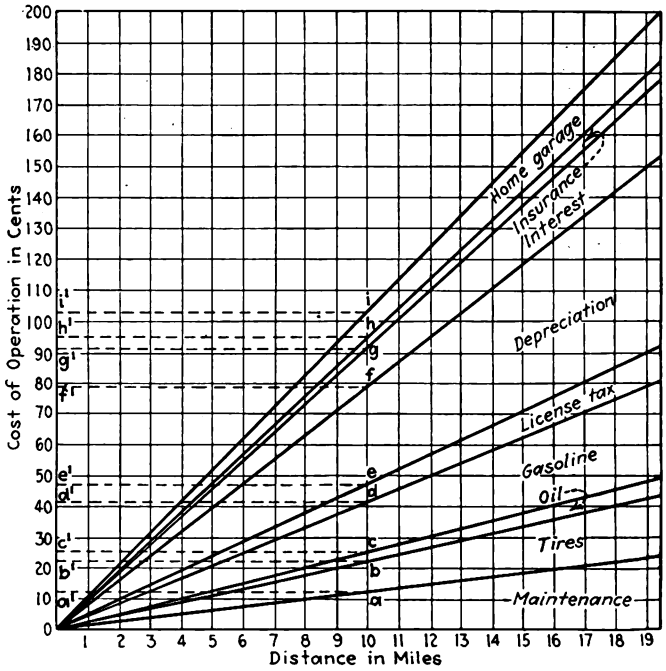
FOUR primary ways exist for selling a commodity against competition: First, make it the most convenient for the customer to buy; second, give more and better service with each sale; third, make the commodity better than any other of its kind on the market, and, fourth, reduce the price of your article below the market price.

While the transportation companies must unceasingly strive to place their commodity so that it may be conveniently purchased, to give more frequent service, to improve the courtesy of their trainmen, and to provide more comfortable riding conditions, they cannot ever hope to equal in these respects the commodity offered by the privately operated automobile. It is this competitor that has made such disastrous inroads in the commercial transportation field today.

Being always at hand when needed, traveling wherever and whenever the owner wishes to go and providing desirable comfort and privacy, the private auto has unquestionably the advantage over the trolley car on the first three points. Electric railways must resort chiefly, then, to selling their commodity at a lower price.

On this score they have a decided advantage over their competitor. This fact is usually admitted. However, transportation companies must sell the idea that this one primary advantage clearly offsets the three others. The companies must capitalize on this argument, just as the auto manufacturers capitalize on convenience, flexibility and comfort.

Many thousands of people drive their automobiles to and from work, or to and from shopping, because they like the service and comfort it renders. They are not bothered about the price they pay. It is too complicated and indefinite for them to figure out, and they continue to deceive themselves from day to day because it is the easiest thing for them to do. It is vital to the transportation companies that they make the privately operated automobile rider face the facts.



What it costs to drive your automobile to town

The accompanying chart, based on a fair average of data, is self-explanatory. A comparison of these data with the rate of fare paid by the average car rider shows that it costs approximately ten times more per passenger-mile for the privately operated automobile than it does for the street car. This tremendous economical difference certainly should outweigh the convenience and luxury of the privately operated automobile.

It may be difficult to make the public read and believe data of this nature, but it is the business of the transportation companies to make them believe it. If the information were placed in the public's hands and pounded into the public's mind, through newspapers, billboards, talks, etc., until the public admitted it was true, wouldn't there be a difference in the transportation company's patronage?

Laundry Bags Advertise Service

FURTHER details regarding the practice of advertising the high-speed interurban service of the Northern Texas Traction Company, Fort Worth, Tex., on the paper laundry bags of the Adolphus Hotel, Dallas, mentioned in the Journal Nov. 12, have become available. The advertisement shows a view in color of the company's "Crimson Limited," which runs between Dallas and Fort Worth. In addition to the picture the text features the topography of the country traversed and the speed, safety and comfort of the service. Economy of the ride by interurban and convenience of train schedules are emphasized. The contract covers 100,000 laundry bags to be used exclusively in the hotel. It is estimated that this amount will be a sufficient supply for two years. The space on the laundry bags cost $1,200, at the rate of $50 per month for twenty-four months. In the event that the bags last over the two-year period the hotel guarantees to use them until the 100,000 are exhausted.

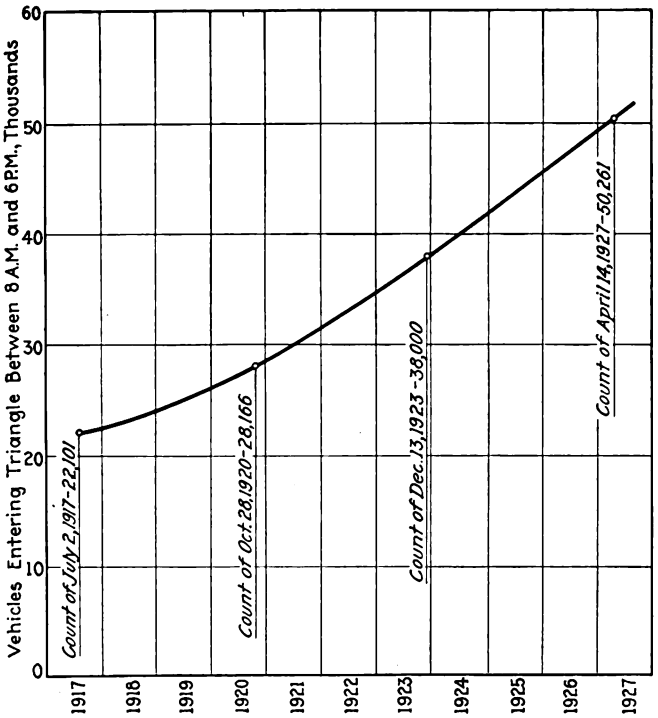
Pittsburgh's Masses Travel by Trolley

Counts show travel into and out of "Triangle" still largely by trolley. Underground tracks recommended in business district

PITTSBURGH, which is the center of a metropolitan community having a population of more than 1,250,000, is earnestly endeavoring to solve its transportation problem. This is especially difficult in that city because, the principal office and financial district is concentrated in a small triangle between the Allegheny and the Monongahela rivers, where they join to form the Ohio.

About three years ago under the direction of the Pittsburgh Traffic Commission and its successor, the City Transit Commission, a rapid transit plan was proposed by Daniel L. Turner, of New York, and Winters Hay-



Graph showing vehicles entering the Triangle of Pittsburgh between 8 a.m. and 6 p.m., on four selected days

dock, of Pittsburgh (see ELECTRIC RAILWAY JOURNAL, March 14, 1925, page 409). The plan suggested was approved by the City Transit Commission and a bond issue was authorized by popular vote to construct the first section of the system. It was to be a subway in the congested district and used by the surface cars. Construction has been delayed, however, due to the desire of the city to employ the assessment principle in the financing of the system. A constitutional amendment to authorize this method in Pittsburgh was passed by the General Assembly in 1925, but it still has to be approved by the voters of the state at an election to be held in November, 1928.

In the meantime the City Transit Commission has been making a detailed survey of surface and underground conditions as a preliminary. It has also seen that the foundations for several new buildings in the downtown area, including the piers for a new bridge across the Allegheny River, were so designed that they would not interfere with the construction of the proposed subway.

The annual report of the City Transit Commission, dated Dec. 22, 1927, outlines some of these activities as well as the result of some recent studies made on Pittsburgh traffic conditions.

The report declares that the problem of street traffic has attained such overwhelming proportions with such suddenness that few cities in the country are prepared to cope with it. This condition is the outgrowth of only two decades of developments in the automobile industry. The fundamental difficulty is that the street systems of all large cities are designed for a horse and buggy civilization, and many of them, including those in Pittsburgh, were very poorly designed for the purposes of even that past era. In the meantime the rate of increase in street traffic congestion is much greater than the rate of increase of population. The proportion of persons owning automobiles is becoming greater each year, and the saturation point of automobile ownership is not yet in sight.

Millions of dollars have been spent by Pittsburgh in the last few years for the widening of old streets and the opening of new streets, and in years just ahead additional millions will without doubt be needed for the same purposes. However, there is a limit beyond which it is not physically or economically possible to go in the changing of the old established street system of a city.

The mass of the population in Pittsburgh, the report says, is transported in street cars, which travel in the same streets as the free-moving vehicular traffic. These free-moving vehicles far outnumber the street cars, but they transport a much smaller part of the population than do the latter. On the other hand, the street cars cause an impediment to traffic that is greater in proportion than the space they occupy, and the mass of automobiles in the street cuts down the efficiency of the street cars to an extent that is scarcely realized.

RAILWAYS NEARLY KEEP PACE WITH INCREASED TRAFFIC

The increase in traffic in the "triangle" during the last ten years is adequately shown in the report by the accompanying diagram. It is based on four counts as stated on the graph and shows an increase of about 127 per cent in ten years. This rate of increase is almost ten times that estimated for the population of the state of Pennsylvania for the same period. In spite of this great increase in the flow of vehicular traffic into the triangle, only a small minority of all persons entering the triangle come by automobile. The street car system is still by far the most important means for transporting the people in the conduct of their daily affairs.

This is indicated by traffic counts made by the Bureau of Traffic on April 14, and by the Transit Commission in 1917 of all persons entering the triangle between 8 a.m. and 6 p.m. These figures, expressed in percentages, follow:

	Per Cent of Total	
	1917	1928
Entering by street car	58.2	51.2
Entering by automobiles and taxis	14.9	21.6
Entering by railroad trains	7.8	11.8
Entering by motor buses	0.0	0.8
Entering by walking	19.1	14.8

If only the groups of persons who enter by street car and by automobile or taxi are considered, the respective percentages shown by these counts are as follows:

	Per Cent of Total	
	1917	1928
Entering by street cars	79.6	70.3
Entering by automobiles or taxis	20.4	29.7

These counts show that a greater proportion of per-

Digitized by Google

sons enters the triangle by automobile now than formerly. But they also show that the group entering by street car is still by far the most important group in the number, since it still comprises 51 per cent of all persons entering in any way, and more than 70 per cent of all persons entering either by street car or automobile.

The report then declares that these figures lead to the conclusion that it is the users of public utilities for mass transportation—the street cars—rather than the automobile users, who should be given the greatest consideration.

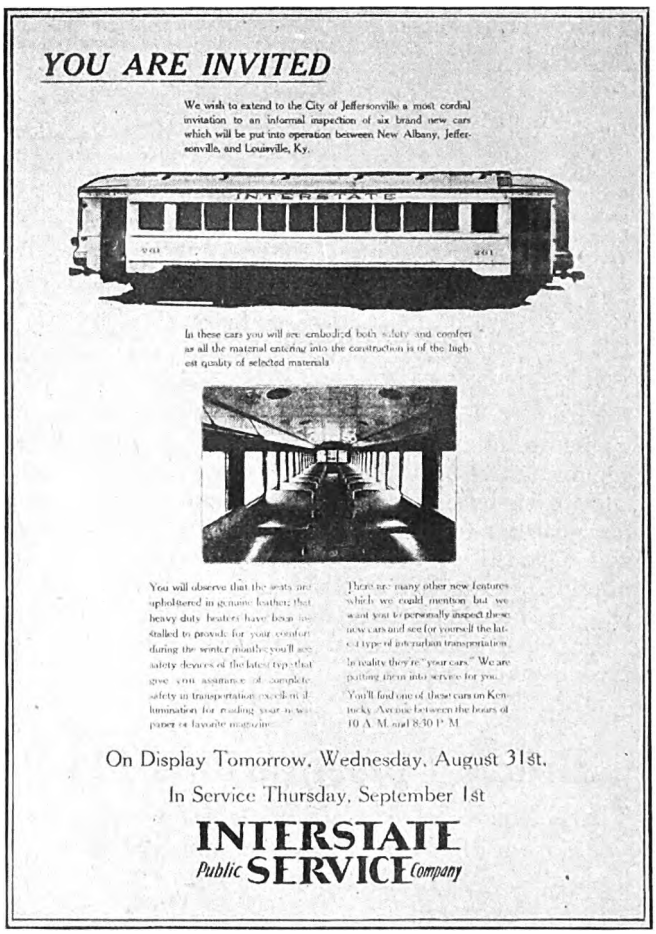
The conclusion reached by the commission as a result of this study is that with the increasing population and increasing business activity in Pittsburgh, the conditions will grow worse rather than better, and that the only logical method of increasing the capacity of the streets is to gain this capacity by vertical expansion. In other words, in the streets of greatest congestion, the street railways should be underground. The improved transit conditions thereby obtained will indirectly reduce the automobile congestion overhead because more passengers will travel on the cars.

Public Approves Interstate's New Interurban Cars

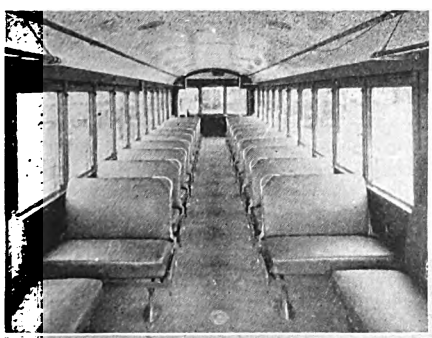
HERALDED by full-page advertising spreads in the local press and inspected by citizens of Jeffersonville, Ind., six new one-man, two-man, double-end interurban cars ordered last April by the Interstate Public Service Company of Indianapolis, Ind., were inducted into service connecting Jeffersonville, Ind., Louisville, Ky., and New Albany, Ind., last fall. The new units were enthusiastically greeted by both press and public

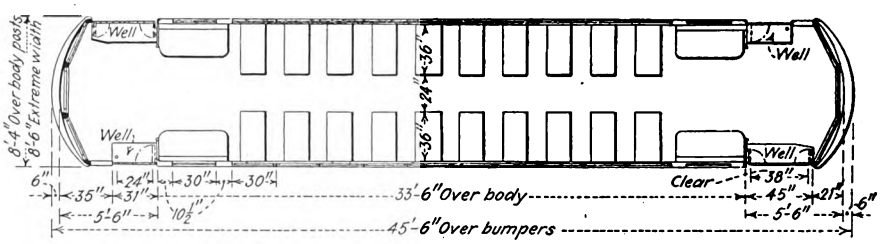
On the preceding day one of the cars was exhibited in Jeffersonville from 10 a.m. to 8:30 p.m., with Mayor Newton A. Green, acting as chairman of the reception committee. W. J. Fox, master mechanic of the company, was on hand to explain the car features to the visitors. Invitation to attend the exhibition met with the hearty response on the part of residents, who rejoiced that by means of the new cars quick access can be gained to Louisville and other large shopping centers without either crossing the river by ferry or driving by private vehicles, in the latter case with the attendant worry of finding parking space at the end of the journey.

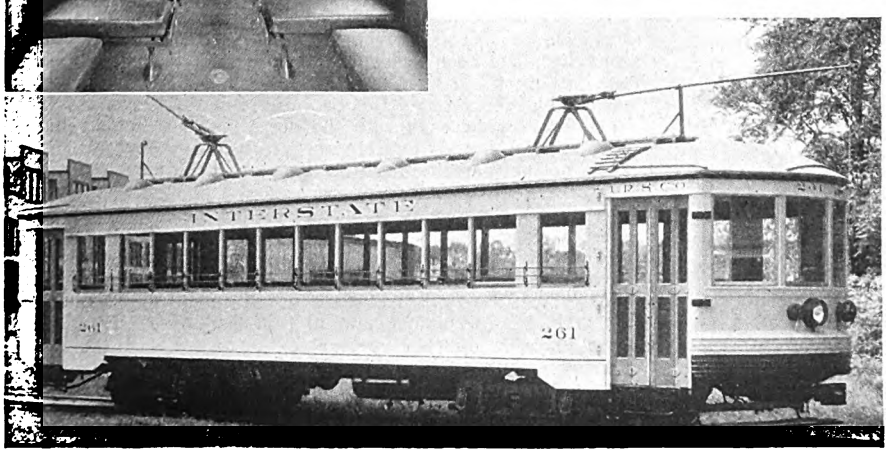
Each car has a seating capacity of 52 passengers.



Facsimile of full-page newspaper advertising employed by the Interstate Public Service Company to introduce its new cars







These six interurban cars were placed in service by the Interstate Public Service Company

Every available space has been used to facilitate passenger comfort. The cars were built by the G. C. Kuhlman Car Company. They are used on light interurban runs connecting Jeffersonville, Louisville and New Albany.

Type of unit	One-man, two-man, motor, passenger, interurban, double-end, double truck
Builder of car body	G. C. Kuhlman Car Co.
Date of order	April 8, 1927
Weights:	
Car body	19,624 lb.
Trucks	10,000 lb.
Equipment	7,876 lb.
Total	37,500 lb.
Bolster centers	22 ft. 0 in.
Length over all	45 ft. 6 in.
Length over body posts	33 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	11 ft. 4 in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Doors	End, folding
Air brakes	Westinghouse variable load
Armature bearings	Plain
Car signal system	Faraday high-voltage and Westinghouse 8-T
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	Westinghouse HL
Couplers	Tomlinson, Form 110
Curtain fixtures	Curtain Supply Co. 88
Curtain material	Pantasote
Door mechanism	National Pneumatic Co.
Fare boxes	Cleveland
Finish	Pratt & Lambert enamel
Floor covering	Battleship linoleum
Gears and pinions	Nuttall helical
Glass	Plate and standard
Hand brakes	Brill
Heat-insulating material	Celotex
Heaters	Consolidated Car Heating Co.
Headlights	Imperial, type WDF
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	3½x6, plain
Journal boxes	Brill
Lamp fixtures	G.E. short-circuiting
Motors	Four Westinghouse 510-E, inside hung
Painting scheme	Orange
Roof material	Canvas
Safety car devices	National
Sanders	Nichols-Lintern
Sash fixtures	Curtain Supply Co.
Seats	Brill 201-A
Seating material	Genuine leather
Seat spacing	36 in.
Steps	Three, one folding
Step treads	Kass and Slikar
Trolley base	Ohio Brass, Form 4
Trolley Retrievers	Knutson No. 5
Trolley wheels	More-Jones 6 in.
Trucks	Brill 177-E-1x
Ventilators	Brill
Wheels	28-in. rolled steel
Special devices	Minier window wipers, Drew motorman's mirrors

Comfort is assured by ample space between the seats. These are of the Brill reversible pattern, upholstered in genuine leather. Wide aisles, roomy vestibules and the latest systems of interior lighting and no-draft ventilation, battleship linoleum floor covering, 30-in. windows and a finish of mahogany are other features of the interior. An orange color scheme, standard for the company, is used effectively on the exterior.

Principal specifications of the car are shown in the accompanying table.

Brady Presentations Made

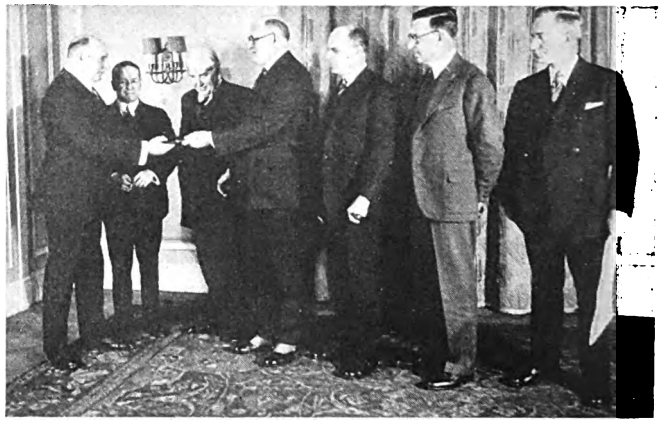
Three Memorial Medals Presented to Representatives of Winners at Ceremonies Held at Hotel Biltmore on Feb. 17

PRESENTATION of the three Anthony N. Brady Memorial Medals awarded by the American Museum of Safety for outstanding accident prevention and health promotion work among electric railways for the year ended Dec. 31, 1926, to the Louisville Railway, the El Paso Electric Company and the Tide Water Power Company and the certificate of honorable mention awarded to the Pittsburgh Railways was made to the executives of the four companies at ceremonies held in New York City at the Hotel Biltmore on Feb. 17.

Lewis Gawtry, president of the Bank for Savings, a trustee of the American Museum of Safety, and chairman of the museum's committee of award presided at the function, and the presentation of the medals and certificate was made by him. Other speakers were Arthur Williams, vice-president in charge of commercial relations of the New York Edison Company and president of the museum; and Col. A. B. Barber, manager transportation and communication department, United States Chamber of Commerce, and member of the committee of awards. Lucius S. Storrs, managing director of the American Electric Railway Association, and James H. McGraw, president of the McGraw-Hill Publishing Company, Inc., were unable to be present, Mr. Storrs having recently been sick and Mr. McGraw being absent from the city. J. P. Barnes, president of the Louisville Railway; C. W. Kellogg, president of the Engineers Public Service Company and vice-president of the El Paso Electric Company; Raymond Hunt, vice-president and general manager of the Tide Water Power Company, and William H. Boyce, commercial manager of the Pittsburgh Railways, were all present to accept the awards on behalf of their companies.

Gold, silver and bronze medals are awarded as first prizes in three classes of companies, those operating more than 5,000,000 vehicle-miles a year, those operating 1,000,000 to 5,000,000 and those operating less than 1,000,000. The details of the award were reviewed in the JOURNAL for Jan. 28, page 148, since which time the principal features of the safety practice of each company have been made the subject of articles in this paper.

The annual award of the Anthony N. Brady Memorial Medal was discontinued during the late World War. The three awards was resumed at the request of the American Electric Railway Association for the purpose of again concentrating upon the element of safety in electric railway transportation which had been so greatly



Winners of the Brady medals receiving their prizes on Feb. 17

stimulated during the period in which the medals were previously conferred. Mr. Williams said in part:

The museum has been impressed by the constructive attitude of the electric railway men of the country. On every hand there is evidence of an intense desire to conserve to the greatest attainable extent the interests of the traveling public and the communities they serve. In a period of relatively low fares and limited income, with necessary economies in many directions, their attitude has been that there should be no curtailment in the safety field. Perhaps no better illustration can be found than in the fact that during the past four years, with enormous increase relatively in the hazards of street transportation, the number of accidents on electric street railways, occurring from all causes combined, has been reduced 15 per cent. There has been only one fatality for each 155,000,000 passengers carried; and intelligent, organized safety effort promises still further improvement.

To those acquainted with the problems of electric railway operation these figures indicate an extraordinary degree of security. Here not only are the hazards inherent in the movement of street cars, often through the densest areas of population, but in addition there are the many uncontrollable hazards occasioned by drivers of horse vehicles and automobiles—and what is perhaps an even more serious problem, the attitude often of extreme carelessness, indifference and seeming willingness to assume unnecessary risks, by pedestraians of all ages. The aroused interest and organized movement in this field of safety effort must be credited in no small degree to the award of these medals in memory of that distinguished public utility pioneer and public servant, the late Anthony N. Brady.

Colonel Barber said in part:

On behalf of the Chamber of Commerce of the United States

Digitized by Google

I am glad to have the opportunity to join in doing honor to the leaders in the great industry of urban transportation who are showing the way to continued improvement in service to the public. Never has there been a more insistent demand for betterment of service in every branch of the public utility field. I think it can equally be said that never has the public as a whole been more appreciative of such improvement and more ready to recognize the necessity of adequate financial return to the utilities if they are to give the service desired.

The National Chamber is firmly convinced that in securing this service the public can reap the greatest benefits through the initiative of modern business enterprise. The Chamber is accordingly gratified when the efforts of the managements and the men of our great transportation systems are stimulated and brought to public attention in such a well conceived contest as this which has been established in honor of Mr. Brady.

I should like to add a word on behalf of the National Conference on Street and Highway Safety, a co-operative undertaking of a number of national associations and other official and unofficial groups for improvement of motor traffic conditions. As director of the conference since its organization by Secretary Hoover in 1924 it gives me pleasure to testify to the splendid co-operation of the electric railway executives in the committee work, in the general conferences and in the work of following up and putting into effect the plans worked out by the conference for dealing with the traffic problem.

Charles Gordon, speaking for Mr. McGraw said:

In these days of increasing traffic congestion and hazards we have become so accustomed to the perils and the tragedies of traffic accidents that our minds accept a situation which a decade ago would have provoked instantaneous public horror and demand for radical measures.

Safety has always been a big word with electric railways. Safety measures have constantly occupied the attention of their managements. The effort to avoid accidents permeates every department of an operating company and the accident hazard has always loomed large in the minds of those in charge of personnel and equipment. As street traffic hazards have increased with the growth of congestion, the pressure of accident prevent work has increased in intensity, until today we find electric railways establishing a record for the safety of their service which shines out as one of the brightest spots in local transportation history.

Today, a passenger on a street car is in the safest place on the street. Hundreds of millions of passengers per year are handled in the rush and bustle and impatience of city life, with an unsurpassed record of safety. This is indeed a record of which every electric railway man may be justly proud.

There is not time here to comment on the accomplishments of the winning properties. It is fitting to note, however, that these several roads succeeded in winning public co-operation and commendation for their safety work. Their attention to safety transcended the limits of merely their selfish interest in the reduction of accidents on their cars. They went outside their own operations and participated enthusiastically in general safety movements in their communities. The attention given to the promotion of safety work among children is particularly worthy of note. The safety message is being taken into the schools, so that the child by being taught the importance of exercising caution on the streets, may be better equipped to avoid the perils of traffic.

I am proud to have served upon this committee and feel that the cause in which the award is made, is indeed a noble one. The gratitude of the entire electric railway industry is due the family of the late Anthony N. Brady for making these awards possible. I sincerely hope that they will be continued and that they will enlist constantly increasing interest among electric railway operating companies. The thanks of the industry are also due the American Museum of Safety for the efficient manner in which the awards are being administered. My hearty congratulations are extended to the Louisville Railway, the El Paso Electric Company and the Tidewater Power Company for their success in winning this distinguished honor.

New Type Street Cars in Holland

TWENTY new motor-equipped cars and twenty trailers were purchased a short time ago by The Hague Tramways, The Hague, Holland. Several new features have been embodied with the object of enabling a higher average speed, reduced maintenance costs and reduced weight. These features include lower mounting step, quieter running, better ventilation and lighting, larger windows, leather upholstered seats and more comfort for the passengers generally.

The motor-equipped cars carry 67 passengers and the trailers 71. However, seating accommodations are provided for only 23, fifteen passengers being allowed to stand in the center aisle of the cars and 29 on the front and rear platforms, with an extra four on the trailers owing to the extra space provided by the absence of the control levers.

Platforms are 25 in. from the ground and entrance is afforded by mounting steps on each side at front and rear and through double sliding doors. At each end and on each side are longitudinal seats for two passengers. The remaining passengers face forward, the back rests being reversible. There are five rows of two-passenger seats on one side and five single seats on the other. The domed roof of the vehicle is 9 ft. 11 in. from the ground. The pantograph for the reception of the current is adjustable for overhead conductors ranging in height above the roadway from 12 ft. 5 in. to 22 ft. 11 in.

All the vehicles are of the four-wheel type, fifteen of the motor-equipped cars having a wheelbase of 12 ft. 5 in. and five having 13 ft. 2 in. The length over buffers is 35 ft. 3 in.

The electrical equipment of the motor cars comprises two Siemens-Schuckert self-ventilating motors, which with current at 550 volts have an hourly capacity of 43 kw. at 700 r.p.m. Controllers are provided at each end of the motor-equipped vehicles. The sliding doors are provided with a device by which they can be electrically opened and closed. Fully equipped, but without passengers, the motor-equipped cars weigh approximately 12 tons and the trailers about 8 tons. All the motor-equipped vehicles and ten of the trailers were built by Allan & Company of Rotterdam, and the remaining ten trailers by the Nicaise-Delcuve Company of Bruges, Belgium.

New High-Power Locomotives for France

TWO electric express locomotives for standard gage lines, claimed to be the most powerful in Europe, were recently delivered to the Paris-Orleans Railway by Brown, Boveri & Company. They have been designed for express service between Paris and Vierzon and will deal with trains of 650 tons trailing weight.

These new locomotives are of the 2-D-2 type. Current is received from an overhead line and from a third rail at 1,500 volts, at which pressure a one-hour rating of 4,000 hp. is obtained at the tread of the wheels at a speed of about 73 km. per hour (45 m.p.h.). The total weight of each locomotive is 119 tons. The chief requirements were that the locomotives should attain a speed of about 130 km. per hour (80 m.p.h.) on suitable permanent way and also be able to traverse curves having a radius of 80 m. (260 ft.) at low speed. These conditions led to the use of a two-axle bogie, fitted with a spring centering device, on each locomotive.

Since these locomotives have been in operation it has been possible to shorten the time required for each journey. The journey between Paris and Les Aubrais formerly took from 92 to 100 minutes and that from Les Aubrais to Vierzon 74 to 76 minutes. Since electrification it is possible for trains of 530 tons to run over these sections in about 75 to 55 minutes respectively.

This single deck coach has supplanted the double decker for base service in Atlanta

Single-Deck Buses Give Base Service in Atlanta

WHEN bus service was begun in Atlanta by the Georgia Power Company a little more than two years ago, double-deckers were purchased. It was believed that the upper deck would attract many passengers except during very inclement weather.

Double-deck coaches were operating exclusively during 1926, but the operating expenses were so large, it was decided either to substitute a smaller coach or discontinue the service. In consequence, ten single-deck coaches of 21-passenger capacity were purchased. During 1927 they were operated exclusively on the base schedules. The double-deckers helped to carry the rush hour crowds and were also in demand for chartered service by picnic parties, convention delegates and other large groups.

The operating expenses and revenue during 1926 and 1927 of the bus service in Atlanta are given in the accompanying table.

It will be noticed that while the revenue from operation is slightly less in 1927, the operating expenses show a reduction of $49,268.53. Of this amount about $14,100 can be attributed to the reduction in tire prices, brought about by buying tires on a mileage basis. Allowing for this saving in tire cost, there is a net saving in operating expenses of $35,268.53. Part of this saving in operating expenses is due to certain economies which have been effected at the garage because of changes in methods and new equipment which has been installed. While the net amount saved in this way cannot be accurately determined, the officers of the company do not estimate it as a very considerable factor but consider that most of the saving is directly attributable to the operation of the lighter equipment.

SUMMARY OF OPERATIONS, ATLANTA COACH COMPANY

	1927	1926
Revenue from operation	$108,162.84	$109,868.75
Operating expenses	124,946.63	174,233.16
Deficit from operation	$16,783.79	$64,364.41
Bus-miles	528,086	504,418

The reduction in revenue from operation is due very largely to a decrease in Sunday and holiday riding. When the coaches were first put on, Sundays and holidays were the busiest days. After the novelty wore off, this riding decreased, so that Sunday riding now is lighter than on week days in about the same proportion as on the street railways.

The accompanying engravings show exterior and interior of one of the single-deck buses, as built by the Yellow Truck & Coach Manufacturing Company.

The 21-passenger coaches operated by the Georgia Power Company in base service are fitted with comfortable seats. and the interior is well lighted

Maintenance Methods and Devices

Magnet Valve Gage

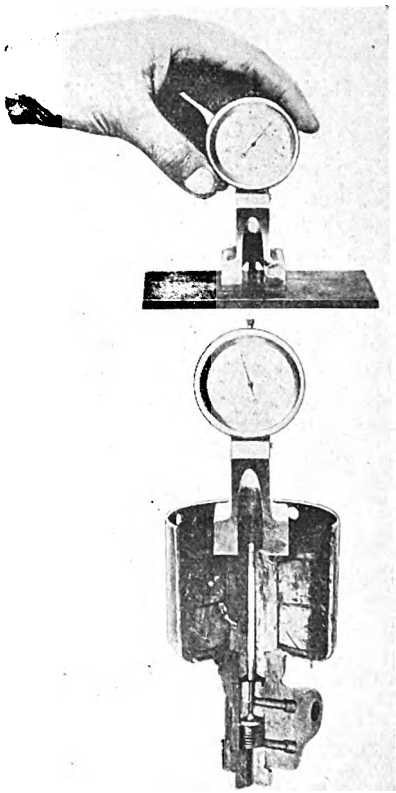
By R. S. Beers,
Railway Engineering Department General Electric Company, Schenectady, N. Y.

When maintaining magnet valves it is desirable to measure the length of the valve stem when overhauling or at more frequent periods. An indicating device that will give measurements in thousandths of an inch can readily be constructed by making an adaptation of an indicating surface gage.

A gage for this work may be purchased from any hardware store. It should have an adjustable dial and a push pin at the top, the former for easy setting of the pointer at the zero position and the latter to check the travel of the valve movement. It will be necessary to make and add to the gage a support or pedestal, as shown at part *A* in the accompanying line cut. Part *B* is an extension piece to the gage push rod. The assembly of the gage and new parts is shown at *C*. Before making any measurements the gage should be adjusted by placing it on any flat surface and turning the adjustable dial until the zero position coincides with the pointer. The gage should then be set on the magnet valve core with the push rod resting on top of the valve stem, as shown in the illustration. The gage then reads directly in thousandths of an inch the distance the top of the valve stem is above the top of the magnet valve core. The push pin is then pushed down and when the valve seats, its travel is read in thousandths of an inch.

These measurements are made quickly and accurately and show whether the valves need replacing or are suitable for further service. The gage has a further use when fitting new valves, as it will indicate quickly how much metal must be removed from the valve stem. The new valve stem is first put in the valve and then gaged.

Assuming that the gage shows that the new valve stem is 0.005 in. too long, the valve stem should be removed from the valve and put in the fixture shown in sketch *D*. The gage should then be set on the fixture with its push rod on the top of the valve stem. The valve stem should next be moved either up or down until the gage shows that the stem projects 0.005 in. above the flat surface of the fixture. The stem is then clamped in the fixture and the top of the valve stem filed off flush with the surface of the fixture. This is a quick and accurate way of making the valve stem the exact length desired. Valve stems finished in this way present a flat surface for the magnet valve armature to strike against and prevent mushrooming of the top of the valve stem.



Micrometer gage for adjusting magnet valve. At top, adjusting gage dial to zero on flat surface; below, method of using gage on magnet valve

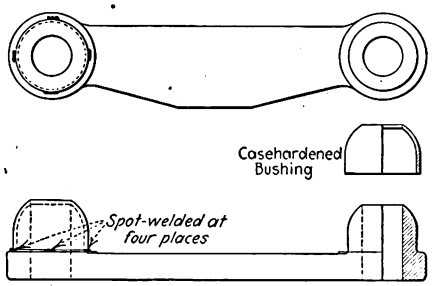
Bushing Provides Increased Service for Brake Hangers

By H. C. Pressler,
Master Mechanic Eastern Texas Electric Company, Beaumont, Tex.

Case-hardened bushings are used in the half-ball brake hanger shown in the illustration herewith. Each bushing is spot welded to the hanger and can be knocked out easily when worn so that a new one can be installed. Before these bushings were used on equipment of the Eastern Texas Electric Company worn hangers of this type were taken off Birney safety car trucks and thrown into a scrap pile. Now they are all reclaimed by filling in with the welder and then grinding off so

Digitized by Google



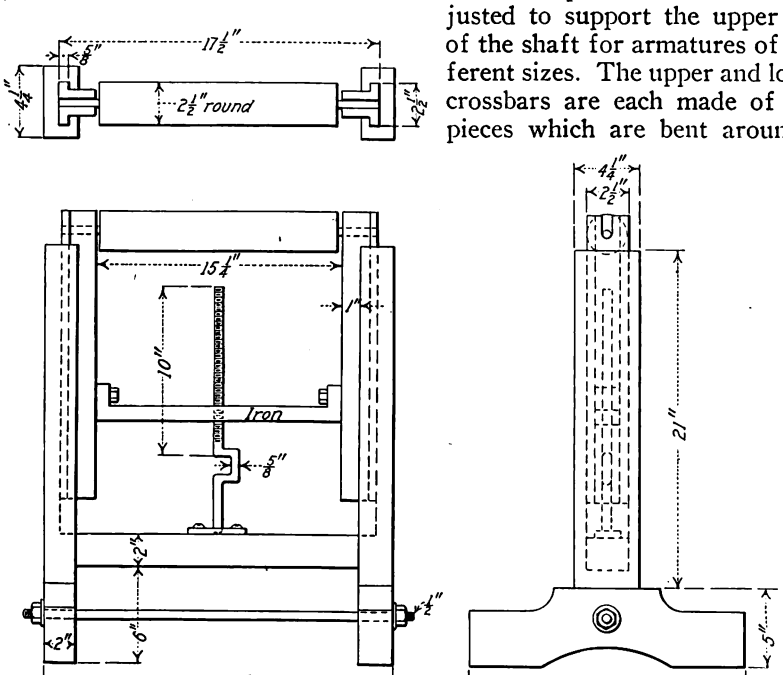
Half-ball break hanger with case-hardened bushing

as to provide a proper fit for the bushing. The bushing is then installed and is spot welded in place. This method of reclamation costs about 30 cents for each hanger. When only a new bushing is required, the cost is 14 cents. There is quite a saving, as new hangers cost $1.65 each. Brake-shoe heads are also equipped with these bushings and castings. Alemite fittings were installed on the shoe heads in 1926. With the installation of the bushings, together with the improved lubrication system, noise in brake rigging has been kept to a minimum.

Portable Adjustable Stand for Drill Press

DRILLING has been simplified greatly in the Woodside shop of the New York & Queens County Railway, Long Island City, N. Y., since a portable adjustable stand was developed for supporting the material undergoing the drilling process.

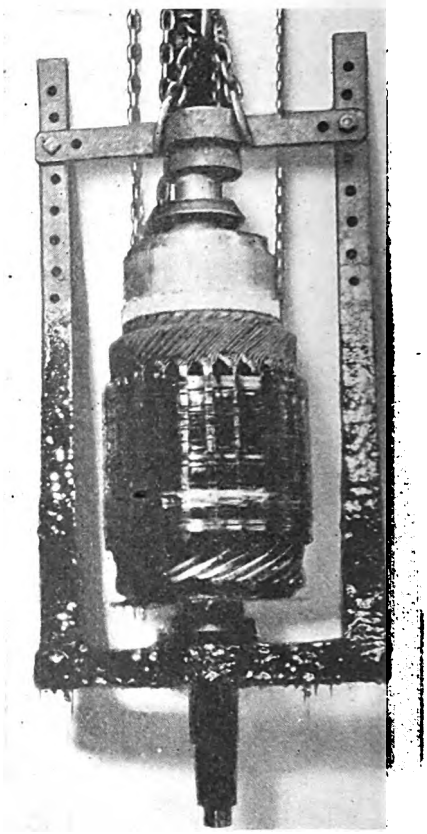
This stand, occupying a space of 17 in. by 21½ in., is made from well seasoned oak. It is 26 in. high in the fully collapsed position. The 2-in. x 4½-in. uprights are mortised into the 2-in. x 5-in. x 17-in. feet and tied together with a ½-in. bolt and a 2-in. x 4-in. beam at the base. Vertical notching of these uprights provides a guide for the up and down movement of the roller supporting framework. The top of the uprights of the movable framework is notched for a bearing support of the roller and the correct center of these uprights is maintained by an iron tie bar drilled in the center for the reception of an adjusting screw. An iron plate fastened to the top of the 2-in. x 4-in. cross beam acts as bottom guide for the ⅝-in. adjusting screw. Turning the adjusting screw permits of raising or lowering the roller to any height desired.



Stand for supporting and guiding material while being drilled

Adjustable Sling for Armatures

WHERE the end method of dipping is in use some type of sling is necessary for handling the armature during the dipping process. The accompanying illustration shows the adjustable sling used in the shop of the Binghamton Railway, Binghamton, N. Y. It consists of a top and bottom crossbar and two side arms, all being made from ½-in. x 2-in. material. The lower ends of the side arms are bolted loosely to the bottom crossbar to form a hinge and the tops are drilled with eight pairs of 11/16-in. holes spaced at 2-in. centers. This allows the top crossbar to be adjusted to support the upper end of the shaft for armatures of different sizes. The upper and lower crossbars are each made of two pieces which are bent around a



This sling will accommodate different length armatures

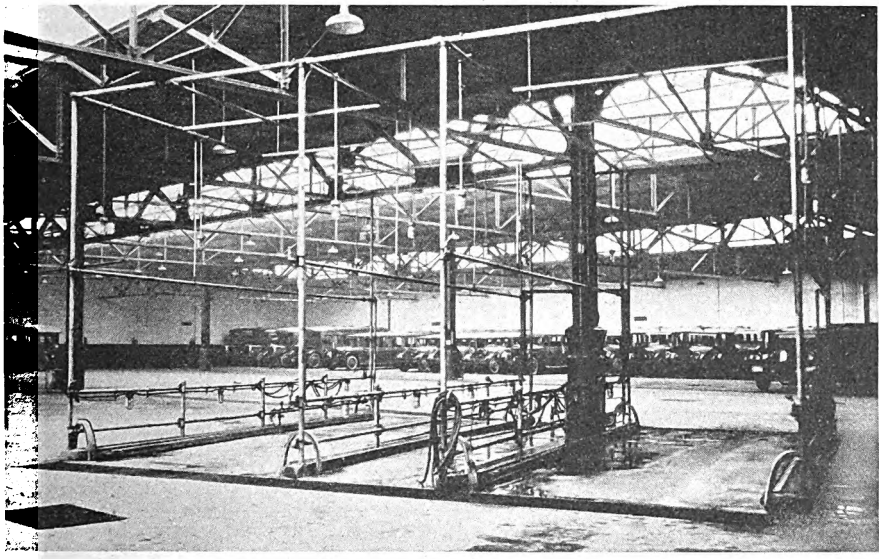
¾-in. mandrel and riveted and welded together. The ¾-in. holes provide an opening for the entrance of the shaft. The sling is 42 in. long over all, and 20 in. wide and is put on and adjusted when the armature is in a horizontal position. The weight of the armature is carried on the pinion end oil deflector.

Bus Cleaning Systematized With Shower Rack

WATER pipes on the regular framework of a wash rack are arranged ingeniously in one of the garages of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. As rapidly as the buses roll in from their daily schedule, they are run under the framework shown in the accompanying photograph and are subjected to a thorough soaking and cleansing, from which they emerge spick and span for the next day's trips.

Two rows of horizontal water pipes, one at a slightly higher level than the bus roofs and the other about level with the fender crowns, are perforated so that water is sprayed evenly and with some force against both sides of the bus at the same time. Water jets placed at the ends of the horizontal pipe lines contribute additional streams to clear both front and rear of the bus body of its ac-

Digitized by Google



Pipe frame spray rack speeds cleansing of Milwaukee's buses

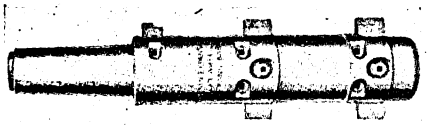
cumulated dirt. Spraying the water on the bus body in fine streams makes it possible to soak the dust and dirt in short order.

Rigidly mounted lamp units are so placed on the framework of the wash rack as to illuminate every part of the bus to be cleaned. Two buses may be washed simultaneously in the double wash frame shown. The arrangement of the pipe frames is such, however, as to lend itself to the addition of an indefinite number of "wash booths."

New Equipment Available

Expansion Boring Bars and Cutters

EXPANSION boring bars and cutters in a new line are announced by the Larkin Packer Company, St. Louis, Mo. Simplicity of construction and ease of operation are features claimed. All unnecessary parts, such as wedge guides, gibs, etc., that tend to weaken a tool due to the removal of excess metal from the tool body have been eliminated. The boring bar bodies are forged of chrome-nickel steel and heat treated. Cutters are of high-speed steel tempered to a uniform hardness.



Triple-duty car wheel-boring bar

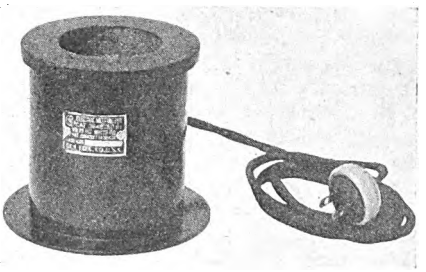
A micrometer adjusting screw piloted in a hardened and ground self-centering thrust bearing controls movement of the expansion wedge and assures quick, accurate adjustment. Cutters are fitted to slots of standard dimensions and are adjustable quickly to any size within range of the bar without special grinding. Direct locking, with each cutter held rigidly in the cutter slot by a piloted eccentric locking screw, insures accuracy of bore. All parts are standardized, and cutters are interchangeable. When worn beyond the expanding limits, they may be used in smaller bars of the same slot dimensions, and they are also adaptable in adjusting tools of other makes.

For boring out car wheels to fit axles, a Larkin triple-duty bar is designed with double arrangement of cutters so spaced as to permit roughing cutters to pass before finishing cutters engage, the single cutter chamfering the wheel following the finished cut, all in one continuous feed.

For older mills, where the spindle travel is insufficient to accommodate the wheel-boring bar, another type with distance shortened between the roughing and finishing cutters is supplied. This is designed to rough bore and chamfer on the first cut and finish bore separately on the second cut. For shops in which only a limited number of wheels are bored, a bar with a single arrangement of expanding cutters is recommended.

Portable Tinning Pot

SMALL tinning and soldering operations can be done conveniently by a late addition to the line of electric heating equipment made by the General Electric Company, Schenectady, N. Y. This portable tinning pot bears the designation RP, Form C. The device is built on the same principle as the larger General Electric melting pots. The heating unit is of the cartridge type and dissipates 150 watts. It is placed in a boss cast on the bottom of the crucible and is readily removable. The crucible and base are made of cast iron and the jacket is made of sheet steel. The connecting leads are heavy Deltabeston heater cord and the plug is of the armored type.



Melting pot for dipping small parts

The pot is designed particularly for solder and tin having a maximum operating temperature of 500 deg. F. About fifteen minutes is necessary to reduce the full contents of the pot to working temperature.

While the pot is designed normally for 110 volt circuits, it can be supplied for use on 100, 120 and 240-volt circuits, if desired. It has an approximate shipping weight of 6 lb. The dimensions are 2¼ in. diameter, 1 in. deep inside, 5 in. diameter and 4½ in. deep outside.

Thin Wrench for Small Spaces

NUTS that are hard to get can be turned with a wrench designed especially for that purpose, which is manufactured by the Billings Spencer Company, Hartford, Conn., and is marketed under the trade name "Klose-Kwarter Wrench." It is double headed, with the openings at a 75 deg. angle. Jaws are narrow and pointed and the heads are very thin. Both heads are on the same side of the wrench; this affords a comfortable grip and leverage.

The new wrenches are made in sizes to fit standard nuts. They are drop forged from chrome-molybdenum steel, which is exceedingly tough.

Association Activities

New Englanders Face Industry Problems

Vital importance of merchandising transportation set forth at Providence meeting. Bus maintenance paper presented

REBUILDING of street railway traffic through vigorous merchandising methods was the keynote of the Feb. 9 meeting of the New England Street Railway Club held at the Hotel Biltmore, Providence, R. I. The program was arranged by A. E. Potter, president of the United Electric Railways. Vice-President W. C. Slade occupied the chair in the absence of R. B. Stearns, president of the club. Two sessions were held as usual, with a banquet between them. The speakers at the afternoon session were: W. C. Bell, general manager Narragansett Electric Company, Providence, whose subject was "Outside Observations of the Street Railway Business"; W. B. Spencer, assistant to the general manager, United Electric Railways, who talked on "Serving a Nation—'Forward Ho' for the Trolleys"; and H. W. Jardine, supervisor of bus equipment, United Electric Railways, on "The Necessity for Closer Co-ordination of Service Automotive Equipment and Bus Maintenance."

At the evening meeting a joint session was held with A.E.R.A. company section No. 12, H. K. Bennett presiding. The speakers were Hon. James E. Dunne, mayor of Providence; John W. Colton of the American Electric Railway Association, on "The Present and Future of Street Railways," and John F. Tinsley, vice-president and general manager Crompton & Knowles Loom Works, Worcester, Mass., on "The Future of New England."

Mr. Bell, speaking from the standpoint of an outsider, pointed out the marked difference between the electric railway business and the light and power industry. One fundamental reason, he said, is that the electrical industry can be operated and is operated in such a manner that it suits the convenience of the user at all times, while the electric railway, to some extent at least, must force the user to suit himself to the service. With this handicap, if the railway is to hold its own or increase its business, the service must be sold to the public. The desire to ride must be created, and the objectionable feature of public transportation must be minimized.

Mr. Bell's observation is that the street railway business has not even started to do a selling job. The street railways must start on this sales job earnestly and with real determination, and not spasmodically as in the past. Somebody, perhaps several people, perhaps whole departments, in each company and in the industry organizations, must study this problem, work on it morning, noon and night, eat, sleep, dream it, and must have the sympathetic backing of the management if results are to be obtained anything like those accomplished by the industries behind the motor car, silk stockings, or cigarettes. A real sales policy, program and organization are essential.

Reasons for Automobile Use

Fewer riders are being carried by the electric railways, according to Mr. Spencer. He believes that this reduction in business will stop, but feels that additional riders must be obtained from the ranks of those now using private automobiles. The reason for the use of the automobile by these potential riders, he said, is probably because it is not necessary to wait on the corner, the rider is assured of a comfortable seat, a private unit, with continuous motion until the destination is reached. Perhaps the railways need a smaller unit operating more frequently. On the other hand, Mr. Spencer believes there is no substitute for mass transportation service. Automotive vehicles could not meet the test, due to lack of sufficient unit carrying capacity and the utter lack of sufficient street capacity. To get back the business Mr. Spencer advocates a national advertising campaign through newspapers, magazines of the greatest circulation, billboards and radio.

Commenting on the foregoing papers, vice-president Slade said that he was forcibly struck with the statement of a speaker that he would rather ride in the oldest "relic" the company has on the streets than to wait five minutes for one of the most modern type trolley cars with linoleum floor, plush seats, wide glass windows and ultra-modern lighting. This means that the availability of the service is the all-important thing. Speed is another very important factor in patronage. Mr. Slade said that the average street railway will have to use buses more extensively if it is to render the type of service above described.

A motion picture "East Side, West Side," drawing a comparison between the convenience, speed and comfort of street car and automobile travel in city service, was shown. John W. Colton spoke of the organized efforts the companies in Chicago, Pittsburgh and elsewhere have been making in the past decade to "sell" transportation. The film above mentioned, slightly modified, is now available through the American Electric Railway Association.

Charles C. Pierce, General Electric Company, Boston, commented upon the importance of developing the industry commercially and stated that plans are afoot to recapture lost traffic on the Boston, Worcester & New York Street Railway by placing open type cars in service.

Co-ordinated Maintenance of Automotive Equipment

Mr. Jardine pointed out that on most street railways all automobile equipment, buses and service vehicles alike, should be maintained in one group as motor-vehicles. Some roads operate nearly as many service vehicles as buses. From appearances, many operators are not giving as much attention to service equipment as they should. Apparently, street railways now operating buses are passing through a period of transition in maintenance practices similar to that through which the large motor-vehicle companies went several years ago. Many of the latter had no periodic lubrication and inspection, overhaul programs of any kind, and paid dearly for their neglect in poor returns and costly maintenance.

On one property, he said, fifteen years ago the usual method of rebuilding was to pull the truck out of service, dismantle it and reconstruct from the ground up. This was satisfactory as the fleets were made up of so many types, makes and capacities that the cost of stand-by units was prohibitive. Its weak point was the great number of service hours lost during overhaul. About 1916 many of the older motor vehicles had been retired and steps were taken to standardize fleets. It was found feasible to start a unit overhaul program, because experience had shown that a complete overhaul of a vehicle failed to obtain the necessary results either in satisfactory operation or sufficiently low maintenance costs.

It was found that some units were capable of continuous operation for longer periods than others, and that a great deal of time and labor could be saved if complete assemblies were changed as units. It was therefore necessary to establish a simple system of mileage records and an identification system of unit numbers for all parts of the vehicle except the body and frame. Under this system a sufficient number of spare parts were held in readiness, so that, for example, when the engine on a truck had reached the point of overhauling, determined by the number of miles it had been continuously operated, a spare engine could be quickly substituted with minimum loss of service time to the truck. Not only was the loss of time to trucks cut down, but a considerable

Digitized by Google

saving in the machine shop followed. A number of street railways operating motor buses, including the United Electric Railways, as well as some motor vehicle transportation companies have adopted this system of unit overhaul.

There are many reasons why automotive service equipment should be maintained at a high standard. The operation of service vehicles is generally tied up with a large number of workmen, and the failure or poor performance of a service vehicle frequently represents a considerable loss of labor. Such vehicles are generally identified with emergency repair work, and failure not only represents a loss of time but may contribute to the length of time that the basic schedules are interrupted. These losses of course do not appear in the vehicle maintenance costs.

The Future of the Electric Railway Industry

Mr. Colton pointed out that about 41,668 miles of track are now being operated by the street railways of this country, a decrease of 7.2 per cent from the maximum of 44,835 miles in 1917. Over 18,000 miles of bus routes are in service, all established since 1921. There are about 75,000 electric street cars in operation and 9,000 motor buses run by traction companies. Last year the operating revenues of the industry were 2.5 per cent below 1926; expenses were 1.8 per cent less and net revenue 4 per cent less. The operating ratio increased to 75.2 per cent last year as against 74.6 per cent in 1926. Rail traffic was 3.25 per cent below 1926, and combined rail and bus traffic was 1.25 per cent lower.

The Metropolitan cities of New York, Chicago, Philadelphia and Boston show traffic increases of one-fourth of 1 per cent, but elsewhere losses average slightly over 2 per cent. In the small cities, those of 30,000 population or under, it is estimated that traffic has decreased 25 per cent since 1923. The interurban roads, most of which operate in comparatively thinly settled sections of the Middle West have lost about 22 per cent. In medium sized cities losses range from 1 to 7 per cent. Only a few have shown increases.

If these losses of traffic had been confined to the last year or two we should have little concern about them, but actually there has been a continuing traffic decrease for some years.

While figures like these sound depressing, we need to have them in order to face the facts. Mr. Colton declared that he believed the worst is over and that from now on traffic will show gains. The chief cause of lost traffic is private automobile competition. Before the automobile became cheap the traction industry gained an average of 5 per cent yearly in traffic. As the number of motor cars grew troubles began, until finally there were some who proclaimed the end of the industry. Motor bus manufacturers were notable among these prophets of doom; experience has shown that they were wrong, and in recent years electric railways have actually been their best customers.

"My belief," said Mr. Colton, "that we have about reached rock bottom in traffic losses is based on two facts, (1) the automobile industry seems to be approaching the saturation point in the distribution of private vehicles; (2) the productive power of industry seems to have become greater than the consuming power of the public, with the result that industrial conditions are somewhat unsettled."

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 2 — Metropolitan Section, American Electric Railway Association, Engineering Societies Building, New York, N. Y.

March 13-15—Oklahoma Utilities Association, annual convention, Tulsa, Okla.

March 14-15 — Illinois Electric Railway Association, Springfield, Ill.

March 21-22 — Central Electric Traffic Association, Seelbach Hotel, Louisville, Ky.

March 23—Maryland Utilities Association, annual meeting, Emerson Hotel, Baltimore, Md.

March 30—Executive Committee American Electric Railway Association, 292 Madison Avenue, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City. Mo.

May 2-5—Southwestern Public Service Association, Dallas, Texas.

May 6-12—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.

June 6-8—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.

June 20-27 — American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.

June 21-22 — American Railway Association, Motor Transport Division, Atlantic City, N. J.

June 28-29—Central Electric Railway Association, Cedar Point, Ohio.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

July 25-27—Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

No matter how convenient the motor car may be to the individual it is undeniable that the presence on city streets of many thousands of automobiles tremendously increases the life hazard and materially affects the volume of business done by the merchants. It also places a heavy financial burden upon the taxpayer. Not long ago merchants in cities like Providence and Boston thought that the presence of a line of shiny cars in front of their doors advertised their popularity. Lately they have been finding that this does nothing but block the entrances to their place of business. Therefore, there is an increasing demand from merchants and other business men for the abolition of parking. Where parking has been forbidden in business districts, as in Pittsburgh and Chicago, it has been found that all kinds of traffic move more rapidly and that it is easier for the public to reach the stores.

It will not do for electric railway men to sit back and wait for business to come to them. The demands of the public today are vastly different from those of a few years ago. There is no panacea to be applied equally in all communities. It is quite possible many companies will have to abandon rail lines operating through the so-called high-class residential district and substitute for them a modern system of motor bus transportation.

Above everything else public transportation must be attractive, and having been made attractive it must be actively sold. After all the transportation business is nothing more than a merchandising proposition. Only by active, persistent, continuous promotion of the advantages of street railway service will it be possible to attract to the cars those who now prefer to ride in their own private vehicles, even though they know that the cost of using the private vehicle is much greater than that of using the street car or public service motor bus, and are fully aware of the inconveniences of driving through congested traffic.

Utilities Advertising Association Studies Stockholder Contact

A SPECIAL committee designated as a committee on contact with stockholders has been appointed by Donald M. Mackie of Hodenpyl, Hardy & Company, president of the Public Utilities Advertising Association, to study the practices employed by public utilities with respect to contact with stockholders. William H. Hodge, vice-president Byllesby Engineering & Management Corporation, has accepted the chairmanship and is working out a plan of activity.

Among the objectives of the committee will be a study of the policies observed by different utilities throughout the country in the matter of establishing contact with stockholders and the practices followed in keeping stockholders informed not only as to earn-

Digitized by Google

ings in customary channels but also as to what is being done to inform them as to the company's plans, its developments and its activities in the public service. From present indications, practices followed by different utilities are widely divergent in their aims and operations. There is a great diversity of opinion as to the manner and extent of disseminating information. This is the first study of this nature undertaken in the industry since the customer-ownership movement attained its present proportions.

The committee, in addition to Chairman Hodge, includes:

A. C. Watt, Hodenpyl, Hardy & Company, Inc., New York; Paul Jenkins, Utility Securities Company, Chicago; R. E. Smith, Southern California Edison Company, Los Angeles; Robert Montgomery, Louisville Gas & Electric Company, and C. E. Neil, North American Company, New York.

Special Transportation Arrangements for Rome Convention

SPECIAL arrangements have been made for transportation to and from the Rome convention of the Union Internationale de Tramways, de Chemins de fer d'Interet local et de Transports Publics Automobiles. The sessions will be held May 6 to May 13 inclusive, but during the convention a trip will be made to Naples, and after the convention one to Turin and Milan to inspect the electric railway systems there. In an announcement made on Jan. 25 it is explained that Premier Mussolini of Italy has agreed to act as honorary president of the congress.

The transportation arrangements for those who expect to attend from this country have been made with the Navigazione Generale Italiana line, whose headquarters are at 1 State Street, New York. The registration fees at the convention will be 100 lire (about $5.30) for gentlemen and 50 lire (about $2.65) for ladies.

Work of Special Libraries Association Told in Year Book

PURPOSES of the Special Libraries Association, and the advantages of membership in the organization, are set forth in a year book recently issued. It was sponsored by the membership committee, of which Lewis A. Armistead of the Boston Elevated Railway is chairman.

There are at present about 1,200 members and subscribers in the United States, and four specialized groups have been formed within the national association. These are the Commercial-Technical, Financial, Insurance and Newspaper groups.

Included in the membership are several of the larger electric railways and holding companies. Largely through their co-operation the bibliography on transportation has been enlarged so that many subjects in the field may be studied with much less effort than formerly. Those who visited the exhibit of the association at the last Cleveland convention were impressed with the value of the work which has been done along these lines, according to the year book.

Central Traffic Association of Growing Importance

WORK of the Central Traffic Association was reviewed in the annual report of the chairman, presented at the recent Cincinnati meeting. As each year brings additional legislation, states the report, further rulings from the Interstate Commerce Commission and state commissions and a broadening in the scope of the activities of association lines, so the past year has been the most active in the history of the association. Tariff publications are more numerous and more comprehensive to meet changes made effective in steam road tariffs applying on competitive traffic, or to enable electric roads to extend their operations to points on steam line connections. Changes in freight equipment and the purchase of new equipment have necessitated the reissue of the Equipment Register. Twenty-six changes in the classification of commodities have made necessary reissue of the Joint Exception Tariff and the issue of one supplement. The Joint Class Rate Tariff, first published on Jan. 1, 1926, has been revised and is now ready for reprinting. Two new freight tariff publications have been completed during the year, one a Prepay Class Rate Tariff and the other the Joint Dispatch Freight Tariff.

During the year five regular and two special meetings were held, the average attendance being 33 members. Twenty-eight committee meetings have been held and 147 subjects have been considered by the association. Among the valuable things done by the association have been changes in the rules governing settlement of freight claims, transportation of freight by truck, revision of the official interurban map, and an institutional advertising compaign. The past year has witnessed the consummation of through joint class rates to territory south of the Ohio River. This will greatly extend the territory for which shipments can be accepted by the electric lines.

"The success achieved by the Traffic Association," concludes the report, "is due to a very great extent to the splendid co-operation of each individual member and the untiring efforts of the association committees. Delays in the performance of certain work have occurred, and certain work has been authorized by the association which has not been completed as the man power available has not been sufficient to carry out all these plans, but these matters are being worked out with the idea in view of affording the greatest possible benefit to the association members."

Central Accountants' Association Elects Officers

FORTY members from Indiana, Ohio, Kentucky, Pennsylvania and Michigan attended the convention of the Central Electric Railway Accountants' Association held at the Hotel Gibson, Cincinnati, on Feb. 17-18. Interchange rules applying to the accounting systems used by various railways, both steam and electric, in handling freight records, were the center of discussion.

The following officers were elected for the ensuing year:

President, F. A. Healy, auditor and treasurer Indiana, Columbus & Eastern Traction Company, Springfield, Ohio.

First vice-president, H. F. McColgin, auditor Interstate Public Service Company, Indianapolis, Ind.

Second vice-president, C. E. Baker, auditor Lima Toledo Railroad, Lima, Ohio.

Secretary, L. E. Earlywine, Indianapolis, Ind.

Executive committee — Terms expiring in 1929: J. B. Hooper, Detroit, Mich., and L. J. Wetzler, Chicago, Ill. Terms expiring in 1928: O. A. Small, South Bend, Ind., and A. E. Wafer, Akron, Ohio.

In his inaugural address President Healy traced the history of the association and its influence in the national association. Coming into the electric railway field in 1906 from the steam railroad field, Mr. Healy was instrumental in forming this association, which was organized in the spring of 1907. At that time, he said, electric railway accounting was in its infancy. There was no uniform classification of accounts and no standards to go by. Fortunately most of the auditors at that time came from the steam railways or at least had training in that school, so that after forming the association it was not difficult to harmonize the views of the auditors of the various railways and finally bring about a uniform system of accounting.

Mr. Healy pointed out that a number of the leaders in the American Electric Railway Accountants' Association have been actively connected with the Central Association, six presidents out of fifteen having been members. He said the electric railway accountants are still young in their experience compared with the steam railroad accountants. To succeed in the future it is necessary to keep abreast of the times, to study new methods and to co-operate one with the other.

It was decided to hold the next meeting of the association in Detroit, on July 27-28.

British Tramways Association Meeting

ANNOUNCEMENT has just been made that the annual conference of the Municipal Tramways and Transport Association of Great Britain will be held in Manchester, England, on Sept. 12, 13 and 14, this year.

News of the Industry

No Rehearing in Baltimore

The United Railways & Electric Company, Baltimore, Md., has decided for the present not to ask the Public Service Commission for a rehearing in either the fare case or the easements case, both of which were decided a short time ago.

Just before the fare order was handed down the Public Service Commission placed a valuation of $5,000,000 on the company's easements, a reduction of $2,000,000 from the figure first set. The $7,000,000 valuation case was appealed to the courts and the Maryland Court of Appeals ruled that it was proper to value the easements but held that the commission had not done so in the proper manner. Another hearing was held and the $5,000,000 figure placed on the easements.

A few days after this case the commission handed down an order and opinion granting the company a fare increase from 7½ cents or two tokens for 15 cents to 9 cents or three tokens for 25 cents. This decision and order were dealt with at length in ELECTRIC RAILWAY JOURNAL of Feb. 18. Under the Maryland Public Service Commission law the United had either to accept the ruling or file notice that it would not accept it within ten days.

In a statement sent to the commission by Charles D. Emmons, president of the United, and also signed by counsel for the company, it was said that both cases were so fully presented before the commission that the company felt that no good could be accomplished through rehearings. The statement mentioned, however, that that action did not affect the company's rights to ask for a judicial review of the findings by an appeal to the courts, which rights were fully reserved.

The company has 60 days from the date the decision was handed down in which to appeal to the courts. Officials of the United will make a close study of the effect of the increased fare before deciding upon an appeal. The original petition asked the commission for an increase to a 10-cent straight fare.

Traction Legislation Continues in Chicago

Deliberations of the Chicago City Council traction sub-committee in the drafting of acceptable legislation for the solution of the local transportation problem again have reached a point of almost hopeless confusion. Three terminable permit bills are now being considered by the sub-committee as a result of nearly eight months of intermittent work and negotiation.

One bill presented recently by Alderman Jacob M. Arvey seeks to give unlimited power to the city to grant a franchise without limitation of time. A second drafted by the corporation counsel is also without time limitation but stipulates that the penalty for violation of the terms of the grant shall be either purchase by the city or by a private company designated by the city. The third bill is the one which received the approval of the railway companies' attorneys. This measure does not provide for amortization of the properties or for punishment of the company for any violation of the franchise within a year after the violation has been committed, although it does state that the permit may be revoked by purchase by the city or by another company designated by the city.

Some of the members of the committee are now favoring a 40-year term franchise under which the companies have admitted they could properly finance a consolidated transit system.

The amended consolidation bill which was expected to be passed in the aldermanic session following the companies' approval of it—like the terminable permit bills—is now being submitted to further study by the committee. This bill differs from the city's earlier draft in that it allows for the acquisition of the existing surface and elevated lines by an entirely new corporation or holding company.

Court Acts on Interborough Labor Issue

Justice Wasservogel decides contract between men of New York Company and management is unfair—President Hedley promises review of findings

THE Interborough Rapid Transit Company, New York, lost its injunction suit on Feb. 15 to restrain the American Federation of Labor and the Amalgamated Association from organizing the subway and elevated men. Supreme Court Justice Wasservogel decided that the contract between the Interborough and its men was unfair and that a court of equity would not protect it.

Justice Wasservogel also denied the Interborough's application to punish James H. Coleman, general organizer of the Amalgamated, for contempt of court for violating the injunction granted a year ago in the previous litigation to prevent unionization of the subway and elevated men. The court ruled that because the Court of Appeals had vacated the injunction before the contempt plea was made, on the ground that "its broad scope was beyond the power of the court," the restraining order was then a nullity. Decisions both of the Court of Appeals and of Chief Justice Marshall of the United States Supreme Court were quoted in support of this ruling.

In refusing the new injunction against the American Federation of Labor and the Amalgamated, Justice Wasservogel relied to a great extent on the Court of Appeals' holding in the Lavin case, brushing aside the contract signed last summer by the members of the Interborough company union, the brotherhood of the Interborough Rapid Transit Company, under which the members ceased to become mere employees "at will," but were signed up by the company for a two-year period.

In discussing the contract Justice Wasservogel said:

While plaintiff claims that the present contract involves mutual rights and obligations and was therefore made upon ample consideration, it is the contention of defendants that it is without consideration and because of the conditions to which it was made subject, should fail in equity. Defendants call attention to the fact that the separate ratifying instrument is signed by the employees and does not contain any promise by the company to employ the men for any period of time; that it was not executed by the company, and any promise of the company to employ the men for a period of two years must come through the general committee of the brotherhood which, by the terms of the constitution of the brotherhood had the power to bind the men. Assuming, however, that the promise contained in clause 1 of the contract between the company and the brotherhood with respect to an employment of two years was actually made by the company to the men, it seems to me that such promise is practically made valueless to the employees by clauses 5 and 6 of this contract.

Justice Wasservogel said in part:

The contract purports to bind the employee for two years, while the employer is not in substance subject to a reciprocal obligation. Where an employee abandons all right to leave the service of his employer, whereas the employer reserves practically entire freedom to discharge him, there is no compensating consideration.

Whatever the status of the contract at law, the provisions above referred to are, to say the least, inequitable. The term of the contract is, in effect, controlled by the will of the employer and plaintiff is therefore in no better position than it was in the Lavin case. Not only the employees but also the third parties made defendants in this case may, in a court of equity, avail themselves of the defense interposed.

The allegations of the Interborough were that the defendants had organized Division 977 of the Amalgamated for

Digitized by Google

the purpose of bringing into it the subway and elevated employees and thus to "destroy" the Interborough Brotherhood, and that plaintiff's employees were being induced to "secretly violate their contracts of employment and become members of the Amalgamated while ostensibly remaining faithful to their obligations as members of the brotherhood."

The defendants denied these allegations and set up the defense that "the two-year contract is void and unenforcible by reason of alleged fraud, deception, duress and overreaching conduct on the part of the plaintiff."

James L. Quackenbush, counsel for the Interborough, announced Feb. 15 that the company would appeal.

Frank Hedley, president and general manager of the railway, said:

The law department of this company will take steps to obtain a review of the recent decision denying an injunction to restrain interference to procure members of the brotherhood to break their agreements. In the meantime every member of the brotherhood is assured that it is the intention of the management to live up to the agreement in every way.

The agreement between the brotherhood and the company is plain that no Amalgamated members can remain in the employ of the company. That agreement will be carried out by the company so long as the existing contract lasts. It is not intended to permit a small group of misguided employees to dictate terms to an overwhelming majority of loyal employees.

Celebration in Oklahoma City

Oklahoma City's first street car was piloted through the streets of Oklahoma City by L. B. Poulson on Feb. 15, celebrating the 25th anniversary of the first trolley service in the city. The car was placarded in recognition of the event and attracted much attention. The first street car in charge of Poulson, clattered down Broadway on Feb. 15, 1903. The system at that time consisted of 5 cars and 5 miles of track. The Oklahoma Railway now has 140 miles of track 129 cars, including interurban and 34 buses.

Safety Results Improved in Providence

Total accidents on the lines of the United Electric Railways, Providence, R. I., in 1927 decreased 8.9 per cent from 1926 or 641. Collisions with autos decreased, during the same period, 14.8 per cent or 549, this latter in the face of an increase, in round figures, from 112,000 to 120,000 in automobile registrations. In the large proportion of major accidents the trend was downward as it has been since 1923. In 1927 the cars ran an average of 3,811 miles per accident each month, and the buses an average of 9,509 miles.

Although the company regrets the increase in fatal accidents and collisions between its cars, it is gratified that employees' accidents in 1927 decreased 11.9 per cent over 1926.

Fare Increase to Be Asked in Shreveport

Capt. H. B. Hearn, president of the Shreveport Railways, Shreveport, La., has announced that the board of directors has decided to appeal to the Louisana Public Service Commission for an increase in car fares. The present fare is 7 cents for adults and 3½ cents for school children.

In a formal statement, Captain Hearn declares that the company's net earnings last year were $69,634 "on a property investment, , valued by eminent utilities engineers to be $2,804,884 at a minimum." After deductions of $51,037 for interest on borrowed money, the statement continues, the company had $18,597 left for improvements or dividends. The statement follows in part:

We have made a sincere and honest effort to operate successfully on the 7-cent fare for adults, and 3½ cents for school children. At the end of the last year we found that we had net earnings of $69,634 on a property investment, valued by eminent utilities enginees to be $2,804,884 at a minimum. After a deduction of $51,637 for interest on borrowed money, we had only $18,597 left for improvements or dividends. In short, the return was only approximately 2½ per cent, whereas the recognized fair return is 8 per cent.

The revenues under the 7-cent fare make it absolutely impossible for us to meet the demands for service required by this growing community. We believe that when the people of this community are fully acquainted with the facts of the case, they will agree that our petition for an increase in the rate of carfare is fully justified.

We must remember that the system of the Shreveport Railways of today has been evolved at heavy expense from a small, inferior transportation medium into a service utility extending over 35 miles of track. The equipment of the company is of the latest design. The maintenance of the property has always won the admiration of men familiar with transportation problems and attending costs.

Everything has been done by this company to insure to the people good service. But conditions are such, under the present rate of fare, as to make it mandatory for us to seek relief in the form of an increase.

It will be impossible for us to continue to operate successfully, and on a high basis of efficiency, unless we are afforded such relief as the condition warrants.

We are now compiling complete statistics and records which will place the entire case before the commission, and we intend also to acquaint the public with these facts, that they may judge whether our petition is justified. We believe that the judgment of the fair-minded people will be that we are warranted in seeking this relief.

Co-operation in Omaha Means Improved Service

Extra railway service for the convenience of the workers in the south side packing plants of Omaha, Neb., is now provided daily at the hour of dismissal through the co-operation of the packers and the Omaha & Council Bluffs Street Railway. The special service was arranged at a conference with C. A. Cushman of Swift & Company, and W. C. Baughman, representing the railway. As the packing plant employees did not end their day's work at a given hour each day Mr. Cushman asked if the company could not supply extra cars no matter what the closing hour. Under the arrangement now in force Mr. Cushman's office notifies the railway each day at the release hour of the workers.

In this connection the improvement of the south side service followed a suggestion from outside of the company.

And Lo! Richmond Led All the Rest

Advertisements carried by the Virginia Electric & Power Company, Richmond, Va., in the *News Leader* for the period of one month were awarded first place in a competition with advertisements of 32 large utilities under the management of Stone & Webster. At the close of each month the Stone & Webster managed companies forward copies of all advertising matter put out by them to the company's home offices in Boston, Mass. These are analyzed by the McJunkin Advertising Company, of Boston, and the ratings announced.

In a letter received from the McJunkin Company on Feb. 14 the Virginia Electric & Power Company was notified that it carried the largest volume of advertisements of any one of the Stone & Webster companies and the advertisements were noted for their effective, terse language and their pleasing appearance.

Injunction Against Parking Refused

Attempts of dissatisfied business interests to obtain an injunction against enforcement of the no-parking ordinance, which is now in its second month's trial, on downtown streets of Chicago ended suddenly on Feb. 18 when Superior Court Judge Oscar Hebel granted a motion to dimiss the bill of complaint. In denying a temporary injunction against the ban on Feb. 11, Judge Hebel had allowed the petitioners one week in which to file an amended bill.

The reason given for the withdrawal of the complaint by Samuel Pancoe, a "Loop" stationer who had headed the small group opposed to the law, was that the task of assembling evidence would require too much time and entail excessive expense.

An alternate plan of carrying to the Supreme Court a test case of a person arrested for violating the ordinance is said to be under consideration by attorneys for the dissatisfied merchants. This procedure, it was pointed out by the attorneys, would be much less expensive than to test the legality and reasonableness of the ordinance in the superior court.

Inquiry by Trade Commission

Walsh resolution amended. Investigation will concern itself with interstate companies

THE Senate, by a vote of 46 to 31, on Feb. 15 sent the utilities investigation to the Federal Trade Commission, thereby defeating the proposal of Senator Walsh for a Senatorial inquiry. The vote was on the amendment to the Walsh resolution offered by Senator George. After that, the amended resolution was adopted without a record vote.

The resolution as passed, in addition to the provision calling for monthly reports to the Senate, also authorizes an inquiry into alleged political activities of corporations concerning the public ownership question and elections since 1923 for president, vice-president and members of the Senate. Another provision is that the commission shall ascertain whether any of the alleged practices referred to in the resolution constitute unfair methods, tend to restraint of trade or to create a monopoly or violate the anti-trust laws. Another provision is that the sessions shall be open to the public.

The report of the Senate interstate commerce committee on the Walsh resolution was debated in the Senate on Feb. 13, 14 and 15. Senator Walsh led the argument for adoption of his resolution. He said the committee's restriction upon the inquiry to interstate business and companies with interstate connections was satisfactory, as it was never intended that the proposed committee should inquire into plants of small communities. However, he opposed the restriction that public utilities' campaign contributions to be inquired into should be limited to the elections of President, Vice-President and members of the House and Senate.

Senator George, having offered an amendment that the inquiry be made by the Federal Trade Commission, was the principal backer of this proposal. The proposition of Senator George included a provision that the Federal Trade Commission should report to the Senate within each thirty days after the passage of the resolution, and, finally, on the completion of the investigation.

On Feb. 13, Vice-President Dawes, as president of the Senate, explaining that he was financially interested in various public utilities, asked the Senate to amend the Walsh resolution so that appointment of the special investigating committee would be placed in other hands than his. Senator Walsh gave his assent to this, saying that he would ask that the special committee be elected by the Senate.

Five Lost on Key System Ferry

Official investigations into the Key System Transit Company ferryboat tragedy have ended and reports will be made next week. Five are believed to have been drowned when the ferryboat Peralta, loaded with commuters on the way back to Oakland from San Francisco, suddenly plunged downward and shipped considerable water on Feb. 17. Twenty-one were washed overbroad from the forward deck, but 16 were rescued. Of the 5 lost, 3 were men and 2 women. No bodies have been recovered.

Government steamboat inspectors in an attempt to fix the blame, called many witnesses, including officials of the company and passengers.

New safety precautions have been instituted on the Yerba Buena, sister ship to the Peralta, in accordance with an order of John K. Bulger, supervising inspector of steamboats. Hereafter chains will keep passengers 40 feet from each end of the boat during trips and use of ballast, or trimming tanks will be discontinued. These rules will also apply to the Peralta when she returns to service. The tanks were blamed for the accident by many witnesses. It was claimed that the forward tank of the Peralta was filled with water when the accident occurred and that the weight of this water, plus the weight of the passengers who crowded forward as the craft neared the Oakland mole caused the Peralta to do a "nose dive."

Key officials denied that the tank was full. They declared that it had never been used for ballast purposes.

Fare Injunction Argued in New York

Counsel for city and the commission contends statutory court required—Counsel for company that federal jurisdiction be established

THE hearing on the temporary order granted by Federal Judge Winslow to the Interborough Rapid Transit Company, New York, restraining procedure under the State Supreme Court injunction was held on Tuesday before Federal Judge William J. Bondy. William L. Ransom, counsel for the Interborough, and Samuel Untermyer, for the city and the Transit Commission, argued as to whether the hearing should be before one federal judge or in a statutory court consisting of two federal judges and a judge of the Circuit Court of Appeals.

Mr. Untermyer raised the question of procedure to be followed. He contended that under congressional law a single federal judge could not hear and continue a temporary injunction which sought to displace state courts as having jurisdiction. He argued that the law required a statutory court of three federal judges to hear the motion. He said that "if these people are successful in holding up the city's action in state court, then the railroad 'has a royal road' on March 3 to a 7-cent fare."

Gist of the Company's Plea

Judge Ransom stated the company's original complaint filed in Federal court established the Federal court's jurisdiction. He argued the original complaint was sufficient and not premature. The second proceeding by the company, that of getting a temporary injunction, he argued, was a separate move; that it relates only to and shows "acts by these defendants, subsequent to filing of the original bill in Federal court, which appears a deliberate plan amounting virtually to conspiracy, seeking to deny the company an orderly hearing before the court in seeking relief."

In later remarks he said the motion was simply to force the defendant to show cause why they should not be enjoined from prosecuting the actions which they began in the Supreme Court of New York County. According to Mr. Ransom it was simply a question of the priority in time of the filing of the action. All the points of the State court suit are included in the action pending in the Federal court, he said, and declared that the real purpose of the defendants in getting into the Supreme Court was to gain some device by which they could restrain the Interborough from coming to the Federal court and getting protection from confiscatory proceedings. He said there was no question of the priority of the Federal court's suit, as it was filed at 9:20 a.m. Tuesday, Feb. 14, while the suits in the State court were not filed until after 12 o'clock. Under these circumstances Mr. Ransom said, the Federal court had no option but must assume full jurisdiction.

Mr. Untermyer said he asked the courts to decide that the city suits were begun first. He said the Transit Commission had taken two weeks to pass on the Interborough's application and that it did not act sooner because it was disturbed by the question whether it had a right to act under the city contract with the Interborough. The court asked Mr. Untermyer whether there had been any cases in which the question of contracts has been raised in rate-making actions. There have been many of them, Mr. Untermyer answered, particularly the Columbus Railway case which was decided by the United States Supreme Court. In this case, the company was losing money, not even making operating expenses, while the I.R.T. is making money.

On Feb. 23 Mr. Ransom filed in the United States District Court a reply affidavit answering briefs filed on behalf of the city and the Transit Commission in their opposition to the suit now pending in the Federal court.

Mr. Ransom's affidavit is, generally, a repetition and summary of assertions made to him in the course of argument Tuesday before Federal Judge William Bondy. He lists five facts which he says neither the Corporation Counsel nor

Digitized by Google

the counsel for the Transit Commission has denied. The facts have been summarized as follows:

1. That the Interborough's suit was started in Federal court before the authorities filed in the State courts.

2. That the commission and the city started their actions for the purpose of preventing the Interborough from making an application for a special statutory court and from taking other steps in the Federal action.

3. That the schedules embodying the increased fare were duly filed with the Transit Commission by the company and are still on file.

4. That the 5-cent fare is "grossly inadequate, and in fact confiscatory."

5. "That at least $142,894,000 of present value of the elevated properties are being daily confiscated by the inadequate earnings under the 5-cent fare; that $140,579,474 of property owned by the plaintiff and $272,940,174 of other property provided by the plaintiff is being confiscated by the 5-cent fare; and that not more than $342,380,000 of the total of $898,793,648 of the present value of rapid transit properties used in the plaintiff's business was provided by the city of New York."

The city and the Transit Commission secured a temporary injunction from Supreme Court Justice Edward J. Glennon on Feb. 14 restraining the Interborough from increasing its fares to 7 cents. Procedure under this injunction was stayed by a temporary restraining order issued to the company by Federal Judge Winslow on Feb. 17. The latter restraining order is effective for 10 days or until Feb. 27. The question for Judge Bondy to decide is whether he had jurisdiction in the matter and if so whether the restraining order should be continued. If the Federal Court's temporary restraining order is continued, then the company will probably ask for a temporary injunction permitting it to charge a 7-cent fare pending decision on its original application asking for a permanent injunction.

Hearing on Use of One-Man Cars in New York City

The operation of one-man cars by surface railways in New York City will come before the Transit Commission at a public hearing on Feb. 29, called on recommendation of the service bureau and the chief engineer. According to the report made to the commission by the service bureau, some of the companies have started or extended one-man car operation without due notice to the commission. At the present time 1,404 one-man surface cars are being operated in the city. The commission seeks to have all of these cars equipped with more safety devices, and to compel the railways to notify the commission before starting or extending one-man car operation on any of their lines so that the commission may approve any plans for changing equipment of cars for one-man operation or of the routes over which one-man cars are to operate.

More Moves to Speed Up Traffic in Detroit

At a meeting held with the Mayor, Common Council and interested department heads on Jan. 24, the Commissioner of Public Safety at Detroit, Mich., suggested that a 30-day test be made on Woodward Avenue between the River and Fair Grounds during which time the street cars would make express stops between Adams Avenue and the Six Mile Road; local stops between the River and Adams Avenue and between the Six Mile Road and the Fair Grounds; and the buses would make local stops between the River and the Six Mile Road. It is believed that a combined service of this kind would materially expedite the flow of all types of vehicular traffic on any street where trolley cars are operated. In this connection it will be recalled that a combination express street car and local bus service was placed in service on East Jefferson Avenue under date of Sept. 18, 1927.

AVERAGE VEHICLE SPEEDS ON WOODWARD AVENUE AS DETERMINED FROM TESTS

	3:30 to 6:30 P.M. Northbound Thursday, Dec. 9, 1926 M.P.H.	7:30 to 10 A.M. Southbound Saturday, Dec. 18, 1926 M.P.H.
Jefferson Ave. to Fort St...	5.8	7.0
Fort to Grand River.....	4.4	8.3
Grand River to Adams....	5.7	7.0
Adams to Columbia.....	4.6	4.5
Columbia to Eliot.....	7.6	12.0
Eliot to Warren.....	8.3	9.6
Warren to Grand Blvd....	9.5	12.9
Grand Blvd. to Clairmount	12.3	14.0
Clairmount to Tuxedo.....	15.8	17.0
Tuxedo to Davison.....	13.4	17.0
Davison to Six Mile Road..	10.2	14.5
Six Mile Rd. to Seven Mile Road.....	13.0	15.5
Seven Mile Road to Fair Grounds.....	12.2	15.2

G. C. Schink, inspector, director of traffic for the Detroit Police Department, on Jan. 26, in a bulletin on the general features of the traffic situation from the police department's traffic survey bureau report, said:

We believe that "rush hour" traffic (to the Loop District in the morning and outbound in the afternoon) should be given special prference by keeping open for moving vehicles the full width of pavement in the direction of the greatest traffic movement. This is provided for by the present ordinance but is not yet satisfactorily observed although conditions are improving.

Slow moving vehicles obstruct traffic, diminish the number of vehicles that can pass a given point in a given time and increase the amount of passing of one vehicle by another, thus adding to confusion and danger. Certain vehicles, such as heavy trucks, which inherently must proceed at slow speed are required to travel close to the curb. This requirement is fairly well observed but fails to solve the problem of interference with free movement caused by the presence of othr slow moving vehicles.

Street cars using the natural highest speed lane and operating on a local stop service become slow speed vehicles and in view of the ordinance requiring other vehicles to stop with them, have a very definite retarding action on all other vehicular movements.

Various writers on traffic matters point out that the maximum results in the flow of vehicles along a thoroughfare are obtained when vehicles move at a rate of speed between 15 and 25 m.p.h. On Woodward Avenue, for example, tests show that the average vehicular section speeds are considerably lower. This necessarily means that the most economical use of the roadway is not being attained. Other thoroughfares on which street car lines are located, show similar conditions.

Safety Bonus in Houston

The Houston Electric Company, Houston, Tex., has announced that beginning Feb. 1 all operators of cars and buses who are not charged with an accident during the month will receive a bonus of $5. It is expected that the 460 men on the company's pay roll will receive about $25,000 through this bonus. During 1927 accidents decreased 12½ per cent, compared with the number reported during 1926. Last year the number of miles covered by buses and street cars increased more than 8 per cent compared with the preceding year. Accidents for which operators are not responsible will not be charged against their records.

Transportation in Other Lands

A description of transportation in other lands is being published in the British Columbia Electric *Employees' Magazine* from a copyright illustrated travel talk by P. Bentley, Dominion Photo Company, Vancouver. Mr. Bentley has granted special permission to the *Employees' Magazine* to run these articles. The fourth of a series appeared in the February number. His talk on freight transportation in India was prepared by him while on board the R.M.S. "Empress of Canada" during a world tour.

Safety Posters in Indianapolis

A series of safety posters will be placed on the cars of the Indianapolis Street Railway in Indianapolis, Ind., in an effort to curb automobile accidents this year. The cards will be replaced with different ones weekly.

Veterans Awarded Emblems in Atlanta

Nine 40-year men of the Georgia Power Company, Atlanta, Ga., were recently decorated with diamond buttons indicative of their loyalty and service. In ceremonies which marked the award of emblems, officials of the company paid high tribute to the faithful men. Beginning with exercises in December when 714 Atlanta employees, with ten or more years of continuous service were given their buttons, a total of 926 employees throughout the state were decorated during the course of the same week in similar exercises at various district headquarters.

Singing the Song of the Trolley in Grand Rapids

Having the praises of the railway, its rail coaches and its service sung by an entire city to the accompaniment of the leading orchestras is the new good will and publicity program launched by L. J. DeLamarter, vice-president and general manager of the Grand Rapids Railroad.

When the Grand Rapids company placed its new electric rail coaches in service it also launched a new slogan to go with them "Don't Worry! Relax! Ride the Street Cars. The Safest Place in Town."

Other local advertisers adopted the "Don't Worry! Relax!" part of the slogan to tie to their own publicity until the slogan practically became a household word.

One day recently, Mel Gilleland, director of the leading orchestra in the city, scribbled off a verse that he believed fitted in well with the slogan and showed it to Mr. DeLamarter. He revised his work and then the orchestra director set the words to music, a catchy and tuneful melody that offered opportunity for pleasing syncopation by orchestras:

RIDE THE TROLLEY CARS!

Don't worry! Don't hurry!
Relax; ride the trolley cars
The safest place in town.
Don't worry! don't hurry;
Ride and be merry.
Happy friends will meet you there.
Smile, and the world smiles with you,
Frown and you frown all alone.
So don't worry! Don't hurry!
Relax and ride the trolley cars,
The safest place in town.

Without previous announcement Mr. Gilleland sprang the song a few nights later at a large dance. It proved a "hit." There was a demand for encores. Other orchestras asked permission to use it and Mr. Gilleland cheerfully dedicated his song and music to Mr. DeLamarter and the railway. Then it received city-wide and free distribution. Now it is being sung and played by the orchestras in dance halls, theaters and other public places, while in hundreds of homes small groups gather around the piano and sing the words.

Another Transit Plan Proposed for New York

Public ownership of all transit facilities in New York has been proposed by Comptroller Charles W. Berry in a report to the Board of Estimate.

He would have the city take over all subway, elevated, surface and bus lines, which eventually it would own outright. The city would control all finances and the operating company would be under municipal supervision.

A 5-cent fare would be compulsory for three years. At the end of that time, if a deficit were shown, the Board of Estimate would decide either to try the experiment for three years more or submit the fare increase to the voters.

Among the outstanding features of the plan are:

1. Absolute control by the city of New York of its transit facilities—subways, elevated, surface and bus lines—and all revenue derived therefrom above actual expenses of operation.
2. Ultimate ownership by the city of New York of all transit lines with the right to remove or replace any line at any time.
3. A 5-cent fare with adequate transfer for a unified interborough service embracing all subways, elevated, surface and bus lines which are rendering necessary service or may be needed for a comprehensive transit system.
4. Consolidation in one body of all commissions having supervision over transit activities with corresponding economy of administration, improvement in service and elimination of jurisdictional disputes.
5. Construction of necessary bridges or tunnels between the boroughs of the city.

Wage Increase in Baltimore

An increase of 1 cent an hour for all platform men and a 2 per cent increase for all salaried employees was announced recently by the United Railways & Electric Company, Baltimore. The increase dates from Feb. 13 when the new fare rate of 9 cents or three tokens for 25 cents went into effect. In this order $260,000 was allowed for wage increases this year. Under an agreement the company had with its employees similar increases were granted the first of this year. Trainmen are now receiving 55 cents an hour.

Officials of the company and representatives of the employees held a conference in 1926 and following this the company contracted to grant increases on Jan. 1, 1927; on Jan. 1, 1928, and a proportionate increase at any time a raise in fare was granted. Charles D. Emmons, president of the United, has pointed out that platform men were receiving 22 cents an hour in 1916. The two increases granted this year amount to about $130,000 for platform men and about $130,000 for salaried employees.

Alameda Lines to Be Restored

The Key System Transit Company, Oakland, Cal., has been authorized by the California Railroad Commission to re-establish railway service on certain portions of its San Jose Avenue and High Street lines in the city of Alameda. Discontinuance of these portions was authorized by the commission recently during a 90-day experimental period for the operation of buses.

Enviable Safety Record in Philadelphia

A reduction of 15 per cent in all types of accidents in 1927 over the record of 1926 was effected by the Philadelphia Rapid Transit Company, Philadelphia, Pa., in its handling of trolleys, buses and cabs. There were fewer car collisions and a general reduction in the number of accidents on all the surface lines. The record of one-man cars was better in this respect than that of two-man cars.

Scioto Valley Line Tells of Service to Theater

The Scioto Valley Railway & Power Company, Columbus, some time ago took advantage of a combination of circumstances to put over a very effective newspaper ad in connection with the opening of the Loew's and United Artists' Theater in Columbus, Ohio. By means of the electric railway persons living in the most distant towns reached the theater within a few hours.

The ad, which is shown herewith, tells of the new chair cars recently put in service by the company, together with the many other features installed in recent months. In addition the ad contains a picture of Gloria Swanson, one of the United Artists' stars, affiliated with Mr. Loew in the management and direction of the theater.

$47,000,000 in Loans Before Philadelphia Voters

Voters at the April primary in Philadelphia, Pa., will be asked to approve several loan bills, totaling $47,000,000. They also will have for consideration a referendum transferring the $10,000,000 loan of 1913 for the Chestnut Street subway to another purpose.

Largest of the loan items is $10,000.000 for the extension of transit facilities. Of that amount $6,000,000 will be for the structural changes at City Hall station of the Broad Street subway, including the proposed concourse, and $4,000,000 will be spent for the Ridge Avenue delivery loop.

Sightseeing and Route Guide of Chicago

The Chicago Surface Lines has issued a new sightseeing and route guide of the system. The booklet, 5x8½ inches, contains 36 pages with a folder map in four colors showing the entire system. It is profusely illustrated. Directions are given for reaching all important points of interest by street car and a complete description of all of the routes of the system is included.

A feature of the distribution is the compilation of the dates of approaching conventions with the name of the secretary of the organization. A month before the convention is to meet, samples of the book are forwarded to the secretary with the suggestion that copies are available to the delegates. In this way practically all who come to the conventions are supplied with street car route guides. The booklet is being distributed free through the medium of railroads, hotels and public service offices.

Transfer Changes in Indianapolis Continues

Continuance of the present 2-cent transfer charge of the Indianapolis Street Railway, Indianapolis, Ind., for an indefinite period from March 1 is asked in a petition filed by the company with the Indiana Public Service Commission. The commission extended the privilege about a year ago following its authorization of the charge in 1925 to assist the company to bolster up its depleted finances. The company states similar conditions affect the property.

New Schedule in Terre Haute Sought

Permission has been asked of the City Council at Terre Haute, Ind., by the Terre Haute, Indianapolis & Eastern Traction Company, to lengthen its schedule on all city car lines and to stop the regular schedule after 11:30 o' clock p.m. The request is made to enable the company to cut down operation expense rather than to raise the fare charge. It is estimated that if the change is granted, a big saving will be made each month. The schedule, as requested, would start the first morning car on all city lines at 5 o'clock, with a second at 5:30. Then cars would start operating in all directions on a basis of no less than eight minutes nor more than twelve minutes.

Fare Increase in Tulsa

An increase of 3 cents in single cash fare was granted the Oklahoma Union Railway in Tulsa, Okla., on Feb. 15, by the Corporation Commission. The increase makes a single fare of 10 cents or three checks for 25 cents, which is the same rate charged on the buses of the Union Transportation Company of Tulsa, a subsidiary of the Oklahoma Union Railway. The old fare was 7 cents or four checks for 25 cents. No protest was offered and the commission granted the increase from the bench. The company, in its application for a fare increase, alleged that it lost $377,152 since 1923.

San Antonio Boasts of Service Record

In its elimination of delays the San Antonio Public Service Company, San Antonio, Texas, boasts of its 1927 record. There was an average of 24 delays a day in 1926, against ten a day last year. The cars traveled about 3,500,000 miles in 1927 and during the entire year were delayed only 3,650 times. These were consequent to parades, traffic congestion and automobiles. Figured in another way the statisticians declare that for every person annoyed or inconvenienced by street car delays in 1927 more than 419 enjoyed practically perfect service.

Fare Bill Favors Norfolk

The City Council of Norfolk, Va., has approved a bill to be introduced in the General Assembly confirming the power of the State Corporation Commission to exercise jurisdiction over services and rates of the Virginia Electric & Power Company in its operation of the electric railways in Norfolk.

The right of the State Corporation Commission to fix rates and prescribe services for electric railways in Virginia has been upheld by the Supreme Court, but the Norfolk city charter has a provision at variance with the Supreme Court's ruling in the matter. The purpose of the bill approved by the Council is simply to remove this discrepancy so that the railway's bonding power will not be reduced.

Foreign News

Poland Completes New Electric Railroad

Operation of the new electric railroad between Warsaw and Grodzisk, Poland, was begun recently. This is the first electric railway to be constructed in the country of Poland since the World War.

The distance between the two towns is 33 km. (20½ miles) and the scheduled running time is 66 minutes, with two trains per day each way. The cost of a one-way ticket is 2.30 zlotys (approximately 25 cents), but it is expected that the tariff will be reduced shortly and the service augmented.

The line was constructed and is operated by the Soc. Anon. Silia i Swiatlo (Power and Light Company). British and Belgian interests are closely allied with the Polish company and most of the equipment has been purchased from the countries named.

Individual Good Relations Work

The London Underground Electric Railways has recently been conducting a house-to-house canvass among its commuters, to collect suggestions for improvement. The calls are made by inspectors who are men carefully chosen for their tact and other necessary qualifications. In one district, they made 13,000 calls, and in another, 1,100. They make their visits in plain clothes, generally in the evening, when it is expected that the head of the family will be at home.

Siam Electrification Completed

The Societe des Tramways et Electricite de Bangkok has lately completed the work of electrifying the Paknam, Siam, steam railroad. To supply the necessary electric power a new 5,000-kw. steam turbo-generator has been installed.

Latest British Traction Contracts

Among the latest contracts placed in Britain for electric railway equipment is a repeat order of the Sydney Suburban Railways for motor-coach and trailer-coach equipments from the Metropolitan Vickers Electrical Company. The motors, two for each motor coach, are units of 360 hp.—probably the most powerful individual motors ever installed for multiple unit trains. Another order from the Sydney Suburban Railways is for more than 100 control equipments for converting non-driving into driving motor coaches. For the Dutch Railways a repeat order has been received for 50 motors, complete with gears, further control equipments, pantographs, and various details. The motors are of 210 hp. each, for operation at 1,500 volts.

Following the order placed in January, 1927, for 104 motors of 230 hp.

Digitized by Google

each for the Barcelona-Manresa electrification of the Norte Railway of Spain, a further order has now been placed for similar motors for the 1,500-volt electrification of the Irun-Alsasua section. As in the former case, the coaches will be manufactured by the Sociedad Española de Construcción Naval (the Spanish Associate of Metropolitan Vickers) at its Bilbao works.

Edinburgh Adopts Upholstered Seats

Refitting of the top decks of 162 tramcars with upholstered seats has been authorized by the Edinburgh Tramways Committee, Edinburgh, Scotland. Thirty cars also are being fitted with transverse upholstered seats in the lower saloons. Mr. Pilcher, the tramways manager, said that everything should be done to keep the cars attractive and up to date, and that the Tramways Committee should not hesitate to spend money in improving the rolling stock.

First Subway in Far East Opened in Tokio

The first electric subway train service in the Orient was opened in Tokio on Dec. 30 last. The line has been constructed on the pattern of the New York system, and is claimed to be earthquake-proof. At present this subway is 1½ miles in length. It connects the railway terminus of Ueno with the pleasure quarter of Asakusa. It will eventually be extended for 9 miles westward into the suburbs.

International Exhibition at Liege

An international exhibition of the heavy industries will be held at Liege, Belgium, in 1930. It will celebrate the centenary of the independence of Belgium. Railways and transportation will be included, and there will be an exhibit of electric railway equipment and apparatus.

May Combine in Glasgow to Meet Bus Competition

Steam and electric railways may combine forces in Glasgow in an effort to adopt a scheme to control passenger traffic because of the competition on the bus lines. The London, Midland & Scottish Railway and the London & North Eastern Railway, which between them own and work all the steam railways in Scotland, have applied to the Glasgow Town Council for a conference to discuss the terms of a possible alliance between the parties for the purpose of defending the railways and tramways against bus competition. To do this the letter suggested the adoption of some method of co-operation for the control of passenger traffic. The tramways committee appointed seven of its members to meet representatives of the railway companies as requested in an effort to find a solution.

Recent Bus Developments

Staggering the School Load in British Columbia

Officials of the traffic department of the British Columbia Electric Railway, Vancouver, B. C., have been facing a very big transportation problem since the autumn of 1925 when the University of British Columbia moved to its permanent site. A service of motor coaches was started to connect with street cars at the Sasamat terminus and special low rates were arranged. The big difficulty arises from the fact that 1,700 students have to be transported from the railway terminus to the University in approximately 30 minutes each morning during the term. The traffic is light during the rest of the day as the students leave at different times. It would therefore be a considerable loss to operate a sufficient number of coaches to handle the rush traffic during the morning period, as these vehicles would have to be purchased specially and would be idle for more than twenty-three hours during the day, and for the entire time during vacation periods.

The officials of the University laid their case before the faculty of the University and suggested that the term which students travel be extended by fifteen minutes. It was a matter of indifference to the British Columbia Electric Railway whether this change in arrival time be made to an earlier or a later hour, so long as it would serve the purpose of spreading the arrival time of students at the University before 8.45 a.m. upon mornings that their timetables include lectures in English 1, physics 1, or physics 2. This arrangement will be tried for the period of one month.

Dean Coleman, on behalf of the faculty, has recently written to the railway and expressed the appreciation of the authorities to the excellent service maintained by the company during the recent snow. He states that the faculty feared it would be impossible to hold the examinations before Christmas owing to the difficulty of running coaches during the heavy snow, but because of the manner in which service was maintained the examinations were held as usual.

Extension in St. Louis Approved Despite Railway Objection

Approval of the extension of the Kings Highway line of the People's Motorbus Company from Penrose Street northward to Florissant Avenue was given by the St. Louis, Mo., Board of Public Service on Jan. 24. The extension of the bus line had been opposed by the St. Louis Bus Company and the St. Louis Public Service Company, as the territory served by the buses is in the path of a contemplated extension of the Lee Avenue division of the railway company.

Bus Ordinance Passed in Berkeley

The City Council of Berkeley, Cal., has approved an ordinance to allow a revocable permit to bus interests, the ordinance to become effective in thirty days.

Several months ago such permission was sought from the Council by a company headed by Postmaster Charles D. Heywood, which stated it would install a system of thirty buses, operating over six districts of Berkeley to connect with the Golden Gate Ferry in West Berkeley, with an 18-cent fare.

The bus line officials held that their system would reach territories not now served by other systems, and would offer frequent service to outlying residential districts.

The new ordinance provides among other things that an application for a permit must specify general routes to be served, the minimum schedule of operation and the various transfer points. The Council is to decide if the need for such service is imminent, and may then issue a permit with a revocable clause. In return for the permit the bus company must pay the city $10 each month or portion of a month for each bus in operation and must carry fleet insurance to the extent of $100,000 and post a surety bond of not less than $10,000.

Both the Southern Pacific Company and the Key System Transit are opposed to the granting of the permits to bus companies.

Jersey Bus Line Sold

The Public Service Co-ordinated Transport is now operating the bus lines of the Morris County Traction Company, the sale of the latter company to the Public Service by the bondholders' committee having been approved on Feb. 20 by the State Board of Public Utility Commissioners. This opens a new territory for Public Service transportation lines extending from Newark to Netcong and embracing upwards of 25 communities with an approximate population of 145,000 persons not including Newark and Maplewood. At present 40 buses will serve the territory.

Some of the principal communities through which they run are Netcong, Stanhope, Port Morris, Ledgewod, Mine Hill, Wharton, Dover, Rockaway, Denville, Mountain Lakes, Boonton, Mount Tabor, Morris Plains, Morristown, Convent, Madison, Chatham, Summit and Newark.

Would Substitute Buses on Line in Gadsden

Authority to abandon railway service on Ewing Avenue, Gadsden, Ala., and to establish a line of buses instead has been asked by the Alabama Power Company of the Alabama Public Service Commission. The company agrees to pay $5,000 towards paving this street. It is claimed that cars over this line no longer pay.

Hearing on Pasadena-Long Beach Service Adjourned

The hearing before State Examiner Williams of the California Railroad Commission covering the question of through bus service between Pasadena and Long Beach by way of Atlantic Boulevard as proposed by both the Motor Transit Company and the Pacific Electric Railway has been adjourned to March 19 and 20 at the Los Angeles headquarters of the State Railroad Commission. During the hearing of Feb. 9 and 10, held at the City Hall in Pasadena more than twenty witnesses testified.

According to Deputy City Attorney Leonard A. Diethe, who appeared at the hearing, Pasadena is interested in the proposed routing of the buses and the question of applicants securing a franchise, rather than a certificate of public convenience and necessity from the State Railroad Commission.

Grant in Buffalo Opposed by Railway

The International Railway, and its subsidiary, the International Bus Corporation, Buffalo, N. Y., are opposing the granting of a certificate of convenience and necessity to the Van Dyke Motor Bus Company, Buffalo, for the operation of de luxe buses between Shelton Square and the American terminal of the Peace Bridge across the Niagara River in connection with the Buffalo, Fort Erie, Bridgeburg, Ont., interurban service. The railway contends that the bus riders are potential car riders and that there would be duplication of service from Main Street to the Peace Bridge terminal.

New Bus Law in New Jersey in Interest of Co-ordination

A bill has been drawn for introduction into the Legislature of New Jersey to bring about, under the jurisdiction of the Board of Public Utility Commissioners, the thorough co-ordination and unification of electric railway and bus services. Under the present law, electric railways may own and operate buses, but under the conditions imposed, such companies are in some respects considered as separate and distinct utilities, thus preventing complete and efficient co-ordination.

Further, whenever an electric railway substitutes buses for any part of its railway lines, it must now obtain consent for a definite number of buses, regardless of the changing needs of the public. The new bill would provide that in cases where buses are substituted for railway cars, the company, after obtaining municipal consent and the approval of the Board of Public Utility Commissioners, shall operate buses sufficient in number to furnish adequate service, subject, of course, to the jurisdiction of the Board of Public Utility Commissioners and under similar conditions as to revocation as apply to all other buses. This bill further provides the conditions under which rail service may be restored in cases where substitution is made.

Georgia Commission Would Assume Jurisdiction

The Georgia Public Service Commission has taken its first step toward the regulation of bus lines within the state with an order requiring all bus companies to report to it. The order is as follows:

All companies or individuals engaged in transporting passengers or freight over the highways and public roads within the state of Georgia between given municipalities and over the streets and highways of municipalities where fixed routes, schedules and rates are maintained are hereby required to file with the Georgia Public Service Commission, time-tables, schedules and tariffs, showing the service and rates or fares charged for such service over said highways and public roads within the state of Georgia and within municipalities herein enumerated.

Said statement showing service and rates shall also show whether such service has been performed by a corporation or individuals, the amount in all equipment used in such service and, if a corporation, where incorporated. Said showing shall also contain the amount of insurance, if any; the company in which such insurance is carried for the protection of passengers and freight entrusted to such corporation or individuals, and such other information as may be in the possession of such companies or individuals calculated to acquaint the commission with the conduct of the said corporation or individuals.

At two successive sessions of the Georgia General Assembly all attempts to pass legislation regulating bus lines in the state have met with failure, and the present order of the commission is an attempt to bring bus lines under the control of the Public Service Commission without legislative action. Whether this can be legally done is a question which the courts may be called upon to decide.

Already one coach company — the Atlanta Coach Company—has refused to pay its assessment for the support of the commission on the ground that the commission has no power to regulate bus lines in the absence of legislative action. And it is possible that this order will meet the similar opposition from other operators.

Tax of Interstate Buses by Connecticut Upheld

In a decision handed down on Feb. 20, the United States Supreme Court upheld the right of the state of Connecticut to impose a tax of 1 cent for each mile of highway traversed by buses engaged in interstate commerce. The Interstate Bus Corporation, which operates buses between Connecticut and Rhode Island, and to Massachusetts points, had sought in the lower courts to enjoin the State Tax Commissioner from collecting this tax, protesting that it was discriminatory and therefore unconstitutional. The ruling of the district court refusing to grant this relief is now upheld by the Supreme Court.

Justice Stone who handed down the opinion in this case expressed himself as follows regarding the contention that the bus company already contributed toward highway maintenance in its regular taxes:

That Appellant is already contributing to highway maintenance is not in itself significant because the State does not excede its Constitutional authority in imposing more than one form of tax as a charge for the use of its highways in interstate commerce. It is for the Appellant to show that the aggregate charge bears no reasonable relation to the privilege granted.

In concluding, Justice Stone said:

But we need not consider here whether the principle relied upon goes so far as to prevent the State from excluding from its highways, a motor carrier which refuses to pay charges for their use.

The fact that buses operating in intrastate commerce in Connecticut were exempted from this tax and paid instead a gross receipts tax, did not alter the opinion of the court.

Substitution of Line in Oakland Sought

The Key System Transit Company, which was recently authorized by the California Railroad Commission to substitute a bus line for its "Rockridge" Street railway line for an experimental period of 90 days, has applied to the Railroad Commission for permission to substitute a bus route permanently on this Oakland line. This route would make a connection with the Key transbay service.

New Route in Richmond Opened

A new bus route serving the Oak Grove section of Richmond on the southside and the teritory in the vicinity of the Richmond Cedar Works has been put into operation by the Virginia Electric & Power Company. The bus runs on a 30 minute round-trip schedule. Plans for the establishment of the new route have been underway for some time and service was commenced with the completion of street improvements undertaken by the city.

Financial and Corporate

7 per Cent Preferred to Be Retired by Illinois Power & Light

It is proposed by the Illinois Power & Light Corporation, Chicago, Ill., to call and retire all of the 7 per cent cumulative preferred stock. For this purpose, it is expected that a formal call will later be issued to redeem the stock at $105 a share plus dividends.

In order to raise funds with which to accomplish this, the corporation proposed to create and sell a new class of preferred stock. This class will be without par value, will be preferred in involuntary liquidation at $100 per share and in voluntary liquidation at $110 per share, plus accrued dividends. The call price will also be $110 per share. The call price of the existing 6 per cent preferred stock, as well as its price on voluntary liquidation, will be likewise raised to $110. Otherwise, the new class will have substantially the same charter protection as the existing preferred stock.

This proposed refinancing plan is subject to action of the stockholders at a meeting to be held for that purpose on April 23 and to the approval of the Illinoise Commerce Commission. If adopted, it is expected to result in the following advantages to the company and its stockholders:

1. Most of the holders of the 7 per cent cumulative preferred stock will receive a substantial present profit;

2. The existing 6 per cent cumulative preferred stock (which will remain outstanding) should have its market value materially increased.

3. All holders of 7 per cent cumulative preferred stock will be given an opportunity to reinvest in the new $6 cumulative preferred stock, on a favorable exchange basis.

4. The company will be materially benefited by the resulting reduction of its dividend requirements.

Every holder of the 7 per cent cumulative preferred stock will have full opportunity to acquire the new $6 preferred stock, share for share, by exchange, with a substantial cash difference paid to the stockholder who elects to take advantage of the exchange offer.

Abandonment Sought in Fort Smith

Robert C. Coffy, vice-president and general manager of the Fort Smith Light & Traction Company, Fort Smith, Ark., has filed with the city commission a letter asking permission to abandon the company's railway system in Fort Smith and Van Buren on the ground that money is being lost in its operation, and that the company is unable to meet the expenses of paving between its tracks in the $275,000 street improvement program planned by the city.

The company will consider any suggestion the commission might make for relief in its present crisis. Action has been deferred by the City Commission for further consideration.

Increase in Net Income

Duluth-Superior Company reports increase in total operating revenues with falling off in expenses. Bus service not self-supporting

THE NET income of the Duluth-Superior Traction Company and subsidiary companies operating in Duluth, Minn., and Superior, Wis., was $107,645 for the year ended Dec. 31, 1927, compared with $60,796 for the year previous. This and other important results of the year's operation were contained in the annual report recently submitted to the stockholders, and shown in the accompanying statistical statements.

Progress has been made in settling paving claims which had been made by the city of Duluth during the past ten years. The city had brought suit for the sum of $68,306, being part of the cost of paving two streets in the business section of the city in which the company's tracks are constructed and operated. This suit was finally disposed of on July 15, 1927, by a decision of the Minnesota Supreme Court, affirming an order of the lower court awarding the city of Duluth the sum of $7,420. Since that decision other paving claims of the city of Duluth aggregating $36,113 against the company on account of paving have been settled by the payment of $701. This disposes of all the paving claims against the company by the city with the exception of $22,787.

On April 11, 1927, the United States Supreme Court handed down its decision affirming the decree of the United States District Court, District of Minnesota, upholding the company's

CONSOLIDATED INCOME STATEMENT OF THE DULUTH-SUPERIOR TRACTION COMPANY

	1927	1926

STATISTICAL STATEMENT OF THE DULUTH-SUPERIOR TRACTION COMPANY

Railway and Bus Operations

Total miles, all track reduced to single	112.62
Total miles of street and right-of-way occupied by tracks	61.76
Total miles of bus routes	28.77
Revenue from transportation, per mile single track including miles of bus routes	13,780
Revenue from transportation	$1,948,393

Digitized by Google

right to go into the Federal Courts to protect the property with which it is vested from confiscation.

On July 11, 1927, application was made to the Railroad Commission of Wisconsin for an increased fare in the city of Superior. Hearing on this application was had before the commission on Sept. 26, 1927, and on Dec. 3, 1927, the Railroad Commission of Wisconsin filed its order fixing a rate of fare to be charged in the city of Superior of 8 cents cash, five tickets or tokens to be sold for 35 cents, this rate to become effective Jan. 1, 1928. This order fixes the same rate of fare in the city of Superior as in the city of Duluth.

The report reviews the history connected with the collision between a last passenger train of the Great Northern Railway and a car of the company in Superior on Jan. 6, 1927. This accident being unusual in the experience of the company, the amounts paid in settlement have been charged directly against the company's profit and loss account.

Depreciation has been accrued and charged monthly into operating expenses for the Duluth division in the amount fixed in the order of the Railroad & Warehouse Commission of Minnesota dated Oct. 4, 1926, and on the Superior, Wis., division, at the rate of 2.5 per cent upon an estimated undepreciated original cost of the depreciable property.

Automobile bus service, operated as a feeder to electric railway lines, while justified from a service standpoint, has not proved self-supporting. This service prevented greater loss from operation than would have resulted if street railway extensions had been constructed and operated.

No general mortgage bonds were authenticated or sold during the year but $26,000 par value of general mortgage bonds were retired under the sinking fund provision of the mortgage.

Western Pacific After Petaluma & Santa Rosa Railway

The Western Pacific Railroad filed with the Interstate Commerce Commission in Washington on Feb. 10 application for permission to purchase the Petaluma & Santa Rosa Railway. Some weeks ago the Southern Pacific and the Santa Fe, acting jointly, filed with the commission application for permit to purchase this line.

The Petaluma & Santa Rosa company operates a line between those two cities, the other principal city on the line being Sebastopol. The line has 48 miles of trackage, 38 being main line, and the company also operates two steamboats from Petaluma to San Francisco.

In its application the Western Pacific said it was prepared to pay $90 a share for the common stock, but said it had no contract for such purchase. The financial setup of the short line consists of a $750,000 bond issue, of which $590,000 is outstanding, $1,000,000 in common and $250,000 in preferred stock. Of the common there is outstanding $770,700 and of the preferred, $127,800. The common stock has a market value of $45.50, and the preferred $87.50.

Seattle Doing Better

Declaring that the "tide has turned in the affairs of the municipal street railway," Mayor Bertha K. Landes, of Seattle, Wash., further states that for the first time in nine years the city has owned the system "the future really looks hopeful." Mayor Landes declares that the people of Seattle have good reason to be gratified at the results obtained for the railway in 1927, and that the "railway is making substantial progress toward financial stability." Some facts which she quotes as encouraging follow:

	1926	1927
Operating revenue	$5,741,029	$5,703,873
Operating expense	5,015,887	4,765,845
Operating income	$725,142	$938,027
Miscellaneous revenue	18,179	26,598
Gross income	$743,321	$964,625
Interest	698,841	665,382
Net income	$44,480	$299,243

The net income of the railway for 1927 was $299,243, compared with $44,480, during 1926, due to economies put into effect during the year.

For several years the cash revenues have been decreasing, but the decrease in revenue for 1927-1926 was only one-seventh as great as for 1926-1925.

As the Mayor sees it the large jump ahead in net income will go a long way toward reducing the railway deficit of $694,153, and it is probable that when the years' accounts have been checked by the city comptroller, this deficit will have been reduced by nearly one-half.

Mayor Landes states that the improved financial condition of the railway has enabled the department to reconstruct the tracks in places where work had been deferred on account of lack of funds, and to introduce the 5-cent fare loop cars in the business district.

With her statement, Mayor Landes gave out the accompanying comparison.

Mortgage to Secure Advances Refused

In refusing to sanction a bond and motgage of $308,558 to be executed by the Phillipsburg Transit Company, Phillipsburg, N. J., to the Lehigh Valley Transit Company, Allentown, Pa., the Board of Public Utility Commissioners of New Jersey has announced there is no immediate likelihood of the Phillipsburg company earning even part of the interest which the bonds would bear.

The Phillipsburg Transit Company is owned by the Easton Transit Company, the stock of which is owned in turn by the Lehigh Valley Transit Company.

For some years the Phillipsburg company has been unable to meet all its pecuniary liabilities and has been partially dependent for operating and other expenses upon the Lehigh Valley Transit. The latter is still providing funds to continue operations, but asked for a mortgage to protect itself. The commission said it is not apparent that the creation of mortgage indebtedness would place the Lehigh Valley Transit in any better position than it now occupies.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

†This index is changed to a base of "1926 = 100." That notation replaces the former basis of "1913 = 100." Inasmuch as the bureau has not calculated the index on this new base any further back than January, 1923, no figures are shown in this tabulation for the high and low points since the war. It is planned to compute the index on the new basis as far back as January, 1913. Until such time as the bureau makes public these figures for the earlier years this information will be lacking.

Revenue Increase on Washington Railway

The total amount of money credited to profit and loss during the year 1927 by the Washington Railway & Electric Company, Washington, D. C., was $760,019. This was disclosed in the annual report to the stockholders submitted at the annual meeting on Jan. 21. Earnings and expenses for the year ended Dec. 31, 1927, are shown in the accompanying table.

Aside from dividends from the Potomac Electric Power Company, included above, no income was received by the Washington Railway & Electric Company on its investment in stocks of subsidiary companies.

During the year the company's system carried 99,665,934 passengers, of whom 23,916,630 were carried on transfers, leaving 75,749,304 revenue passengers. In 1916 there were 76,797,163 revenue passengers, indicating a decrease in 1927 of 1,047,859. The report states that other cities within close proximity of Washington showed decreased patronage, that although traffic had been falling off almost constantly since 1920 it fell off to a considerably less degree in the past three years than formerly. Further, that appreciation of the street car as "the most economical means of transport with the highest relative value in handling mass transportation" and as "indispensable in urban communities" was growing throughout the country, with the result that consideration for the rapid and safe movement of street cars was being given in the formulation of traffic regulations.

Largely due to the enjoyment of a great increase in chartered bus service, and relatively more passengers paying their fare in cash than formerly, the loss in revenue through the decrease in revenue passengers carried was wholly overcome, with the result that operating revenues in 1927 increased $18,898. This, together with further economies in operation, brought about an increase of $78,601 in operating income.

The amount expended in 1927, for the proper upkeep of track and roadway, together with allowances for depreciation, was $866,191. The major projects covered the reconstruction during the year of 1.61 miles (8,510 feet) of underground conduit track, and 3.85 miles (20,306 feet) of overhead trolley track, at a total cost of $311,678.

The popularity of the fifteen modern cars, with automatic rear-exit doors and leather covered deluxe seats, purchased in June, 1926, reflected itself in a very satisfactory increase in revenue and convinced the company, so it claims, of the desirability of having similar equipment on the twelve new one-man cars ordered in 1927. These cars are to cost $175,000 and delivery is to be made in February, 1928. The company is also equipping 41 other one-man cars with automatic rear exit doors at a cost of $46,750.

In connection with its railway lines, the company is operating 70 buses, over routes having an aggregate mileage of 58.3 miles. Twenty of these buses were purchased in 1927 at a cost of $139,806, making the total investment now in buses $487,797. In the last report the company mentioned that since bus service was started in May, 1922, the expenses of operation had exceeded the receipts by $175,916, but that the results for 1926 offered more encouragement. This opinion had been borne out by the results for 1927, which showed the receipts approximately $2,400 in excess of operating costs.

The safety contest opened in February, 1921, is still being carried on. There was a reduction of more than 7 per cent in the number of accidents in 1927 compared with 1926, and a reduction in the amount paid in the settlement of damage claims and suits of $30,676. Efforts of the company in drawing the attention of its employees to the need of care in all street movements, and the high degree of operating efficiency in which the equipment has been maintained have all aided in bringing about this splendid showing. Greater efficiency in operation, together with improved condition of the equipment and track, has also brought about a dcerease in interruptions to service. The number of detentions decreased 17 per cent and the time lost in detensions decreased 30 per cent.

On the subject of the District of Columbia merger President Ham said that conferences were in progress and it was hoped that some plan fair alike to the public and the holders of the securities of the companies involved might be devised.

The outstanding bonded debt of the Washington Railway & Electric Company and subsidiary companies, including the Potomac Electric Power Company, is now $24,120,700. Adding this to the $15,000,000 capital stock of the parent company, and $7,002,850 outstanding capital stock of subsidiary companies, makes the total outstanding capitalization as of Dec. 31, 1927, $46,123,550. This excludes bonds purchased for the sinking fund and for temporary investment.

For the year 1927 the total payroll of the Washington Railway & Electric Company and subsidiary companies, including the Potomac Electric Power Company, was $4,960,298, an increase of $166,157 over that of the previous year. The number of employees in the service of the company's system is now 2,976, of which 2,139 are members of the Washington Railway Relief Association. This organization, in conjunction with the company, has continued the group life insurance of its members. This plan has now been in effect almost seven years, and during the period 67 payments, aggregating $81,911, have been made to beneficiaries. The relief association expended $12,433 in sick benefits to its members, and, together with the Washington Railway & Electric Company, is now paying pensions to its members aggregating $38,140 annually.

The number of stockholders at the close of 1927 was 2,021 of whom 1,159 were women, trustees, charitable, beneficial, religious and other similar organizations.

CONDENSED STATEMENT OF THE WASHINGTON RAILWAY & ELECTRIC COMPANY FOR YEAR 1927

Gross earnings from operation	$5,865,429	
Miscellaneous income (including dividends from Potomac Electric Power Company)	1,300,682	
Gross income		$7,166,112
Operating expenses (including depreciation), taxes and miscellaneous charges	4,846,618	
Interest on funded and unfunded debt	746,429	
Payment of dividends on preferred stock	425,000	
Payment of dividends on common stock	390,000	
		6,408,047
Balance of income for year 1927 credited to profit and loss		758,064
Miscellaneous items credited to profit and loss		1,954
Total credited to profit and loss during the year		$760,019

Some Recent Results in Toledo

Street Railway Commissioner Graumlich at Toledo, Ohio, reported that the first week in March would see sufficient money in the sinking fund to retire bonds up to 20 per cent of the total capital value of the Toledo Traction Company and, therefore, after that time the sinking fund would cease to operate. The company has a total capital value of $9,096,940 of which $1,820,000 will be retired early in March.

This will throw about $27,000 a month into the picture and with other economies will soon be reflected in surplus credits to the stabilizing fund in which there is an accumulated deficit of $1,272,369, in addition to the $400,000 originally set up.

Bus operations has begun to show a profit under the plant of awarding as revenue to the feeder lines all of the revenue collected from passengers and half that collected on cars from passengers turned over to the feeders. Under this accounting plan the gross profit from coach operation for January in Toledo was $3,450.

Abandonment of Fulton Line Allowed

Abandonment of the Fulton, N. Y., city line of the Empire State Railroad Corporation was approved by order of the Public Service Commission recently. Evidence before Commissioner Brewster showed that the line paid until bus operations were established in the same territory. Without considering taxes or interest charges, there was a deficit in 1926 of $1,239, and for the first six months of 1927, $1,127.

Personal Items

D. J. Torrance Promoted in Seattle

D. J. Torrance, assistant comptroller in the Seattle offices of the Stone & Webster Corporation, a position he has held since 1925, has been named secretary-assistant to A. W. Leonard, president of the Puget Sound Power & Light Company. Mr. Torrance has had wide experience in public utility operation and in finance to qualify him for the range of his new duties.

A native of Georgia, he was early identified with the Key West Electric Company and the El Paso Electric Company. Later, he went to Peking, China, for seven years where he served as Chinese representative of the American International Corporation. He is a life member of the Peking Club, was president of the American Association in Peking and for many years has been an associate member of the American Institute of Electrical Engineers. When conditions became chaotic in China, Mr. Torrance returned to the United States and for one year was in the Boston offices of the Stone & Webster Corporation.

W. H. Taylor Heads Philadelphia Electric

William H. Taylor, vice-president in charge of operations and maintenance of the United Gas Improvement Company, was recently elected president of the Philadelphia Electric Company. Immediately after the announcement of his election to the presidency, Mr. Taylor, who has had twenty-five years' experience in the public utility industry, said he had resigned as vice-president of the United Gas Improvement Company.

Mr. Taylor, well known in utility circles as an expert in appraisal and rate matters and in general consulting engineering work, and a former vice-president and general manager of the Georgia Railway & Power Company, Atlanta, was elected vice-president of the United Gas Improvement Company early in 1927. He began his career in 1903 as a constructor with the United Gas Improvement forces. Mr. Taylor was graduated from the Stevens Institute of Technology.

F. I. Hardy Leaves Boston & Maine

F. I. Hardy, assistant to the president of the Boston & Maine Railroad, has resigned to become president of the Woodbury Granite Company of Vermont, with headquarters at Burlington. Mr. Hardy had charge of the Boston & Maine's motor trucking activities.

The electric railway business had claimed many years of his career. Prior to his affiliation with the Boston & Maine in 1924 he served as manager of the Chelsea District of the Eastern Massachusetts Street Railway. In the past he was identified with the Union Traction Company of Indiana, the Fort Wayne & Northern Indiana Traction Company, the Chicago, South Bend & Northern Indiana Railway, the Southern Michigan Railway and the Northern Ohio Traction & Light Company of Akron, now known as the Northern Ohio Power & Light Company.

C. R. Bendell General Manager at Wheeling

C. R. Bendell was recently appointed general manager of the Wheeling Public Service Company, Wheeling, W. Va.

C. R. Bendell

He has been connected with this property, which operates railway, bus and power service, for several years in the capacity of dispatcher, division superintendent, head of the claim department and maintenance of way and equipment. Later he became general superintendent. With keen powers of observation and a long and valuable experience in Wheeling he is prepared to take over the managerial duties incident to his recent promotion. The territory in which the company of which Mr. Bendell is a part operates has, particularly since the war-time period experienced phenomenal growth.

Mr. Bendell was born in Martins Ferry, Ohio. He received his early education in the public schools of that state. At an early age he went to Wheeling and entered the utilities field in a minor position.

Changes in Louisville

At the general meeting following the stockholders meeting of the Louisville Railway, Louisville, Ky., on Feb. 15, the following changes were made in the operating staff.

Samuel Riddle, was elected secretary and now carries the title of vice-president and secretary.

E. F. Kelley was appointed assistant secretary and assistant treasurer, in addition to his duties as purchasing agent and private secretary to President J. P. Barnes.

Mrs. Anna L. Humphrey was appointed treasurer. In June, 1927, following the death of Samuel G. Boyle, for many years secretary and treasurer of the Louisville Railway, Mrs. Humphrey took over the duties of the treasury department as assistant treasurer.

Mrs. Humphrey was connected with the auditing department of the United Traction Company, Albany, N. Y., from 1918 until 1922. In 1922 she was located in Louisville, Kentucky, as auditor of the Inland Waterways Company. This company operated a line of steamboats and barges on the Ohio and Kentucky Rivers, between Pittsburgh, Beattyville and St. Louis. On Jan. 1, 1926, she became auditor of the Louisville Community Chest, which represented forty-three social and charitable agencies in the city of Louisville.

J. H. Ward at Port Arthur

J. H. Ward was recently made assistant superintendent of transportation, Eastern Texas Electric Company, Port Arthur Division, Port Arthur, Tex. He entered the service of this company at Beaumont in 1917. Two years later he was appointed supervisor and in 1927 he assumed charge of the Beaumont-Port Arthur Bus Line route. On Jan. 21 of this year, he was transferred to Port Arthur. His excellent record while in Beaumont resulted in his being selected to the post at Port Arthur upon the purchase of the Port Arthur Traction Company's physical properties by the Eastern Texas Electric Company. This purchase became effective on Jan. 22.

Obituary

Richard A. Berry

Richard A. Berry, assistant engineer of the Board of Transportation, New York, N. Y., died on Feb. 18. He was engaged in engineering and construction since 1899. Mr. Berry's service as assistant engineer with the Public Service Commission, the Transit Commission and the City Board of Transportation was mainly on the construction of the subway stations in the Bronx. His latest work in that field was the construction of the enclosed passenger transfer connection between the elevated lines and the subway lines at 149th Street and Third Avenue.

Mr. Berry attended Fordham University and Manhattan College and was graduated with the degree of bachelor of science and civil engineer.

Manufactures and the Markets

Use of Simplified Invoice Form Steadily Increasing

By Ray M. Hudson,

Assistant Director Commercial Standards, Bureau of Standards, Dept. of Commerce, Washington, D. C.

With the view to reducing avoidable waste in office operations, several nationally known trade associations and business organizations co-operated in producing the simplified invoice form which was brought out a year ago. The group includes the National Association of Purchasing Agents, Railway Accounting Officers' Association, National Association of Cost Accountants, Controllers' Congress of National Retail Dry Goods Association, also several prominent manufacturers. The Division of Simplified Practice of the United States Department of Commerce, in response to the request of the above-interested parties, acted as a co-ordinator for the group and is now assisting it in promoting the application and use of the form.

To date, the simplified invoice has been accepted by 27 well-known trade associations. Countless prominent firms and corporations have accepted this form as their standard. Others say they will do so when stocks of their present individual forms run out. The experience of several firms is that each day's mail brings in a few more invoices on the simplified form.

As might be expected with a project of this kind, some companies find a problem in substituting the simplified invoice form for the invoice form they are now using. This problem naturally divides into two phases—one dealing with outbound invoices, the other with inbound.

Consider the outbound invoice. The company rendering the bill naturally prefers to do its billing on one form, and preferably one which will not only meet its own needs in the circumstances, but will also be acceptable to the recipients. When the issuing company is requested to use the purchaser's supplied form, there arises the problem of training billing clerks to put the data on each individual form, a consequent slowing down of the clerk's output, possible delay due to running out of stock of a customer's form, also risk of return of invoice by the recipient because the information is incorrectly placed on his special form. Add to this the yards of correspondence, hours of dictation and stenographic effort, the reams of paper, the dollars of postage, and all the other costs necessary to clear up misunderstandings, and the probabilities are that the cost-to-issue per invoice soon reach an amount out of proportion to the real value of this kind of customer-accommodation.

There is also the question as to whether the issuing company is in duty bound or under any special obligation to render such peculiar and special service to a customer. Billing on customer's forms is usually done as a matter of good will, or courtesy. Obviously the customer buys the goods for their ability to meet his requirements, and not because of the vendor's willingness to render his bills on the customer's forms. Imposition on vendors of costs which normally belong to the customer means those costs usually find their way back to the customer in the price he pays for the goods he buys.

Consider the inbound invoice. Under former conditions, a company buying from 100 vendors was likely to receive nearly 100 different invoice forms, each varying from the other in size, spacing, arrangement of material on the face of the form, etc. Undoubtedly, the desire to get away from the troubles resulting from too many different forms prompted many purchasing agents to request their vendors to submit their bills on the form furnished by the purchaser. It would seem both possible and practicable in many instances to pass the simplified invoice through exactly the same routine through which the purchaser's present form passes. Through the use of the simplified form, the customer is freed from the bother and worry, also the expense of keeping his vendors properly stocked, with his own company's forms.

Exhibitograph No. 3

CHEERIO!

Why has the Manufacturer Membership in the A.E.R.A. grown from

244 in 1922 to 445 in 1928?

Because A.E.R.A. members secure value received for their money. Think it over, but don't forget to plan early for your Cleveland Exhibit.

Sept. 22-28

Lightweight Cars for Knoxville

Plans for the twelve city-type passenger cars which were ordered by the Knoxville Power & Light Company, Knoxville, Tenn., have been released. Mention of the order was made in this paper, issue of Nov. 5. The cars will be of the one-man, double-truck type for single-end operation. They will be of semi-steel design and will have an over-all length of 43 ft. 9 in. The total weight will be 30,000 lb. and the cars will seat 54 passengers.

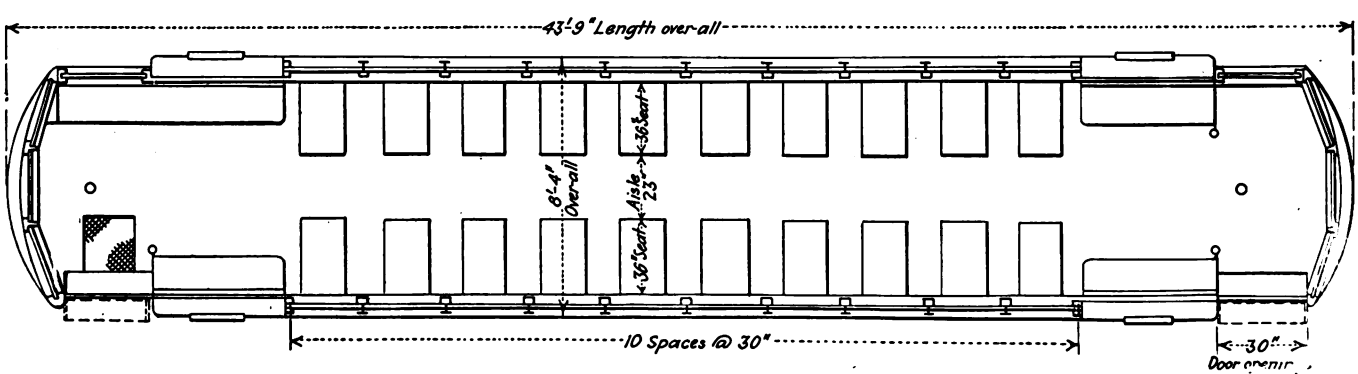
The principal dimensions of the cars are given herewith, along with a floor plan. Complete specifications were published in the issue of Dec. 10.

GENERAL DIMENSIONS

Length over dashers	42 ft. 2 in.
Length over body	33 ft. 6 in.
Length of platform	4 ft. 4 in.
Rail to top of trolley board	10 ft. 5 11/16 in.
Rail to bottom side sill	28 5/8 in.
Rail to first step	15 in.
First to second step	10 in.
Second step to platform	8 in.
Extreme width	8 ft. 4 in.
Bumper extensions	6 in.
Post centers	30 in.
Clear height inside	7 ft. 3 in.
Width of seats	36 in.
Width of aisle	23 in.
Door openings clear	30 in.
Truck centers (approximately)	24 ft. 0 in.
Wheelbase	5 ft. 0 in.
Size of wheel	26 in.

GENERAL INFORMATION

Seating capacity	54
Interior finish	cherry
Type bolster	Box Girder



Floor plan of new cars ordered for Knoxville

Digitized by Google

Purchasing agents willing to test the simplified invoice will find many vendors ready to render their bills on that form. All the purchaser has to do is to request the vendor to "Render all bills on the simplified invoice form."

Not long ago 35 business corporations of average size were asked to estimate what, in the opinion of their officers, might be saved in their purchasing and accounting departments if all invoices received by them were on a national standard invoice form. If these corporations estimated correctly, the annual saving of 25,000 concerns of corresponding size in the United States, Canada and Mexico would amount to $15,500,000. If we discount this figure for the purpose of being conservative, the potential savings would still run into the millions of dollars.

The Department of Commerce, through its Division of Simplified Practice, heartily commends the Simplified Invoice to all vendors and purchasers for their careful consideration, believing a fair and adequate trial of this form will quickly demonstrate its merits and values.

[An article describing the simplified invoice, together with a reproduction of the standard form, appeared in this paper for April 23, 1927, page 760.—EDITOR.]

Attractive Book Issued by Hyatt Roller Bearing

Hyatt Roller Bearing Company, a division of General Motors, Newark, N. J., has published an attractive book with illustrations entitled "Hyatt Equipped Railroad Journal Boxes." The cover design is tan with a darker shade of brown, with an illustration in the center which depicts a locomotive with a mountain in the background. The book contains 44 pages; is replete with illustrations brown over tint and thoroughly takes up the use and advantages of the company's roller bearings.

Among the subjects in the table of contents are: "Hyatt Roller Bearing Railroad Type," "Actual Performance," "The Economic Phase," "Comparative Starting Torque," "Safety and Reliability," and "In Interurban and Street Railway Service." The style of the book is clear and concise with the essentials of the subject kept in the foreground. It contains a picture of the inventor, John Wesley Hyatt, and also of the company's plant at Harrison, N. J., adjacent to Newark.

Banquet Marks Closing of Carhouse

The Gates-lane carhouse of the Worcester Consolidated Street Railway has been closed and the cars have been transferred to the new house and yards on Grove Street. Men employed at the carhouse for years had a banquet to mark its passing. The closing of the Gates-lane carhouse has resulted in centralizing the equipment of the company and has created the necessity of rearranging runs. The Consolidated has recently constructed a bus garage and modern carhouse on the Grove Street property which for many years was used as a storage yard. It is planned to make "running repairs" at the new carhouse while the Market Street carhouse, which is now the only other one of the trolley company in use, will be used for the major repairs.

Cincinnati Car Pleased at Prospects Ahead

For the first time since the reorganization of the Cincinnati Car Company on Oct. 1, 1926, stockholders of the company met recently and received the report of the officers as to operations in the last quarter of 1926 and the full twelve months of 1927.

President Sanders referred to 1927 as "a lean year in which the dividends requirements of $328,805 were earned and also a small amount carried to surplus."

The condensed statement of income and surplus for 1927, showed current assets of $1,542,176 and current liabilities of $209,191. The gross income for that period was $2,040,802, the net income $343,748, dividend disbursements $328,805 and the sum of $14,943 carried to surplus.

The company now has orders in sight for 119 cars as against 68 cars built last year. Mr. Sanders said:

Today it is the almost unanimous belief of railway operators, and I might say city officials also, that, while the bus can be used to advantage in many places, it cannot supplant the rail car in handling mass transportation.

Operators generally are, however, convinced that there is an increasing demand for speedier and more comfortable city and interurban cars, and those with foresight, such as we see in Cincinnati, are meeting the demand by re-entering the market for new and improved cars.

A very large majority of the population of our cities rides in street cars because they are safer, more comfortable and cheaper than other public carriers, and yet this vast majority has been unwittingly discriminated against by municipal authorities in favor of the private automobile owner who not only uses more than his share of the streets when traveling, but uses them for storage purposes as well, and thus selfishly impedes all street traffic.

Redecorated Cars Scheduled to Go Into Service Feb. 19

Refurbished and wholly redecorated street cars were scheduled to be placed on the Northeast-Woodland street car line of the Kansas City Public Service Company, Kansas City, Mo., on Feb. 19, according to a recent report. The shops are turning out two rebuilt cars a day. The entire overhauling of the existing equipment will be finished by July 1, it is estimated.

40 Electric Locomotives for Paris-Orleans Railroad

Oerlikon-Batignolles Company has recently supplied 40 electric locomotives to the Paris-Orleans Railroad. Both passenger and freight locomotives are represented in this order.

ROLLING STOCK

BOSTON ELEVATED RAILWAY, Boston, Mass., has accepted delivery on one 29-passenger Mack four-cylinder, city type bus.

EASTERN MASSACHUSETTS STREET RAILWAY, Boston, Mass., has recently ordered a Fageol (A.C.F.) urban coach.

SHOPS AND BUILDINGS

GENERAL TIRE & RUBBER COMPANY, Akron, Ohio, has announced that it has just completed purchase of ground, and has started plans for a modern office and warehouse building at Kansas City, Mo., and that the cost of the site and building will be about $200,000.

TRADE NOTES

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, has appointed O. D. Fries as salesman in charge of consumer motor business in the Detroit territory under the direction of J. M. Robinson, district manager. Mr. Fries was educated in the Glasgow Royal Technical College and the University of Glasgow, Scotland. Since he was graduated he has had much experience in practical and theoretical enginering as well as a wide sales experience.

ADVERTISING LITERATURE

TORCHWELD EQUIPMENT COMPANY, Chicago, Ill., has issued a new Catalog No. 28 descriptive of its welding and cutting equipment. The pamphlet is entitled "Standard of Comparison."

ENGBERG'S ELECTRIC & MECHANICAL WORKS, St. Joseph, Mich., has recently issued new bulletins Nos. 6023 and 6025 descriptive of its direct-current motors and motor generators.

FUSION WELDING CORPORATION, Chicago, Ill., has issued a descriptive bulletin on its "Fuzon arc welders."

Financial Structure of Buffalo Company Strengthened

STOCKHOLDERS of the International Railway, Buffalo, have approved a plan for strengthening the financial structure of the company, thereby improving its credit and increasing its ability to render steadily improving service. The plan provides for immediate amortization of intangible capital which the Public Service Commission has suggested be amortized over a period of years, for the writing off of strike suspense, for the issuing of no par value common stock in exchange for present common stock of $100 par value and for the issuing of $2,000,000 of preferred stock. The present plan is to make the preferred issue available first to present stockholders in proportion to their holdings.

This action might be dismissed with no other comment than that it is merely another move in the upbuilding of the system, but it really is much more important than that. No end of hard work has been done by the management in Buffalo, and it would appear now that the company there is again coming into its own. The city is saturated with autos even to a greater extent than other cities of similar size, and in addition to that there have been elements of political antagonism to contend with that were largely heritages from past régimes. Some of that ground has been gone over before in ELECTRIC RAILWAY JOURNAL.

The conditions at Buffalo which make desirable the financial changes now proposed had their beginning in 1912, when the railway mortgaged its property. At that time the Public Service Commission directed that the company set up on its books an item of $12,651,500 as intangible capital to be amortized over a period of years. Of this amount approximately $4,000,000 has been written off. The company is now carrying on the asset side of its balance sheet an item of roughly $6,000,000 strike suspense. It was intended that this should be written off over a period of years, but the present plan will permit the amount to be written off immediately. The substitution of no par value stock for $100 par value stock and the resulting changes in the company's balance sheet have been approved by the Public Service Commission. Sanction for the proposed issue of preferred stock will now be sought from the commission. Proceeds from the sale of this preferred stock will be used for the substitution of permanent financing for temporary financing of necessary capital expenditures and for future similar requirements.

For the benefit of the stockholders of the company and for the information of the public the company explains that changing the common stock from $100 par value to no par value has no effect upon the value of the stock, or upon its earning power. There will be exactly the same number of shares, and each certificate will represent the same share of ownership. It is an interesting move, one that the entire industry may well ponder, particularly since the change would seem to presage early future financing with preferred stock, in which it is reasonable to expect both the employees of the company and the public as well will be permitted to participate.

Lessons Taught by the Pittsburgh Traffic Report

DISCLOSURE in the recent traffic study in Pittsburgh that the number of vehicles entering the business district each day has more than doubled during the past ten years, shows a situation that could probably be paralleled in many other large cities of the country. A second fact found in this same survey, that in spite of this influx of buses, taxicabs and private automobiles, the street cars still carry the vast majority of the city workers to their places of business, will also find a counterpart in other metropolitan areas. Hence, if there is a solution of the Pittsburgh problem, it ought to help elsewhere.

The Pittsburgh City Transit Commission thinks that the answer is to put the trolley cars within the business district in a subway which later could be used for high speed trains when rapid transit extensions can be built in the outlying portions of the city. This will relieve the congestion in the downtown area by permitting all of the street surface to be used by free-moving vehicles only, according to the commission. The higher speed of the cars possible underground will attract more passengers to them and thus help still further to relieve the surface congestion.

In cities large and wealthy enough to afford underground highways, the plan is an excellent one, provided the cost of the improvement is not assessed entirely or largely on the car riders. They are only one group among many to whom the increase in street space thus made possible is of benefit. Nor should the transportation company be made to bear the cost. It is quite as apt to suffer as to benefit by the change. Its cars will make better time, it is true, and the company will gain in the number of passengers which it will carry. But these passengers will be in the long-distance class, and the pick-up business of short-haul passengers will probably be much less. Experience has shown that the short-distance rider does not like to climb up and down steps. It must also not be forgotten that removal of the tracks from the surface will decrease the means for riding within the business district. Those who are accustomed to patronizing the street cars for this purpose will have to adopt a more expensive way for getting about or else walk.

Of course, there are many cities in the country with serious street congestion where such a solution is impracticable. A subway is a luxury which only a few communities can afford. The smaller cities must continue to operate cars and automobiles on the same street level.

Digitized by Google

There, the aim should be to secure the maximum useful width of street in the congested sections by reducing or eliminating parking, then to co-ordinate the traffic flow by shortening the waiting time of vehicles at crossings and increase the speed of movement, particularly of the street cars. Until the average car speed equals that of the free-moving motor vehicle on the same street, street railway operation will be under a handicap.

Columbia Reaps the Consequences

COLUMBIA, S. C., is the scene of a transportation travesty with a record number of performances which is becoming a bore to spectators and something of a blight on the accomplishments of that section of the South. Reports emanating from that territory state that the citizens are more and more aroused over the lack of a responsible transport service and are going to force the issue in the April election of City Council members. But making the transportation tangle the main issue in the election will not undo the bungling and befogging of the issues involved for which honors are evenly divided among the people and the authorities. Constructive thinking, deft handling, conciliatory methods and active authority are the new characters that must enter quickly to produce a happy ending in Columbia.

Glossing over the facts will not mitigate the conditions aggravated since Jan. 1 of this year when the citizens were left to the mercy of unregulated jitneys for their means of transportation. Almost a year has transpired since the Columbia Railway, Gas & Electric Company, unable to justify necessary expenditures to physical property, abandoned service on its railway system of 32 miles. A glance at the traffic records since 1923 is convincing proof of the inability of the company to continue to supply this service. In that year 3,270,321 passengers were carried. Since then there has been a consistent decline—1924, 2,948,928; 1925, 2,290,734 and in 1926, 1,613,891. The loss of patronage forced the company to abandon service on March 11, leaving approximately 50,000 people to be transported by the systems which had contributed to its downfall, namely, the Carolina Transit Company and the 10-cent haphazard jitneys.

Events since that time have been covered in the news section of this paper. Suffice it to say now that the past fourteen months have been prolific of multifarious moves toward restoration of railway service, counter moves for bus operation, bills to eliminate the jitney, threats to intimidate the railway, an impasse, commission opinions, another impasse, federal stay, public demands and so on ad absurdum.

Whatever conclusions might be drawn on the rights of one utility agency against another, it would appear that co-operation and conciliation could certainly have done no worse than condemnation and conflict, and considered in the light of experience in other cities, they might have helped toward a solution. Three separate and distinct agencies serving approximately 50,000 people were competing for a failure, and that failure appears to have fallen on all three. Now if the people want the railway service restored—and many indications point that way—then that system should be so supported that it will be a paying enterprise responsible to a thinking and just authority and reliable to a co-operative and fair-dealing public. If public opinion prefers another system of transport, then such a system should be installed and should meet the same conditions as would prevail with a railway.

These unsavory details in the story of a public service represent the ultimate result of destructive public policy founded on much opinion, little knowledge and the lack of a spirit of fair play. One can hardly refrain from expressing the opinion that Columbia is in a measure reaping as it sowed. The transportation comedy there has its tragic aspects—tragic indeed to those who invested their money in good faith. It is to be hoped that the story may be broadcast to other cities that are inclined to think that they can manhandle and starve facilities and have them continue to perform. As for Columbia, it is high time for it to draw the curtain on the scene and put on a new act with sufficient promise to induce forgetfulness of past performances.

Accountants Should Not Be Historians Only

GROWING interest in accounting is shown by the work of the Central Electric Railway Accountants' Association at its recent meeting. Problems that deal with the progress of the electric roads in the territory were discussed at length and plans were made for furthering the interchange of freight, handling of records and other details that are essential if these railways are to increase their business. Along the same line, President Healy in his inaugural address showed how the accountants have been an influence for many years in the affairs of their companies.

A progressive viewpoint such as this is essential if the accountant is to be the power for good that he can be. He is in a position where he is able to wield an immense influence over his company. While the keeping of records of what has happened already is fairly simple, it is the interpretation of what is likely to happen, as disclosed by the figures, which is of far greater value. This is a task of no mean importance. Budgeting is being resorted to more and more, both with regard to expenditures and on some properties with regard to revenues. Naturally if a program for expenditures is to be figured out for a year or any longer period it is essential that some attention be paid to the collection of revenue that will make the program possible. In both of these phases the accountant must exercise the best of judgment if the estimates are to be of maximum value.

Another class of accounting, which perhaps has not been given equal attention, is the determination of costs for different types of construction or equipment. For instance, carefully kept records over an extended period almost invariably will indicate which type of car, of motor or of track is the most economical. Operating costs should indicate whether it is an economy to continue the use of an obsolete car, an old substation or an antiquated stretch of track as compared with the cost of new. Similar comparisons can be made regarding any detail of the operation. Occasionally the individual departments have made the attempt to keep such figures, often without result. The accounting department, however, is the place where information of this sort can be compiled most accurately and most cheaply. Naturally, conferences with the other departments involved are necessary if intelligent statistics are to be collected. It is the exercise of such intelligence that makes the accountant a real power in his company rather than a mere bookkeeper. Meetings of accountants that look forward to this end are well worth while.

The Turk Turns on the Onion Eater

CIVILIZATION as the West knows it has had unexpected results in its application to the Turks. The fez is going or has gone, the harem as an institution has passed, trousers have come in for use by the ruler's wife and his inamorata or inamoratas and the veiled woman meanders only through the pages of history and the stories of oriental romance. In Turkey modernism has gone mad. Witness the reported order issued recently to street car conductors of Constantinople to eject from the trams passengers who have been eating onions. In other words, conductors there must really know their onions. So it will be the rule that the men who man cars there must choose between the onion eater and the lotus eater. There must be nothing the matter with their olfactory organs lest an inspector passing through the car detect an odor where they have sensed none.

Here is a parallel out of the East to the beautiful girl in the newspaper ad who grows reticent because the man with millions or erudition that she should adore is a victim of halitosis. In that respect she has nothing on the Constantinople conductor who should now apparently recommend the use of some deodorant. Since onions are a national dish of the Turks the idea of legislating against the weeping weed might have terrible effects should others adopt a similar policy. Suppose Dublin conductors had to put passengers off who were suspected of eating Irish stew, Viennese trainmen to eject those suspected of eating Hungarian goulash, Berliners those of eating Limburger cheese, Glasgowans those of eating Scotch scones, and New Yorkers those of eating gefilltefish or known to have gulped garlic.

Here is an idea for the segregation of passengers along gastronomic lines. Enforced use of the open air elevated lines in New York by all of its garlic eaters might make it possible for the rest to ride in comfort in the subway. There is no end to the possibilities that are opened up. It was the late Mr. Whitridge, then receiver of the Third Avenue Railway in New York, who said that he didn't improve the rolling stock of some of his lines because there was no sense of putting people who apparently never bathed into surroundings with which they were utterly unfamiliar. Of course he stretched the thing a little, as was his wont as a practical joker. He did what little he could about it. The Turk apparently is more militant. The gastronomic special will never be realized, but if advices so far at hand are to receive credence it will probably not be because the Turk has not tried. In any event it will be interesting to have further information on the effect of the order.

Interborough Labor Controversy Has Several Angles

HASTY conclusions should not be drawn from the decision of Justice Wasservogel in the Interborough Rapid Transit labor case. Certainly, the decision is not the sweeping victory indicated in the statement of the organizer of the Amalgamated Association to the effect that "the absolute justice of our cause has now been established." As the *Wall Street Journal* has forcefully pointed out, nothing in the decision as reported in the press touches upon the asserted right of the company to lay down such conditions of employment as it pleases. The court simply refuses the Interborough an injunction to restrain the national union from soliciting Interborough employees to join its ranks. It affirms the right of the company to make as a continuous condition of employment for each individual in its employ that he will not join any particular union. Reduced to its essential the present decision is that the agreement which the railway requires of all of its employees to sign is on its face inequitable and therefore not the kind of a contract which a court of equity will protect. The court ruled that whatever the status of the contract at law, there was no compensating consideration where an employee abandons all right to leave the service of his employer, whereas the company reserves practically entire freedom to discharge him.

In the various comments on the case the instance of the United Mine Workers is mentioned and also that of the more recent decision of a federal court in Texas under which the Southern Pacific Company has been required to recognize a national union which claimed to represent the road's clerks, instead of the union with no affiliations outside the company. As between the Interborough case and that of the mine workers, there would seem to be an apparent conflict, since in the mine case the Supreme Court upheld an injunction which prevented the United Mine Workers from soliciting membership among the non-union miners in West Virginia. Whether the conflict here is real or only apparent depends, of course, on the nature of the two contracts.

The Southern Pacific litigation, just decided, involves both questions of law and of policy far reaching in their importance. The questions of law arise out of the construction of the so-called railway labor act passed in 1926. The questions of policy may be briefly stated to be whether the local employees on a railway shall be free to conduct their negotiations with the management in their own way, or whether they shall be dominated and controlled by an outside organization. The position of the company was that in dealing with the local association, which its clerical employees had formed on these lines, the company felt that it was representative not only of a majority of the clerical employees, but that it was a local organization that would have more vitally at heart the success of the railway enterprise in which both management and men were engaged, and the welfare of its members as a whole, than the clerk's union dominated by central powers from abroad. The company has determined to carry the case up on appeal.

So much for some of the technicalities. Within the limitations imposed by the 5-cent fare the Interborough has shown itself ready to deal liberally with its employees. It has even indicated that if the proposal for an increase in fare is successful, the men will participate to a greater extent than at present in the earnings of the company. But even at the present rates of pay, there is no indication that the roster of the company is not always full. A condition of this kind certainly indicates that the scale of pay must be fairly comparable with that which obtains in other lines of work similar to the railway service in the conditions that are exacted from those engaged in it. That, of course, is just one way of looking at the matter. If it would seem from the court's decision that the company has perhaps been over-zealous in the lengths to which it has gone in its efforts to protect all its employees, the reason for its concern was very well expressed by the Amalgamated's own organizer when he said following the court's ruling that "we intend to hammer our way through to victory whether or not stubborn Bourbons oppose our progress." This statement appears to leave little doubt as to the identity of the aggressor.

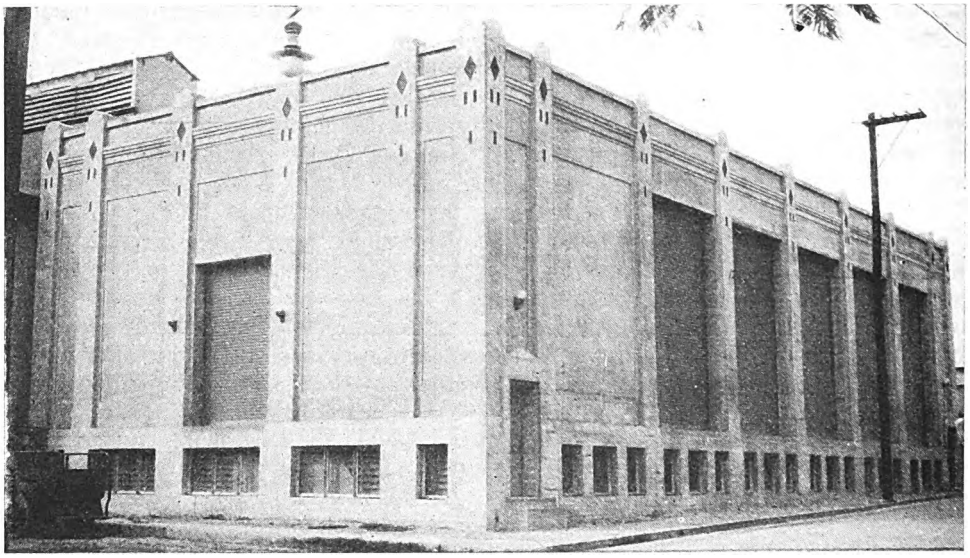
Two Automatic Substations Installed in Cuba

Operation of the new stations has increased the trolley voltage and given relief to the other substations of the Havana Electric Railway, Light & Power Company

By G. S. Whitlow
Switchboard Engineering Department, General Electric Company



Principe, Cuba, automatic substation, built to carry railway, power and lighting loads. A similar station has been built at Toyo

PERHAPS the most interesting recent installations on the island of Cuba are two automatic substations recently put into operation for the Havana Electric Railway, Light & Power Company, one in Principe, the other in Toyo. They are arranged for automatically supplying railway, power, and lighting loads. Power is brought in through 13,200-volt, 60-cycle, three-phase underground feeders and is stepped down to 4,000 volts for a.c. distribution, or converted into 600 volts direct current for the street railway system.

Prior to the new installation, the distribution system of this company included eight outlying substations, four for railway, power and lighting loads, two for railway loads only, and two for lighting loads only. All of the a.c. distribution, except for three 6,000-volt feeders from the power plant, is at 2,300 volts, three-phase. Voltage in each feeder is regulated by a bank of two induction regulators connected in open delta. The 600-volt railway system is ungrounded with two overhead trolleys.

The exterior of the Principe substation is shown in one of the views. The other, located in Toyo, is identical in construction. Both are of reinforced concrete, having a single story with basement, and built to withstand the cyclones experienced in this climate. Neither building is soundproof but with all the doors closed the machine noises are barely perceptible outside. The transformers are installed in fireproof compartments with doors opening on the outside. These may be seen closed in the view of the station and opened in another illustration. On the main floor of the Principe substation, shown in one of the engravings, are the truck equipments, d.c. switchboards, synchronous converter, and power transformers. Space and conduit runs have been provided for a second converter and future d.c. feeders. The voltage regulators, current limiting reactors, station service transformers and storage batteries are located in the basement. Provision has been made for two additional 4,000-volt feeders, as may be seen in the illustration of the basement.

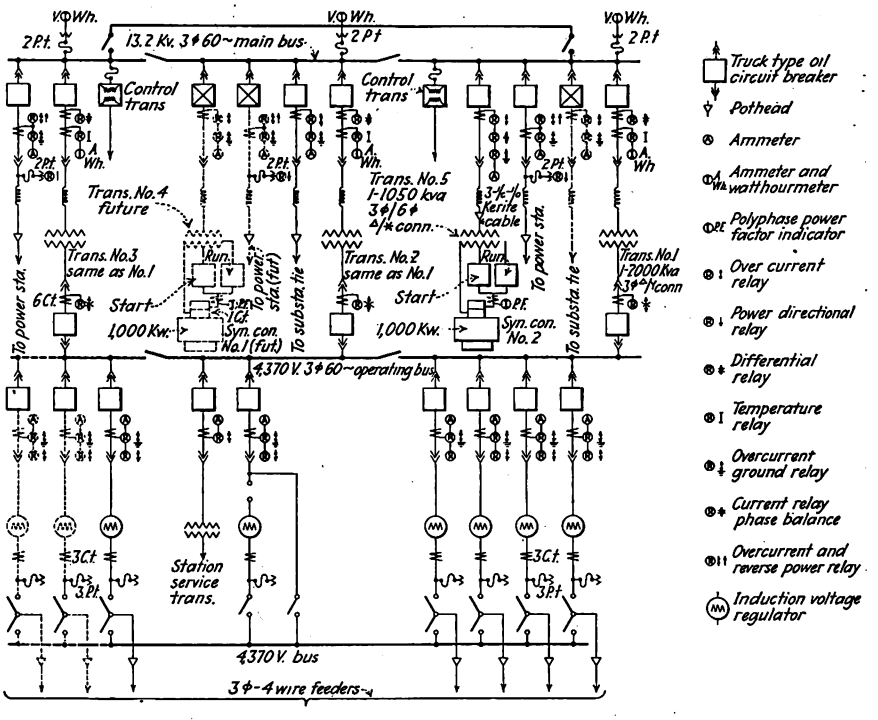
Ventilation of the machine room is by louvers below the main floor level in three of the side walls. The air passes out through rotary-type roof ventilators. The transformer compartments have forced ventilation, the cool air entering through louvers below the grille-work floor on which the transformers are set, while the warm air is forced out by individual motor-operated fans in the roof. When an oil circuit breaker closes, energizing a transformer, the ventilating fan motor for that transformer is automatically started.

Each substation has a 13,200-volt underground tie to a substation that was formerly fed solely by overhead feeders from the power plant. This makes it possible to feed all substations in the system by underground feeders. This is desirable because of the severe windstorms which

Digitized by Google

sometimes damage the overhead lines. All incoming and outgoing a.c. feeders are three-conductor, paper-insulated, compound-filled, lead-covered underground cables. The power connections inside the substation are single-conductor, rubber-insulated, flame-proof cables.

The Principe substation equipment, listed in an accompanying table, includes three transformers, rated 2,000 kva., 13,200/4,370/2,530 volts, three-phase, three-wire and 60 cycles. The neutral on the low side of each one is grounded. The synchronous converter is rated 575 volts d.c., 1,000 kw., six-phase, six-wire and 60 cycles. It is shunt-wound and started from the 50 per cent transformer taps. Eighteen induction voltage regulators, a station service transformer bank and feeder, a 1,050-kva. transformer with 50 per cent taps in secondary and automatic selector supervisory equipment are also installed in the substation. The Toyo substation is identically equipped except there are only two 2,000-kva. transformers.

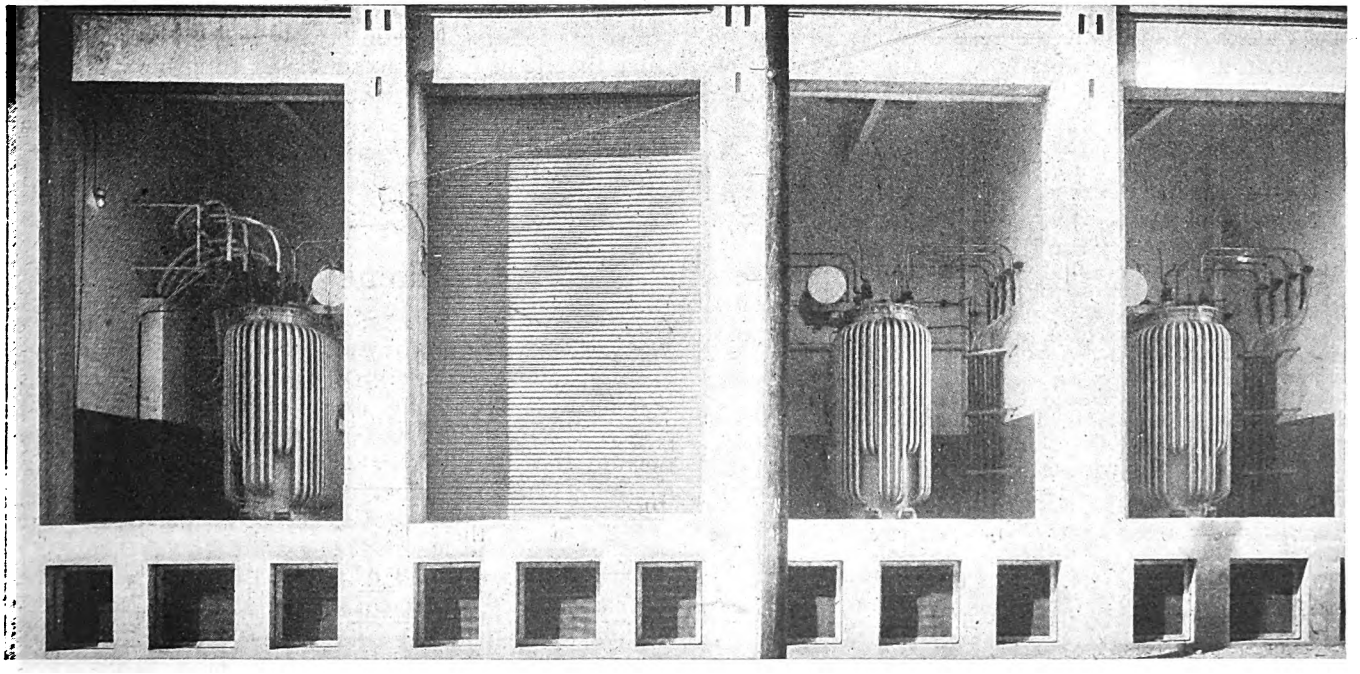


Wiring diagram showing relation of the many relays and meters. The broken lines indicate future installations

The incoming line circuit breakers will close automatically when three-phase voltage of the correct phase rotation is impressed on them. If trouble occurs on either line, the breaker in that line will open by the action of the power-directional and over-current relays. When the breakers in the power plant are closed again manually, after the trouble has been cleared, the substation breakers will reclose automatically.

One of the power transformers is normally connected to the load. Should the 4,000-volt a.c. load increase to slightly more than full load in the first transformer, and be sustained for a predetermined time, the second transformer automatically will be brought into service. Similarly, the third transformer is connected when the load exceeds the predetermined value for two units. Should any transformer fail the next transformer in sequence takes its place. When the trouble on the faulty transformer is cleared it automatically resumes its original place in the sequence. Differential relays protect against internal transformer faults, and thermal relays provide protection against continued overload. By a manually-operated transfer switch transformers No. 1 and No. 3 can be interchanged in the leading and trailing sequence positions to equalize the service.

The substation tie feeder has a transfer switch for local or remote control. In the local position, the tie breaker can only be operated by a control switch mounted on the breaker truck. In the remote position it is con-



Transformers are installed in fireproof compartments with forced ventilation, opening only to the outside

Digitized by Google

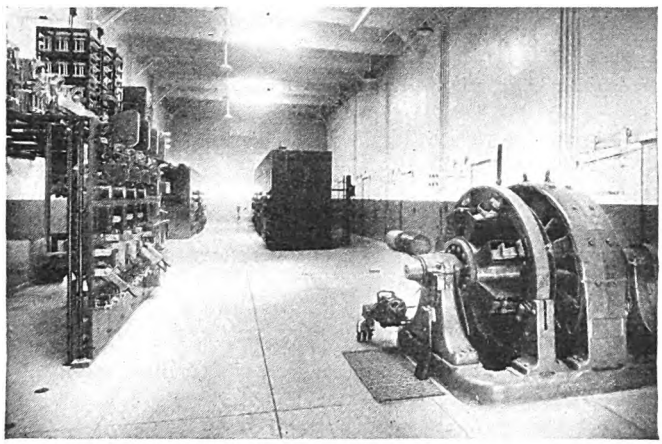
trolled entirely by the supervisory equipment from the dispatcher's office. This feeder is provided with overload protection.

The 4,000-volt a.c. feeders are protected with inverse time delay overload relays, arranged for three reclosures at 30-second intervals. If the overload persists after the third reclosure, the breaker will be locked out and must be reset manually. If the breaker is tripped manually by the control switch, the automatic reclosures will not take place until the breaker is again closed by the control switch.

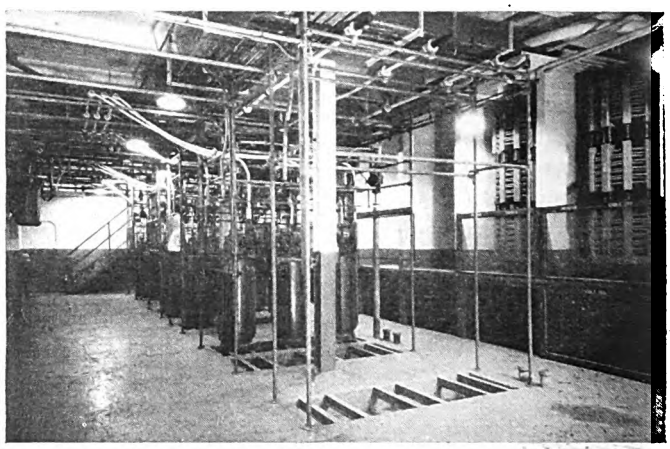
The synchronous converter equipment is arranged so that with low trolley voltage, persisting for a predetermined time, the converter will be started and connected to the load. This equipment is protected against low a.c. line voltage, single or reverse phase conditions, internal machine faults, a.c. overload, overheated winding, overheated bearings, overspeed, reverse power and flashover. The equipment is also arranged with load limiting resistors in order that the machine will not be connected directly to a heavy load so that it would cause a disturbance to the system, and so as to limit the amount of overload carried by shifting part of this load to adjacent substations. If this limited overload is carried long enough to overheat the resistors, the machine is shut down until the resistors have cooled. Normal trolley voltage and light load will shut down the converter after a predetermined time.

The automatic d.c. reclosing feeders will trip at a predetermined current. If the overload disappears they will reclose after a definite time, on either stub or multiple feed from either direction.

The automatic supervisory equipment used in these substations is of the selector type. It controls and indicates the position of the substation tie and indicates the position of all other breakers and the d.c. line contactor. In the dispatcher's office is the key and lamp cabinet in which are located the keys for sending out signals, and the red and green indicating lamps. Any change in the position of a substation breaker closes a circuit through an auxiliary switch, starts a motor-sending key and releases the corresponding code wheel which sends a series of impulses out over the line wires to the dispatcher's office. A selector relay having the same code setting is caused to move to the operating point and close an auxiliary relay which changes the indicating lamp. A bell also rings to notify the operator. A similar sequence of operations takes place when the dispatcher, desiring to operate a substation breaker, turns the proper selector key. The dispatcher also is provided with a means of checking the position of any supervised devices.



Interior view of the Principe substation showing the positive d.c. board, equipment for the 4,000 and 13,200-volt trucks and the 1,000-kw. converter



Voltage regulators, reactors and service transformers are located in the basement. Note the provisions for installing two additional feeders

EQUIPMENT OF THE PRINCIPE AUTOMATIC SUBSTATION OF THE HAVANA ELECTRIC RAILWAY, LIGHT & POWER COMPANY

All apparatus is designed for three-phase 60-cycle circuits except as indicated.

Two a.c. incoming lines, each 13,200 volts, 5,000 kva. maximum.
One a.c. substation tie line, 13,200 volts, 500 kva. maximum.
Three transformers, each 13,200/4,370/2,520 volt, 2,000 kva.
Six a.c. feeders (one transfer), each 4,370 volt, 300 amp. maximum, neutral grounded.
Eighteen induction voltage regulators, 250 amp., 2,300 volt, single-phase, with three connected in Y and neutral grounded.
One station service transformer bank and feeder, 4,370 volt, 50 kva.
One transformer, 13,200/430 volts, 1,050 nominal kva., three-phase, three-wire/six-phase, six-wire, step down with 50 per cent taps in secondary.
One synchronous converter, 575 volt d.c. 1,000 nominal kw., six phase, six wire, shunt-wound and started from the 50 per cent transformer taps.
Four d.c. positive feeders (one transfer), 600 volts, 1,500 amp.
Three d.c. negative feeders, 600 volts, 1,500 amp.
One storage battery, 60 cell, 120 volts.
One automatic selector supervisory equipment for controlling one oil circuit breaker and indicating the positions of ten oil circuit breakers and one d.c. line contactor.

The installation of these substations resulted in an increase of trolley voltage in heavily loaded areas, lengthening the life of the car motors and permitting better car schedules; relief of the distribution load on other substations by the installation of new 4,000-volt feeders; and the removal of load from one distribution substation, which will be abandoned in the near future.

Car Efficiency Increased

CHICAGO SURFACE LINES cars made a new record last year for mileage operated without mechanical failure. The average car was run 24,168 miles without a failure of any of its equipment of sufficient importance to require its being taken off the street and out of service. This is an increase of 10,961 miles in operation per car as compared with the previous year and indicates an increase in efficiency of 83 per cent. The better record is made possible by careful maintenance.

During the year 1,591 of the 3,639 cars owned by the company were sent through the shops for complete overhauling and repainting. On this schedule, practically every car will be completely overhauled, repainted and put in first-class condition once in two years.

Service First

Is Milwaukee's Transportation Slogan

PART II

By Charles Gordon

The Milwaukee Electric Railway & Light Company's program of anticipating the transportation needs of its community has resulted in major improvements of city service and the development of a comprehensive co-ordinated bus system

THE construction of rapid transit facilities for Milwaukee and the improvement of interurban service has been paralleled by service improvements on street railway lines within the city. One of the first departures in the development of Milwaukee rolling stock was made in 1919 when the first sample three-truck train was designed and built. In 1920, the first sample one-man, two-man car of the Milwaukee 800 type was built in the company's shop and was tried in service.

Back of the three-truck train was the idea of providing a more efficient means of handling rush-hour traffic, through the utilization of the existing equipment on the property. Adoption of this policy led to the double economy of cutting the cost of handling rush-hour business, while at the same time relegating the oldest equipment on the property to operation only a comparatively few hours a day during the rush periods. This made it possible to use money spent for new equipment, for the purchase of comparatively light-weight and efficient cars to be used on base schedules throughout the day. Introduction of one-man operation made it possible to give improved service through operation of cars at maximum possible frequency.

The standard of service in Milwaukee is unusually high and is enforced by the Railroad Commission under the following regulations:

On two-man lines all peaks of the rush period shall receive service on the basis of 67 seats for each 100 passengers.

All transition intervals of the rush period shall receive service on the basis of 90 seats for each 100 passengers.

Peaks of the non-rush period shall receive service on the basis of 90 seats for each 100 passengers, except that at no time shall the application of the standard require additional service for less than two round trips unless the ratio of seats to passengers is less than 67 to 100.

All normal intervals of the non-rush period where the traffic is not greater than 100 passengers per half hour shall receive service on the basis of 133 seats for each 100 passengers, provided that between the hours of 6 a.m. and 11 p.m. not less than a ten-minute service shall be operated except on certain divided outer ends of lines which shall receive not less than a twelve-minute service, and provided that on all lines between the hours of 11 p.m. and 1 a.m. not less than a fifteen-minute service shall be operated, and provided further that hourly service shall be operated on the principal lines from 1 a.m. to 6 a.m.

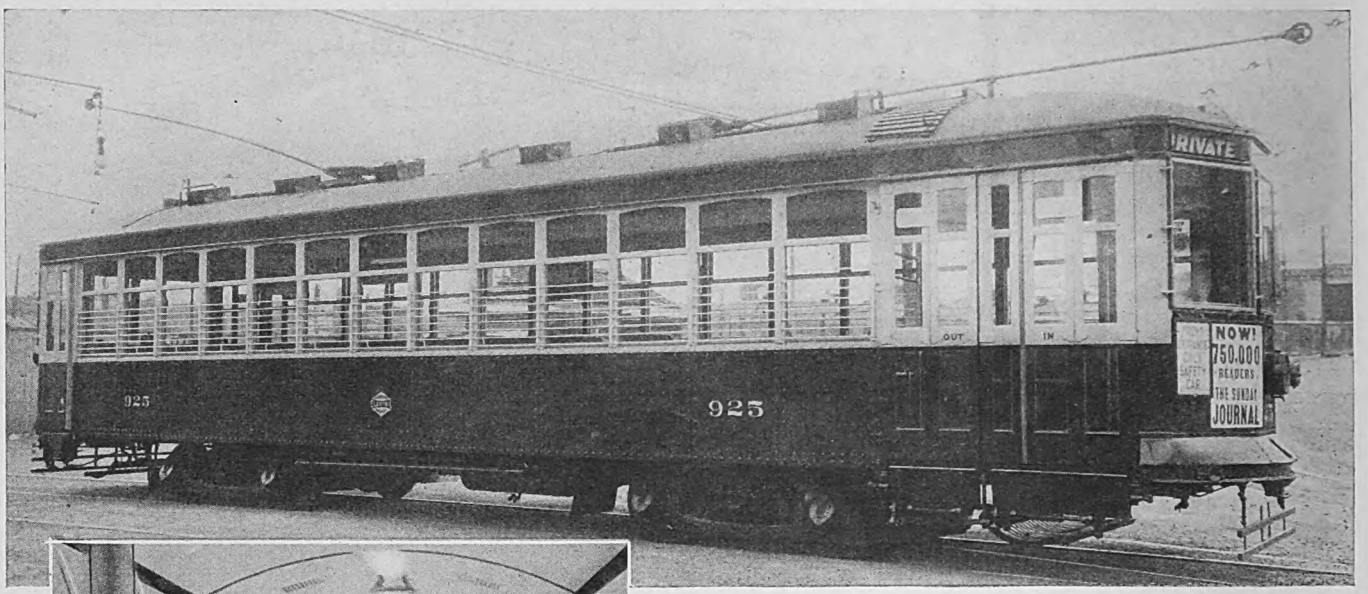
Normal intervals of the non-rush period where the traffic is greater than 450 passengers per half hour shall receive service on the basis of 110 seats for each 100 passengers.

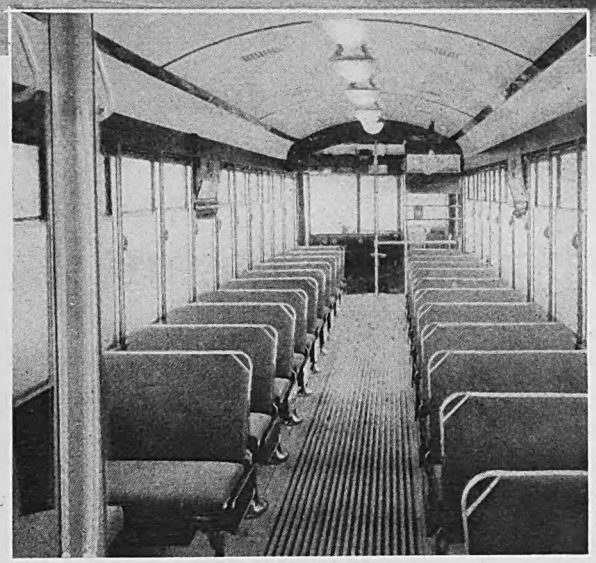
All normal intervals of the non-rush where the traffic is greater than 100 and less than 450 passengers per half hour shall receive service upon the basis of a ratio of seats to passengers that gradually diminishes from 133 to 100, to 110 to 100.

At no time shall the peak (rush or non-rush) or transition service be less than the requirement for normal traffic in any half hour of the one hour preceding or following the peak or transition. At no time shall the transition service be greater than the rush-period peak requirement immediately preceding or following.

For one-man cars service has been furnished during the peaks of the rush period on an 80 seats per 100 pas-

Digitized by Google





The most recent type of one-man car in Milwaukee includes many features for passenger comfort and safety. The lower view shows the interior of recent one-man city cars with center lighting, wide aisles and comfortable seats

sengers standard. No non-rush standards have been set except that it has been the practice of the company to increase the non-rush service by at least 20 per cent.

Additions and improvements to the company's equipment followed rapidly after the preliminary experimental work was done. In 1919, 60 Birney-type, one-man safety cars were purchased for service in Racine. From 1919 to 1925, a total of 165 three-truck trains were built from former double-truck bodies, and these were rapidly introduced on various lines in the city as soon as they could be put through the shops.

In April, 1920, a lot of 100 cars of the original 800 type, designed for one-man, two-man operation, were ordered from the St. Louis Car Company. These cars were all equipped with full safety car devices. In 1921, the 35th Street line was started with one-man operation, using ten of the new group of "800 type" cars. From this time until 1924, one-man operation was gradually introduced on several of Milwaukee's outlying lines. In 1923, another lot of 25 cars of similar type were purchased, and ten cars of the same general design, but shorter in over-all length, were added to the service in Racine.

By 1924 the further extension of one-man operation on lines operating through the business district of the city became an obvious necessity to make possible desirable service improvements within the limited income available from railway operations. An investigation was started in co-operation with the Wisconsin Railroad Commission. This led to a decision to give a serious trial to the use of one-man cars on a line operating through the congested district. In undertaking this step, automatic exit doors were introduced at the rear ends of the cars, and the operator's duties were further simplified through the introduction of electric heat and other labor saving and safety devices on the cars.

In January, 1925, the Clybourn line was started with one-man operation, these being the first one-man cars in regular service through the congested business district. Today a total of 217 cars, including ten new cars just being delivered, are arranged for one-man operation and are run on the 35th Street line, 27th Street, Center, North, Clybourn, Walnut, Oakland-Delaware, Wells-Downer, and State Street routes. Five of these lines operate through the congested business district. During the rush hours, the one-man car service is augmented with three-truck trains. The net result of the greater operating efficiency which is thus made possible by one-man operation is that the public has in every instance profited through a 20 per cent increase in service, while at the same time, operators of the cars receive increased pay.

Following the demonstration of the service improve-

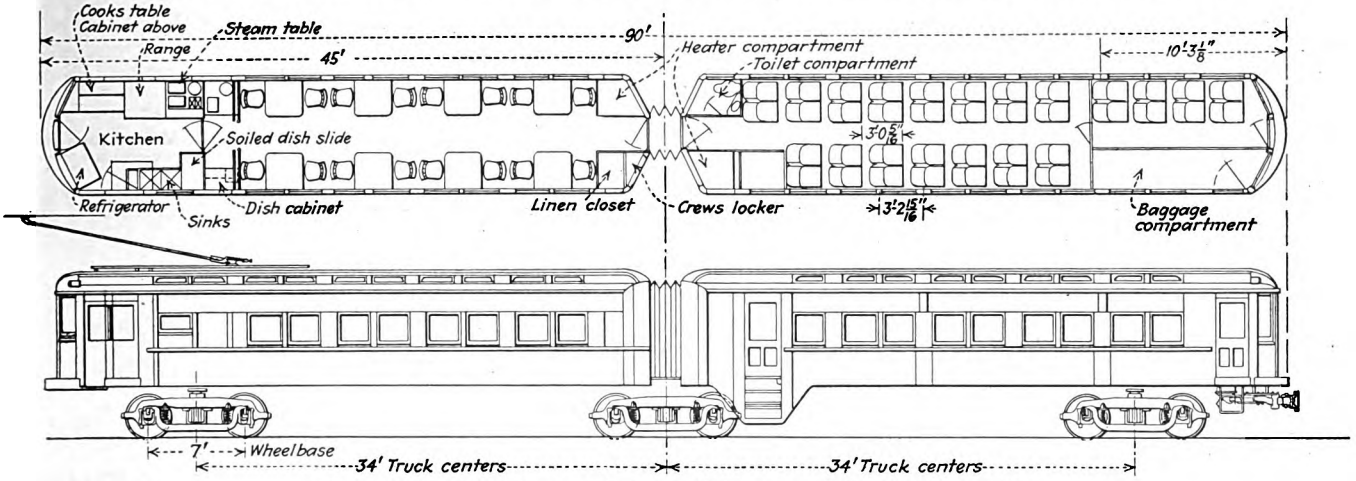
These three-truck trains in Milwaukee have proved very efficient for handling rush-hour loads economically



Plan and elevation of new articulated dining car unit for Watertown line

ments which are made possible through one-man operation, 40 more of the "800 type" cars were purchased in 1926, which included many features for improved passenger comfort, safety and operating efficiency. These cars are equipped with fabric upholstered seats, cabinets enclosing the controllers, electric heat, center lighting, and treadle exit doors with safety control. In 1927 ten more cars of this type were purchased and have just been delivered within the past few weeks. These cars have genuine leather-covered seats.

Additional one-man equipment was provided in 1926 by rebuilding twenty cars of the 500 type. In 1927 an additional lot of twenty of these cars were put through the shop and equipped with all the convenience and safety features for one-man operation that are included in new equipment purchased by the property. At the present time there are available for service in Milwaukee 737 city cars. In addition there are 54 city cars in Racine and thirteen city cars on the Milwaukee Northern property. Including the equipment of the Milwaukee Northern, there are in addition to this city equipment, a total of 109 interurban passenger cars available.

The Milwaukee Electric Railway & Light Company was one of the pioneers among electric railway properties in the operation of buses. It extended this service rapidly as the use of buses to supplement rail lines became better understood, and today furnishes both in Milwaukee and in the entire southeastern portion of the state a completely co-ordinated service which has been carefully built up step by step to complete the company's transportation service to the city of Milwaukee and to the surrounding communities in the state.

In the fall of 1921 there were a total of thirteen buses in service. Nine of these were used for feeders to city lines and for transfer connections. Four were put on roads adjacent to interurban lines of the company to meet the incroachments of independent competitors. Following this early experience with buses operated directly as auxiliaries of the rail service in the city of Milwaukee, an independent preferred type of service at a 10-cent fare was started in the city. During this period, also, interurban bus operation was extended rapidly to meet and anticipate the demand for bus transportation in the entire area of the company's operations.

Up to 1922, buses in use consisted of comparatively crude equipment with home-built bodies and in some cases light truck chassis with makeshift passenger bodies. During the year 1922

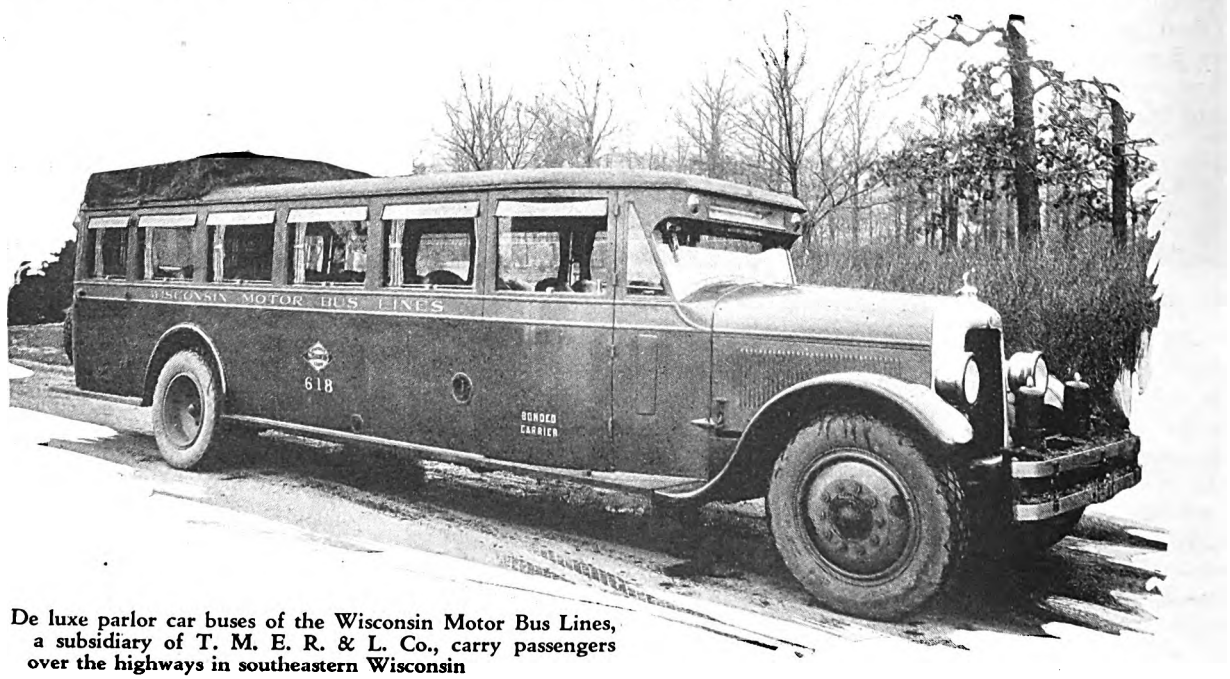
the number of buses operated increased from seventeen to 76. The first 10-cent city service was started with ten model L Fifth Avenue double-deck buses on the Wisconsin-Prospect route. At about the same time, ten White model 50 chassis with street car type bodies were put into interurban service. Later, five Bender sedan bodies on model 50 White chassis were purchased for interurban service. These were followed with ten model 15 White chassis equipped with home-built bodies and used on interurban routes. Later, most of this equipment was transferred to city service. In 1923, nine single-deck type J Fifth Avenue equipments, and five double-



De luxe parlor car buses of the Wisconsin Motor Bus Lines, a subsidiary of T. M. E. R. & L. Co., carry passengers over the highways in southeastern Wisconsin

Digitized by Google

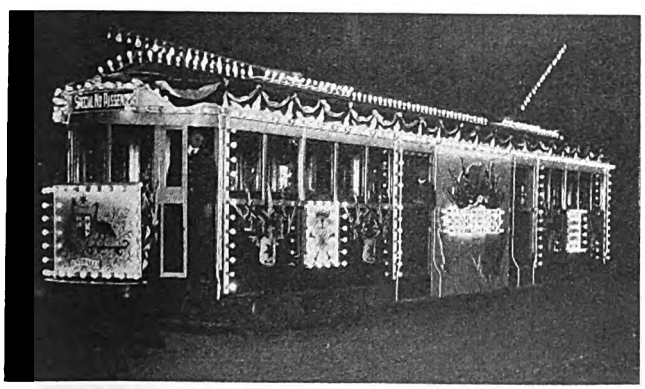
deck model Z Yellow coaches were purchased for the extension of 10-cent city lines. During this year also, ten White model 50 sedans, seven White model 15-40 sedans and three four-cylinder Fageols were added to the interurban equipment. Interurban lines were operated at this period between Milwaukee and Waukesha, Milwaukee and Oconomowoc and Milwaukee to Racine and Kenosha. A number of short feeder lines to interurban rail routes were started about this time, but most of these, together with the Milwaukee-Racine-Kenosha bus line, have since been withdrawn.

During the years 1923-1924, interurban bus lines were started from Milwaukee to Madison, the state capital; Milwaukee to Fond Du Lac, Milwaukee to Hartford, Milwaukee to Janesville, and Milwaukee to Beloit. The first group of five Fageol six-cylinder parlor-car type buses were purchased in 1924. These, together with one Pierce-Arrow parlor car, were operated in long-distance tour service. New purchases of buses for interurban service have all been of the six-cylinder parlor-car type since this time. The present fleet consists of 150 buses of which 141 are in active service. A complete summary of Milwaukee city and interurban bus routes, mileage, equipment and other statistical data is given in accompanying tabulations.

Melbourne Trolley Becomes "Sun on Wheels" to Honor Duke of York

"HITCH your wagon to a star" is what Emerson said, but "Hitch your wagon to a duke" is the way it has been modified at Melbourne, Australia. When the Duke and Duchess of York visited that city the Melbourne and Metropolitan Tramways Board found it possible to honor the ducal couple and give the tramways favorable publicity at one and the same time.

The board was well entitled to any credit it could gain, for there were so many merrymakers on the streets that it was almost impossible to move the cars. Almost every day all trolley traffic was held up for several hours, during which period the platform wages went on as usual. On the day of the arrival all employees were paid time and one-half, with the result that the net earnings were actually 25 per cent under normal. For the ten days complete the tramway earnings were 6 per cent greater and the travel 7 per cent heavier.



Melbourne's "Sun on Wheels" to honor a duke

If New York thinks it did well by Lindbergh, consider Melbourne's 500,000 celebrants in a city of 1,000,000 permanent population. This was the figure attained on the day of the big parade, when 25,000 "Anzac" veterans turned out to honor the ducal visitors.

Bourke Street, Melbourne's White Way, was more gayly illuminated than usual, but one of the most striking attractions was the board's car carrying 800 colored lamps and transparencies. The lights clearly showed every detail in private suburban gardens 100 ft. away. So it is not amiss to speak of Melbourne's "Sun on Wheels." The picture tells the rest.

Another Interurban Adds New Cars

The Kansas City, Leavenworth & Western Railway has placed four light interurban cars in service. Latest de luxe features give cars riding appeal

FOUR new passenger cars, lighter and speedier than those now in use, and designed to appeal to the public's love of comfort and beauty as well as to permit more economical operation, have been placed in service by the Kansas City, Leavenworth & Western Railway Company, operating an interurban line between Kansas City, Mo., and Leavenworth, Kansas. The new cars were furnished by the American Car Company, St. Louis, Mo., and will be operated with one man. The change from the former plan of using two men is part of the policy of cutting down operating costs, adopted as the most effective way of meeting the heavy bus competition the company encounters.

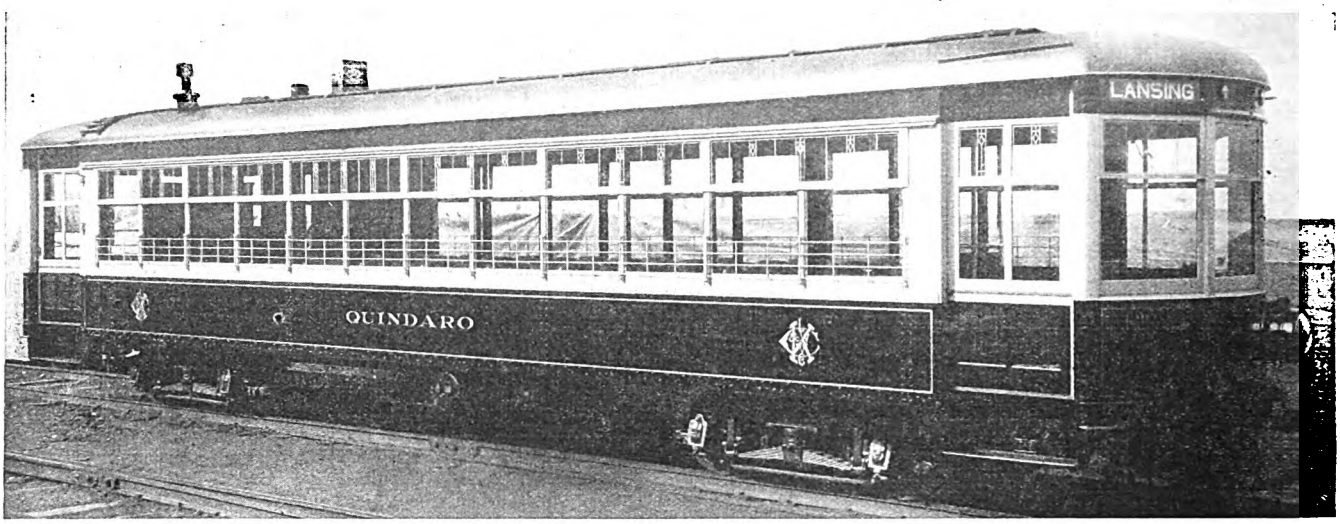
In commenting on the new cars W. H. Holmes, vice-president of the company, said: "We believe that the peak of the depression caused by bus competition has been reached. The electric lines have a legitimate place in the transportation field and by offering the public better service and improved, modern equipment they should be able to win back some of the patronage they have lost. We realize fully, however, that what will help more than anything else is cutting operating costs to the bone and placing the interurban business on a modern basis. We cannot continue with the equipment and methods of twenty years ago."

The four new cars will meet all regular service demands of the company. Most of the present rolling stock will be disposed of, the company keeping only such old cars as are necessary for reserve. The new cars weigh 33,000 lb. each as compared to from 75,000 to 88,000 lb. for the old ones. They seat 52 persons, which is approximately the same as the old, but the passengers will be carried at a great saving in power and in maintenance-of-way.

They embody all the latest features designed to make interurban travel more comfortable and safe and to make the electric car appeal to the public's liking for beauty in common carriers. They are 45 ft., 6 in. long by 8 ft., 6 in. wide, and are equipped with four 45-hp. motors as against four 75-hp. motors on the old cars.

Wheel diameters on the new cars are 26 in. as compared to 34 in. on the old ones. The old cars have cane seats. The new ones have individual bucket-type seats, upholstered in leather, with pneumatic cushions. The new cars have rubber tile floors, all-steel bodies, exteriors painted in red with blue roof, and finished on the inside in two-tone mahogany. An indirect lighting system has concealed lamps in a panel skirting the roof of the car.

Digitized by Google



Exterior of one of the new cars of Kansas City, Leavenworth & Western Railway. The car is painted red, with cream trimming and blue roof

Light is reflected from a buff-colored, wood pulp combination dome. The roof is arched and the large windows make the new cars appear roomy.

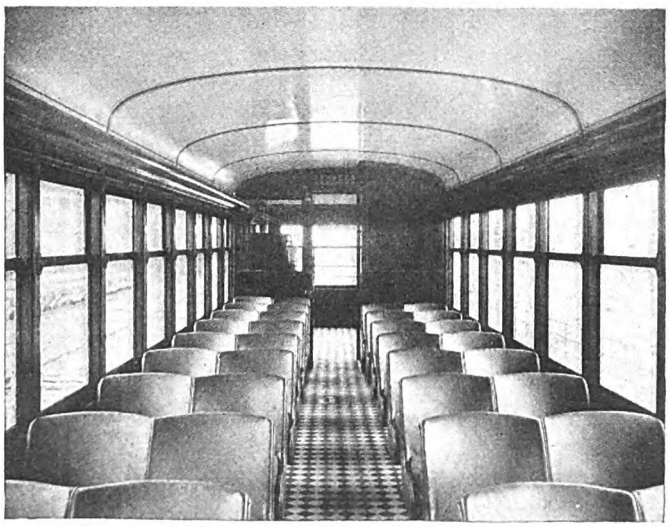
The front vestibules are of the semi-circular type. In the rear of each car is a combination smoking and baggage compartment, capable of seating twelve persons and with a square bus-like vestibule which imparts an observation platform effect. Low stream lines prevail throughout the cars and both front and rear doors are under control of the motorman.

General Rehabilitation Program Carried Out

The company has put more than $100,000 into new equipment and improvements in the last year. Approximately $25,000 was spent in repaving and repairing car tracks in the city of Leavenworth; $10,000 in repairing roadbed and putting in new ties and rails between Kansas City and Leavenworth and more than $5,000 in repairing and putting in new freight switches all along the line.

The new switches will give the company freight connections with the Greater Kansas City railroad switching system, known as the Outer Belt, used by all the railroads centering in Kansas City, Mo., and Kansas City Kan., and their suburbs. They also provide connections with the Missouri Pacific railroad at Wolcott, between Kansas City and Leavenworth, with the industrial department of a home for the blind in Kansas City, Kan., and with the prison industries of the Kansas state penitentiary at Lansing, Kan., as well as with numerous private industries. The company will expand its freight business and hopes to increase its revenues greatly from this source.

The above figures do not include the cost of thirteen buses, purchased within the last three years to supplant the company's electric cars within the city of Leavenworth and to the United States army post at Fort Leavenworth, 6 miles away, and to the government soldiers' home, 3 miles from Leavenworth. The last of these buses were placed in service in October of last year. They enable the company to serve its patrons at these points more cheaply than could be done with the electric cars, and the buses are routed up the streets at the army post and the soldiers' home, bringing transportation nearer to the patrons at these points than was possible with the interurban cars.



Bucket type seats upholstered in leather and rubber-tiled flooring provide comfort for passengers

The Stock Book for Stabilizing Stores

Particulars are given of a simple form of stock book, based on that used on many steam railroads. It has many advantages over the use of cards

By R. A. Weston
Special Accountant the Connecticut Company, New Haven, Conn.

STEAM railroad companies of the United States 25 or more years ago devised a form of stock book as a means of ordering materials for replacement of stock materials. The advantage of the book was that there could readily be derived from it information on what the consumption of a particular item of material had been over a period of time, so that replacement orders could be based upon the actual history of the past as to consumption. The book quickly grew in favor and is probably the best device now in use for the purpose of regulating the stock. A brief explanation of this form and how it is used may be of some interest.

In its simplest form an outline of the book is as shown in the accompanying illustration. It is to be noted that there is no column on this form to show consumption of material or material issued. The usual form of stock ledger sheet or stock card has spaces on which all daily issues of stock from the stores are posted and permits of a perpetual inventory. It necessitates a great deal of clerical work.

THE A. AND B. RAILROAD COMPANY

Description of Material	Average Monthly Consumption Previous Year	JAN			FEB			MAR			APR				December		
		On hand	Due	Ordered	On hand	Due	Ordered	On hand	Due	Ordered	On hand	Due	Ordered		On hand	Due	Ordered
Trolley wheels 5" spec. 0234	400	500	300	300	200	600	200	400	400	100	550	100	100				

This form of stock book has many advantages over card listing

The stock book here illustrated is used in the following manner. It is kept in the stock room itself and not in an office apart from the stock room. The man who physically handles the stock keeps the book. Once a month there will be prepared in the book a stock-replenishing requisition in the following manner. The storekeeper and the stock clerk will make the round of the stock room. In the first column, for the month in question, headed "On Hand," will be entered the actual quantity of the item in the bin. It will be perceived that this means an actual inventory of the stock room once a month. The bins must be mostly open shelving, with no concealing bin fronts, and the materials physically arranged in order so that they can be counted by inspection without physical handling. The unit piling system needs to be followed.

In the next column, under the word "Due," is entered the quantity previously ordered on requisitions and not yet received. This will consist of all the unchecked items in the preceding third columns, a check mark being made against the item from the receiving record when the material is received. The next entry is to be made in the third column by the storekeeper, who decides upon the quantity to be ordered. He is governed very largely in fixing this quantity by what the book shows is being used.

An illustration will show how he calculates this. On Jan. 1, for the item illustrated, he finds that he has 500 on hand and 300 due on order, and the book shows that during the previous year his consumption averaged 400 a month, or he has on hand and due a 60-day supply. Assume that he decided to order 300. On Feb. 1 he has 200 on hand and 600 due. Not having received any during the month, and his stock having decreased from 500 to 200, he sees that he has issued out 300 during the month. He cuts his order down in February to 200. On March 1 he finds that he has 400 on hand and 400 due. This indicates that he has issued out from Jan. 1 to March 1 the amount on hand Jan. 1 (500) plus the amount received (400) less the amount on hand March 1 (400), or the issues have amounted to 500, an average of 250 a month for that period. He cuts his March order down to 100. He could safely have omitted to order in March. On April 1 he has 550 on hand and 100 due. The consumption in three months has been 750, or an average of 250 a month for the period. The storekeeper is reducing his monthly orders in order to regulate his stock to the basis of his issues. After the stock room has been gone through and all entries made in the book it is turned over to a stenographer to type up the requisition.

Advantages Set Forth

Some of the advantages claimed for the stock book system as here described are the following:

1. The order is based on personal inspection and inventory of what is on hand. It avoids what may be a costly mistake in ordering from a card record figure where some clerical error may have been made in posting to a card.
2. It forces an orderly and systematic arrangement of the storeroom and of piling the stock due to requiring an actual inventory monthly.
3. The psychological effect is good of determining on the quantity to order when facing the material itself and realizing its comparative costliness.
4. When thousands of items are carried in stock it is a very laborious and slow process to consult individual stock cards for such information. The stock book very much facilitates the work.

Form With More Details for Large Companies

The form of stock book here illustrated is in its simplest form and is sufficient probably for a majority of street railway storerooms, and simplicity is quite an advantage. In the form shown, however, it is good for only one year and has to be written up new each year. This can be overcome by having the description column written or printed on a narrow page separate from the rest of the page, removing the latter only, each year.

Digitized by Google

The principle of the stock book was recommended in the 1923 report of the committee on purchases and stores of the American Electric Railway Association, working in conjunction with the committee on stores accounting, and a recommended form of stock book was included in its report. This form is more elaborate and can be used for two years without rewriting. It has an additional space for showing the amount of unfilled requisitions, which is desirable in the case of a general store supplying divisional stores, but not necessary excepting for such a store. The form recommended by the committee provides for considerable additional information and permits of only seven items of material to a page of rather large size. The simpler form of book would permit of 30 to 40 items to a page of materially smaller size which is quite an advantage. It would also seem as though, with the simpler form, the figures for the calculations are more readily grasped and used. It might perhaps be said that the committee could well have included also in its report a simpler form of stock book that could be used in a majority of cases, while the larger systems would use the more elaborate form in their general storehouses. The report of the committee is referred to for detailed instructions covering the use of the book and for specifications for printing and binding.

As above stated, the system has proved its merit after more than 25 years service on steam railroads, and the opinion is ventured that the electric railways can adopt it in their storeroom practice with great advantage. It of course has to be supplemented by known conditions and work planned and in prospect, and it is the storekeeper's business to be supplied with this knowledge as well as the history of the immediate past.

Detroit Express System Benefits Motorists

Drivers of private automobiles and operators of trucks report big savings in time and general traffic improvement on Jefferson Avenue with express trolley system

DESIROUS of determining whether operators of private automobiles and trucks were benefiting by the combination express trolley and local bus service on Jefferson Avenue, the Traffic Survey Bureau of the Detroit Police Department sent out a number of letters requesting information relative to the use of the avenue before and after the express service was started.

Drivers of private automobiles were requested to give their average time from starting point to destination before express service was in operation, average time under present conditions and any other benefits or disadvantages. Operators of trucks or commercial vehicles were asked to list any benefits or disadvantages of the service to them and to state if any time was saved.

Practically every automobile driver who replied gave a favorable expression of opinion and reported a substantial reduction in traveling time. The time savings ranged from five minutes on a former twelve-minute run to twenty minutes on a former forty-five-minute run. The running times under the new system varied from 55 per cent to 89 per cent of the former times and averaged between 75 and 80 per cent.

Criticism of the system was scarce and concerned two unfavorable conditions: "bottlenecks" are formed at express stops by requiring traffic to go to the right of the safety zones and traffic signals are masked by the curtains on the safety zones.

A few of the replies from automobile users, typical of the large number received, are reprinted herewith:

Average Time From Home to Place of Employment in Minutes		
Former Conditions	New System	Benefits or Disadvantages
10	7	It's a great thing. I have noticed practically no jamming of cars since new system started. Practically no hold-ups.
35–40	29–30	Driving is easier and less crowded. Traffic moves faster and because there are fewer jams the accident hazard is reduced.
35	22	Fewer quick stops necessary as there are no pedestrians crossing the avenue except at car stops. I consider this express service to be the best improvement in traffic handling in Detroit.
28	23	I find that due to the non-stops the traffic moves more smoothly. General improvement. Good work.
30	24	The avenue is not so congested.
45	30	Think it a great advantage in every way.
40	30	Very much better. A big improvement and hope it is not changed back.
30	20	Much easier driving. Not so many stops and starts.
20	15	The express service has helped the motorist unquestionably.
60	45	I believe the express service has resulted in a time-saving not only to the auto owner but to people who must use street cars, buses or jitneys, as well.
12	7	Traffic moves smoothly without congestion or rush. Plenty of benefits and no disadvantages from the driver's viewpoint.
35	25	I want to endorse the new system heartily. It relieves congestion both for autos and pedestrians.
20	15	It's the best thing the city did since it took over the street railway.
25	15	Formerly used the bus but now use the street car because of a saving in time.

The truck operators who replied were as enthusiastic over the new system as were the private automobile drivers. All reported a saving in time. Many pointed out that they were able to operate more trucks and that operating costs were reduced.

Some of the comments of the operators of commercial vehicles follow:

Is Any Time Saved	Benefits or Disadvantages
A considerable amount	A noticeable speeding of traffic is a result of the express service on East Jefferson. We are pleased that it has been placed in effect.
Considerable	I find it expedites traffic and saves us money inasmuch as we can make more trips.
Yes	It appears to be safer.
Yes	It speeds up traffic and enables us to make more money by being able to carry more loads on our trucks.
Yes	Traffic isn't tied up so frequently. It saves the driver's nerves and patience.
Yes	It saves gasoline by not having to stop and start so often for the street cars.
Considerable	It saves wear and tear on the trucks by not having to stop for street cars every other block.

Rubber Used to Reduce Noise and Vibration on Cars

RUBBER is being used by the Market Street Railway, San Francisco, to reduce noise and vibration in street cars. Pure rubber pads, five-eighths of an inch thick, are used to insulate the car bodies from the trucks, thereby preventing the transmission of gear and other noises to the car body itself. This idea is following out one used by automobile engineers for several years, in using pure rubber pads to insulate the engine from the frame of a motor car.

New cars will be equipped with this device when built, and old cars will be fitted up at the rate of about eight per week.

The adoption of this scheme has followed many weeks of experiments, and tests show an appreciable reduction in noise.

Manuals of

Operation and Accounting

By H. E. Jordan

Assistant Engineer Los Angeles Railway, Los Angeles, Cal.

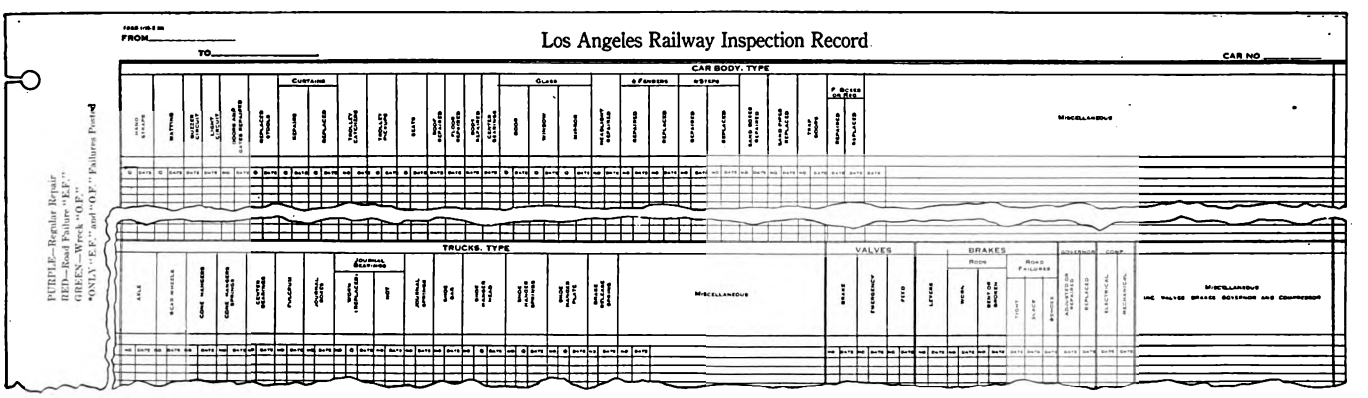
COMPILATION and issuance of manuals of operation and accounting to each employee of the Los Angeles Railway, Los Angeles, Cal., has proved a very effective means of stabilizing the routine of its mechanical department. The primary object of these manuals is to set forth the duties, principles and practices of the department organization and certain general and specific rules for its operation, so that each member of the department may understand the requirements of his own position as well as those of the men with whom he works.

By reading these manuals, new men entering the organization learn the routine and become familiar with the requirements of their jobs in much less time than if they had it all to learn from the foremen and fellow workmen. This not only saves the time of the new men but that of the foremen and the other workmen as well. Men of lower positions may learn from the manuals the requirements and the duties of the positions above them. This gives a man a definite objective to which he may aspire, which is an incentive to an ambitious individual. Many internal conflicts and misunderstandings are avoided by having the jurisdiction of each office defined.

There are two manuals, covering organization, operation and inspection. One is for the five division carhouses that maintain the cars in regular service; the other is for the general shops that repair wrecks, do general overhauling and the work required by store and work order authorizations.

Inspection card rack located in carhouse foreman's office containing last inspection record of each car

The manual for the five division carhouses prescribes the routine rules of the operation of the carhouse organization regarding the proper handling of tools, fire-fighting drills, overtime, absence from work, etc. It sets forth the duties of the general foremen of carhouses and the duties of each office of that department branch, down to the workmen. Further it defines such terms as scrap, salvage and second-hand material, pull-in, equipment and operating failures and describes the use of certain forms that are to be used to make reports of



Each car has a ledger sheet, size 22½x11½ in., with headings for the common items of repair or adjustment. Motor, control and overhead repairs are entered on the reverse side of this same sheet

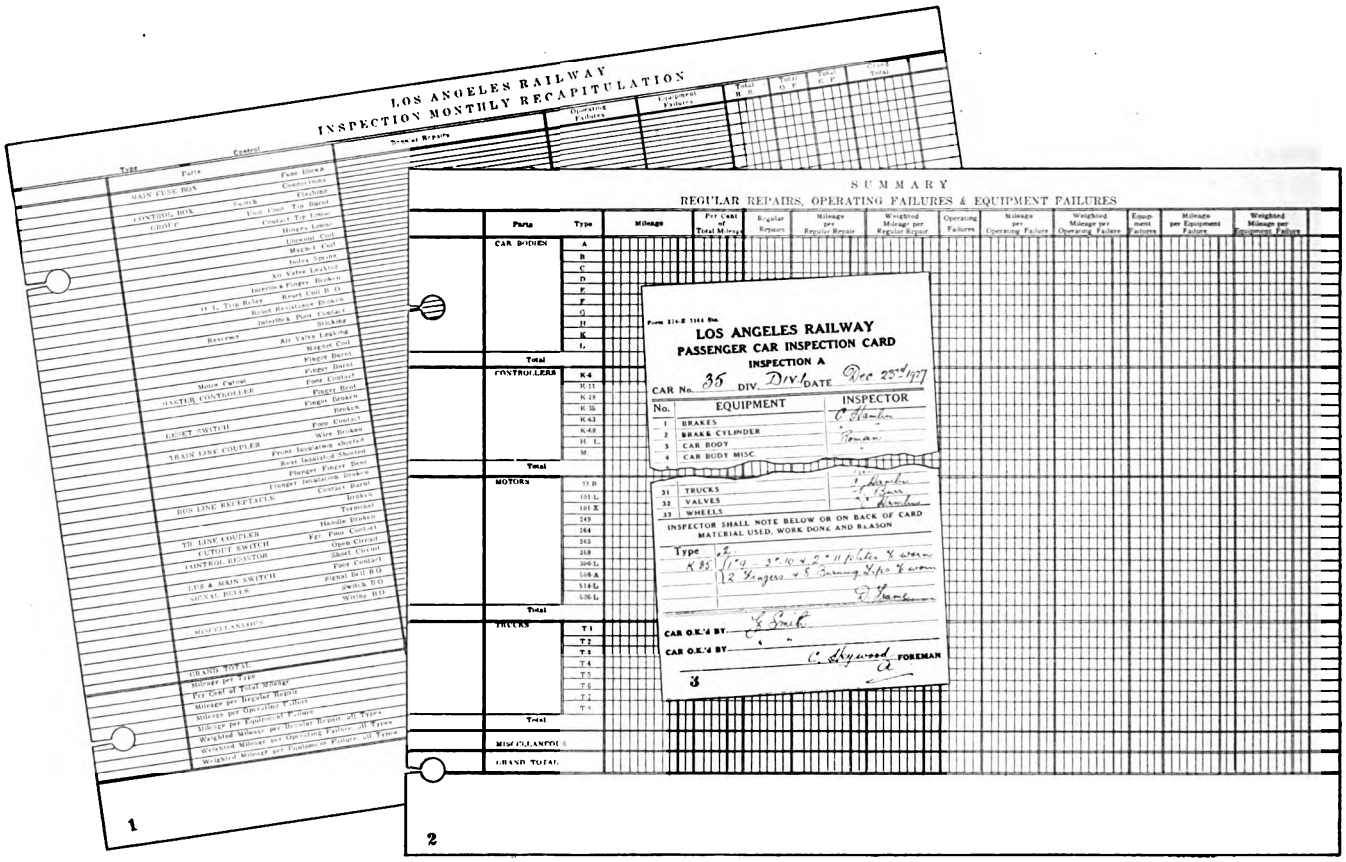
Digitized by Google

work done. It also prescribes the time limit of each inspection and specifically tells the requirements of each inspection, from the "safety inspection" that must be made each time a car leaves the carhouse yards, regardless of the mileage made, on through the "A," "B" and "C" inspections, which vary in degree of thoroughness with respect to hours of operation.

Inspection System Outlined

The inspection system which is outlined in the carhouse manual warrants a description here. A record of the number of hours operated is kept for each car by the office of the carhouse foreman, for the cars operated out of the respective carhouses. When a car is due for an inspection it is held in by the switchmen and the proper inspection card, whether "A," "B" or "C," is placed on it, in a card holder. Each inspection is classified under headings on the card, as body, brakes, control, etc. When a repair or adjustment is made the workman makes a brief notation of the work he has done and briefly states the reason the repair or adjustment was necessary, as, for example, "Replaced P.E. arm. brg. No. 2 motor acct. of worn." When the inspection is completed the inspector signs his name on the card opposite the equipment he inspected and the card is placed in an active card rack in the foreman's office. If a car has a failure while it is in service or it is necessary to do work on it for any reason, its inspection card is taken from the rack and placed in a "B.O. (bad order) car box." As the card contains the records of the previous inspection, the foreman very readily determines what inspectors and workmen are falling down in their work. After the workman completes the repair he notes briefly what he has done and why it was necessary on the back of the inspection card. When the next inspection is due on a car a new inspection card is placed on it and the old card is sent in to the master mechanic's office.

Each car has a large ledger sheet with headings for all of the most common items of repair or adjustment. All data are posted on these ledger sheets from the card by a clerk who enters the data under the proper heading. The difference between regular repairs and failures is indicated by the use of different colored ink. The equipment is also classified according to type, as various types of car bodies, motors, etc. The data contained on the inspection card are further posted on type sheets, with headings similar to those of the individual car. This classifies all the various repairs and failures according to what they are and the type of equipment on which they occur. This record is summarized at the end of each month, all repairs and failures are put on a "miles per failure" basis and a regular formal report is made. It is evident that from such a report the relative merit of types may be readily ascertained and the particular weakness of each type of equipment made apparent.



The inspection cards, individual ledger sheets and summarized data sheets are explained in the carhouse manual

No. 1. One of the six monthly inspection recapitulation sheets for posting repairs and failures of equipment. The size is 14¼x11⅜ in.

No. 2. Summary sheet of repairs and failures by types of equipment, put on a mileage basis. This sheet is also 14¼x11⅜ in. in size.

No. 3. Passenger car card for inspection "A." Work done by the inspector is noted on the bottom and repairs between inspections on the back. The card is 4 5/16x11¼ in.

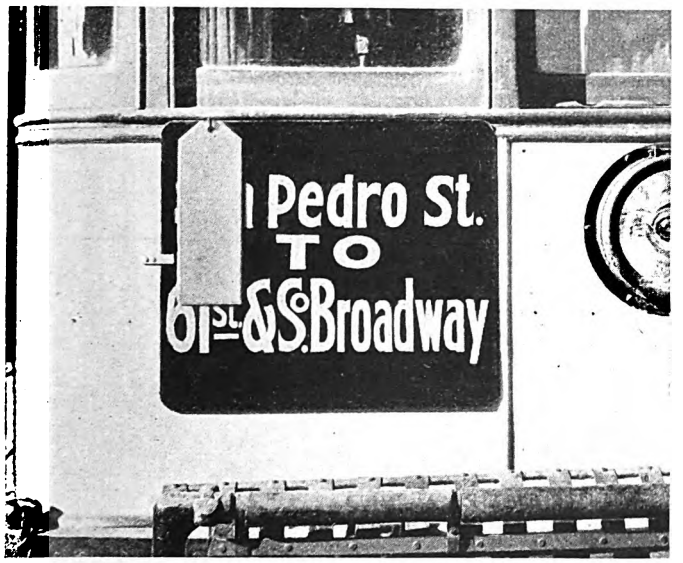
Manual for the General Shops

The shop manual prescribes the routine rules of operation of the general shop, defines the jurisdiction of each office and the responsibility of each position; gives the name, number and use of all mechanical department forms and practice in overhauling cars and equipment.

Digitized by Google

The company's accounting manual prescribes the general and specific rules pertaining to the charging and crediting of material and the charging of labor. The "Uniform System of Accounts for Electric Railways" prescribed by the Interstate Commerce Commission has been followed. However, some of the operating accounts have been divided into subheads to show certain segregations of cost. For example, Account 30-B represents maintenance of brakes; 30-C, car bodies; 30-T, trucks; etc. In addition to the segregation of charges by accounts, the charges are also segregated by types of equipment. The types of equipment are the same as those used in the inspection reports.

All of these costs are established monthly and are put on a cost per mile basis. However, complete written reports are made only quarterly. Three months is considered a sufficient period in which to eliminate severe fluctuations caused by an epidemic of repairs that may occur on any one type of equipment over a short period of time. The quarterly report shows the segregation between regular maintenance and general overhauling charges, summarized by types. Although the regular maintenance costs are segregated only by types of equipment, the general overhauling costs are segregated by individual cars and the detailed cost of overhauling these cars is furnished to the master mechanic's office by accounts. The combination of these two reports has eliminated the guessing or estimating of the relative merit of any type of equipment.



Inspection card in holder on car to be inspected

On a large system, where repairs are made by a large number of mechanics at several different points, it is impossible to spot many important weaknesses in the equipment unless classified summaries are made. The inspection report plainly indicates the weakness of the equipment by showing relatively large numbers of repairs and failures under the classified headings. Where these weaknesses are apparent the mechanical department makes an effort to eliminate them, and sometimes by relatively small changes effects a large reduction in operating costs, reduces equipment failures and thus betters the service. The cost report plainly indicates the most economical equipment to maintain. From it the engineering department may readily determine at what point in the life of the equipment it is economical to replace it.

It is vitally essential that every large electric railway keep records of repairs and failures. If these records are not kept up it is necessary to make special studies and investigations regarding the rumored reports of excessive failures and repairs of various types of equipment. When these studies are made, if no detailed record has been kept as the work was done, they are essentially based upon hearsay, or opinions of various workmen and foremen, which is at best a very unsatisfactory means of supporting important conclusions. We believe that it is more economical to keep a detailed record of repairs and failures, so that we may have ready reference on the actual conditions which pertain to all of our types of equipment. This record not only eliminates the necessity of making special studies and investigations but often has called to our attention certain weaknesses which had not been apparent prior to keeping this record.

Training by Individual Instructors in Atlanta

Demonstrations given on a moving car, courses of further study available for those who desire it

TWO features stand out in the instruction course given to new employees by the Georgia Power Company of Atlanta. One of these is an adaptation of some of the latest university methods and is the assignment of each student to one instructor who may have several other students assigned to him but not a large number. This instructor is expected to look individually after the work of each of these students and is held individually responsible for their progress. In collegiate work this is known as the "Oxford" system.

On the Georgia Power System there are two full time instructors and 63 trainmen who have been especially trained as platform instructors, employed in teaching new platform men the way of discharging their duties. As explained, every student is assigned to some one of these instructors. During his course of study he goes to various line instructors to learn the car routes, etc., but he returns to his original preceptor for the final phases of his instruction. Before this plan was begun a student was sent to one instructor one day, to a second the next day and to a third the following day to learn different phases of the work. The result was that no one instructor was responsible for his progress and no one took any great amount of interest in it.

Largely as the result of a scientific approach to the problem, the company has found it possible to reduce the period of instruction by 25 per cent, and at the same time turn out better qualified men. This is of benefit to the company through the more efficient use of the time of the instruction course. It is of equal benefit to the students in view of the fact that they are not paid during their period of instruction. Higher standards of intelligence and character of the applicant also are being required, and it is a real testimonial to a man's physique or intelligence to be selected by the company for the position of one-man operator. It makes the man feel that the job is worth something to him after he has acquired it.

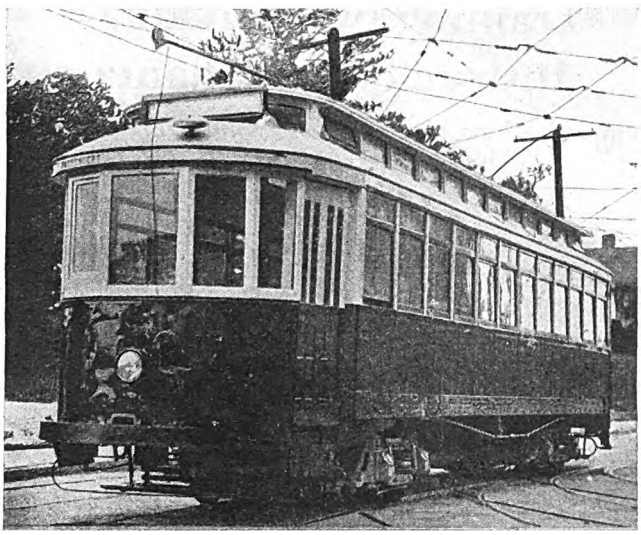
A second important feature of the training course is the instruction car illustrated on this page. It is unique

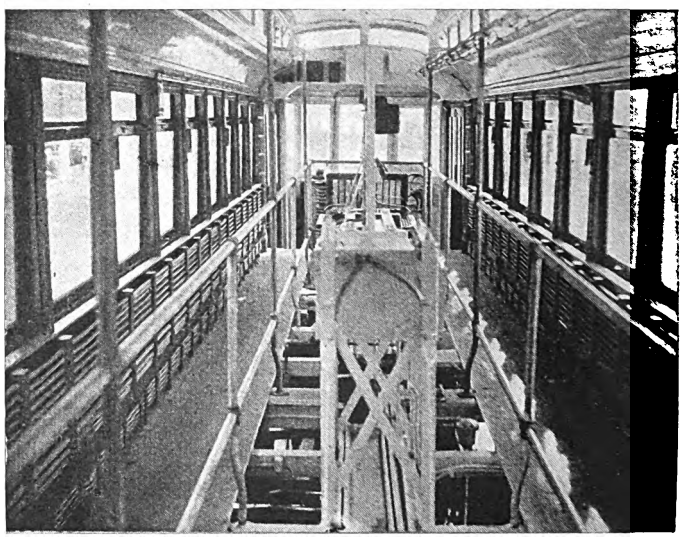
Digitized by Google

in that it is a skeleton car, at least on the inside, which can be operated over the road to teach the men the practical working of the machinery. It was remodeled from a four-motor, double-end car which had been retired from passenger service.

The flooring in the center was removed, leaving a walkway protected by a railing on each side. The line breaker is mounted above the floor and the air brake valves and piping are mounted above the center sills and painted a distinctive color. Door hinges, sprinklers and valves forming a part of the treadle step and door mechanism are exposed. The power wiring and door circuits are also exposed. The controller has a glass cover. The car is equipped with an economy meter and a voltmeter so that more intelligent instruction in power saving may be given.

A group switch in the car is controlled remotely by eight snap switches, the snap switches opening and closing the unit switches in the group. The unit switches are used to demonstrate the most frequent troubles in the motor circuits, i.e., grounded armatures and fields, open circuited armatures and fields, grounded and open circuited resistances and short circuited fields and resistances.





This old car has been fitted out for instruction purposes. The floor has been cut away to show the operation of the machinery. The wiring, air valves and other parts are also visible

The car is designed so that the instructor, by throwing the switches, can cause the various kinds of trouble. The student is then told how to operate the cut-out switches in the controller to clear up the trouble. After all parts of the mechanism of the car have been explained to him, the student is required to correct the various troubles and get the car in operation after the instructor has thrown it out of order.

The instruction of the men does not end with their technical training. Every man before qualifying has a talk with the safety director, who seeks to impress upon him the primary obligation of safety and his responsibility as a representative of the company. He then meets the superintendent of transportation for a personal talk. The company believes the benefit of these interviews cannot be overemphasized, as the student comes from them not only with a feeling of the importance of the job but with a knowledge that the officials, from the superintendent down, are backing him in his efforts to make good.

Those who finally qualify for service have the opportunity of pursuing their education further if they desire to do so. The men are encouraged to take correspondence courses relating to the public utility industry. The cost of such courses may be deducted from an employee's salary if he desires, and if he completes the course and makes a grade of 70 per cent or better the amount so deducted is refunded to him. The company also assists employees desiring to take night school or other courses, by arranging their hours of work. It was discovered a few years ago that 34 motormen could neither read nor write. Special classes for them were organized and all were given the rudiments of an education.

For the last three years the superintendent of equipment, his foremen and several of the point supervisors have attended a course in foremanship at the Georgia School of Technology. The results were so satisfactory during the first two years that in 1926 the company made arrangements for the entire supervisory force of the transportation, roadway and mechanical departments to take this course at the same technical school. The men attended on their own time and an average attendance of more than 90 per cent was maintained.

P.R.T. Remarkable Example of Employee Participation System

THE Philadelphia Rapid Transit Company, Philadelphia, Pa., is cited as the most remarkable example in the United States of employee participation in management in a survey recently completed by the International Labor Office of the League of Nations. According to the report that company is particularly striking, "as the employees are in process of acquiring complete financial control." The 10,000 employees already hold more than one-third of $30,000,000 of capital, giving them two directors of eight on the board of management. In conclusion, the report states that the communication of information to workers' councils and the sharing with them of some of the anxieties of management have led to a better understanding of problems of industry by the workers.

The study was made by H. B. Butler, C.B., deputy director of the International Labor Office.

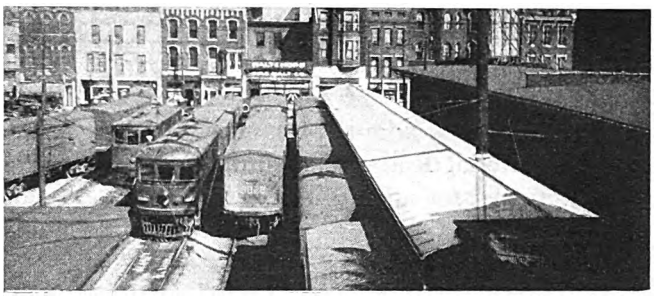
Columbus Freight Terminal Enlarged

Steady increase of freight business made the former building inadequate. Receiving capacity has been increased 70 per cent

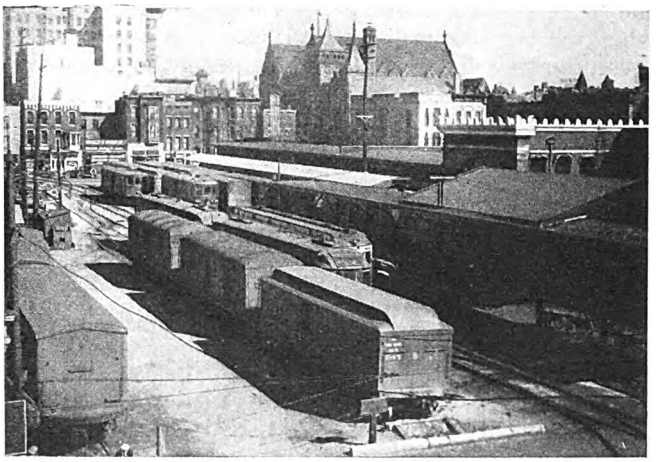
FREIGHT-HANDLING facilities of the Columbus Interurban Terminal Company were increased considerably by the enlargement of the previously-congested terminal. An extension, 41 ft. wide and 65 ft. long, was built on the freight house and the yard capacity increased to accommodate 30 cars. The extension has permitted an increase in floor space of 65 per cent, and an increase in the receiving capacity at the door of 70 per cent.

The effect of the changes was noticed immediately by the three roads which use the terminal, the Indiana, Columbus and Eastern Traction Company; the Southern Ohio Public Service Company, and the Columbus, Delaware & Marion Electric Company. Overnight service traffic between Columbus and the cities of Springfield, Cincinnati, Dayton, Fort Wayne, Detroit and Cleveland, as well as many intermediate cities, has picked up since the changes were made, according to reports. Before the terminal was completed many complaints were received from connecting lines about congestion. Since the new terminal has been placed in service, no more complaints have been received, it is stated, and many patrons have indicated that they were highly pleased.

Prior to 1911, all freight tonnage in and out of Columbus was small as compared with that of today. However, the terminal then in use was inadequate and a new one was constructed. The new freight terminal exceeded the abandoned station many times in size and exceeded the need of that day, but the management foresaw a sufficient increase in freight business to warrant the larger building. The terminal constructed in 1911 provided ample space for the efficient handling of freight, both in and outbound, until about 1922 or 1923 when congestion became quite noticeable. With the year 1926, which was the banner freight year of the company, the terminal was found to be inadequate and congestion



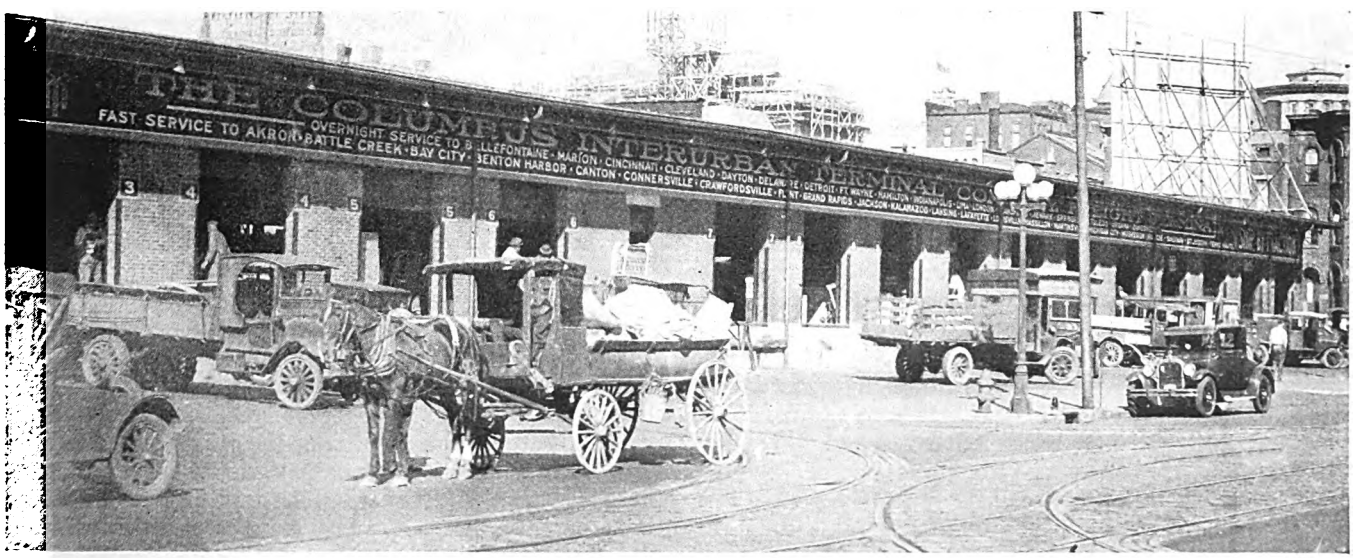
Track facilities of the terminal have been increased to accommodate 30 cars



The passenger station and the adjoining flatroofed freight house are back of the transfer shed in this view

was an every-day occurrence. Often three or four cars were standing under load in the yards from 24 to 48 hours.

Completion of the enlargement of the terminal was the occasion for an inspection and "get-together" party at Columbus, Ohio, Oct. 27, attended by traffic representatives of most of the electric railway properties of Ohio, Indiana, and Michigan, shippers of Columbus, representatives of civic organizations in Columbus, and officials of the Indiana, Columbus and Eastern Traction Company, who sponsored the party. Details of this meeting were given in a news item appearing in the Dec. 24, 1927, issue of the JOURNAL.



Seventeen service doors are provided in the present terminal for inbound and outbound freight

Buffalo Transfer Embodies New Features

Design recently adopted to meet conditions of International Railway, including use of one-man cars and universal privileges

By P. C. Snow
Vice-President Globe Ticket Company

EVERY transfer system, good, bad or indifferent, must include certain essential features, which are: (1) The date the transfer is issued; (2) the route or routes to which a passenger may transfer; (3) the time when the transfer privilege expires. The care taken in presenting this information determines in large measure

Front and reverse of new Buffalo transfers

The regular transfer (at top) is good on one car only, while the special transfer is accepted on two cars. In a few instances additional transfers are issued.

the success or failure of the transfer system. Adherence to the basic principles involved will go a long way in cutting down, if not eliminating entirely, many of the transfer evils which long have been the bane of transportation men.

The transfer designed and laid out for the International Railway, Buffalo, N. Y., in co-operation with its transportation engineers, is an excellent example of how these results may be accomplished. The study was directed by two engineers, but the employees, including co-operatinve committeemen, supervisors and trainmen, had no small share in the development of the transfer. In the opinion of the writer as close to a perfect transfer for the purpose as has yet been done has resulted. Whether the idea they have worked out can be adapted satisfactorily and used by all roads throughout the country is a question. However, it has been in use in Buffalo for several months and it is reported that results have been most gratifying in every way.

The accompanying illustrations show the two forms in use. The first or regular transfer is good on any line intersecting the issuing line, and requires no line punching. The second or special transfer is issued to cover rides requiring three or more cars. The operator punches the intersecting line, and on that line the stub is lifted, the passenger retaining the body of the transfer, which is collected on the third car. In a few rare instances riders may require four or five cars to make a journey. For these rides the issuing operator punches the word "issue." Only when this word is punched out of a special transfer does the operator of the second or later car issue a transfer on a transfer.

At the beginning of each half trip operators punch out the time, allowing a reasonable margin to cover slight delays in making connections. Thus all punching except for the unusual ride is eliminated from the line, greatly speeding the issuing of transfers. There has been a material simplification from the former transfer. This reduces the time taken by the issuing operator and makes it easy for the receiving operator to scan the transfer on acceptance. This reduction in time is essential for one-man operation, and at the same time decreases abuse given both by operators and by passengers.

The form adopted is what is known as a "line" transfer, the issuing line being indicated by color and by printing in large letters on the face of the form. The issuing date is surprinted in red on the face. On the regular form the transfer point and route are not punched, but instead inbound and outbound forms of different colors and with distinctive printing are used. On the reverse of the transfer is a list of the legitimate transfer routes and points allowed. The receiving operator has no difficulty in identifying the transfer and determining whether it is good on his line at the stop where the passenger boards and in the direction in which he is traveling.

Buffalo has adopted the hourly time limit, following the trend toward simplification. It has been found by experience that this restricts the passenger with a reasonable degree of accuracy, and it is felt that the fractional hour limit is not practicable for pay-as-you-pass and pay-leave collection, both of which were used in Buffalo when the new transfer was first employed. Buffalo cars are now 100 per cent one-man operated, and with the exception of four crosstown lines the method of fare collection is pay-enter inbound and pay-leave outbound. It is also easier for the issuing and receiving operators, particularly on one-man cars, to punch and inspect the hourly limit. As to the abuse, there is comparatively little to be lost with the hourly basis, since the average conductor is usually liberal when punching the fractional-hour transfer. The use of transfers long expired is obviated by the "P.M. coupon," which is torn off all transfers issued before noon. The difference in length and appearance is unmistakable.

Preceding the introduction of the new transfers, a series of newspaper advertisements prepared the public for the change. These advertisements illustrated both the regular and special forms of transfers, and discussed the conditions of use, telling the patron what to do to obtain the correct transfer. These were published in the daily papers for four days preceding the inauguration of the new system. Beside this, dash signs called attention to the newspaper advertising. The day the new transfers made their appearance the dash signs carried the wording, "Need a Transfer? What Lines, Please?" Bulletins in the cars also called attention to the new form.

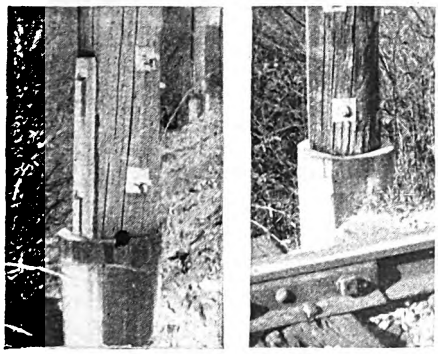
Maintenance Methods and Devices

Poles Butted With Reinforced Concrete

POLE butts of reinforced concrete have preserved for use almost 1,000 poles of the Pittsburg, Harmony, Butler & New Castle Railway and the Pittsburgh, Mars & Butler Railway. The method was devised by Harry Etheridge, vice-president



Two views of the completed butt, showing how the pole is bolted to the projecting tongues

and general manager of the companies. The method is economical, costing only $4.50 per pole. It is convenient as well, since the butts can be produced without disturbing the transmission or overhead.

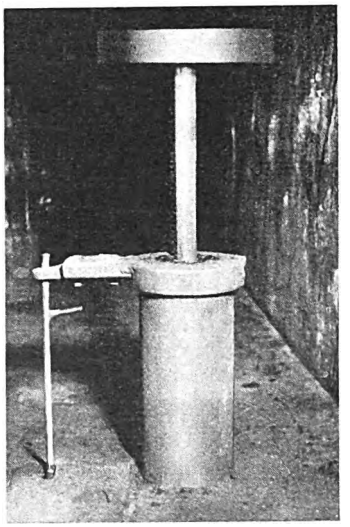
The reinforcing framework is constructed of open-hearth steel bars and rings. Three bars 2x$\frac{3}{8}$ in. and 5 ft. 3 in. long are welded to rings, as shown in the accompanying drawing. The lower ring has a diameter of 6 in. and the upper ring a diameter of 9$\frac{1}{2}$ in. Two bars 4x$\frac{5}{8}$x30 in. project from the lower framework and are welded to the lower bars just above the upper ring, as shown in the upper section view of the line drawing. They are at an angle of 90 deg. to each other and are drilled for $\frac{7}{8}$-in. bolts. Two bolts through each of the two tongues hold the sawed-off pole securely in position.

With the reinforcing framework in place, a specially constructed concrete form is clamped about the base. The form is 6 ft. high, of No. 16 galvanized-steel and in two halves, with flanges so the halves can be held together by external bolts. Fabric gaskets $\frac{1}{4}$ in thick are used between the faces. The inside diameter at the bottom is 10 in. and at the top 14 in.; so a layer of concrete approximately 2 in. thick surrounds the reinforcement in the completed butt.

A ring 3 in. wide and with a diameter of 14 in. is molded in the butt near the top and acts as an outside reinforcement. Three $\frac{3}{8}$-in. rods 8 in. long in chordal positions within the ring further reinforce the concrete at this point. The completed butt weighs 756 lb., of which 105 lb. is metal and 651 lb. concrete.

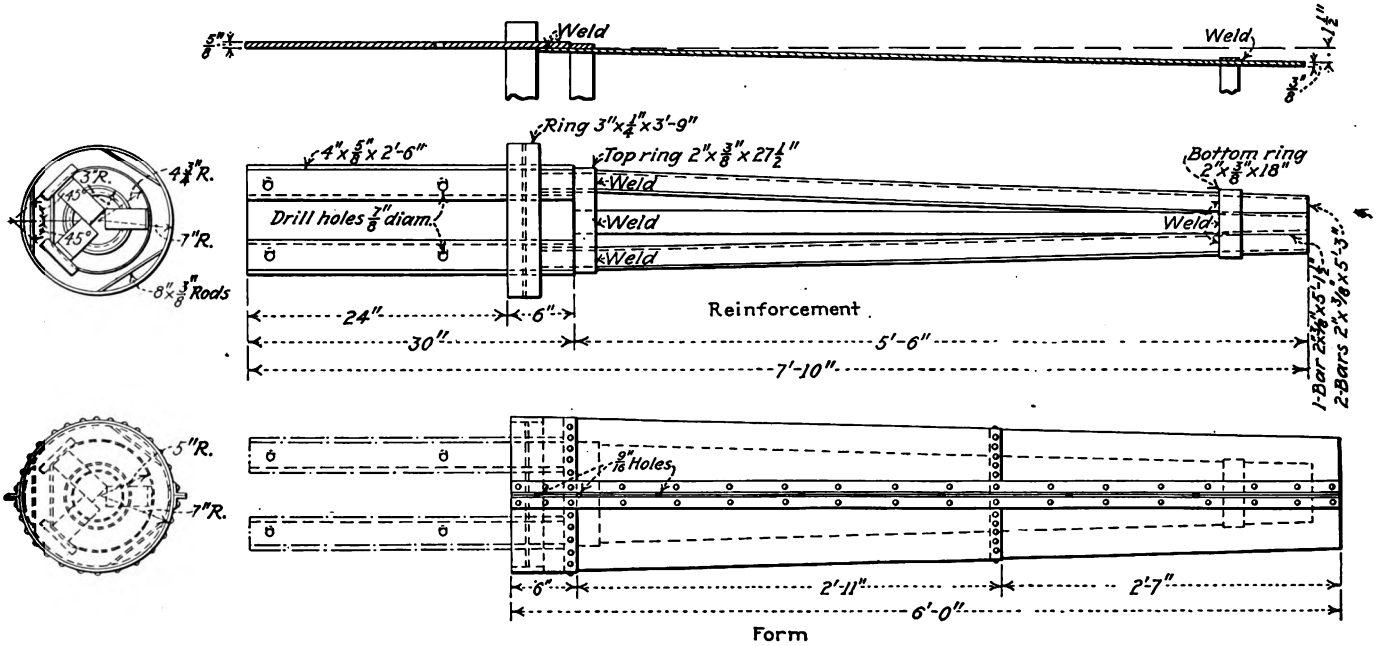
Hydraulic Armature Jack

REMOVAL and installation of armatures is done in considerably less time in the shop of the Binghamton Railway, Binghamton, N. Y., since the installation of a hydraulic



Jack in overhauling pit is an added convenience

armature jack. This jack, which is placed in the center of the pit floor, consists of an 8-in. iron pipe 6 ft. long, threaded on one end and set vertically so that about 3 ft. projects above the floor level. A 2-in. steel piston on one end and an oak plat-

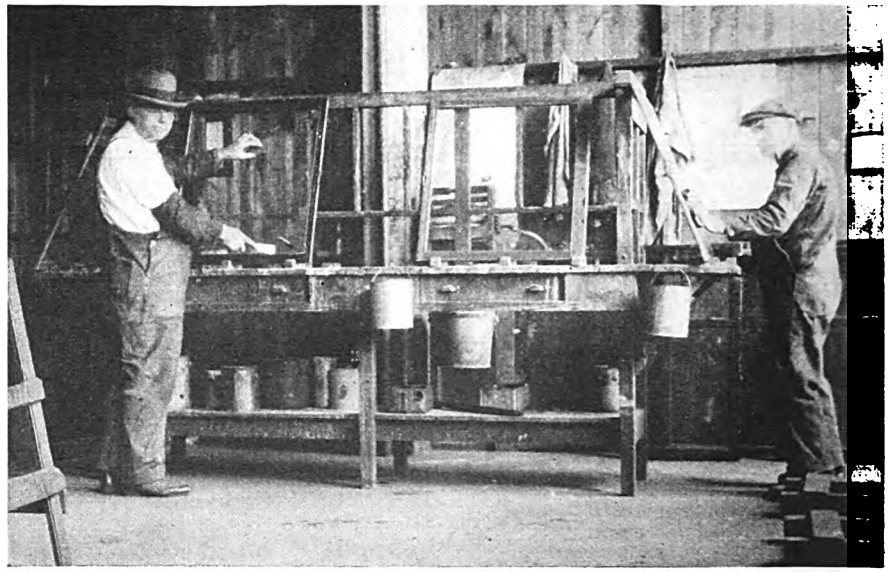


The metal reinforcement and the concrete form used in the work. The upper section view shows how the tongues are welded to the lower bars

Digitized by Google

form on the other are installed in this pipe. The exposed end of the 8-in. pipe has a casting screwed on it which acts as a piston stuffing box and a support for the valve operating handle. A 2½-in. pipe connected to the city water system and the lower part of the 8-in. pipe through a ½-in. globe valve furnishes the water.

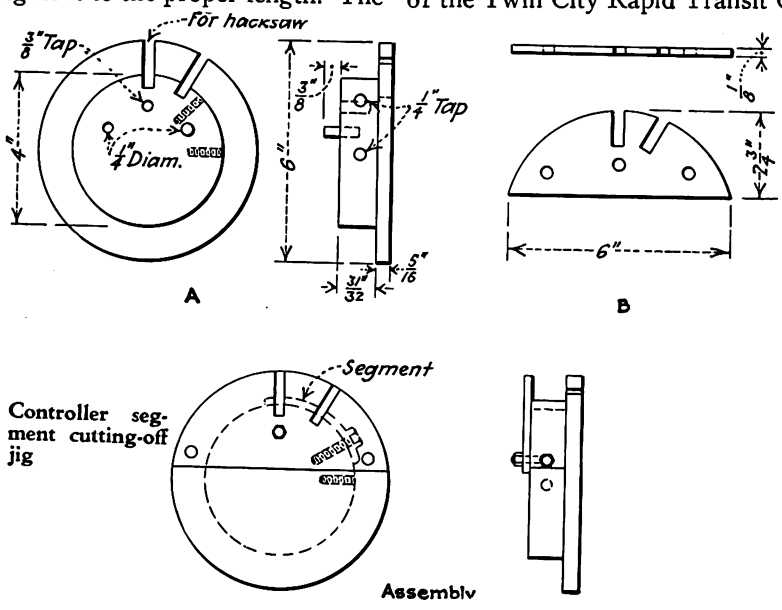
The operating handle moves in two directions. When it is thrown to the right it closes the drain valve and opens the city water valve, thereby raising the piston. When it is thrown to the left it closes the city water valve and opens the drain valve, lowering the piston. The motion of the piston can be stopped at any point desired by placing the handle in the neutral position where both valves are closed. The jack has a 5-ft. lift.



This table, with a rack in the center, facilitates the cleaning of car window sash

Controller Segment Cutting-Off Jig

CONTROLLER segments are being made at a substantial saving in the Woodside shops of the New York & Queens County Railway, Jackson Heights, N. Y., by the use of a simple device designed by controllerman John Hilbert. Burned controller segments formerly scrapped are now salvaged by cutting off the burned portion and using the shorter segment in other parts of the controller. This device is a cutting-off jig and is designed for cutting two lengths of segments. It is made of steel in two parts, *A* and *B*, as shown in the accompanying sketch. The main body *A* has a diameter of 4 in., is $\frac{81}{32}$ in. long, and has a 6-in. flange $\frac{5}{16}$ in. thick. Slotting of the flange radially in two places permits the entrance of a hack saw blade to cut the segment to the proper length. The $\frac{81}{32}$ in. surface of the hub is drilled and tapped for two ¼-in. machine bolts to hold the different lengths of segments. The 4-in. surface is drilled and tapped for a ⅜-in. bolt and provided with two ¼-in. dowels. The ⅛-in. plate, *B*, is drilled and slotted to line up with the slots, dowels, and topping in the hub of *A*. Plate *B* is designed so that the bottom edge stops above the center of *A* to allow for its application and removal without withdrawing *A* from the vise.



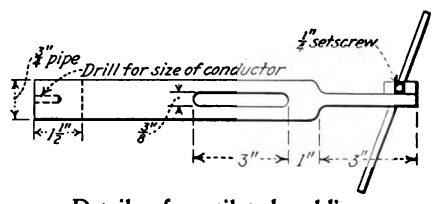
Controller segment cutting-off jig

Convenient Stand for Washing Sash

WHEN car sash are washed prior to installation, for the purpose of removing surplus paint, varnish or putty, it is often difficult to manipulate them so that all parts can be reached readily. To obviate this difficulty Joseph Gabler, foreman painter of the Twin City Rapid Transit Company at the St. Paul, Minn., shops, has designed and built the table illustrated. The bottom portion is an ordinary, sturdily built work table with drawers for holding tools and a shelf beneath. On top of this in the middle of the table there has been mounted a wooden rack, the height of which is correct for resting the sash at a convenient angle. Vertical rails make it equally suitable for smaller sash also. Notched cleats are fastened to the table top so that the sash will not slide off when rested against the central rack. Hinged extension shelves are fitted at the two ends.

Ventilated Welding Rod Holder

HOT WELDING-ROD holders caused considerable complaint from the operators of the shop and maintenance of way departments of the Binghamton Railway, Binghamton, N. Y., until Foreman Chapman designed a ventilated holder to eliminate the objection. It is claimed this holder can be used for any length of time under severe welding conditions and that it will remain at a temperature which will not cause discomfort to the operator's hands.



Details of ventilated welding rod holder

It consists of a ¾-in. pipe 16 in. long, flattened on one end for about

Digitized by Google

3 in. A rectangular block riveted to the flattened end is drilled for reception of the welding rod. A hole at right angles to this one, drilled and tapped for a ¼-in. setscrew, holds the welding rod in any desired position. The other end of the pipe is filled with brass to 1½ in. from the end and is drilled for the conductor cable. The feature of this holder is a ⅜-in. by 3-in. slot cut through the walls of the pipe beginning about 4 in. from the end of the holder. This hole acts as a ventilating duct or port for the dissipation of the excess heat.

New Equipment Available

Another Gas-Electric Bus

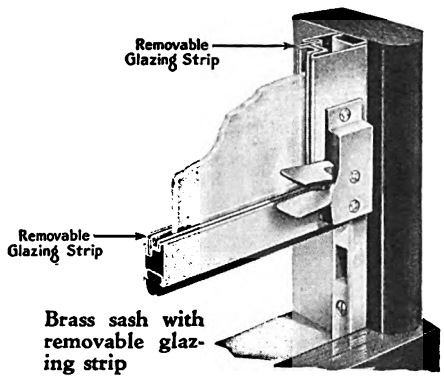
COMPLETION of design of a gas-electric drive motor bus has been announced by the White Company, Cleveland, Ohio. Several months of test have shown unusual power for the new equipment, it is claimed, and have demonstrated hill-climbing ability which permits severe schedules to be maintained without overheating.

The White six-cylinder 100 hp. engine has been modified and fitted with a new chassis for gas-electric service. Electrical equipment was developed in conjunction with the General Electric Company. The six-cylinder power plant permits larger and more powerful electrical equipment than has been customary. The new bus will carry a full load of passengers on fast bus schedules over hills which would tax the capacity of ordinary equipment. Although not designed for long distance work over open routes with few stops, it is suitable for routes combining suburban and city traffic conditions, and for intercity service.

The chassis is a complete unit, making it possible to mount bodies without alterations to the chassis wiring. In addition, attention has been given to the mounting of the motors and generators so that the work of removing any unit is simple. The generator is driven by a flexible steel shaft which runs through the generator to the commutator end, the drive being taken through rubber ball joints. The two motors are connected to the underslung worm-drive rear axle by short universal joint shafts, and the propellor shaft brakes are mounted directly on the rear end of the motor, thus forming a part of the motor design.

Sash With Removable Strips Make Reglazing Easy

WHEN brass window sash made its appearance some years ago, there was no provision made for quick reglazing in case of glass breakage. To provide for easy reglazing,



Brass sash with removable glazing strip

the O. M. Edwards Company, Syracuse, New York, has announced a metal sash with removable glazing strips. With this feature, a new glass may be inserted quickly without removing the sash from the opening.

To insert a glass, sash strips are removed from the two side stiles and top rail, the new glass is placed in the opening and the strips are reinserted in their grooves. No screws are used to hold the strips in place.

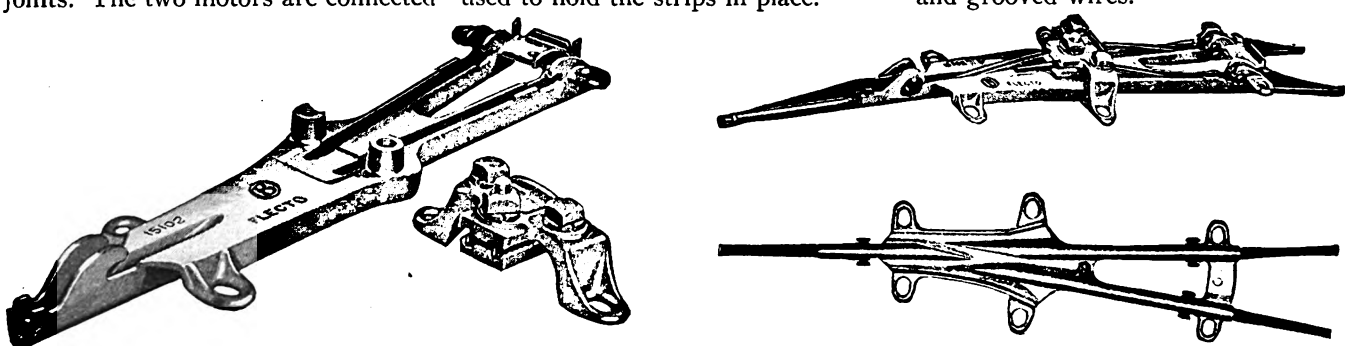
Duplex Trolley Frog With Detachable Pan

EASE and rapidity of replacement are features of the new Duplex trolley frog now offered to the trade by the Ohio Brass Company, Mansfield, Ohio. With this construction, a detachable suspension yoke and clamp become a permanent part of the overhead and permit replacement of a frog without disturbing the supporting span or trolley wires or losing the exact location of the frog being replaced. The suspension yoke is supported by cross-span wire for which pull-off eyes are provided. To this yoke is fastened by means of a ⅝ in. bolt the clamp which holds both trolley wires in relative positions. The frog itself is in turn attached to the yoke by two ⅝ in. bolts.

To make a replacement by installing the new frog the body or pan is released by removal of two bolts and the cam tips. With a Duplex frog in position there is no need to disturb supporting span or trolley wires when renewals are made since relocation and realignment need not be considered.

Long life is assured by special runners of liberal height, narrow cross-section and with extended overlap at the center of the pan. The runners are designed primarily to guide the wheel through the frog without break in contact and without permitting the flanges to touch the pan at any point. Current collection by the wheel alone, not by the flanges, results in longer wear for both frog and wheel. The Duplex frog and body suspension yoke are made of Flecto malleable iron, hot-dip galvanized, rust resisting and brittle free. The frog body is also equipped with pull-off eyes at each end for use when necessary and with the usual O-B cam tips which insure a smooth approach and leave. The same yoke is suitable for both right and left hand frogs.

The new type frog can be furnished for the usual sizes of round and grooved wires.



New duplex trolley frog

Special runners are provided of narrow cross-section and with extended overlap at the center of the pan.

Association Activities

The Place of the Interview in Selection*

By Dr. S. M. Shellow
Psychologist, Milwaukee Electric Railway & Light Company

In our zealous effort to introduce scientific methods in the selection of employees, we are likely to throw out any former devices which smack at all of subjective judgment. Those of us who have succeeded the old-time employment clerk with his systematized prejudices and intuitive hunches, have laid great stress on the error of personal judgment. So much effort has been expended in trying to correct the evils of the old-time personal interview by substituting objective tests that we have often leaned over backward in trying to stand up straight.

There can be no doubt of the value of properly standardized tests in determining fitness for a job, especially when they are checked by careful and reliable follow-up reports. But the test alone is insufficient. Again and again we find individuals who lie beyond the 60 or 70 correlation coefficient who do poorly in a test but make good on the job, or do well in tests but fail on the job. We might consider them as necessary errors in any selection procedure, or we might study the causes of success and failure and see whether or not they cannot be anticipated in selection.

There are still many traits which are necessary for the proper suitability to a job which cannot be adequately measured by tests. Personality is something more than a combination of various quantities of different traits. The whole may be qualitatively different from the sum of all of its parts. Behavior cannot be predicted simply on the basis of sufficient ability. There is a great difference between the ability to do a thing well, and the interest, desire and ambition necessary to employ that ability. Attitude greatly influences performance.

The interview is designed to supplement and interpret the test results. Its value depends upon its nature. Interviews range from rapid-fire cross-examinations to the thorough and careful searching of the personality characteristic of the psychiatric clinic.

Somewhere between those two extremes lies the practical interview for selection. The nature and extent of the interview depends entirely upon the nature of the job and the qualities which need to be brought out. There are, however, certain primary functions of an interview which make it an integral part of good selection procedure.

In the first place, the interview serves as a shock absorber. It establishes a friendly relation and understanding between the examiner and the applicant. It lends a personal interest atmosphere. The initial contact should be with this purpose in view, to put the applicant at ease so that his test results may not be effected by nervousness. An easy-going conversation about the applicant's past experience, reasons for applying for the job and whatever personal information is required can quickly establish good *rapport* as well as provide material for later filling in the face sheet or application blank.

The Nature of the Interview

Many important items which lead to conclusions as to the possible permanency of the applicant can be tapped during the interview.

The objection might be made that much of this information can be obtained by having the applicant fill out a blank. It is true that the information can be so obtained, but the proper introductory atmosphere for testing cannot be so established. And often much richer results are obtained in conversation about previous experience than in simply an itemized statement.

For many simple jobs, especially of a clerical nature, such an introductory interview is sufficient. The test results are paramount.

As the job becomes more complicated, the value of the interview increases. Especially is this true with jobs which require contact with the public.

There are many tests which attempt to get at "social intelligence." Some of them are helpful and suggestive, but they are indirect methods at best. Often the questions are answered as the applicant believes he is expected to answer them, and they do not represent his actual behavior in the given circumstance. The most direct measure of social ability is an actual social situation. An interview is such a situation. It is essentially the meeting of two personalities with different background and purpose. Its possibilities depend upon the training and the ingenuity of the interviewer.

A few examples may serve to illustrate the difference between testing social reactions through the interview method and through objective standardized tests. We will take the example of selecting a bus operator. The job divides itself into two major parts—ability to operate a bus and ability to deal courteously with the public. The first has been successfully measured by objective tests. For the past five years I have tried to find adequate objective measures for the second. Several of the current tests have been tried, as well as some which I devised myself. I have gone back to the interview method. The reason will be clear after an illustration or two.

Take the question: "What would you do if a lady got on your bus and gave you a counterfeit dime?"

Objective method:

1. Put her off the bus.
2. Say nothing and give it in change to someone else.
3. Call her attention to it and ask for other money.
4. Report her to the police.

This question can be answered by checking any one of the four statements

The possibilities of behavior are circumscribed. They include only four ways out. Chance operates. Take this same situation in an interview.

Question: What would you do if a lady boarded your bus and gave you a counterfeit dime?

Answer: I would not take it.

Question: What would you say?

Answer: I'd tell her it wasn't no good, and ask her for another one. (Note incorrect English—need for class in Practical English.)

Question: Suppose she was very much surprised when you told her it was no good and looked into her purse to get another one, and that was all she had?

Answer: Well, she'd have to get off.

Question: How would she get home?

Answer: That's not my business, she has to pay or get off. I couldn't let her ride for nothing.

Now why does he make this decision? Is it because he thinks it is what is expected of him, and he wants to make a good impression? Or would he actually put the lady off? Let us push it a little further.

Question: How do you think she would feel toward the company if you put her off a bus because you said her dime was not good?

Answer: Well, I guess she wouldn't like it.

Question: Part of your job is to get along nicely and make friends for the company. Couldn't you think of some other way to handle that situation?

Answer: Well, I could let her ride then.

Question: That isn't allowed. You'd lose your job if you permitted anyone to ride without a fare.

Answer: Well, I guess I could loan her a dime then, and she could pay me back.

The result of this interview shows that the applicant is trainable. He can be made to appreciate good public relations.

Other hypothetical situations bring out other characteristics. Hot temper, willingness to fight, impudence, all of these often creep through unguarded.

**Abstract of paper presented at the convention of the American Psychological Association, held at Columbus, Ohio, Dec. 28, 29 and 30, 1927.*

Digitized by Google

In a paper test they might easily be covered up.

The value lies in the elasticity. The questions are constantly shaped to bring out the attitude of the applicant. It is obvious that in order to gain results, the interviewer must be familiar with such psychological process as suggestability, defense mechanism and the like. A background of clinical experience is extremely helpful.

Checking Results

It is quite possible, and indeed often happens, that an applicant may have sufficient ability to pass the objective tests but lacks the proper attitude or personality for the particular job. It is the function of the interview to supplement the test results. Many an applicant has been rejected on the basis of the interview.

But interviews must also lend themselves to verification through follow-up record. It is possible so to record the interview results that follow-up forms may be designed to correlate with them. For example, in the case of public service, such expressions as these might appear on the follow-up record sheet which is sent to be checked by the department head or supervisor:

1. Actively courteous (makes a distinct effort to bring out good public relations).
2. Passively courteous (answers questions courteously, but does not take initiative).
3. Apathetic (has shown little tendency toward courtesy, though not actively discourteous).
4. Actively discourteous (has bad complaints).

In recording the results of the interview, the same phases can be used—and later checked against the follow-up reports. Verification and disagreement serve to guide the interviewer in the future

In the present state of objective selection procedure, we cannot rely entirely on test results. The careful observation of an intelligent and trained interviewer is invaluable in interpreting test results in the light of the particular individual in question, as well as venturing at a prediction of future success.

Group Meetings Stressed in Oklahoma Meeting

GROUP meetings will be stressed in the tenth annual convention of the Oklahoma Utilities Association at the Mayo Hotel, Tulsa, March 13, 14 and 15, according to E. F. McKay, manager of the association and chairman of the convention committee. Seven groups will hold separate meetings during the afternoons, and the general sessions will be held during the mornings. The groups will be the telephone, electric, gas, electric railway, public relations, manufacturers, suppliers and womens' committees. Papers and addresses throwing light on various operating and public relations problems will be presented to each group.

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 6-8 — American Railway Engineering Association, annual convention and exhibit, Chicago, Ill.

March 13-15—Oklahoma Utilities Association, annual convention, Tulsa, Okla.

March 14-15 — Illinois Electric Railway Association, Springfield, Ill.

March 21-22 — Central Electric Traffic Association, Seelbach Hotel, Louisville, Ky.

March 23—Maryland Utilities Association, annual meeting, Emerson Hotel, Baltimore, Md.

March 30—Executive Committee American Electric Railway Association, 292 Madison Avenue, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City, Mo.

May 2-5—Southwestern Public Service Association, Dallas, Texas.

May 6-12—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.

June 6-8—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.

June 20-27 — American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.

June 21-22 — American Railway Association, Motor Transport Division, Atlantic City, N. J.

June 28-29—Central Electric Railway Association, Cedar Point, Ohio.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

July 25-27—Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.

SEPT. 22-28, 1928

American Electric Railway Association, 47th. annual convention and exhibit, Cleveland, Ohio.

Indiana Utility Association Reorganizing

SINCE Oct. 1 the Indiana Public Utility Association has been in the process of reorganization. The old information bulletins have been stopped and a new information bulletin will be established early in 1928.

During 1928, according to an official bulletin, the Indiana Public Utility Association by its acts and its viewpoint will endeavor to be one of the most active and influential business and industrial associations of Indiana. To this end committees to direct the various activities of the association have been organized and are working. Particularly active since Nov. 1 has been the tax committee. H. S. Morse, of the Indianapolis Water Company, is chairman. The committee already has taken part in the general effort being made in this state to study the taxing situation. Mr. Morse takes a stand for a more scientific taxation system and has pledged the support of the association toward every effort for tax honesty and equity.

Ernest Van Arsdel, president Interstate Public Service Company, has been appointed chairman of the association's advertising committee. C. L. Kirk is now chairman of the association's committee on membership and finance.

American Association News

Electric Railway Finance

NEW car financing was the principle subject of discussion at the organization meeting of the committee on electric railway finance, held at association headquarters in New York on Feb. 24. Those present included the following: Luke C. Bradley, chairman; J. G. Barry, S. M. Curwen, P. W. Winslow, E. A. Tuson, representing Percy S. Young, J. W. Welsh, J. A. Miller, Jr., and Charles Gordon.

The committee devoted its attention to determination of the factors which affect the ability of electric railways to finance new car purchases out of earnings. Chairman Bradley held that the advantages of new cars have been demonstrated on many properties, but that the problem of financing such purchases out of earnings is a difficult one for some properties. Since the restricted credit of electric railways, attributable in many instances to unwieldy financial structures, stands in the way of securing capital for the purchase of new equipment, he felt that acceleration of the industry's recovery is contingent on devising means to make it possible to finance such equipment out of earnings. The experience of properties that have obtained new cars shows that they permit reduction of operating expenses and stimulate improvement of the many factors in railway operation ranging from public and employee relations to volume of riding.

Based upon this preliminary discussion the committee decided to devote its attention to the problem of encouraging the purchase of new cars out of earnings. This program was adopted on the assumption that some properties do not find it practicable to finance new car purchases out of earnings on the present customary terms. It was agreed to undertake the study of several typical properties to determine the basis on which new equipment could be financed and to investigate the possibility of broadening existing facilities for handling equipment trust obligations.

News of the Industry

Fare Changes Sought in Green Bay

Permission to increase the price of strip tickets to six for 50 cents and to abolish the city ride book with the cash fares remaining the same will be sought by the Wisconsin Public Service Corporation, Green Bay, Wis., from the Wisconsin Railroad Commission. The company now charges a 10-cent cash fare, and sells strip tickets four for 25 cents, and city books containing tickets for $2.50. On the interurban lines zone tickets are sold in 40-ticket books at $3 a book, and permission is asked to increase the price to $4 per zone book of 40 tickets each.

Figures accompanying the petition indicate that the deficit on both the city and interurban line was $279,824 in 1926, and $185,808 from Jan. 1 to Aug. 31, 1927. It is expected the new rates will reduce the deficit to $209,018 or to the rate of $.069 cents per passenger carried.

The company will also request permission to discontinue the fast freight service now offered over the interurban line between Green Bay and Kaukauna, which is being operated at a loss.

Appeal in Denver Case Refused

The United States Circuit Court of Appeals refuses to reopen the case of the city of Denver, Col., vs. the Denver Tramway, the court having ruled that the tramway has a "perpetual franchise" under the grant of 1885-1886. However, the court changes the fare stipulation, agreeing with the lower court that the company is entitled to charge a fare sufficient to net 7½ per cent upon a valuation of $23,514,769. It is said that the city will take the case to the United States Supreme Court, despite the fact that the Supreme Court refused in January, 1927, to take jurisdiction.

Hocker Line Restoration Successful

Service on the Hocker electric line between Kansas City, Mo., and Rose Hill, Kan., will be restored, according to an agreement reached by the Kansas City Public Service Company and the Sonken-Galamba Corporation, which purchased the line for junking.

A reorganized company, known as the Kansas City, Merriam & Shawnee Electric Railway, in which ownership of the line will be vested, will be formed, and $35,000 in bonds reissued to finance the rehabilitation. W. K. Paul, former manager of the line, will be the manager of the new concern. The Kansas Public Service Company will subscribe to $15,000 of the bonds, the Sonken-Galamba Corporation to $16,000, and $4,000 will remain in the treasury of the company. Preferred stock will be issued to patrons of the line who subscribed $10,000. The residents of the vicinity have subscribed more than the $10,000 quota as assigned to them, following a series of meetings in the towns to be served. The money will go to improvements. The special committee representing the citizens and railway officials are working on a plan to sell the bonds. It is said contracts will be let by March 12 and operation of the line started April 1.

The Kansas City Public Service Company will operate the cars on the line, which will serve the citizens of Kansas City, Shawnee, Kan., Merriam, Kan., South Park, and smaller rural communities. It will receive compensation of 4 cents per car-mile and 2 cents a kilowatt-hour for power. Five to 7 miles of the track will be replaced.

A freight connection with the Frisco Railroad is to be sought by the operators of the Hocker electric line. In addition to passenger service from the west limits of Rosedale to Rose Hill, a mile west of Shawnee, the reorganization will operate a freight car over the line.

Jitneys Die Hard in Detroit

More court actions and delays. Review of recent proceedings. Corporation Counsel Wilcox claims jitneys can establish feeder lines

FURTHER delay in ousting the jitneys from Detroit's main traffic arteries was won by counsel for the jitney drivers' associations when Circuit Judge Clyde I. Webster agreed to analyze the validity of the city ordinance against the jitneys. Edward N. Barnard, attorney for the jitney associations, argued that neither the Michigan Supreme Court nor the United States Supreme Court had declared the jitney ordinance valid and contended that the state court had found the measure valid only "as to the objections offered" to it in the case brought before it. Mr. Barnard further contended that the higher court had seen the ordinance was invalid in other respects than the objections brought before it.

The action was taken in a hearing on the motion of the corporation counsel to dissolve the temporary injunction issued in July by Judge Dingeman restraining the city from interfering with the operation of the jitneys. The motion was filed in December in an effort to remove the last legal barrier preventing the enforcement of the ordinance to regulate the jitneys.

The Council later voted unanimously to back Clarence E. Wilcox, corporation counsel, in his decision to carry an appeal to the Supreme Court.

In connection with this matter the corporation counsel's office won another point in the city's fight against the jitneys when the State Supreme Court on Feb. 15 issued an order requiring Judge Webster to defend his injunction of Jan. 31 which restrains the city from enforcing the jitney ordinance. The State Supreme Court granted the city's petition for leave to appeal from Judge Webster's denial of the motion by the city to dismiss the bill of complaint filed by the jitney interests.

In their petitions the corporation counsel and his assistant pointed out that the jitneys are starting on their fifth case, the other four having been decided adversely and one having been carried to the Michigan Supreme Court and to the United States Supreme Court. The corporation counsel contends that further to prevent the public authorities from exercising their legal functions would invade the rights of the people of Detroit, contrary to the public peace, good order and well-being of the community.

The City Council declined to hear an ordinance submitted by counsel for the jitney drivers' associations, intended as a substitute for the existing regulatory ordinance which the city has been seeking to uphold. Corporation Counsel Wilcox, to whom the substitute ordinance was referred, recently advised the Council against rescinding the present ordinance and passing a substitute. Mr. Wilcox feels that the fight is virtually won, and that the Supreme Court will vacate the circuit court injunction, but that if a new ordinance were passed, its validity could be questioned and carried through the same court procedure that followed the city's attempt to enforce the original ordinance.

Under the terms of the present measure the jitneys are not barred from the streets, but the ordinance prevents them from operating on certain main arteries in direct competition with the Department of Street Railways. The Council was informed by Mr. Wilcox that the jitneys, under the present ordinance, could establish feeder routes that are needed in the outskirts of the city.

Pass Restored in Youngstown

A plan whereby patrons can ride the cars of the Youngstown Municipal Railway, Youngstown, Ohio, for a whole week for $1.50 was put into effect on Feb. 26. No limit is placed on the number of rides, and the pass is good from midnight Saturday till midnight the following Saturday.

In order that the public might thoroughly understand the new weekly-pass plan, the company is giving full particulars through newspaper advertising which will be continued indefinitely.

The restoration of the weekly pass was decided upon when the 10-cent cash fare schedule was recently approved. This schedule calls for 10 cents on both buses and cars, a no transfer charge, six tickets for 50 cents and a weekly pass for $1.50. The City Council recommended an eight weeks' trial of the new fares. The old rates were 8 cents cash, seven tickets for 50 cents with a 1-cent transfer charge.

City Against Sacramento Increase

City Attorney Robert L. Shinn plans to renew his attack on the application of the Pacific Gas & Electric Company to increase the fares on its railway lines in Sacramento, Cal., to 7 cents. The hearing on the proposal is now before the State Railroad Commission. The Central California Traction Company's application for a 7-cent fare on its Colonial Heights line will also be considered. This company, however, is willing to stipulate that it will accept whatever rate is fixed for the Pacific Gas & Electric Company's lines.

Peoria Council Wants Monthly Permit System Restored

The Peoria, Ill., City Council will seek reversal of the Illinois Commerce Commission order which authorizes the Illinois Power & Light Corporation to abolish its monthly permit system, by which passengers were carried on the Peoria city lines for a nickel, and establish a fare of three tokens for a quarter. The 10-cent basic fare remains. The railway was denied the right to establish a 1-cent transfer charge. City authorities claim that about 7,000 50-cent monthly cards are issued during the summer season and 8,000 in winter, with the average holder using the card twice a day 25 days a month.

Modification of Fare Order Sought

The Johnson City Traction Company, Johnson City, Tenn., has petitioned the Tennessee Railroad & Public Utilities Commission for a modification of its order of Jan. 4, 1927, allowing the company to charge a 7-cent fare instead of 5 cents on condition that the extra revenue would be used in the immediate purchase of four one-man cars, and making other improvements to equipment. The company says that two of the cars have been purchased and that other conditions of the order have been partially met, but that the company is without funds to meet its current expenses. It is asking the commission to make it optional with the company as to when additional cars shall be purchased.

President Mahon on State of Employment

Lack of work among electric railway employees throughout the country indicates a generally widespread unemployment among all classes of workers in the view of W. D. Mahon, president of the Amalgamated Association. Mr. Mahon was in Washington for a conference with American Federation of Labor officials on the subject.

The federation has just compiled data showing a sharp increase in the number of union men out of work. Unemployment of the members of trade unions averaged 13.8 per cent in the last three months of 1927. The percentage had increased during the beginning of January to 17.8 per cent and preliminary figures for February indicate an increase even above the January figures.

The percentages of figures of unemployment for those of the 23 cities not already listed are as follows, the periods given being from October to December, 1927, and the month of January, 1928:

Atlanta, 8.7, 9.7; Birmingham, 12.3, 16.6; Boston, 17.8, 19.6; Buffalo, 12.3, 26.7; Cincinnati, 12, 18.6; Cleveland, 16.6, 33.8; Denver, 19.4, 21.3; Detroit, 21, 32.3; Jersey City, 12.4, 21.6; Los Angeles, 16.2, 22.7; Milwaukee, 7.3, 9.8; Minneapolis, 8.1, 11.6; Omaha, 14.7, 26; Philadelphia, 14.3, 30.6; Pittsburgh, 15.1, 17.6; San Antonio, 4, 9; San Francisco, 11.7, 14.3; St. Louis, 9.4, 12.5; Seattle, 10, 11.3; Washington, 9.3, 13.

Mr. Mahon is reported to have said that crews in nearly every city of the country were alternating in voluntary time off, taking a full day in many cities to keep a maximum number employed. A drop in street car traffic, he said, always reflected other unemployment. He cited the recent situation in Detroit when 82 train crews were laid off as a result of the shutdown of the Ford factory.

Rapid Transit Survey Bill in St. Louis

A bill establishing a rapid transit commission for St. Louis, Mo., was presented to the Board of Aldermen on Feb. 24 by Alderman Samuel Wimer, chairman of the special aldermanic committee on rapid transit. The measure calls for an appropriation of $25,000 for survey purposes. The commission would be composed of the Mayor, president of the Board of Public Service, a member of the Board of Aldermen, an engineer and three other citizens.

Baltimore Company Does a Real Service

A big hit has been made with an easy guide to new street names and car lines by the United Railways & Electric Company, Baltimore, Md. Recently the city authorities changed the names of approximately 900 streets, and the public has been more or less confused as a result. The guide issued by the United contains 46 pages and gives the new name of each street, its location, the section of the city, the car line nearest it and the old name. A cross index under the old name also is given.

About 20,000 of the guides were issued by the railway and are being distributed without charge. They are in great demand. The company mailed about 4,000 of the booklets to the individual members of the Baltimore Association of Commerce. As a result hundreds of letters have been received in which the company is praised for its move to help the public. A street car directory issued by the company was referred to in the JOURNAL for Feb. 11, page 254.

Sentence Served, Indianapolis Strike Organizers Leave Jail

Robert B. Armstrong and John M. Parker, who organized the strike in 1926 in Indianapolis, have been released from jail, where they served 90-day sentences for violation of a strike injunction issued by Judge Robert C. Baltzell, federal judge. They expect to be called before the United States Senate judiciary committee at its investigation of the anti-strike injunction issued by the court. The committee decided to call counsel for the Amalgamated Association together with officials of the Indianapolis Street Railway.

Would Extend Subway in Rochester

Extension of the Rochester, N. Y., subway in the bed of the abandoned Erie Canal is already being planned although the line has been in operation less than three months. The City Planning Commission has under consideration the extension of Broad Street, the overhead street now covering the subway in the center of the city from South Avenue to Oak Street. This plan would take the Park-Dewey surface trolley cars off the streets through the congested part of the city by diverting them by a ramp into the subway spur at Chestnut Street. The extension of Broad Street would necessitate razing of many large buildings in the downtown area and would involve great cost.

The subway railroad, built by the city at the cost of $12,000,000 and operated by the New York State Railways under a three-year service-at-cost contract, has not yet been put into full operation on high-speed schedules as proposed, but patronage is exceeding the hopes of the city and railway officials.

Strike Talk Revived

Correspondence of Mayor Walker to President Hedley of Interborough Indicates Critical Situation

FRANK HEDLEY, president of the Interborough Rapid Transit Company, New York, has reiterated the stand that its contract with the Brotherhood of Interborough Rapid Transit Company Employees makes it impossible for it to employ any members of the Amalgamated or to reinstate 23 members of that union which it has discharged because of that membership.

The letter in which this attitude was rephrased was made public shortly after Patrick J. Connolly, president of the Brotherhood, had announced that that organization would strike if the men dismissed for Amalgamated membership were re-employed. Mr. Connolly's statement follows:

Nine-tenths of the 13,000 employees are loyal members of the Brotherhood and want to be left alone. We are not fighting any outside labor organization but they are apparently fighting with us. We have an agreement with the I. R. T. and we are going to insist that the Interborough live up to this agreement. We ourselves are going to live up to our agreement with the Interborough.

Our agreement with this company requires that the I. R. T. must employ only those who are members of the Brotherhood. We will not tolerate Amalgamated sympathizers in this organization.

We had a meeting this morning and were instructed to see that none of the 23 members discharged be reinstated. We have been running this road since 1916 and we are not striking or tying up any railroads or threatening or causing any trouble.

In his letter to the Mayor Mr. Hedley restated his desire to avoid a strike. It was made in reply to a request from the Mayor that a representative of the company confer with the Mayor in relation to the demand of the Amalgamated organizers that certain Interborough employees who had been expelled from their Brotherhood be restored to their jobs by the company. The request was first submitted to the general officers of the Brotherhood for their consideration. Mr. Hedley said:

The management has been informed by the officers of the Brotherhood that the Brotherhood expects the management to live up to its agreement with the Brotherhood and not to retain in its employ any men who have been expelled from the Brotherhood. The Brotherhood officers request that they have a meeting with you so that their side of the matter may be presented to you. In case you care to arrange such meeting your office will find the Brotherhood officers ready to call upon you at your convenience.

The last thing which this company desires is a strike. No matter what the outcome, it may result in bankruptcy. It certainly will greatly incommode the public even if as perfect order be maintained by the Police Department as was done during the strike of 1926. But as you were advised last summer, the management cannot operate efficiently unless its operating forces are a harmonious body of loyal men.

This company operates the safest railroad in the world. With the exception of small groups of men scattered throughout the various branches of our organization who are affiliated with the Amalgamated Association in violation of their pledges to their Brotherhood and of their promises to the company, we have an efficient, loyal, satisfied and harmonious body of men. They constitute nine-tenths of our 13,000 employees, if not more.

They have repeatedly informed the management that they desire to be let alone by the Amalgamated members and sympathizers. Quarrels and vilification back and forth would be rife if this property were partly Amalgamated and partly Interborough Brotherhood. It must be one or the other in the interest of safe and efficient operation. Therefore the management must stand by its agreement with the great mass of loyal employees and discharge all others when so requested by the Brotherhood and decline to reinstate disloyal employees who have been expelled by their Brotherhood. By standing with more than 90 per cent of our loyal men we would seem to be able to render better service to the public and perhaps as well thereby have a better chance of avoiding bankruptcy.

Your good offices are earnestly requested to persuade the Amalgamated Association to refrain from officially calling a strike and also from taking such action as will result in a so-called outlaw strike where it will be claimed that the men got beyond their control. No body of men will go out on strike without indirect assurances of support from the Amalgamated.

Discussion of Chicago Bills Put Over

Samuel Insull, recently the target of innuendo and intimation in connection with his attempt to bring chaos out of the Chicago transportation muddle, has served notice that first he will withdraw from all effort to bring about a merger of the various properties if attacks upon him continue, and secondly, that the recent request for a higher elevated railroad fare was to render relief to the west side, declaring that whether better service is to be granted that section rests entirely with the politicians.

He covered the two points of just why he is in the railway situation, and why an increase in rapid transit fares has been asked, and summed up his answer in an emphatic and categorical denial that there ever was any "deal" between him and the politicians.

Meanwhile termination of all discussion on the local railway bills has been voted by the sub-committee of the City Council's committee on local transportation until after the primaries on April 10.

Freight Service Contracts for Rochester Subway Signed

Three steam railroads entering Rochester, N. Y., have signed contracts with the New York State Railways whereby the latter will operate freight service over the new municipally built subway railroad in the bed of the abandoned Erie Canal in the city. The latest railroad to sign is the New York Central which handles 80 per cent of Rochester's rail freight, it is estimated. The Buffalo, Rochester & Pittsburgh and the Lehigh Valley previously had signed agreements with the New York State Railways, leaving the Erie and the Pennsylvania the only ones yet to come into the fold.

Installation of the signal system is completed and reballasting of the road bed and straightening of curves remain to be done before the new line can install high-speed service and all interurban lines entering the city can be diverted to the subway.

Strike Averted in Memphis

Although a resolution had been approved looking toward a strike of the employees of the Memphis Street Railway, Memphis, Tenn., on March 1 a strike cancellation order was issued following the naming of W. A. Ransom, Gayoso Umber Company, as third member of the arbitration board. Mayor Overton's assistance was instrumental in deferring this drastic action. He suggested that a new contract be drawn up following the termination of the present one on March 31.

Differences between the company and the employees of the Memphis Street Railway have been widening since early last year when the men set forth their demands for an increase. Under the contract which expired on April 1, 1927, the scale per hour is: first year men, 47½ cents; second year men, 52½ cents, and third year men and older 57½ cents. The company, on the other hand, sought a reduction of 11 cents an hour. Although two arbitrators were selected, namely A. B. Galloway representating the men and F. N. Fisher representing the company, they have been deadlocked over the third.

Nashville Fetes Old-Timers

Old timers of the Nashville Railway & Light Company, Nashville, Tenn., gathered at the Chamber of Commerce Building for their annual banquet on Feb. 1. It was a meeting of the company's Twenty-Year Honor Club which numbers more than 90 men. Eight more employees were scheduled to receive their twenty-year service stripes.

Viaduct Service Resumed in Kansas City

Cars of the Kansas City Public Service Company, Kansas City, Mo., are running through the old Eighth Street tunnel and over the reconstructed elevated road making regular transportation service available again to the central industrial district, where a temporary system has existed since the abandonment of the elevated line six years ago. The resumption of elevated road service saves most of the workers from fifteen minutes to half an hour in getting to work and dispenses with transferring to reach their places of employment. Resumption of service caused the company to discontinue one line—the Minnesota-Argentine line, although it was announced that the route would be virtually duplicated by the new Indiana-Chelsea line. Rerouting was also made necessary.

Another Fare Hearing in New York on March 5

Federal Judge William Bondy has granted an extension of time to March 5 to attorneys for the city of New York and the Transit Commission to file their reply and briefs to the Interborough Rapid Transit Company in connection with the proceedings under which that company seeks to put a 7-cent fare into effect on its rapid transit lines. This was done by agreement of both sides and also because of the illness of Samuel Untermyer of counsel for the city. This automatically extends the time of the restraining order which will prevent any increase in fare on the Interborough Rapid Transit Company's lines before March 14.

One-Man Cars Make Safety Record in Rochester

On the Rochester, N. Y., lines of the New York State Railways, January accidents in which one-man cars were involved averaged only half of the number in which two-men cars were participants, based on mileage. Leon R. Brown, safety director of the railways, so announced at a meeting at which the safety banner for January was awarded.

The State Street division won the coveted flag with a low average of one accident for every 8,729 miles traveled. This division, of which F. F. Livernash is superintendent, covers more miles than either of its competitors, the Portland and Main divisions.

The monthly competition is part of Director Brown's campaign to reduce street car accidents in Rochester to the minimum and has stimulated much interest among the employees. The meetings at which awards are made are well attended and are addressed by a prominent speaker on some phase of safety work.

Competition Keen in Salt Lake City Safety Contest

Much interest is being displayed by trainmen of the Utah Light & Traction Company, Salt Lake City, Utah, in a safety contest which is now being conducted by that company. Some time ago the seniority list was divided into three teams, which were named the Red, White and Blue teams with a captain over each. The contest runs for alternate periods of 30 days. For example, it was conducted during January, and will be resumed again during March, May, and continued in this manner. At the end of each 30-day period the winning team (the one which has the fewest accidents) is given recognition in some form of entertainment.

A simple set of rules has been placed in effect. Each accident counts one point against the team whose member was involved, the failure of a contestant to report an accident costs his team five points, while a misleading report counts five against the team involved. Each team member wears a button signifying his membership in one of the three teams, and a great deal of intense interest has been developed among the men, with a remarkable degree of friendly rivalry.

The White team won the January contest, with a record of eighteen accidents as against twenty for the Reds and 25 for the Blues. These, of course, include minor accidents, regardless of their degree of seriousness.

It's No Longer Only a Street Car

"THEY never come back" may have its application to prize-fighters and opera singers but certainly not to street cars. They are back on the streets and look better for their period of depression and neglect. Its everybody's business to see the *Nation's Business* for March, 1928, and read what Raymond Willoughby has to say about the new vision of the electric railway industry. "Right Up Front, Please!" is a complete picture of the untiring efforts at solving the operating, manufacturing and employee problems inherent in and incident to the transportation business. The writer had recourse to the analysis of the American Electric Railway Association and to the ELECTRIC RAILWAY JOURNAL for certain data on operating statistics.

Taxi War Hurts Seattle Trolleys

Two proposals are to be laid before the City Council of Seattle, Wash., for eliminating taxicab competition which, with its cut-rate fares, is causing losses to the Municipal Railway. One plan will provide for the operation of taxicab companies on a franchise basis. The other plan will provide for a rigid system of licensing. T. J. L. Kennedy, corporation counsel, has not given an opinion as to what legislation may be enacted. Clark R. Jackson, superintendent of public utilities, said that recent low fares by taxicab companies have cut the number of street car passengers 2,400 a day. Councilman Campbell declared that if competition between taxicab companies continues, they will be operating at rates as low as the old jitneys.

New Tariff in Chicago Suspended

A suspension until July 13 of the new passenger tariff of the Chicago Rapid Transit Company, Chicago, Ill., was ordered on Feb. 21 by the Illinois Commerce Commission. At that time attorneys for the elevated lines may appear before the commission to argue for the elimination of the three tickets for a quarter rate, the $1.25 weekly pass and the establishment of a straight 10-cent fare.

Ambitious Transit Plan for San Fernando Valley

Plans are now being worked out by a committee called together by the combined chambers of commerce of the San Fernando Valley immediately north of Los Angeles, for the construction of a rapid transit railway line between that valley and Los Angeles. According to D. W. Pontius, vice-president of the Pacific Electric System, who spoke to a group of the leading citizens of San Fernando Valley recently, one million are headed toward California, and it is up to the leaders of the San Fernando Valley just how many will settle there. He added that only by building a railway system that would carry people to the heart of the city in fifteen or twenty minutes could a portion of that host be attracted to San Fernando Valley.

At the present time, the San Fernando Valley is served by an interurban line of the Pacific Electric Railway. It is the expectation of this group of the Chamber of Commerce that the service of the valley can be much improved by the construction of a direct line with a more frequent schedule.

G. A. Damon, prominent engineer, once affiliated with Bion J. Arnold, Chicago, said in commenting on the suggestion that the cost of the improvement be levied against property owners who would benefit most by the road:

> As a matter of fact, rapid transit from outlying districts is not popular with many of the suburban communities. Hollywood has no desire for rapid transit and Pasadena is opposed to it. The doubling of land values would work a hardship on many small home owners. Car service to and from Pasadena is improving, the patronage of the Pacific Electric is increasing and I am sure that Pasadena would be unwilling to bond itself for extra service.

Among the advocates of the plan is Charles H. Kline, chairman of the rapid transit committee of the Burbank Chamber of Commerce.

Harbor Belt Line in Los Angeles Planned

A contract for the unification of about $59,000,000 of railway facilities in Los Angeles Harbor has been completed by the Los Angeles officials, representatives of the Harbor Commission of Los Angeles and the Southern Pacific, the Union Pacific, the Atchison and the Pacific Electric Railway Companies. All these properties will participate in the development under which an independent operating unit, to be called the Harbor Belt Line, will be organized. Formal action by the city officials and railways is now awaited. The several railroads concerned in the agreement own tracks running into the harbor and the contract provides for the unification of their operation. It is expected that the Harbor belt line will facilitate the arrival and the passing of shipments to and from shipboard in the harbor.

Dinner to Brady Prize Winners

Louisville Railway entertains its employees at safety gathering. W. T. Kays gets Connelly Award

MORE than 1,000 employees and their wives attended the first all-carhouse safety dinner at noon on Feb. 20 as guests of the Louisville Railway, Louisville, Ky., in the paint shop at 29th Street and Broadway. The dinner was held to commemorate the outstanding safety record on the company's lines in 1926, which won national recognition by carrying off first honors in the Brady Safety Award Contest.

Employees of the company have a record to be proud of, many speakers declared, as they exhibited the Anthony N. Brady Medal Award from the American Museum of Safety to the Louisville Railway for the greatest achievement in safety and sanitation of any electric railway in the United States in 1926. They pointed to the average of 37,490 miles per accident during the month of January on the company's lines. They warned, however, that an even greater effort on the part of every employee is necessary to maintain the high standard that has been established.

Outstanding public service on the part of an individual employee was rewarded by the company at the dinner, when the Anthony F. Connelly Award was presented to William T. Kays, 38 years old, 2426 West Broadway, a motorman on the Oak Street car line, operating out of the 29th Street and Broadway carhouse.

James P. Barnes, president of the company, presented the award in honor of the late Anthony F. Connelly, who died three years ago after being connected with the company for more than 50 years. The award included the Anthony F. Connelly medal and $75 in gold. Mr. Barnes also announced that Mr. Kays would be a guest of honor of the railway at the American Electric Railway Association convention in Cleveland next September.

Five other employees who received honorable mention in connection with the Connelly Award were Clint Kessler, Fourth and Avery carhouse; Fred Gollar, Shelby Street carhouse; George Bishop, 29th and Broadway carhouse; Charles A. Buren, 25th and Market carhouse, and William Schwindel, 27th and Chestnut carhouse.

Mr. Barnes said it was not believed a few years ago that all of the company's carhouses would ever be represented at the same safety dinner, because it was necessary for each carhouse to have a record of at least 25,000 car-miles per accident in a given month to be eligible for the dinners. Last month was the first month such a record has been attained, he said.

The Chestnut Street carhouse was the only one having a perfect record, as its record of 61,683 miles during January was unmarred by a single accident. The other carhouses' mileage per accident was as follows:

Highland, 67,363; Shelby, 47,523; Market, 41,341; Thirteenth and Main, 37,258; Fourth Avenue, 33,582; Seventh, 33,326; Portland, 31,228, and Broadway, 30,668.

Chartered cars brought motormen, conductors and other employees and their wives to the improvised banquet hall from all sections of the city. Music was furnished by the Louisville male high school band and numerous entertainment features were provided.

A similar meeting on the night of Feb. 20 was attended by more than 1,400 employees and their wives, who were on duty at noon and unable to attend the earlier dinner.

In commenting on the matter editorially the Louisville *Times* of Feb. 21 said under the caption "High Honor":

> Employees of the Louisville Railway are recipients of high honor. Nothing less than good team work, every day, could get for the employees of a city railway the Anthony N. Brady Award from the American Museum of Safety.
>
> The dinner last night commemorating receipt of the award, and calling attention to the January record of more than 30,000 miles per accident directs attention to the spirit and the achievement of the car men. That spirit, and that achievement, should be valued.
>
> By the way, the record pretty flatly contradicts carpers who, here and there, complain that car operators are discourteous and disregardful of patrons. A car operator who disciplines himself in caution is not often one who is without consideration for car patrons.

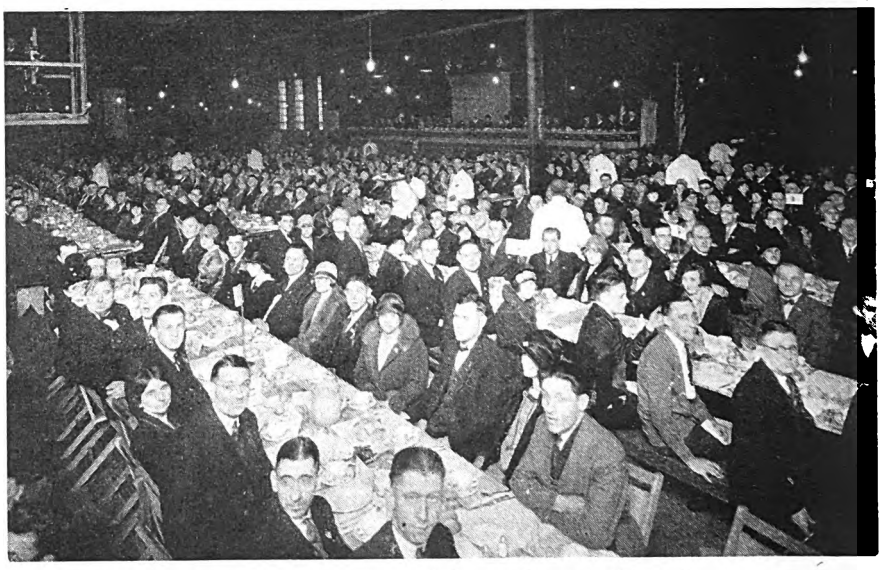
Children Ride St. Louis Cars to See Colonel Lindbergh

Approximately 60,000 school children were carried by the St. Louis Public Service Company from various points in St. Louis to the river front to see Col. Lindbergh and the Spirit of St. Louis perform on Feb. 15. Through arrangements with the St. Louis Board of Education the company provided 350 chartered cars and seven special buses to transport the children. Six buses also were put into service between Fourth Street and the levee to provide accommodations for the little ones. The children came from 99 grade and fifteen high and junior high schools scattered throughout the city.

The schedules provided for the children to reach the river front about 1:30 p.m. while 3:20 p.m. was the time set for their departure. It was necessary to reroute every line touching Broadway or Fourth Street and the arrangement called for the turning back of certain other lines. One hundred supervisors were placed at advantageous points to direct traffic while special emergency trouble crews were placed at convenient spots in case of need. But so efficiently did the traffic department of the company operate that none of the 60,000 children was injured or lost while the chartered cars were taken out of the congested zones in time to avoid the afternoon rush.

The Board of Education paid the customary charge of $14 per street car and $6 an hour for the buses used. Children and their teachers and principals were provided with identification slips in the form of pasteboard street car tags.

All those wearing such tags were permitted to use the cars to return to their schools. Cars also bore signs showing the name of the school served and carried two small American flags as identifying marks.



A representative group of those who serve humanity

Paving Plan in Toledo Awaits Franchise Passage

The Community Traction Company has written the administration at Toledo, Ohio, that it cannot go along with the big paving program unless the plan for the new franchise offered last summer is adopted. This plan would make available more than $1,000,000 in new money and contemplates several new bus routes.

Offices in Ohio to Move

General offices of the Surburban Light & Power Company, the Surburban Power Company and the General Light & Power Company will be moved from Cleveland to Alliance, Ohio, some time during February, according to E. W. Sweezy, president and general manager of the companies. The suburban Light & Power Company is the holding company for the other two corporations. The companies were recently purchased by New York capitalists who own the Stark Electric Railroad operating between Canton and Alliance. Mr. Sweezy was named head of the concern following the purchase.

New Safety Contest in Youngstown

Operators of Pennsylvania-Ohio Electric Company are in the midst of a new accident prevention contest with every employee of the three railway divisions outside of Youngstown, Ohio, determined to reduce the accident record to a new low level. The conditions are similar to those imposed before except that the year has been divided into four periods of three months instead of six periods of two months. The division with the highest average mileage per accident at the end of each three-months period will celebrate. The division winning the most victories at the close of the year will get a permanent trophy.

Interchange Privilege in Olneyville

An interchange of transfers between the Olneyville-Eddy Street buses and trolley cars in Olneyville has been made effective by the United Electric Railways, Providence, R. I., at the request of the Public Utilities Commission. The company had previously issued transfers only on the Eddy Street end of the bus line.

Strike Continues on Pottsville Lines

The strike on the lines of the East Penn Electric Company, Pottsville, Pa., continues with little prospects of a settlement. Meanwhile buses are being operated in the territory by the individual certificate holders. On Jan. 6 the employees walked out because they were unable to agree with the company on the inclusion of the word "subsidiary" in the new contract. The old contract expired on Dec. 31, 1927. Since the inception of the strike the so-called grievance as regards buses has been abandoned by the men. Now the company insists on certain conditions being eliminated which were in the former contract and is also insisting on the dismissal of a number of men especially objectionable to it. Members of the union appear adamant against receding from their stand that all strikers be returned.

Recent Bus Developments

Another Plan to Solve Tangle in Columbia

Another panacea for the transportation ills in Columbia, S. C., was suggested recently when the City Council adopted a resolution to the effect that bus equipment to the amount of $25,000 or $30,000 be purchased and leased to some responsible concern for an annual sum sufficient to repay the city in approximately three years. This company would be granted exclusive right during this period to operate bus service in Columbia and to control all forms of motor vehicle transportation charging not more than a 10-cent fare. This resolution sets forth that the city intends to hold the Broad River Power Company for whatever loss, if any, may fall upon the city from the putting into effect of such a plan.

Meanwhile, action is pending in the Supreme Court to compel the Broad River Power Company to resume railway operation. Several bus operating concerns have made definite offers to operate systems in Columbia under certain conditions, but so far none of these offers has been accepted.

The General Assembly, now in session, has under consideration a bill introduced by the Richland delegation (Columbia is in Richland County) which authorizes the City Council to control traffic on the city streets. The purpose of this bill apparently is to put the jitney out of business, as the measure provides that the Council may designate on what streets jitneys may run.

Citizens generally are becoming more and more aroused over the transportation situation and it promises to be a main issue in the election for the members of the City Council to be held in April.

Several of the suburbs of Columbia are being served by privately owned buses which make three or four trips each day. Parents of school children are demanding that something be done to enable them to get their children to school without being forced to depend entirely on uncertain jitneys. Since March, 1927, no street cars have been running in Columbia.

Muncie Case to Go Back to District Judge

The United States Circuit Court of Appeals at Chicago has reversed a recent ruling of Judge Robert C. Baltzell of the district court in Indianapolis in the suit of the Equitable Trust Company, New York, trustee, against Sumner W. Denny and other operators of independent bus lines in Muncie, Ind. Attorneys have been advised that the district judge erred in his ruling that he was without jurisdiction to try the suit in which the trust company, as trustee of a mortgage on all the property of the Union Traction Company of Indiana, seeks to prevent the defendants from operating buses in Muncie in competition with the railway lines. The action will result in the case being referred back to the district judge for trial.

Express Bus to Cuyahoga Falls

A new express bus line to Cuyahoga Falls, Ohio, from Akron, was started on Feb. 27 by the Northern Ohio Power & Light Company. The base schedule is half-hour headway from 4:30 a.m. until 8 a.m., then one hour headway until 3 p.m., when the headway again changes to half-hour until 7 p.m., and after 7 p.m. until midnight one-hour service will be maintained. As the riding develops extra tripper service will be fit in during the rush hours when and as required. The purpose of the new operation is to serve a wider territory in Cuyahoga Falls and to relieve the heavy load situation which has developed on the present express bus line.

Houston's Suburb Enjoy Bus Service

Fifteen new Twin Coach buses were put into service on Feb. 1 by the Houston Electric Company, Houston, Tex. These buses serve Harrisburg, one of Houston's suburbs, an industrial center and residential section located on the water front. Prior to this installation of bus service one portion of this section was served by twenty jitneys while the other section was served by a car line. Operation of both the jitneys and car line was stopped with the inception of the bus service. Round-trip mileage on the line is 14.5 miles, minimum headway three minutes and the maximum headway nine minutes.

Regulatory Conference on Buses in Georgia

As soon as it can digest the information secured as to schedules, locations, rates and other features the Public Service Commission of Georgia will call the bus men together for a conference to work out details of supervision, uniform rates and so on. Already the companies must obtain permission from the commission before they can issue bonds or stocks for sale.

Some weeks ago the commission asked all operators of bus lines in Georgia to file reports giving necessary details of their business by Feb. 21. All of the companies complied with the order except the Pierce Bus Lines, Griffin, which questioned the jurisdiction of the commission. However, this company declared that it would comply with the order under protest.

Detroit Debates Jefferson Avenue Test

Percentage of passengers transferring between bus and car decreases and expenses are much higher

TWO reports on the combined bus and railway service on Jefferson Avenue, Detroit, have been submitted to the Common Council. One was from the Rapid Transit Commission. It is dated Jan. 25. The second is a combined report of the Rapid Transit Commission and the Street Railway Commission. It is dated Feb. 13. The report of the Rapid Transit Commission is accompanied by numerous charts.

Some of the Details

This latter report points out that the Grand River-Jefferson Avenue lines are the only ones of the system affected by the service. The former is 10.7 miles long, the latter 6.37 miles. Prior to the express experiment they were operated as one line with a combined length of 17.07 miles. A partial combined railway express and bus service was begun on the Jefferson Avenue line for a distance of 4.13 miles on Sept. 18, 1927. There were six express stops ranging from 0.52 to 1.22 miles apart. Free transfers were made to and from a local bus service at these stations for the regular fare of 6 cents. On Oct. 1 the operation of through cars at frequent intervals during the rush hours was resumed. During the last part of December the maximum distance of 1.22 miles between express stops was cut to 0.55 and 0.67 miles by the introduction of a new stop.

There was no change in speed on the Grand River line. On the Jefferson Avenue line the former speed of 13.5 m.p.h. between Woodward Avenue and the terminal at Wayburn rose to 14.8 m.p.h. On the express section alone a speed of 17.96 m.p.h. was attained. For the entire distance the passenger would save 3.24 minutes over his former travel time. At intermediate destinations he would save less, and if his journey required transfer to a local bus, he would lose a little time over the former run.

Combined Street Railway and Rapid Transit Report

During the first few weeks of the new service about 50 per cent of the bus passengers transferred to the rail, but this dropped rapidly upon the extension of the local bus service to the business district until it reached 12 per cent in December. Of the rail passengers 93.5 per cent remained on the cars. The gross revenue was fairly uniform, being in July $189,401, November $182,322, and December $195,334. The expenses grew rapidly, however, so that while in July the operating ratio on the combined lines was 82.5 per cent, and in August 83.4 per cent, in October, the first full month of operation under the experiment, it was 96.5 per cent, in November 95 per cent, and in December 97.5 per cent.

The combined report to the Common Council, signed by the presidents of the two commissions, related particularly to a suggested plan to erect a station structure in the center of the street with one or more under-passes to connect the structure with the sidewalk, the whole to be used with a combined electric railway express and local service.

The report points out that such a station would require car loading on the left hand side of the cars, instead of on the right and also a shift of the tracks to curve around the proposed station. Both of these changes would require extensive and costly alterations in existing equipment and track. Referring to the service on Jefferson Avenue the report says, in part:

Jefferson had the highest average speed of any of our street car lines before the present test, and with the express method of operation will permit speed not attainable on any other line. It is the only street that is 120 ft. wide for several miles, and it has the minimum of cross traffic. Its physical characteristics are most favorable. We should learn all we can about the cost, speed, etc., under those particularly favorable conditions before attempting to determine our future policy.

Statement About Riding Habits

During December, 1927 (after 3½ months of operation), the riding habit on the express street car and local buses was as follows: Using street cars exclusively, 73.3 per cent; transferring from car to bus, 4.3 per cent; using local bus exclusively, 19.4 per cent; transferring from bus to car, 3.0 per cent; total, 100 per cent.

The report declares it is most important to determine whether a bus line can be operated in connection with a railway line upon a 6-cent fare. Further research is thought necessary. The test now being conducted on Jefferson Avenue should be continued for a further period. The proposed transfer station between the tracks is condemned, but a passageway, to be designed and constructed under the direction of the Department of Street Railways, is recommended at Jefferson Avenue at Chene to determine whether pedestrians would use it rather than wait for the green traffic signal and cross on the street surface.

As opposed to these reports the express system of car operation seems to have reduced delays of street traffic. Statements on this point from drivers of automobiles and motor trucks appear on page 358 of this issue.

Bus Substituted on Chattanooga Line

Discontinuance of passenger service on the Red Bank and White Oak lines of the Chattanooga Traction Company, Chattanooga, Tenn., has been authorized by the Tennessee Railroad & Public Utilities Commission. At the same time the company has been permitted to operate a passenger bus line connecting Chattanooga, White Oak and Red Bank. Transfers on the buses will be accepted on any cars of the railway system. The company must continue railway service between Valley Junction and Woodlawn, a distance of less than a mile, Woodlawn being off any highway. Valley Junction is the point where the company's Signal Mountain and Red Bank lines divide.

Would Run Bus Line in Marlboro

The Boston, Worcester & New York Street Railway has made a request of the Marlboro, Mass., City Council for permission to operate a bus line in that city to replace railway service. Action by the City Council was held up until such time as officials explain whether their plan is to discontinue the railway line entirely.

Bill to Permit Bus Extensions in New York

Under the provision of a bill introduced in the Senate by Walter W. Westall, Republican of Westchester County, section 50-a of the public service commission law is amended by authorizing the commission to permit a street railroad or railroad corporation to operate stages, buses or motor vehicles on streets not included in, but forming route connecting with the route of such railroad, provided local consents are obtained. The matter has been referred to the public service committee.

Run South of Indianapolis to be Continued

The Indiana Public Service Commission has ordered the Interstate Public Service Company, Indianapolis, Ind., to continue for a trial period of sixty days the operation of a bus route south of Indianapolis. A loss on the route during the first 60 days of operation was reported by the company.

Replacement on Buffalo Line Under Consideration

Action has been withheld by the Town Board of Cheektowaga on the application of the Buffalo & Williamsville Electric Railway, Buffalo, N. Y., for approval of a franchise to operate bus service through the township as part of the Williamsville-Buffalo interurban line to replace the present single track electric railway along Main Street from Williamsville to the Buffalo city line. The Town Board said it desired additional information regarding rates of fare, local stops and maintenance of road repairs.

Stage Service for California Orange Show

The Pacific Electric Railway, Los Angeles, Cal., has been granted a certificate by the California Railroad Commission to operate an auto passenger stage service between San Bernardino and the Fair Grounds of the National Orange Show during the period each year when that show is open.

Financial *and* Corporate

Financial Structure of Lackawanna Line Simplified

The Lackawanna & Wyoming Valley Railroad, Scranton, Pa., recently arranged with a banking group composed of Taylor, Ewart & Company, Inc., Bioren & Company, and Samuel McCreery & Company, for an issue of $4,000,000 in bonds, the money to be used to take over from the Scranton & Wilkes-Barre Traction Company, the holding company, the bonds, mortgages, preferred and common stocks of the company and place them in control of the railroad. The Scranton & Wilkes-Barre Traction Company holds $5,000,000 in bonds of the Lackawanna & Wyoming Valley Railroad. With the elimination of the holding company the Lackawanna & Wyoming Valley will save about $10,000 a year in interest on bonds held by the holding company.

The $4,000,000 is to be obtained through the sale of $2,900,000 first mortgage bonds and of $1,100,000 gold debentures. Upon completion of this financing, the $2,900,000 first mortgage bonds and $1,100,000 debentures will constitute the only funded indebtedness of the company.

The Lackawanna & Wyoming Valley Railroad (Laurel Line), operates by a third-rail double-track railroad of modern construction connecting Scranton, Pittston and Wilkes-Barre. This road, including an extension to Dunmore, is 22 miles in length and has been built entirely on private right-of-way owned by the company with one minor exception. The road is constructed in accordance with standard specifications, permitting an interchange of equipment with the Delaware, Lackawanna & Western Railroad, the Lehigh Valley and the Erie. The company owns the entire capital stock of the Lackawanna & Wyoming Valley Power Company, which generates the power used by the railroad.

Taylor, Ewart & Company, Inc., New York, are offering at 100 and accrued interest to yield 6 per cent $1,100,000 of the twenty-year 6 per cent gold debentures dated Feb. 1, 1928, and due Feb. 1, 1948.

In addition to this offering Taylor, Ewart & Company, Inc., Bioren & Company and Samuel McCreery & Company are selling at 97 and accrued interest to yield more than 5.20 per cent $2,900,000 of the company's 5 per cent first mortgage gold bonds. These bonds are dated July 1, 1913, and are due Aug. 1, 1951.

Stockholders Approve International Railway Changes

At a special meeting of stockholders of the International Railway, Buffalo, N. Y., on Feb. 23 the plan to provide a stronger financial structure for the company was unanimously approved. Of the outstanding stock 96.18 per cent was represented. The plan provides for substitution of no par value common stock for the present $100 par, and issuance of $2,000,000 of 7 per cent cumulative preferred stock. The Public Service Commission has approved the first change, and the company will apply immediately for approval of the proposed issue of preferred stock. Proceeds from the sale of this issue will be used for the substitution of permanent financing for temporary financing, for necessary capital expenditures, and for future similar requirements.

Chicago Rapid Transit Reports

Company operating elevated lines shows slight decrease in gross and net in 1927. Traffic practically constant

OPERATING revenues of the Chicago Rapid Transit Company, Chicago, Ill., for the year 1927 were $20,011,911 and non-operating income was $332,840, making total gross revenues of $20,344,751, compared with $20,420,659 in 1926. The fares collected in 1927 averaged 8.30 cents per passenger, a slight increase over the average for the years 1925 and 1926. These facts were contained in the annual report of the company recently submitted to the stockholders.

Operating expenses (including $323,542 set up for retirement reserve) were $14,189,150. The taxes were $1,767,948. Total operating expenses and taxes were $15,957,099. This compares with $15,797,655 for the previous year.

INCOME STATEMENT OF THE CHICAGO RAPID TRANSIT COMPANY
For the Year Ended Dec. 31, 1927

Gross operating revenues:		
Passenger revenue		$18,778,321
Other transportation revenues		1,233,589
Total		$20,011,911
Operating expenses:		
Maintenance of way and structure	$1,819,075	
Maintenance of car equipment	1,567,760	
Power	2,115,545	
Conducting transportation	7,267,199	
General and miscellaneous	1,419,570	
Total		(a) 14,189,150
Net operating revenues		$5,822,760
Taxes and city compensation		1,767,948
Operating income		$4,054,812
Non-operating income		332,840
Gross income		$4,387,652
Deductions:		
Rentals	$1,074,347	
Interest on mortgage debt and equipment obligations	2,398,332	
Other interest	(b) 29,349	
Amortization of discount	69,526	
Total		3,571,556
Net income for the year 1927		$816,096

Gross income was $4,387,652, a decrease of $235,351 from the previous year.

Interest on funded and other debt, amortization of discount and rentals of leased lines, aggregated $3,571,556, an increase of $66,184. The net income for the year was $816,096, a decrease of $301,535.

Dividends of $464,369 were declared and paid on the company's prior preferred stcok, leaving a balance of $351,726, which was credited to the surplus account.

Corporate surplus as of Dec. 31, 1927, was $2,917,503, compared with $2,514,418 at the close of the previous year.

The number of revenue passengers carried during the year 1927 was 226,212,172, compared with 228,812,766 in 1926. This decrease is accounted for in part by general business conditions and considerable unemployment and in part by the fact that a number of conventions and the Eucharistic Congress brought exceptionally large groups of people into the city during the year 1926.

The traffic statistics show a steady increase for the past six years, with the exception of last year, as follows:

Year	Number of Passengers
1922	181,280,754
1923	203,953,574
1924	212,901,024
1925	216,045,575
1926	228,812,766
1927	226,212,172

Since the issuance of the last annual report, $1,795,000 of first and refunding mortgage 6 per cent gold bonds, due July 1, 1953, were sold to reimburse the treasury for refunding and acquiring underlying lien obligations. Equipment notes and mortgage bonds paid off or acquired during the year aggregated $1,184,000, which includes $238,000 first mortgage 5 per cent bonds of the Northwestern Elevated Railroad purchased pursuant to the terms of the sinking fund. The funded debt outstanding in the hands of the public was increased a net amount of $619,700 during the year. An issue of $1,500,000, 7.2 per cent prior preferred stock, Series "B," was sold during the year at par and the proceeds were used to reimburse the company's treasury for expenditures for improvements, betterments and additions made to its properties. There were 10,932 stockholders at Dec. 31, 1927, an increase of 1,283 during the year.

Inadequate track facilities in the downtown district have for years been a serious handicap, and the efforts of the company have been steadily exerted toward increasing the efficiency of the available tracks through their more intensive use. This has been accompanied by lengthening station platforms and operating longer trains during the rush hours. The company operated 58,102,242 car-miles in 1927, compared with 57,486,898 in 1926. The company plans during the year 1928 to purchase a substantial number of new modern steel cars.

Various operating changes were made during the year to improve the service

SURPLUS ACCOUNTS		
Balance, surplus Dec. 31, 1926		$2,514,418
Net income for the year ended Dec. 31, 1927 (as above)	$816,096	
Less dividends paid on prior preferred stock	464,369	
Surplus earnings for the year unappropriated		351,726
		$2,866,145
Miscellaneous debits and credits (Net)		51,357
Surplus, Dec. 31, 1927		$2,917,503

Note—(a) Total operating expenses include $323,542.56 credited to Retirement Reserve.
Note—(b) Does not include interest accrued during the year, on Adjustment Debenture Bonds.

and new buildings were completed and placed in service. Some important structural changes were made necessary because of street-widening projects which are being carried on by the city. Total expenditures for additions, betterments and improvements were $1,610,809 and the retirements of property were $300,593, leaving an net addition of $1,310,215 to the capital account for the year. During the year $1,819,075 was expended for maintenance and renewals on the right-of-way and structures and $1,567,760 for maintenance and renewals of car equipment.

According to the report the rates of fare now in force are insufficient to produce a fair return upon the value of the company's property. The present rate schedules have been in effect a little more than five years and their inadequacy has been thoroughly demonstrated. Although the traffic has steadily increased from 203,953,574 in 1923 to 226,212,172 in 1927, the return in 1927 was only about 3.50 per cent. The highest return for any one of the last five years was about 3.85 per cent in 1926. The board of directors has recently decided that proper steps be taken to secure increased revenues from rates, and, accordingly, the company has caused to be filed at Springfield with the Illinois Commerce Commission new rate schedules. Under these schedules all weekly passes and the three-for-a-quarter tickets will be abolished.

Under the group insurance plan for employees, $10,399,260 of life and accident and health insurance was in effect at the end of December, 1927. A total of 5,713 men and women in the service are covered by this insurance. The insurance company paid out during the year $107,320 for sickness and accident claims and $146,825 for death claims, a total of $254,145. Accident and health insurance and $1,000 life insurance were provided at the company's expense as a result of the arbitration of the wage question in 1926.

In furtherance of the company's educational work in accident prevention, 327 demonstrations in first aid were given during the year by trained and uniformed teams of employees, before audiences aggregating 138,300 persons. These demonstrations were given in public schools, at meetings of women's clubs, business men's organizations and fraternal orders. So popular is that feature of the work that there is a constant demand for demonstrations by the first aid teams.

Continuing the program originated in 1926 of instructing trainmen, ticket agents and platform men in correct methods of serving patrons, a total of 207 conferences of employee groups were held throughout the year. More than 2,600 employees attended those conferences and received direct personal instructions on how to answer questions and give correct information to customers. They also received instructions pertaining to neatness of dress, personal appearance, manner of speech and to showing interest in the passenger's comfort.

At the end of the year, there were 5,885 employees in service, of which number 3,541 have been with the company more than five years and 1,998 for more than ten years. The total pay-roll of the company for the year was $10,227,783.

Portland Electric and the Northwestern to Merge

A plan by which the Portland Electric Power Company will acquire by purchase the Northwestern Electric Company, both of Portland, Ore., has been announced by Guy W. Talbot, president of the Northwestern company, and Franklin T. Griffith, president of the Portland Electric, in a statement issued over their joint signatures.

The Portland Electric Power Company owns and operates the entire railway system of Portland as well as some suburban lines.

The Northwestern Electric Company was organized in the days of the former Portland Railway, Light & Power Company, when neither Mr. Talbot nor Mr. Griffith was heading the respective organizations.

Duplicate Lines in Salt Lake to Be Discontinued

Permission to discontinue railway service and remove its tracks on sections of five lines is sought by the Utah Light & Traction Company, Salt Lake City, in an application filed on Feb. 17 with the Public Utilities Commission.

It is pointed out by the application that the lines are being operated at a loss, the gross revenue received from traffic originating on and destined to points on those lines being insufficient to pay the costs of operation and maintenance, without any allowance for depreciation or return on investment. The application also contends that deferred maintenance on those lines amounts to approximately $344,315.

The application shows that each of the lines it seeks to remove is paralleled by other lines and proposes to construct one block of track on Third South between Ninth and Tenth East Streets, and the territory now served by the Second South line beyond Third South and Tenth East Streets will be served by cars routed over Third South from State Street to Tenth East.

Legality of Phoenix Bond Issue Upheld

The State Supreme Court of Arizona decided on Jan. 16 that there is no legal flaw in the $750,000 issue of bonds authorized by taxpayers of Phoenix to finance a modern, efficient railway to be run under city auspices.

As soon as City Manager Rieger learned definitely the import of the court's decision, he telegraphed its substance to Gray, Emory & Vasconcelles, Denver bond dealers heading a syndicate which includes the Harris Trust Company of Chicago and others. In reply, the Denver firm wired that, on receipt of Mr. Rieger's message it had ordered the bonds printed and that the cash would be available as soon as the bonds could be signed and delivered. Since then the bonds have been publicly offered in a 4½ per cent issue at a price to yield 4.2 per cent.

W. A. Ensign has filed a taxpayers suit in the Superior Court by which it is sought to enjoin the city from paying out any money derived from sale of the street railway bonds to Claude Fisher Company under contract recently entered into to reconstruct the railway system. The ground for action is alleged want of power in the city to own or build a railway outside the city limits.

Receivership of Ohio Road to Be Lifted

Prospects are good for the reorganization of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad, which has been in the hands of a receiver since its business was damaged by the 1913 flood of the Ohio Valley. Charles H. Deppe, vice-president of the Fifth-Third Union Trust Company, Cincinnati, the receiver, is slated to become president under the reorganization and Joseph L. Lackner, of the Queen City law firm of Maxwell & Ramsay, to be secretary. Samuel I. Lipp will continue as vice-president and general counsel. As a move toward lifting the receivership articles of incorporation have been filed for a successor company which will issue 7,500 shares of no par common stock, to be distributed among bondholders of the old company. The Fifth-Third Company, as trustee, recently bought the assets of the old company for the bondholders for $205,000, subject to approval of the Common Pleas Court.

Scioto Valley Company Seeks Reimbursement

Permission to issue $500,000 in notes for a three-year period is sought by the Scioto Valley Railway & Power Company, Columbus, Ohio, in an application filed with the Ohio Public Utilities Commission. The proceeds are to be used to reimburse the company for money spent during the past five years from income for extension and improvement of lines.

Receiver for Western Washington Properties

Upon hearing of the application of the Old Colony Trust Company, Boston, Mass., which has long been acting as trustee under the indenture securing certain bonded indebtedness of the Puget Sound Electric Railway, Tacoma, Wash., Judge Edward E. Cushman of federal court has appointed Scott Z. Henderson, Tacoma attorney, receiver for the company's properties in western Washington. Bond was fixed at $50,000 with the understanding that if an order is entered directing the property be sold that amount will be raised.

The appointment of a receiver resulted from the filing of a complaint with the court by the Boston company alleging that there was now due and payable to it as trustee under certain mortgages a total of $2,552,505 and that a receiver should be appointed for protection of bondholders.

Mr. Henderson was formerly attorney for the Tacoma Railway & Power Company and Pacific Traction Company, the majority of the outstanding stock of which is owned by the Puget Sound Electric Railway, which owns the Tacoma-Seattle interurban line.

Similar action against the Tacoma Railway & Power Company was forecast at a meeting which was held in New York some few weeks ago, but it is denied by Evans & Ellis, Tacoma attorneys for the plaintiff, that the present action has anything to do with the Tacoma Railway & Power Company.

Decrease in Detroit in January

Auditor Hauser says it is believed seven year record of achievement of municipal railway is unequaled. Progress reviewed since city entered on municipal ownership program in 1921

THE balance of net income reported by the Department of Street Railways at Detroit, Mich., for January, 1928, is $2,977 after the payment of sinking fund charges. The balance of net income for the month of January, 1927, was $57,999, so that January, 1928, shows a decrease as compared with January, 1927, of $55,022.

During January, 1928, 38,520,987 passengers were carried by the rail lines and 3,943,503 by the coach lines, a total of 42,464,490 passengers compared with a total of 42,313,631 carried in January, 1927, divided, 38,935,672 rail lines and 3,377,959 coach lines. In other words, the Department of Street Railways carried 150,859 or 0.36 per cent more passengers in January, 1928, than in January, 1927.

On Feb. 1, 1921, the Department of Street Railways began to function as a transportation agency, so that the general balance sheet statement at the close of business Jan. 31, 1928, may be taken as reflecting the results obtained in seven years of municipal ownership and operation. On this account W. M. Hauser, auditor, took occasion to review the seven years operation. During this time the citizens of Detroit have provided by ballot $41,080,000 for the purchase, construction and improvement of the property. This debt has been reduced until now as of Jan. 31, 1928, it amounts to $27,304,343. The difference between this amount and the amount provided by the people is $13,775,656, which represents the city's equity in the property, paid entirely from revenues. Of this thirteen odd million dollars $6,535,000 has actually been paid off and there is on hand in sinking funds $7,240,656 to meet the requirements of the debt obligations as they fall due.

On Jan. 31, 1928, other long term debt existed to the amount of $3,318,296, the action creating this debt having been approved by the Board of Street Railway Commissioners and the Common Council. The debt incurred remaining unpaid at Jan. 31, 1928, was for purposes as shown below:

New Rail line extensions	$882,648
125 new street cars	2,034,000
41 coaches	136,647
Property for carhouses, etc.	265,000
Together	$3,318,296

In order to provide service for the fast growing city it was necessary to finance these extensions in the manner adopted, as no bonds were available for the use of the department.

The accrued depreciation (road and equipment) at Jan. 31, 1928, as shown by the balance sheet, amounts to $4,772,153 equal to 9.4 per cent of the $50,549,472 of the cost of road and equipment. Mr. Hauser says that "this, it is believed, compares favorably with any city transportation system in the country."

Since the Department of Street Railways has been criticised with respect to the subject of depreciation, Mr. Hauser made the following statement to help clarify the situation:

Private corporations as a rule issue capital stock and bonds to secure money with which to acquire their property. It is not their intention to purchase back this capital stock or retire the bonds out of earnings of the property, but only to pay dividends on the capital stock and interest on the bonds, i.e., pay interest on the money received—provided such dividends and interest are earned, but that is another story. As such capital stock and bonds are never to be retired out of earnings, some way must be devised to replace the property when it is worn out. Accordingly, an account is opened up called "accrued depreciation" to which annual installments are transferred from earnings in an amount sufficient to equal the cost of the property by the end of the period of years that it is estimated it will last in operating condition. For purposes of discussion, it is immaterial whether such an ideal condition is exactly realized or not.

Municipal corporations do not issue capital stock but they issue bonds instead. Probably the law provides no other way for them to finance the construction or purchase of their public utility properties. It is the intention where such bonds are issued to redeem them at maturity, i.e., to buy them back. Accordingly, a fund is set up called a "sinking fund" to which annual installments are transferred from earnings in an amount sufficient to equal the cost of the property by the end of the period of years that it is estimated the property will last in operating condition. Some cities have not been careful about the length of the term of their bonds, but in all cases the term of the bonds issued should coincide with the life of the property purchased by such bonds, or having a less life, so that the transaction may be conservative. It is apparent therefore that at the time when the property is worn out the bonds will be paid and the city will have neither property nor debt. Should the citizens wish to continue the property in the future, property can be bought with a new issue of bonds to be paid as before.

In conclusion Mr. Hauser says that failure to distinguish between private finance and public finance has led many to make statements that becloud the issue. According to him it is impossible to pay for two plants at the same time and that is, in effect, what is being done when depreciation and sinking funds are both established. He says:

This is practically impossible and would not be right if it were possible. It is impossible first because to pay for one plant and to lay aside funds to purchase another would call for an excessive rate of fare, and for the present generation to provide for future properties to be used by the following generation is wrong in principle because it is making one generation pay for the next generation's needs. Notwithstanding this, however, the Department of Street Railways with its existing rate of fare has been enabled, in addition to paying off $13,775,656 of debt, to set up accrued depreciation in the amount of $4,772,153. The amount represented by this accrued depreciation has been earned and has been invested in property, a proper procedure. Not one cent of any of this money has been contributed by the taxpayer. It has all come from the car riders.

In other words, as Mr. Hauser puts it, the Department of Street Railways, during the period from Feb. 1, 1921, to Jan. 31, 1928, the past seven years, has:

1. Paid all operating and maintenance expenses, including paving between tracks.
2. Taxes on the physical property of the entire street car system, the same as if privately owned.
3. All interest charges on the debt outstanding against the property.
4. All sinking fund requirements as required by the City Charter.

Nebraska Company Retired from Railway Field

The Nebraska Railway Commission has authorized the Bethany Traction Company, a subsidiary of the Lincoln Traction Company, to remove all of its trackage from 49th and Holdrege Streets to a point on Hiram Street, Bethany. This will end the corporate life of the company, as it is without ownership of any property now. The suburb of Bethany is served by buses operated by the Lincoln company elsewhere in the city.

Changes in Capital Structure of Nova Scotia Company

The Nova Scotia Tramways & Power Company, Halifax, N. S., is to change its name to the Nova Scotia Light & Power Company and to effect a capital reconstruction which will affect all the present outstanding security issues and place the company in a financial position with capitalization more in line with earning power.

A total of $3,682,500 in first mortgage and in general mortgage bonds is now outstanding. Both these issues will be called and will be replaced by a new 5 per cent first mortgage issue. The redemption of the present issues will involve an annual saving in fixed charges, for the general mortgage bonds now bear interest at 7 per cent. Ranking junior to the bonds, the new company will create an issue of 25,000 new 6 per cent cumulative preference shares of $100 par value. Doubtless, some of this stock will be sold to keep the company in a sound working capital position. The new company will have 40,000 common shares of no par value, of which 2,510 will be issued to the holders of the present common shares on the basis of one new share for every ten shares of the present stock. In addition to this, 32,013 shares will be issued to the holders of the present preferred shares of the company on the basis of 1.54 new shares for each preference share. In this fashion, the company will liquidate its arrears of preferred dividends.

As soon as the shareholders of the company have authorized the change in the name of the company and the capital reconstruction, a bill to carry out the plan will be introduced at the present session of the Nova Scotia Legislature. The Nova Scotia Tramways bonds will not be redeemed until June 1 at the earliest.

The company has just experienced the best year in its history. For the year just concluded, the company's deficit account was reduced from $204,023 to $174,476. The results of operations over the past three years follow:

	1927	1926	1925
Gross	$1,491,608	$1,438,903	$1,344,099
Operating expenses	933,902	1,003,765	959,371
Net	$557,706	$435,138	$384,728
Interest	214,976	216,214	216,926
Taxes	120,355	16,520	16,526
For reserves, etc.	$222,375	$202,404	$151,276

Milford-Uxbridge Property Sold

The Supreme Court has authorized Walter Adams, receiver of the Milford-Uxbridge Street Railway, Milford, Mass., to sell the property to the Citron-Beyer Company, Trenton, N. J., for $86,200.

Bids for the property, which was ordered sold at public auction on Feb. 24, were opened by Judge Wait. The only other bid was made by a New York company. It was for $83,625. After the bids had been opened and read the New York people raised their bid to $86,500. This figure was not considered.

Judge Wait said that the sale had been ordered for the best interests of the people of Milford and Uxbridge, and for the railway itself. It was stated after the sale that the new owners would replace the railway with buses.

The railway was organized 32 years ago as the Milford, Holliston & Framingham Street Railway. Since 1902 the name Milford & Uxbridge Street Railway has been used. The Milford & Uxbridge Company has operated cars from Milford to Framingham through Holliston; from Milford to Uxbridge, through Mendon and Hopedale; from Milford to Medway and from Milford to North Grafton by way of Hopedale, Upton, West Upton and Grafton.

The company operates its cars over the latter line over the rails of the Grafton & Upton Railroad, electrified between Hopedale and North Grafton, the railroad company owning the poles, roadbed and other equipment. Until a year ago the Milford & Uxbridge Company also operated between Milford and Hopkinton. This service was discontinued owing to lack of patronage.

Hartford-Springfield Route Sold

The New England Transportation Company has purchased the Hartford-Springfield Coach Company for a price reported to be $250,000 with the purchaser to assume all the outstanding obligations of the Hartford-Springfield line. The line was purchased to perfect the interstate operation of the New England system. The coach company operates between Hartford, Conn., and Springfield, Mass., over the route of the old Hartford & Springfield Street Railway, of which it is the successor.

Seattle Meets Its Purchase Payment

As a result of financial aid from the light department, city officials of Seattle, Wash., were enabled to telegraph to the city's fiscal agent in New York the annual payment due on March 1 on the Municipal Railway purchase bands. The sum, $1,252,510, included $833,000 on the principal and $250,050 in semi-annual interest. The rest of the amount transmitted will go toward retiring other bonds and meeting interests. This leaves $6,161,000 yet to be paid on the $15,000,000 purchase price agreed upon when the city bought the railway system from the Puget Sound Power & Light Company.

The difficulties encountered in meeting this year's payment were sidestepped, temporarily, at least, when the City Council negotiated a loan of $550,000 from the light department to the railway department to enable the railway to meet its payroll and other operation costs while all the revenues were put aside to make up the March 1 installment. The railway is paying 4 per cent interest on the loan. Of a similar loan made last year, $100,000 remains to be repaid.

Dividend on Denver Preferred Cut

The Denver Tramway, Denver, Col., has declared a dividend of 75 cents a share on the preferred stock, payable on April 1 to stockholders of record March 15. This stock is cumulative at the rate of $1.25 a share quarterly. Since the company paid only 75 cents for the two last quarters it is now $1 in arrears on the issue.

Testimony Concluded in St. Louis

Taking of testimony on the valuation of the St. Louis Public Service Company, St. Louis, Mo., was concluded by the Missouri Public Service Commission on Feb. 18. The final witness was M. H. Doyle, chief engineer of C. E. Smith Engineering Company, consulting engineers for the city of St. Louis. His set-up of the investment cost of the railway as of Jan. 1, 1927, used in operation was $47,375,948, to which he added $2,091,833 of non-operating property, giving a total investment of $49,467,781.

The company at former hearings on its application produced evidence to show a reproduction valuation of $100,000,000 and contended for a rate-base valuation of $75,000,000. The temporary value fixed by the commission was $52,000,000.

Net Earnings of Stark Electric Doubled

By manufacturing power part of the year, and cutting costs by the more extensive and intensive use of one-man cars, the Stark Electric Railroad, Alliance, Ohio, shows a net income for 1927 of $113,402 compared with $53,309 for 1926. This is in face of a $1,600 reduction in gross income.

Where in the past the power bill was approximately $180,000, the Stark Electric estimates the 1927 cost at $100,000. The company's plant was operated during most of the year.

Statistics covering the railroad, with the Alliance Power Company, a subsidiary, follow:

	1927	1926
Gross earnings	$459,238	$460,865
Operating expenses and taxes	345,836	407,826
Net income	$113,402	$53,039

Interborough Balance $1,401,578

For the seven-month period ended Jan. 31, 1928, the gross revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., was $38,656,001 representing an increase of $2,845,816 over a similar period of the previous year. Total operating and maintaining expenditures were $22,592,337 an increase of $1,108,236. The balance after interest and rentals and which is subject to Transit Commission readjustment was $1,401,578 or an increase of $1,656,493 for the seven months' period ended Jan. 31, 1927.

Legal Notes

FLORIDA.—*A "Jitney Bus" Is a Common Carrier and Therefore Subject to Appropriate Governmental Regulation.*

The ordinary use of the city streets by a citizen in travel and the prosecution of his business is an inherent right which cannot be taken away by the city and may be controlled only by reasonable regulation. But the right to use the streets for conducting thereon a private business is not inherent or vested. It can be acquired only by permission or license from the city. Where a state had delegated to a city power to license and regulate traffic on its streets, a city ordinance prohibiting the grant of permits for operation of motor buses in congested districts is a valid exercise of the city's police power. [State vs. Quigg, 114 So., 859.]

LOUISIANA — *Municipality Operating Railroad Does So on the Same Basis as Railway Corporation.*

The municipality of Monroe, La., which operates a street railway, passed an ordinance requiring a steam railroad passing through the city to construct over its track certain overhead crossings to be used by the municipal street railway. It was held that the municipal railway was a private undertaking operated for private gain and the position of the city in this case was like that of a private corporation engaged in the same business, and not of a governmental agency. Hence, its ordinance was invalid and it must pay for the construction of the crossings used at its own expense. [Vicksburg S.&P. Railway vs. City of Monroe, 115 So., 136.]

MASSACHUSETTS—*Responsibility of Subway Company for Maintenance of Station Approach.*

A subway passenger fell over a block on the sidewalk surrounding a subway station. The block was 18 in. high and once had been the base of a traffic sign belonging to the city of Boston. It had been in the same location for at least five months. In the lease of the subway from the city to the operating company, the latter agreed to keep in good condition the "entrances, approaches, stations, etc.," of the subway and was held responsible for the accident. [Smith vs. Boston E.R. Co., 159 N.E., 501.]

MINNESOTA. — *Status of Fireman Riding to Fire on Fire Truck.*

A fireman riding to a fire on a fire truck was injured in a collision with a street car. Negligence was charged against both the motorman and the truck driver. The court held that the fireman injured was not engaged in a "joint enterprise" with the truck driver. To constitute "joint enterprise" two or more persons must unite in joint prosecution of a common purpose under such circumstances that each has authority, expressed or implied, to act for all in respect to the conduct or the means or agencies employed to execute such common purpose. [Ring vs. Minneapolis S.R. Co., 217 N.W., 130.]

MISSOURI — *When Passenger Status Begins at a Stopping Point.*

Where a person, following directly behind others who had boarded a bus with the knowledge and assistance of the conductor, had set his foot upon the rear platform with the intention of securing passage therein, he became a "passenger," irrespective of where the regular or customary stopping place for the bus may have been. [Hayward vs. Peoples Motor Bus Co. of St. Louis, 1 S.W. (2d), 254.]

NEW HAMPSHIRE—*Settlement with One of Two Defendants in Claim in Negligence Case.*

A suit for damages was brought against both an automobile driver and street railway alleging negligence, but settlement was made by the automobile driver before the trial. It was held this did not prejudice the claim of the plaintiff against the railway company, though the sum received from the driver should be deducted from the amount of judgment against the railway company. [Masterson vs. Berlin Street Railway, 139 A., 753.]

NEW JERSEY—*Requirements for Franchise Grant Must Be Fulfilled.*

The general ordinances of a city provided that before licenses for motor buses should be granted, applicants must give certain information in writing and then that the application should be acted upon within 30 days. As these requirements were not fulfilled, the court declared that a license granted by the city to a motor bus company was invalid. [P.S. Ry., vs. Hackensack I.C., et al., 139 A., 797.]

NEW JERSEY — *Bus Operating Without Authority Is Not Released From Franchise Tax.*

A state act provides that motor buses operating in or through municipalities of the state shall pay 5 per cent of their receipts monthly to the various municipalities, in proportion to the length of route in each. A bus company which had been operating for a long time in the town of Guttenberg without a permit declined to pay this tax because the town had not officially granted its consent to operation. But as the town had not objected to the operation of the bus, the court held the tax must be paid. [Guttenberg vs. Benjamin, 139A, 823.]

OHIO—*Liability for Baggage of Bus Passenger.*

A bus passenger attempted to take a hand bag into the vehicle, but an official of the bus company insisted upon taking charge of it, stating that it would be returned to the passenger at the end of the trip. It contained among other things a lady's wrist watch and clothing intended for presents to the passenger's family. At the end of the trip the bag could not be found. The court held that the urgency of the agent of the carrier to take the baggage made the circumstances differ from those where baggage is carried on a check system at the request of the passenger, and that he could collect within reasonable limits both for his own clothing and for articles intended for members of his family, like those specified. A judgment for $116.25 was upheld. [Cleveland-Akron Bus Co. vs. Rogoff, 159 N.E., 374.]

TENNESSEE—*Mother Not Entitled to Recover from Fright and Shock when Minor Son Is Injured.*

A mother witnessed an accident in which her minor son was seriously injured by a street car. It was held she could not recover for injuries resulting to herself from fright and shock at such a time. [Nuckles vs. Tennessee Electric Power Co., 209 S.W., 775.]

TEXAS—*Seat Fee For Buses Upheld.*

The Court of Civil Appeals of Texas upheld Article 820 of the Penal Code, which provides that owners of passenger motor vehicles operating for hire, in addition to the regular license fee, based on the horsepower and weight of the vehicle, must pay an additional registration fee of $4 a year for each passenger such a vehicle will seat. [Lowery vs. English et al., 299 S.W., 478.]

WASHINGTON — *Special Precautions Should Be Used When Operating Contrary to Direction of Traffic.*

A railway company had tracks on both sides of the street, but used only one for both directions of operation. In a case of this kind, a car motorman should exercise especial precaution when operating contrary to the traffic on his side of the street, as a stranger might assume that cars on tracks on the right-hand side of the road would be proceeding in the same direction as himself. [Kitchen vs. Tacoma R.&P. Co., 262 P., 961.]

WISCONSIN—*Precautions Necessary in Inspection of Tires.*

While a bus was traveling at the rate of 4 to 5 m.p.h., a tire blew out with such force that it punctured the housing and caused injury to a passenger sitting above the wheel. Prior to starting a representative of a tire company had inspected the tires in the manner regularly followed, namely, by feeling them from the outside. The bus company was held to have exercised ordinary care, absolving it from negligence in the injury to the passenger. [Ormond vs. Wisconsin P. & L. Co., 216 N.W., 489.]

Personal Items

F. A. Healy Honored

F. A. Healy, auditor and treasurer of the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, was elected president of the Central Electric Railway Accountants Association, at the recent meeting in Cincinnati. Mr. Healy has been in electric railway work since 1906 and was instrumental in developing the Ohio Electric Railway at Springfield into one of the most extensive interurban systems in the Middle West. With the segregation of the Ohio Electric System properties in 1921, Mr. Healy became secretary-treasurer of the Indiana, Columbus & Eastern Traction Company as well as its leased lines, and for a few months following the retirement of J. H. McClure as active receiver, he took over the work of general manager in addition to his other duties.

At the age of nineteen Mr. Healy was working in the office of the Atchison, Topeka & Sante Fé Railroad. From then he served many steam railroad properties including the Southern California Railway, the Sante Fé, Prescott & Phoenix Railway, the South Carolina & Georgia Railroad, the Augusta Southern Railway, the Ohio River & Charleston Railroad and the Lake Champlain & Ogdensburg Railroad, the Atlanta & West Point Railroad and the Western Railway of Alabama. From the steam railroad field Mr. Healy then went into electric railroading. He helped to form the Central Electric Railway Accountants Association in 1907 when systematic electric railway accounting was in its infancy. Mr. Healy was born in 1861 at Moline, Ill.

W. O. Wood With Cable Company

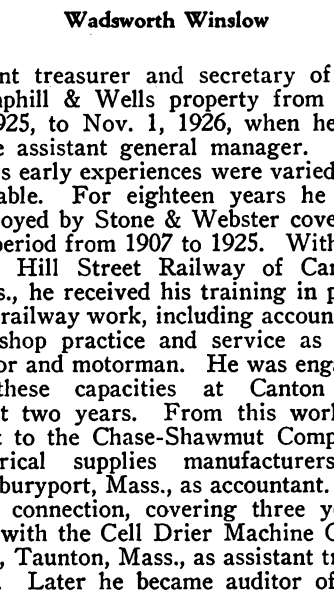
William O. Wood, well known in the public utility field and particularly for his work with the New York & Queens County Railway, was recently elected vice-president of the Waterbury Cable Service, Inc., of New York and Chicago.

For many years Mr. Wood was identified with railroads and electric railways in New York. the Middle West and the South. Following his service with the Louisville and Nashville and the Illinois Central Railroad he entered the electric railway field as general superintendent of the Rapid Railway System, comprising the interurban lines of the Detroit United Railway, Detroit, Mich. Subsequently he was superintendent of the rapid transit lines in Brooklyn and later assistant general superintendent with charge of transportation in Brooklyn. For one year he was operating statistician of the Interborough-Metropolitan Company, New York.

Mr. Wood's most recent electric railway connection was as president and general manager of the New York & Queens County Railway and vice-president and general manager of the New York & Long Island Traction Company and Long Island Electric Railway. These activities covered a period of fifteen years. His headquarters will be at 342 Madison Avenue, New York.

Wadsworth Winslow Advanced with Hemphill & Wells

Although less than three years have passed since Wadsworth Winslow became affiliated with the Interstate Street Railway at Attleboro, Mass., he has ably demonstrated his ability to take over the position of general manager. This appointment became effective on March 1. Mr. Winslow served as assistant treasurer and secretary of this Hemphill & Wells property from Oct. 1, 1925, to Nov. 1, 1926, when he became assistant general manager.



Wadsworth Winslow

His early experiences were varied and valuable. For eighteen years he was employed by Stone & Webster covering the period from 1907 to 1925. With the Blue Hill Street Railway of Canton, Mass., he received his training in practical railway work, including accounting, car shop practice and service as conductor and motorman. He was engaged in these capacities at Canton for about two years. From this work he went to the Chase-Shawmut Company, electrical supplies manufacturers at Newburyport, Mass., as accountant. His next connection, covering three years, was with the Cell Drier Machine Company, Taunton, Mass., as assistant treasurer. Later he became auditor of the Chicago, Wilmington & Franklin Coal Company, Chicago. All these properties were under Stone & Webster management, which he left in 1925 to join Hemphill & Wells in New York.

Mr. Winslow was born in Quincy, Mass., on Sept. 2, 1888. He was educated in the Quincy grammar school and at the Canton high school. His education also included special courses in accounting in the Walton School of Commerce, Chicago.

J. D. Alexander and Guy McDougal Advanced in Fairmont

John D. Alexander, for the last seven years purchasing agent of the Monongahela West Penn Public Service Company, Fairmont, W. Va., became manager of transportation on March 1, succeeding R. W. Spofford, who resigned on Jan. 1.

Mr. Alexander has had considerable construction and mining engineering experience. He went to West Virginia first in 1916 with the Sanderson & Porter organization in charge of the reflooring and reconstruction of the Marietta-Williamstown bridge. Later he was the engineer in charge of construction of the Monongahela system power house at Parkersburg and engineer on the construction of the Boaz Bridge between Parkersburg and Williamstown. While working as engineer on the construction of the big power plant at Rivesville, he resigned to join the army and spent ten months overseas in a machine gun battalion.

Following the war he returned to the Rivesville plant with Sanderson & Porter until the construction work there was completed and then he spent some time in Oklahoma as superintendent of pipe line construction. Later he was employed by the Monongahela West Penn Public Service Company to supervise the construction of the additional unit to the Rivesville plant and since that time has been head of the purchasing department.

Mr. Alexander is a native of Alabama and a graduate of the Alabama Polytechnic Institute. He is one of five Alexanders in the employ of the local company, who are, so far as known, not related.

Guy McDougal, who for a number of years has been assistant manager of the purchasing department, becomes acting manager.

H. H. Cloyd and D. B. Eyer Promoted at Kansas City

Hardy H. Cloyd has been appointed analysis engineer reporting to the comptroller of the Kansas City Public Service Company, Kansas City, Mo. Donald B. Eyer will have charge of the work in vice-president Buffe's office formerly handled by Mr. Cloyd.

Mr. Cloyd entered utility service in Kansas City in March, 1917, as statistical clerk at the Missouri River power station. Later he was transferred as assistant superintendent of power and equipment. In 1924 he moved to the general office as assistant to the general manager, which title was later changed to assistant to vice-president in charge of operations.

Mr. Eyer went to Kansas City from the General Electric Company in 1924 as electrolysis engineer. He was later made electrical engineer in the office of the general superintendent of maintenance. He was graduated from Kansas University.

Manufactures and the Markets

$787,300 for Railway Work in Atlanta

The 1928 budget for the railway department of the Georgia Power Company, Atlanta, Ga., calls for $787,300. This budget does not contemplate any new cars for this year. Of the total $360,000 is for miscellaneous track improvements, $150,000 for new special work and track to enable the company to use the two new viaducts at Central Avenue and Pryor Street now being constructed by the city, $40,000 for miscellaneous improvements, buildings, grounds, etc.

The mechanical department gets $237,300 as a total amount. Of this, $121,000 is for equipment trust payments, $74,192 for remodeling and miscellaneous improvements to cars, and $44,110 for miscellaneous tools and improvements to car shops and carhouses.

The mechanical department expects to change over 40 two-man cars for one-man operation during this year. The cost of changing over twenty of the cars is included in the 1928 budget, and the cost of changing the other twenty is a carry over item from the 1927 budget.

Case Involving Patents Referred Back to Lower Court

A decision by the United States Circuit Court of Appeals has been made in reviewing the findings of the U. S. District Court in the case of Goldschmit Thermit Company vs. Alumino-Thermic Corporation, Hugh G. Spilsbury and Henry J. Barnes. The review of the findings of the lower court was made on appeal by the Alumino-Thermic Corporation.

The Appellate Court modified the decision of the lower court to the extent of finding that Goldschmit patent No. 900366 covering preheating, which expired during the litigation in this case, was invalid. The court found the so-called insert patent of the Goldschmit company valid and infringed. It stated further that the method of undercutting rails for welding is not an infringement of this patent. Goldschmit Patent No. 1075709 covering the manufacture of ferroso-ferric oxide and its use in the manufacture of alumino-thermic mixtures was held valid and infringed.

The case has been referred back to the lower court for modification of its decree.

Stone & Webster, Inc., Open Office in Paris

Stone & Webster, Inc., Boston, Mass., announces the opening of a Paris office at 2 Rue des Italiens. The firm has reported on many large foreign projects recently financed, including the Adriatic Electric Company, the Lombard Electric Company and the Italian Public Utility Credit Institute.

Through the Paris office, investigations, valuations and reports on public utilities, industrial plants and government and municipal loan projects will be handled for bankers and investors.

James F. Case will be in charge of the new office.

Haskelite Sends Lindbergh Air Mail Letters

An air mail letter carried by Lindbergh was the history-making treat sent by the Haskelite Manufacturing Corporation to all of its customers and prospects in St. Louis, Mo., on Feb. 21 when the colonel operated the Chicago-St. Louis air mail line.

To *Electric Railway Journal* via Lindburgh air mail

As a letter could not be sent direct to ELECTRIC RAILWAY JOURNAL in New York, the Haskelite Corporation sent a copy to its railway representative in St. Louis, as illustrated, which was forwarded to New York.

The letter carried a special head and was printed on a light grade of paper permitting it to come under the 10-cent half-ounce rate. The contents of the letter boosted the use of air mail and advised that the plywood used in the "Spirit of St. Louis" is Haskelite.

Some Recent Twin Coach Deliveries

Twin Coach Corporation, Kent, Ohio, reports delivery of twin coaches in January to the following electric railway properties:

Virginia Electric Power Company, Norfolk, Va., ten mechanical drive urban type; Northern Ohio Power & Light Company, Akron, Ohio, one mechanical drive parlor coach; Pacific Electric Railway, Los Angeles, Cal., one urban type; Los Angeles Railway, Los Angele, Cal., one urban type; Portland Electric Power Company, Portland, Ore., two mechanical drive urban coaches. Eight twin coaches with electrical equipment for operation as trackless trolleys were shipped to the Manila Electric Company, Manila, P. I. One of these coaches was completely assembled while the other seven were shipped "knocked down."

Expense of New Truck and Taxi Lines Affect Yellow's Earnings

If extraordinary charges of $561,604 are eliminated, operations of Yellow Truck & Coach Manufacturing Company, Chicago, for 1927 show a slight profit. Militating against the company financially was the expense incidental to bringing out new lines of trucks and taxis. According to the report, the year 1927 was one primarily of readjustment. The company hopes, however, to realize shortly many economies as a result of the concentration of operations in a modern plant and should also benefit by the improvements in and additions to its line of products.

Paul W. Seiler, president of the company, speaking of the 1927 operations, said:

Poor showing in 1927 resulted primarily from losses of an extraordinary character as well as additional expense incidental to bringing out complete new lines of trucks and taxicabs. Eliminating these extraordinary charges, operations for the year would have shown a slight profit. It has become more and more apparent that reconstruction of the manufacturing property was essential. Recently, it has been made manifest that severe writeoffs of asset values were necessary in connection with the obsolescense of products no longer in current production, developing the new line of products and compensating manufacturing operations in a new plant at Pontiac, Mich. Further losses have been suffered in respect to accounts receivable. Writeoffs established in 1927 on account of the above have amounted to $5,641,605.

Total surplus of the company at the beginning of the year stood at $8,073,770. As of Dec. 31, 1927, surplus has been reduced to $165,078. In view of the small available surplus and probable further operating losses during the early months of 1928 there appeared no alternative but to suspend dividend distribution until the operation condition of the company becomes more assured.

The report shows net loss of $6,858,691 after expenses, depreciation, and special adjustment charges of $5,641,604. This compares with net income after expenses, depreciation and federal taxes, of $1,125,922, equal to $7.50 a share on $15,000,000 7 per cent preferred stock in 1926. After payment of preferred dividends amounting to $1,050,000 the total deficit for 1927 was $7,908,691 compared with a deficit of $627,578 in 1926 after dividends on the preferred and common B shares.

A statement was issued which in part follows:

The circumstances surrounding the present situation of Yellow Truck & Coach seem to indicate that holders of its preferred stock will be deprived of income thereon for a period of time impossible to predetermine. Feeling that this preferred stock is amply secured as to its ultimate position and recognizing the probability that some of the present holders purchased the preferred stock by reason of General Motors Corporation's investment in the company, General Motors Corporation has authorized for submission to all of the said holders the following offer: For each share of 7 per cent cumulative preferred stock of Yellow Truck General Motors Corporation will pay $93 in cash. This offer expires at the close of business May 10, 1928.

Digitized by Google

General Motors Corporation does not recommend either the acceptance or the rejection of the foregoing offer.

General Motors purchased its interest in Yellow Truck as an investment. It in no way guarantees the earnings or securities of Yellow Truck & Coach Manufacturing Company.

At the meeting of directors John D. Hertz resigned as chairman of the board of the Yellow Truck & Coach. John A. Ritchie resigned as vice-chairman and was elected chairman.

Spring Meeting of the Policies Division N.E.M.A.

Adoption of definite recommendations on problems of business policies and merchandising principles will feature the Spring Meeting of the Policies Division, National Electrical Manufacturers Association, March 14-16, Edgewater Beach Hotel, Chicago, Ill.

Action by the division will be requested on the matter of an All-Electrial Industry Show, on tariff matters, and on adequate statistics. A request for definite support of the program of the Electrical Industry Sales Conference will also be presented.

More A.C.F. Coaches for Norway

The American Car & Foundry Company, New York, has recently made another shipment of chassis for motor coaches, to the city of Oslo, Norway. Up to date 39 A.C.F. motor coaches have been purchased for this Norwegian service.

These coaches are powered by the 3¾ x 5 in., six cylinder Hall-Scott engine, and have a 198 in. wheelbase. The bodies, built and mounted locally, are similar in design to the modern American coach.

Use of Treadles Grows

An increase of 66 per cent in the use of National Pneumatic Company automatic treadle exit doors in one year is emphasized in a card folder issued by that company. According to the figures given it is stated that 42 cities were operating 1,696 cars and 138 buses equipped with one or more treadle doors a year ago. During 1927 these figures were increased to 64 cities operating 2,829 cars and 216 buses equipped with one or more treadle doors, making a total of over 5,000 doors. A list of the cities in which these cars are operated shows wide geographical distribution of treadle applications.

Last Knoxville Cars to Be Delivered

The last of twelve new cars ordered in 1927 by the Knoxville Power & Light Company, Knoxville, Tenn., are to be delivered in the next ten days. Specifications of these cars, purchased from the Cincinnati Car Company, Winton Place, Ohio, were published in the issues of Dec. 10 and Feb. 25.

ROLLING STOCK

Seattle Municipal Street Railway, Seattle, Wash., needs additional passenger buses to take care of the increasing population in Seattle's outlying districts, according to a letter recently sent by D. W. Henderson, superintendent of the street railway department, to O. T. Erickson, chairman of the City Council utilities committee. He recommended the immediate purchase of ten new buses for distribution on the nine bus lines operated by the railway department.

Detroit Municipal Railway, Detroit, Mich., has not yet made the awards under its recent call for bids for buses. The American Car & Foundry Company is reported as the low bidder on inquiry for 25 to 100 new motor coaches, bidding $12,962, on gas-electric 40-passenger bus, $11,265 for gas-electric 30-passenger, $10,962 for gas-mechanical 40-passenger and $9,265 for gas-mechanical 30-passenger bus.

TRACK AND LINE

Kulp Theft Proof Lamp Company, Chicago, Ill., recently announced that through a contract signed between that company and the General Electric Company, the General Electric Company was to begin immediately to manufacture and bill quantities of Kulp light bulbs.

Washington Railway & Electric Company, Washington, D. C., has been ordered by the Public Utilities Commission to remove its center trolley poles in Wisconsin Avenue from River Road to the District line and substitute side-pole span-wire construction. The work will not be started, however, until the projected widening of Wisconsin Avenue takes place this year.

TRADE NOTES

Waugh Equipment Company, manufacturer of Waugh draft gears, has moved its offices formerly located at 1 Pershing Square, New York, to the new Graybar Building, 420 Lexington Avenue.

Black & Decker Manufacturing Company, Towson Heights, Baltimore, Md., has appointed R. C. Bastress, formerly with the Fort Wayne Iron Store Company, to handle Indiana and part of Michigan. L. W. Beuhausen, formerly with Slocum & Kilburn, has been employed to handle Western Massachusetts and G. N. McCarthy will be the representative in Buffalo territory, taking the place of H. B. Austin, who has been transferred to the Chicago district.

Martindale Electric Company, 1248 W. Fourth Street, Cleveland, Ohio, manufacturer, manufacturers' agent and importer of Martindale motor maintenance equipment products, has recently opened a branch in New York City, at No. 6 East 46th Street in charge of E. H. Mitcham

Ohio Brass Company, Mansfield, Ohio, announces the opening of its new offices at 703 Frisco Building, Ninth and Olive Streets, St. Louis, Mo. This office will be the headquarters of H. W. Kilkenny, district sales manager for the company in the St. Louis territory.

Lincoln Electric Company, Cleveland, Ohio, announces the retention of A. M. MacFarland as a general sales and development engineer, and states that he will devote his efforts to the development and special application of automatic carbon arc welding, with headquarters at Cleveland.

ADVERTISING LITERATURE

Rollway Bearing Company, Inc., Syracuse, N. Y., has recently issued a new catalog 4-A on their wide series and utility type of bearings and also bulletins: Nos. 53—self-aligning pillow blocks equipped with "Rollway" adapter type bearings to fit standard commercial shafting; 54—Various precision types of "Rollway" radial bearings; 55—Self-aligning pillow blocks equipped with standard "Rollway" bearings and 56—Large "Rollway" bearings in the recently adopted international sizes.

Perey Manufacturing Company, Inc., New York, has issued a folder entitled: "The Evening Rush—Gathering in the Shekels by Machinery," emphasizing the advantages of the Perey systems.

International Nickel Company, Inc., New York, has issued in booklet form a Monel Metal and Nickel Buyers' Guide.

Pyrene Manufacturing Company, Newark, N. J., has issued a folder announcing its "Phomene Accumulator" in which it stresses the advantage of its use as fire protection equipment for liquid hazards.

Armco Culvert & Flume Manufacturing Association is issuing an interesting bulletin, "Basing Confidence in Culvert Strength on Engineering Facts."

Commemorating a Service to Humanity

IF THERE is any doubt left at all about the importance of the rôle played by the individual employee in the success or failure of a railway's operations, that doubt is dissipated by the events following the Brady Safety Medal Award to the Louisville Railway. This company, through its president, J. P. Barnes, accepted the award in the name of its employees, and then gave the men themselves the opportunity of celebrating in adequate fashion their accomplishment in the service of humanity. The unique celebration took the form of two great dinners—one for day men and one for men on night runs—given to 2,400 employees and their wives.

It was particulary fitting that this dinner commemorated two other notable events in Louisville. During the preceding month every carhouse on the property had exceeded the record of 25,000 miles per chargeable accident which had been set as the bogie for eligibility to one of the safety dinners that have come to mean so much to Louisville trainmen. The occasion also witnessed the annual award of the Anthony F. Connelly medal to William T. Kays, a motorman on the Oak Street car line, for outstanding public service. This medal, fittingly named in honor of an employee who died three years ago after 50 years of railway service, has come to typify the spirit of public service on the Louisville property.

There is something deeply impressive in this story of 2,400 trainmen and their wives sitting down at a dinner to celebrate collectively their own good work in the interest of humanity and to honor specially one of their own number who had achieved outstanding recognition. Can one doubt but that each of these men went back to his car with the feeling that his job means something more than merely putting in a given number of hours for a specified rate of remuneration? Suppose, then, that each street car operator went forth daily with the conviction that he is concerned not only with the effect an accident might have upon himself and the company, but also with the discomfort and suffering which it might entail; and suppose that he came to see clearly that an accident avoided through his own alertness, regardless of the carelessness of others, is a direct contribution to the welfare of humanity and to the progress of civilization. Suppose he came to regard himself as entrusted with a power to protect human life and property, equal, or in some respects greater, than that of his superiors.

To establish such an *esprit de corps* in its carhouses is the desire of every progressive railway management. But men do not react to such sentiments until they come to understand in its full significance the part they play in their company and to feel the motives that inspire its management. Since time immemorial, the act of breaking bread with a man has been associated with friendliness; and that is the first step toward confidence and understanding. When motorman and manager sit at the same board to commemorate mutual accomplishment in the preservation of human life and happiness the service of humanity becomes a meeting ground of mutual inspiration. Any man who works in this spirit does not live in vain, and any man who helps him to see himself in this light renders no ephemeral contribution to the transportation industry.

The Doctrine of Thrift Is Still Sound Today

THOMAS E. MITTEN did workers everywhere a real service when in the series of articles about him in the New York *Sun* he sounded a note of warning about following what he called "The New American Religion." He was referring, of course, to the practice, particularly by the wage earners of all classes, of mortgaging their future so as to secure present comforts that they have been led to believe are essential to their happiness. No one decries the right of the worker to aspire to better things—so long as they are better things. It is highly desirable that he should, desirable from his standpoint and desirable from the standpoint of better business. But that desire is fraught with great danger, danger alike to the man who permits his wants to outstrip his capacity to pay, and danger to business itself.

Since electric railways are such large employers of labor, these admonitions may well be sounded through such channels as are at the disposal of the railways. Mr. Mitten sees an economic change as inevitable. He says that the doctrine that prosperity depends upon spending freely and pledging future earnings has been sponsored even by business men who would not consider such a rash policy in the financial management of their own properties. In this he is right. He is just as right as the banker was who some time ago said that the trouble with America is that many men are riding around in Packards who ought to be using Fords and that many are riding around in Fords who ought to be pushing wheelbarrows. There was a certain amount of literary license about this characterization, but there was also about it a very large element of truth.

In the present era of inordinate prosperity in the United States a lot of pseudo economics has been paraded which will not stand the acid test of the crucible of experience. The baser metal of slipshod thinking has passed for the gold of fact. Mr. Mitten pointed out that the wise business man uses the surplus of his good years as a cushion for the bad years and that the business man owes it to his workers and his customers to educate them in similar conduct of their personal finances. Many other far-sighted men in business, particularly those who have fostered employee ownership, have made a serious effort to encourage a sound economic policy among the men in the ranks. In recent years, however, anyone who propounded the idea of thrift was likely to find himself persona non grata in

Digitized by Google

many quarters. Thrift and parsimony are very different things that have too often been accepted as one and the same. There is one thing about it—few ever had cause to regret the practice of thrift, but countless numbers have had cause to lament their profligacy. The man who earns $10,000 a year and lives beyond his means is no less profligate than the motorman who permits his outgo to exceed his intake. Each is equally doomed. The doctrine of thrift is as sound today as it was when it was first enunciated by "Poor Richard."

Developing Latent Transport Possibilities

RECENTLY the surprising statement was made by a real estate man that the necessity for adequate parking space will soon force the development of suburban business areas which ultimately will sound the death-knell of retail stores in the larger urban centers. His prediction was based on the difficulty of finding parking space in the centers of certain of the large cities.

A statement such as this certainly shows a very narrow viewpoint. It entirely overlooks the possibilities of public transportation. Should any large number of persons decide to do business in the outskirts because of lack of facilities in the center of the city it would be just that much easier for the street cars and buses to move through the congested districts. This in turn would lead to a larger use of public transport and with it bring greater prosperity for the stores in the central area.

However, to plead for public transportation without giving further thought to it than this would be to leave it just where it has been for a number of years. Even with a reduction in the use of automobiles in the congested district there is need for considering the advantages and limitations of every type of vehicle, both public and private. It is possible to provide better facilities, give higher speeds, and keep the cost commensurate with the value of the service, only if all the transportation agencies are fitted into the picture where they will appear to the best advantage.

Few persons are able to view the entire traffic and transportation problem of a community in such a broad-gage manner that they can determine absolutely the proper place for each of the various vehicles. Even in the matter of parking, well-intentioned city officials have been forced to back down when the merchants have demanded that the ban be lifted. What is needed is not alone co-ordination of services to give real transit relief but a control which will enforce such co-ordination.

A move such as that outlined above has been made in London within recent months in the appointment of a Minister of Transport, who has supervision over all forms of transportation in the metropolitan area. A somewhat similar development has taken place in this country in the appointment of the Port of New York Authority, which has control not only over passenger transport but also over the rivers and harbors in the port and all the rail and highway lines leading to the port. These bodies are making steady progress in dealing with the problems of local transportation. But they are only instances where outstanding communities have attacked the problem. It exists in every city and metropolitan district, and only by careful analysis can the proper solution be arrived at that will give the transport that is needed to develop the possibilities that lie dormant in any locality.

Detroit's Express Line Deserves an Extended Trial

OPERATION of the express street cars service with supplementary local buses on Jefferson Avenue in Detroit is provoking widespread discussion among various factions in the motor city. The article on this operation published in the Jan. 7, 1928, issue of ELECTRICAL RAILWAY JOURNAL has been followed by various supplementary developments. The most recent items, published last week on pages 358 and 376, refer to the results of a questionnaire sent out to operators of automobiles and trucks by the Traffic Survey Bureau of the Detroit Police Department, and to a report made by the city's Rapid Transit Commission.

It is unfortunate that this initial installation includes so many special conditions that the full possibilities of the plan and its suitability for application on other streets and in other cities becomes difficult of determination. Nevertheless it is important, now that the project has been in operation since Sept. 18, 1927, that every effort be made to derive from experience a full analysis of the possibilities and limitations of the idea.

Observation of the Detroit operation indicates several interesting features. First of these is that the elimination of many car stops and the regulation of other traffic to synchronize with the movement of public transportation vehicles speeds up all traffic on the street and materially reduces interference and congestion. Furthermore it has been demonstrated that the scheme of furnishing local service with supplementary buses does not demand an excessive number of buses, because only a small proportion of the passengers carried on the cars actually use the combined service. Of course this situation is subject to considerable variation, depending on the travel characteristics of any given street; but the Jefferson Avenue operation indicates that such a combined service can be operated with only a small proportion of the number of buses that would seem to be required from a purely theoretical analysis of the plan.

Beyond this point it is hard to draw definite conclusions regarding costs or the effectiveness of increased speed in attracting riders. It is important to bear in mind that the present operation includes many expedients and does not represent in any way the full possibilities of the express service. An important change was made in the route simultaneously with the starting of express operation. This consisted of cutting the old Jefferson Avenue-Grand River through line. The experiment was started on a street having many special traffic conditions that are not typical because of the absence of normal cross traffic. Another factor to be considered is that some of the oldest type of cars in Detroit were used for starting the express line. The buses used for the local service were not selected with a view of meeting the particular requirements of this type of service, but were adopted for the purpose merely because they were available. The existence of competition by independent buses and by numerous jitneys, still further complicates the problem of analyzing the economics of the new service.

All of these conditions must be borne in mind when attempting to draw conclusions. Obviously, the success or failure of the idea, or the possibility of its extension should not be judged without considering the various expedients in the present operation. The smoothness with which the operation is being carried out, however, even with these makeshift facilities, and the absence of

Digitized by Google

any really serious operating difficulty is particularly worthy of note. When it is considered that the elimination of many stops reduces the need for a conductor and opens the possibility for one-man operation, the wisdom of witholding judgment on the cost of this combined car-bus service becomes obvious. Operation of single cars with one man would reduce the headway between express units in comparison with present two car trains and would thereby make more convenient the transfer from local buses.

It is fitting that this experiment is being conducted in the motor city from which issue the millions of automobiles that create present day traffic congestion throughout the country. The plan of operating surface cars express is worthy of attention both by transportation men and those who represent the community point of view. Prejudice and snap judgment have no place in this consideration. Any plan which offers even a possibility of giving faster service on the one hand and of avoiding or postponing the heavy expenditures demanded by rapid transit construction, strikes directly at the very heart of the transportation and traffic problem in many American cities.

A Convincing Answer by Those Who Use the Service

THE INTERURBAN is dead—long live the interurban! This salutation by residents of Rosedale, Merriam and Shawnee, Kan., will usher in the resumption of railway service on the Hocker line scheduled for April 1. In good measure the laurels for this revival go to the people living along the Hocker line who willingly subscribed $10,000 in order to have service reestablished and a dependable transportation system a surety.

Events in the restoration of the Hocker line are worth repeating. Officially known as the Kansas City, Lawrence & Topeka Electric Railroad, this line, operating 21 miles, went into receivership in 1919. After eight years the sale of the property at public auction was ordered by Judge Pollock of the Federal Court in Kansas City, Kan., following a request for a termination of the receivership and sale of the property as scrap. In August, 1927, at the courthouse in Olathe, Kan., it was bought by the Sonken-Galamba Corporation, Kansas City, Kan., for $28,500. Mr. Sonken expressed his intention of junking the line. Immediately, appeals to save the road were voiced by residents and property owners who from then on worked indefatigably for the restoration of railway service. Despite setbacks, delays and disappointments an agreement was finally reached with the Kansas City Public Service Company to furnish power at cost, to rent four cars and to purchase $15,000 in bonds of the new company to be known as the Kansas City, Merriam & Shawnee Railroad.

All this took place, even though the line is paralleled by a fine brick highway on which licensed buses are operated. Apparently the experience of those people whose convenience and property value depend on adequate and reliable public transportation service, wanted the interurban badly enough to dig down into their own pockets for the money needed to restore operation. It is to be hoped that their action will result in the ultimate rehabilitation of the road and in the development of a class of service that will repay them for their public spirit and courage. Here is a convincing answer on the part of those who use the service, to those who would have us believe that the interurban of this type has outlived its usefulness.

"Caveat Emptor" Not Part of Modern Business

WHAT is known as a buyers' market exists at present. There is no disposition to quarrel with the purchaser who seeks legitimately to take advantage of it. It is only natural that every one making purchases should seek to do so on terms favorable to him, but that is not the end in itself. Price is important, but price alone is not the controlling factor, or should not be. Other factors are equally important, because they themselves constitute the value for which the price is paid. The chief concern of the buyer should be to see that he obtains a value proportionate with the price. The chief concern of the seller should be to see that he obtains a price commensurate with the value. Railway men are big buyers. They know that under a fixed fare the service rendered tends to approximate the limits which that fare imposes. They should know that it is equally as poor business for them to be a party to a transaction in which either side is going to lose money as it is for the public or its representatives to be a party to inflicting an inadequate fare on the railway.

Samuel Insull, as quoted by Earl Whitehorne in his recent article in the ELECTRIC RAILWAY JOURNAL, put the matter succinctly in talking to electrical men about purchases when he said that if competition is so keen as to hamper research work and threaten the quality or the rate of development; if margins that are too narrow restrict the wholesaler's ability to carry adequate stocks, supply sales service and extend credit to the retailer the purchaser suffers no less than the seller. And if the policy is carried too far the seller is virtually ruined or forced out of business. It is a complex economic problem that would at first appear not to admit of the entrance of the issue of ethics. But an ethical issue is involved. The pressure that can be brought to bear on the seller is, of course, very great. Some are in a position to resist it stoutly, but others are not so fortunately situated. The secret bid is, of course, one of the greatest hindrances to the correction of present-day abuses. Three recommendations made for reform follow:

1. That bids on standard listed apparatus should be offered for examination by any bidder who is called back and asked for a reduction of his price.

2. That salesmen should demand this as evidence of good faith on the part of the buyer whenever asked to cut a price after bids are in.

3. That post mortems on competitive bids should be made standard practice among all manufacturers so that losers may understand their lost business.

As the advanced thought of the day sees it the seller should not be made to fight for this reform unaided. Purchasing agents individually and as nationally organized should also become the exponents of this idea. It is another step to be taken in the banishing of trickery from trade. In other words, in this era of economic intelligence the gentle art of profiteering by purchasers should be laid away in shrouds along with the wooden nutmeg and that once popular commercial slogan—*caveat emptor.*

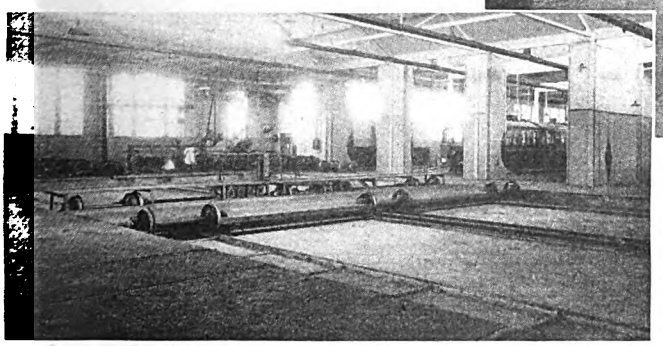
New Repair Shop at Quebec

A main shop building and a carhouse were constructed. Additions provide a boiler room, general storeroom and lumber storage. Interior transfer tables not affected by extreme winter conditions

DIVERSITY of equipment operated was an important factor considered in laying out the new repair shop of the Quebec Railway, Light, Heat & Power Company at Limoilou near the mouth of the St. Charles River. This company supplies all the electric power and gas used in the vicinity of Quebec and operates the city tramway system as well as a 25-mile suburban line to the shrine of St. Anne de Beaupré. Cars for the city division include 63 double-truck and 47 single-truck passenger cars together with 16 miscellaneous cars, making a total of 116. The suburban division has the following cars:

Passenger cars, steam railway type	22
Electric suburban type motor cars	11
Electric suburban type trailer cars	5
Steam locomotives	2
Electric locomotives	4
Freight cars	142
Portable substation	1
Miscellaneous Equipment	7
Total	194

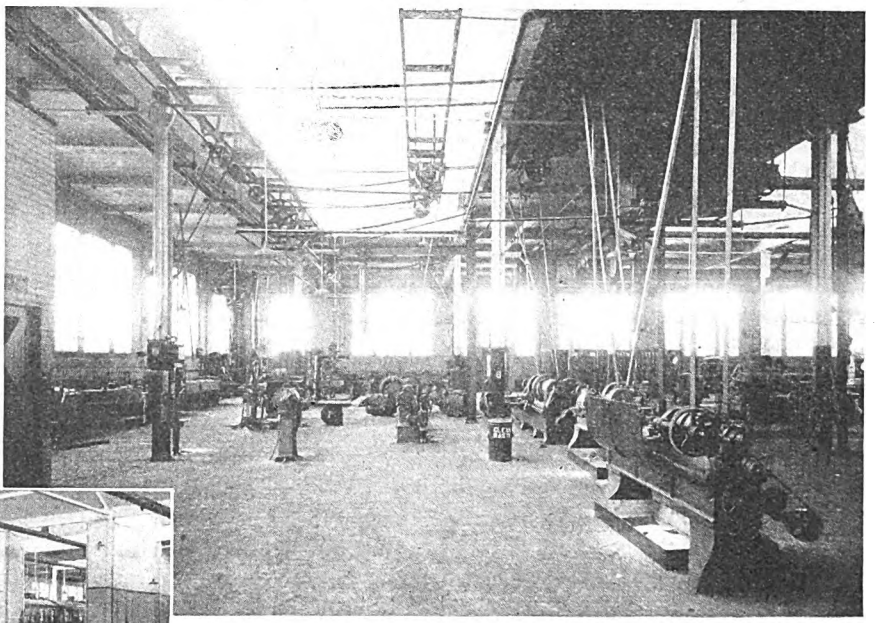
Daily freight and passenger trains of the Canadian National Railway system are operated over the company's tracks between Quebec and St. Joachim, which is the western terminus of the 60-mile branch line of the Canadian National Railway to Murray Bay. In addition to a large amount of local freight, the company serves two large pulp and paper companies with raw material and moves their products back to the trunk line terminals at Quebec. Steam locomotives have been superseded by electric for regular service, but two are kept in readiness for service in case of electrical breakdown.



Transfer table, looking toward the wheel shop and paint shop

The immediate result of the completion of the new shop was the closing down of independent repair shops on the suburban division at St. Anne de Beaupré, and at Montmorency Falls. Repair work previously carried out at the St. Malo, St. John Street and St. Paul Street shops of the city division, has been transferred to the new shop and the former are now operated as carhouses for inspection and storage. The concentration of facilities will allow the carrying out of an effective reconditioning program after which the cost of maintenance should decrease.

The buildings are of light buff-colored Citadel brick with steel sash and skylights. Roof members and supporting columns are of steel with gypsum fireproof covering. This results in a very favorable insurance rating. Floors are of concrete base with creosoted wood block surfaces. The main building is 312 ft. long and 138 ft. wide. Additions provide space for the boiler room, lumber storage, wheel stores, and general stores. The building occupied by the stores department is two stories high, the upper part being used for the lighter material and for the offices of the superintendent of equipment and general foreman. The stores for all departments of the company are now concentrated at this point.

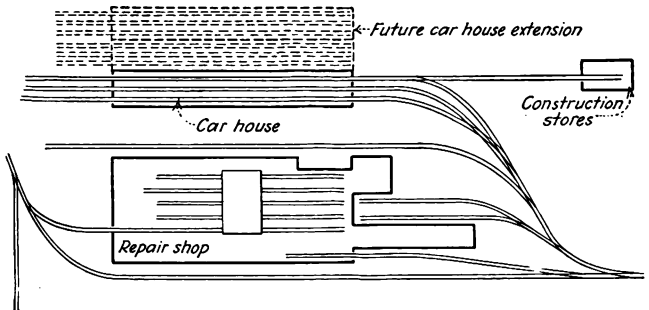


Machine shop, looking from the armature repair department

In the design and layout of the buildings, consideration has been given to an arrangement which will allow for general extensions without altering existing plans and loss of efficiency. The shops were planned by P. J. Quinn, superintendent of equipment, co-operating with D. E. Blair, general superintendent of the Montreal Tramways. The buildings were designed and constructed under the supervision of John S. Archibald, architect, of Montreal.

Climatic conditions in winter are such that the entrances were limited to a main lead-in track feeding an interior transfer table from the north side, and a special rear entrance for long wheelbase steam locomotives in the south end of the building. This south track

Digitized by Google



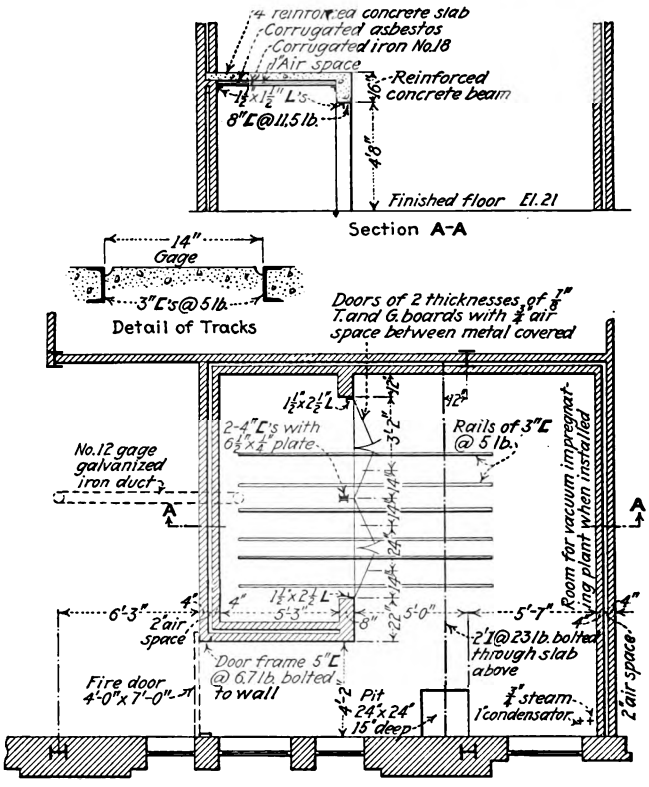
A three-track carhouse has been constructed paralleling the main shop. Ultimately it will be a nine-track building

is also used during the summer months for repairing the large number of box and freight cars used on the suburban system.

As shown on the accompanying plan, the section of the shop north of the transfer table is devoted to overhauling work and machine shop work. Four tracks, each with a pit, lead into this section from the transfer table. Two of these overhauling tracks are fitted with Columbia car hoists and provision has been made for the installation of a third when necessary. A 10,000-lb. traveling electric crane over the truck repair tracks is used for dismantling and handling the heavy electric locomotive equipment. The runways of this crane can be extended as required. Jib cranes serve the motor overhauling tracks and benches as well as the two heavy lathes in the machine shop.

The machine shop is well equipped to carry out the kinds of railway repairs necessary. A list of the various machine tools is given on the accompanying plan. Space has been reserved for the installation of a planer and some other machine tools as these become necessary for economical operation. Machine tools that are used intermittently have direct motor drive. Lathes, drill presses and other tools in constant use are driven in groups from line shafts with counter shafts.

The blacksmith shop, located in the northeast corner, is equipped with Canadian Blower & Forge Company's down-draft forges. The air brake shop is along the east



Layout and details of the impregnating room

wall adjacent to the blacksmith section, and just south of this and at the end of the transfer table, is the wheel shop. This is fully equipped with a double-drive wheel turning lathe, wheel-boring machine, wheel press, axle racks and storage trucks for wheels mounted on axles. This department is so placed that wheels and axles can be handled to and from the shop and to outside stations with a minimum of labor and no interference with working tracks. The wheel storage is just south of the wheel shop.

The northwest corner of the shop is taken up with the armature repairing department. This is equipped with an overhead traveler carrying an 8-in. air hoist. An im-

pregnating room is provided which is arranged for dipping and baking of armatures and field coils. The baking oven is heated electrically and is served by an overhead hoist and small trucks on rails, each truck having a capacity of five armatures standing vertically. Drip pans are provided beneath each truck. A free storeroom in this location provides for safe-keeping and handling of re paired equipment parts.

The woodworking mill, carpenter shop and painter's departments are located at the south end of the shop. All woodworking tools have independent motor drive. The woodworking shop is arranged so that the large quantity of lumber entering into the repairs of wooden box cars and freight cars can be handled from the lumber room through the proper machine onto the car repair track by the most direct and shortest possible route. A separate fireproof paint-mixing room is provided at one end of the paint shop.

The transfer table occupying the central position in the shop serves all departments. It has a capacity for handling 60-ton electric locomotives. Compressed air outlets have been installed throughout the shop for various purposes. These are supplied by a 100-ft. air compressor located adjacent to the air brake department.

A new carhouse just east of the general shop is 312 ft. 4 in. long and 46 ft. 4 in. wide. It has three tracks, each with a pit. This is the first bay of what will ultimately be a nine-track operating carhouse and is parallel and close to the main shop for convenience. The pits are equipped with Watson-Stillman hydraulic pit jacks supported by rails set into the concrete pit floor.

Heating of the building is partly by direct ceiling type heaters with electrically operated blowers, and partly by wall radiators placed under the windows in the main repair shops and service section.

Rapid Transit Faster Than Autos

SOME interesting figures regarding the relative time consumed by and the convenience afforded to suburban commuters in traveling to and from Chicago's Loop district by automobile, elevated train and steam railroad are given in a survey by the Chicago *Tribune*.

Taking a central point in the north side suburb of Evanston, the test showed that the Chicago & Northwestern steam line commuters accomplished the 10-mile journey to the "heart of the Loop" in 39 minutes, elevated line travelers in 45 minutes and motorists in 48 minutes. In actual riding minutes, however, the trip by elevated was thirteen minutes faster than by automobile and ten minutes slower than by the steam line express trains, as the figures were based on a five-minute walk to the elevated and steam road stations, but with no walk for the motorist. The test was made at the height of the morning rush hour. In the automobile test no attempt was made to speed. The return trip during the evening rush hour showed the elevated line commuter six minutes slower in reaching his destination than the autoist and twenty minutes slower than the steam road user, but in actual riding time he consumed about four minutes less than the motorist did.

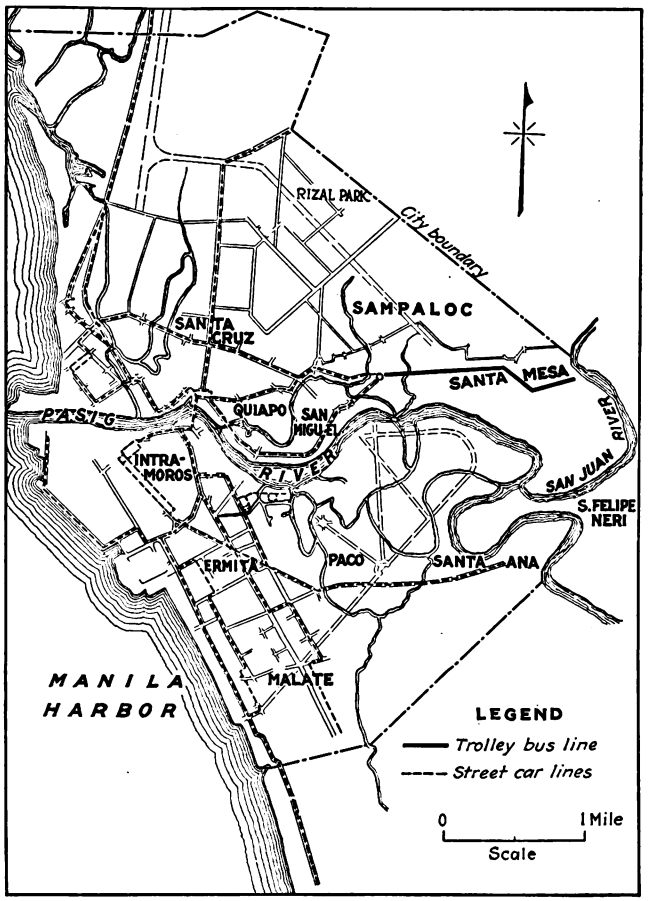
Similar studies made of transportation service from the south side of Chicago brought out that the electrified Illinois Central Railroad service in one direction is three minutes faster for the 10-mile trip from 81st street to the Loop than the automobile and five minutes faster in the other.

Manila to Use Trolley Buses

Economy of electric operation and need for reconstructing track if street car service were continued led to their purchase

EIGHT Twin Coach trolley buses have been purchased by the Manila Electric Company, Manila, P. I., operated by the J. G. White Management Corporation, New York, N. Y., to replace the street cars on the San Juan line of the property. The need of reconstructing all track of this line and the economy of the electric operation prompted the purchase of the trolley buses in preference to rail cars or gasoline buses.

The route, shown in the accompanying map, extends on Calle Santa Mesa from the Rotonda to the bridge over



The new trolley buses on the San Juan line will feed two lines entering the central business district of Manila

the San Juan River at the city limits, and is 2.96 miles in length. Calle Santa Mesa is a narrow street and is subject to heavy traffic. Continued operation of the street cars would have required construction of double track, at a cost of approximately $100,000.

The management of the Manila Electric Company was convinced of the practicability of operating trolley buses in the Orient by the example of the electric railway in Shanghai. This company has been operating trolley buses successfully for ten years and is planning to extend this class of service. The street railway in Singapore also is planning to use the new type of vehicle. The Shanghai installation is the more convincing since commodity costs are much lower in Shanghai than in Manila and labor costs there are only 20 to 25 per cent as much.

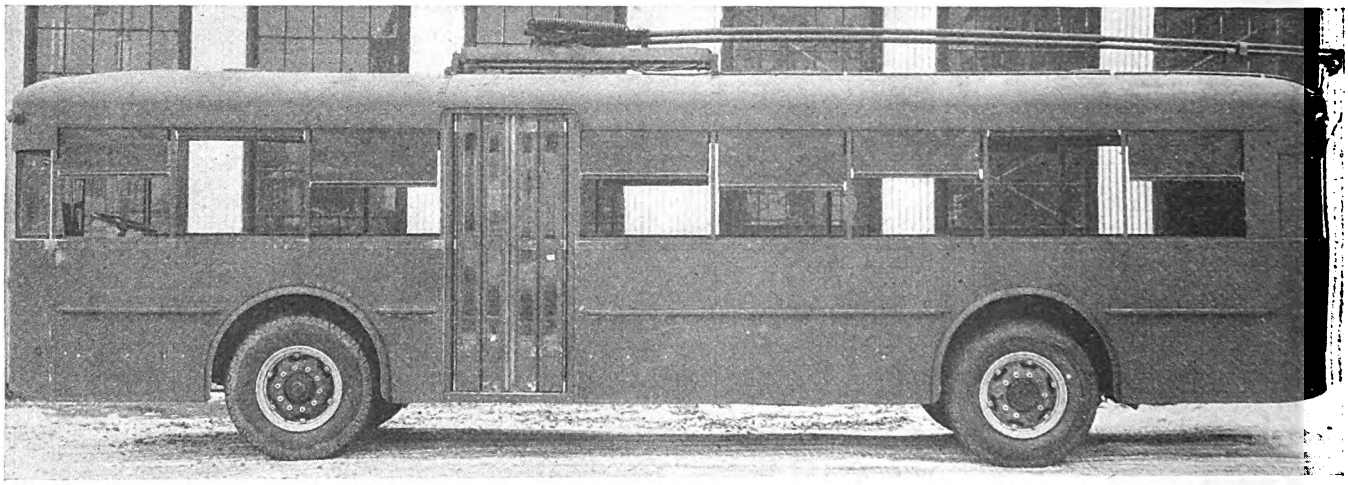
Digitized by Google

As mentioned previously, the buses will replace the street cars now operating on the San Juan line and will feed two trolley lines routed from the Rotonda to the heart of the city. Six buses will be used on regular schedules while two will be retained as extras. A headway of ten minutes will be maintained throughout a sixteen-hour day with a reduction to 3⅓ minutes during rush hours. To give this service it is estimated that 196,100 bus-miles will be operated annually. An average speed of 8.88 m.p.h. will be maintained over the route.

Considering both operating costs and fixed charges trolley buses were considered to offer the least expensive type of vehicle, figures being on a vehicle-mile basis. The cost of operating rail cars was found to be 29.6 per cent and the gasoline buses 36.4 per cent greater than the trolley buses. The high cost of gasoline in the Philippine Islands makes the gasoline buses very expensive. The comparative costs as computed on a vehicle-mile basis for the street car and the trolley bus are given in the accompanying table.

COMPARATIVE OPERATING COSTS OF STREET CARS AND TROLLEY BUSES, COMPUTED ON A VEHICLE-MILE BASIS

	Street Car	Trolley Bus
Way and structures	$0.0170	$0.0085
Equipment	0.0170	0.0360
Power	0.0255	0.0176
Conducting transportation	0.0600	0.0600
Traffic	0.0019	0.0019
General and miscellaneous	0.0290	0.0290
Totals	$0.1504	$0.1530



One of the Twin Coach trolley buses assembled but not painted. A separate base and trolley pole are provided for each overhead conductor

Fixed charges, including interest, taxes and depreciation, respectively total 14.6 per cent and 16.3 per cent of the street car and trolley bus investments. Including $100,000 for track work and approximately $20,000 for paving charges the sum required to continue street cars was found to be $215,700, as against $104,350, including a $10,000 paving charge, the cost of starting trolley bus operation.

Considering both operating costs and fixed charges the comparative figures on a vehicle-mile basis are $0.311 and $0.240, for the street car and trolley bus, respectively. The actual saving was estimated to be $14,000 per year.

The buses, manufactured by the Twin Coach Corporation, Kent, Ohio, use the single-deck street car type Twin Coach chassis and body with a seating capacity of 40. Electric motors replace the engines of the standard automotive unit. The bodies are designed for two-man operation with an entrance on the left side ahead of the center.

All electrical equipment for the buses was furnished by the General Electric Company. Two 600-volt G.E. 1126-A railway motors are used and a G.E. C-154 master controller. The controller is similar in construction to the usual street car controller, but much smaller. It is of the series-parallel type, having four steps series and three steps parallel, and will operate over a range of 300 to 600 volts. Cartridge fuses inclosed in a metal box are provided in each side of the line to protect the motors from severe overloads and short circuits. The controller is operated by a pedal and spring arrangement which permits the operator to use both hands for steering the bus. The master controller handles only the small current used to actuate the contactors which in turn handle the motor current. The master controller has seven positions, with seven corresponding contactor combinations. The rotation of the motor is reversed by a G.E. DH-69 reverse switch, hand operated.

A complete trolley base and pole is provided for each of the two overhead conductors. The poles have swivel harps and at moderate speeds the bus can diverge from 8 to 9 ft. from its regular course. The trolley poles are of sufficient length to accommodate overhead ranging from 16 to 22 ft. above the street.

The motor circuit resistors are iron grids insulated from their support and one another by mica. They are mounted under the bus body with supplemental insulation between the resistor frames and the floor. Cables for the motor control and lighting circuits have one layer of tape and one layer of compound-filled braid over the rubber. A switch connected to the emergency brake handle automatically cuts off power from the motor when the emergency brakes, which act on drums anchored integrally to each electric motor, are set.

The lighting system consists of twenty 30-watt, 30-volt lamps in series. The bus interior is illuminated by ten dome fixtures.

A test of one of the completed buses was conducted near the Twin Coach plant in Kent, Ohio, on Jan. 31, under the supervision of the factory officials and F. L. Aime of the J. G. White Management Corporation. D. C. Green, vice-president Utah Light & Traction Company, Salt Lake City, Utah, and Edward A. West, general manager of the same company also attended the test.

North Shore Line Uses

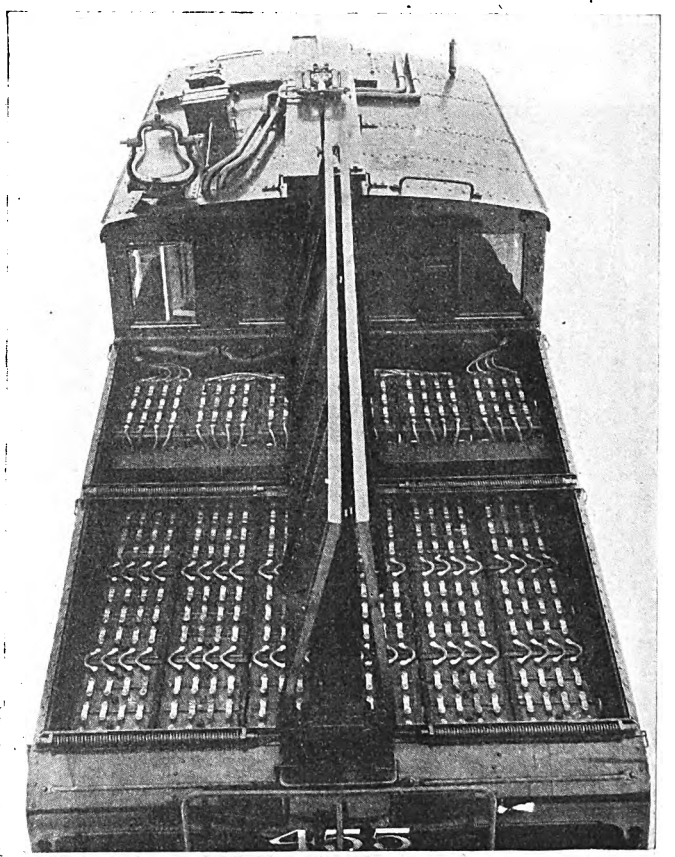
Combination Trolley and Battery Locomotives

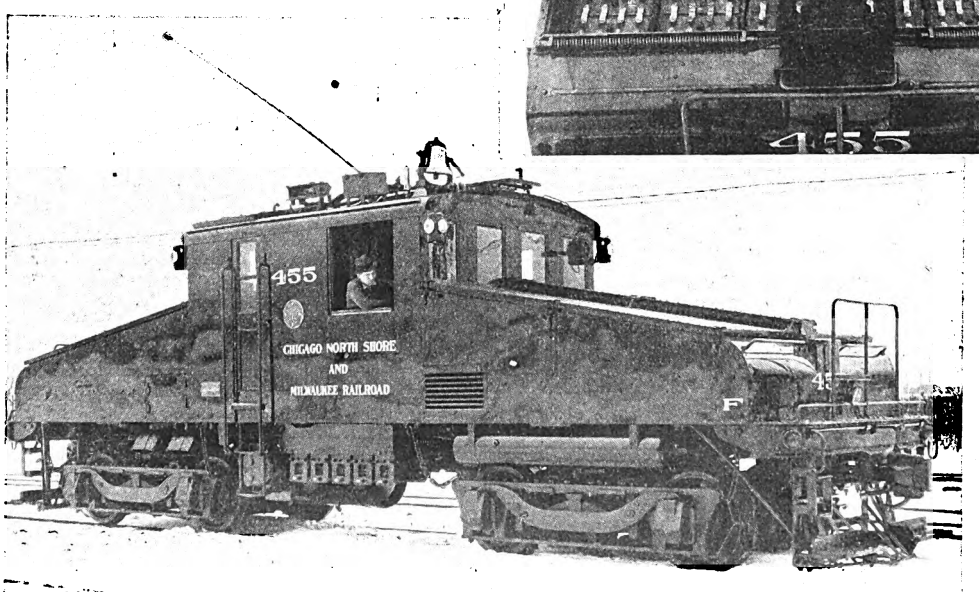
By F. H. Brehob
Railway Engineering Department, General Electric Company

TWO combination trolley and battery locomotives of a new type have just been placed in service by the Chicago, North Shore & Milwaukee Railroad. Provision is made for charging the battery from the trolley supply when necessary. The locomotive is thus available for use both on the trolley system and on tracks not so equipped.

Each of the two-axle swivel equalized trucks has a cast-steel transom and built-up side frames, rigidly bolted together. The journals are of the A.R.A. collar type, size 6 in. x 11 in. Brake cylinders are mounted directly on the trucks, eliminating brake rigging from underneath the platform.

The steeple-type cab has a control station at each end of the central compartment with the control equipment in the middle. The battery is located in the two sloping end cabs and is divided equally between them. The battery cells are in a single tier, permitting convenient access for the addition of water. Holes cut in the floor underneath the trays provide for ventilation of the batteries, permitting the heat to escape through ventilators built into the battery compartment covers. The cab rests on a platform with structural steel framing, riveted and





Trolley-battery locomotive—70 tons, 600 volts. The top view shows the battery in place

braced to the floor plate. Spring draft gear is attached to the center sills of the platform.

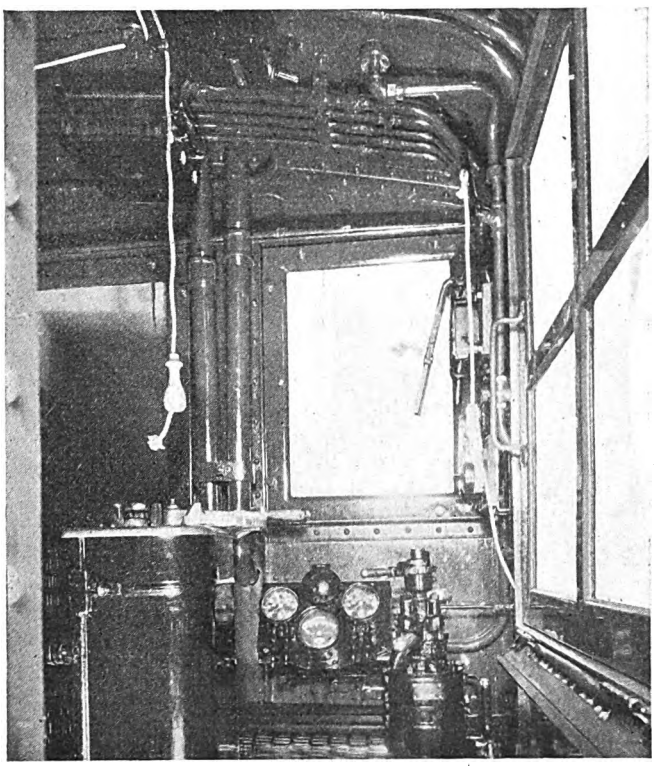
Four GE-251 single-geared, commutating pole, box-frame type motors are suspended on the axles and truck transoms. Each motor has a continuous rating of 4,250 lb. tractive effort, using a 69-tooth gear and a 17-tooth pinion. The motors are ventilated by an electrically driven blower in the central cab, with an intake drawing the air from the outside and discharging it to the motors through a duct built into the platform. Smaller ducts with sliding flanges distribute the air to the traction motors through the top of the magnet frame.

Digitized by Google

The control equipment is type M, multiple unit, with a master controller at each operating position. The main power contactors are actuated magnetically and the motor reverser is electro-pneumatic. Three-speed control is provided from either trolley or battery power. Transfer from trolley to battery power is automatic. A relay actuates the transfer contactors. In order to restore trolley power, however, it is necessary to move the master controller to the first notch.

Besides the air pressure gages, an ammeter at each operating position indicates the current flowing through one motor. There is also an ampere-hour meter in the battery circuit to indicate the state of charge of the battery.

Electric heaters of the sheathed wire type are located



View of operator's position

near the operating positions connected in the trolley circuit only. Power for operating the control and lights is supplied by the battery at all times. One sixteen-point coupler socket at each end of the locomotive permits use of two locomotives in multiple unit. Neither battery nor trolley are bussed through so that each locomotive receives its own power for traction purposes.

An Exide Ironclad battery is used, consisting of 192 cells, type MVA-41, furnished by the Electric Storage Battery Company. The battery is grounded at the midpoint. This reduces the voltage stress to ground to one-half battery voltage or about 225 volts. A switch breaks the battery into two sections, ungrounded, making it safe for maintenance and the addition of water.

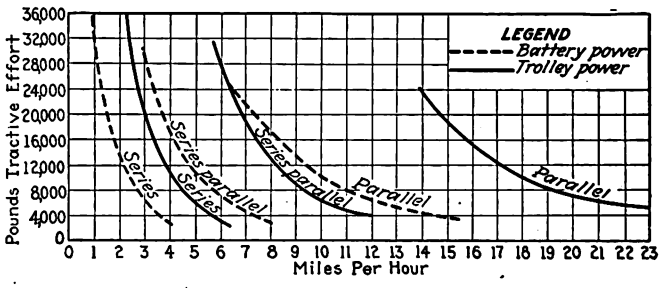
A 25-kw. motor-generator set is located in the main cab. Its control is automatic by the use of a contact in the ampere-hour meter. When the battery becomes fully charged, this contact automatically causes the motor-generator set to be shut down. When the battery becomes about 15 per cent discharged again, the set is started automatically. If, while the motor-generator set is running, the locomotive leaves the electrified line, the set will shut down, and it will start again upon the return of trolley power without attention from the operator.

Weights		Dimensions	
Electrical equipment	68,000 lb.	Height over cab	12 ft. 1 in.
Air brake and compressor	5,000 lb.	Width of main cab	9 ft. 8 in.
Mechanical portion	67,000 lb.	Length of main cab	11 ft. 6 in.
		Width of auxiliary cab	9 ft. 8 in.
Total, all on drivers	140,000 lb.	Lgth of auxiliary cab	11 ft. 6 in.
Per driving axle	35,000 lb.	Lgth between knuckles	40 ft. 0 in.
Minimum radius of curvature, locomotive alone	50 ft.	Rigid wheelbase	7 ft. 2 in.
Maximum speed	40 m.p.h.	Total wheelbase	28 ft. 8 in.
		Diameter of wheels	36 in

Battery Characteristics	
Ampere-hour capacity at six-hour rate	680
Average volts at six-hour rate	380
Kilowatt-hour capacity at six-hour rate	258
Maximum discharge rate in amperes	3,000
Maximum kilowatt discharge rate	600
Approximate weight of battery, pounds	30,000

Westinghouse 14-EL partial schedule straight and automatic air brake equipment is furnished. The leverage is so proportioned to give 75 per cent braking with 50 lb. cylinder pressure. Two General Electric CP-30 air compressors have a rated capacity of 35 cu.ft. per minute each. A hand brake operated from the main cab has sufficient power to hold the locomotive at a standstill on a grade.

The accompanying speed-tractive effort curve shows the operating characteristics. The one-hour rating is



Speed-tractive effort curve

22,000 lb. at 14 m.p.h. and the continuous rating is 17,000 lb. at 15 m.p.h. when operating from a 600-volt trolley.

The accompanying tabulation gives the principal data for this locomotive.

Milwaukee Issues Attractive Route Guide

DISTRIBUTION of a new street railway and motor bus guide is now being made to the public of Milwaukee by the Milwaukee Electric Railway & Light Company. An edition of 300,000 was printed. The guide is an attractive sheet, 12x18 in., folded in time-table form, having on one side a map of the city showing all street car and motor bus routes. The other side has an index of Milwaukee streets, list of places of interest in the city reached by street car and motor bus and a small map of the interurban system of the company, which covers southeastern Wisconsin by both rail and bus lines.

Early this year, Milwaukee underwent quite a street name changing program so that the map and street guide is particularly welcome at this time. The maps are being given out on the street cars, at the information desk in the Public Service Building, at several bus and railway stations and at the company's ticket office. Copies have also been distributed to information bureaus, travel bureaus, hotels and newspapers. The maps are being advertised on dash signs and interior car cards.

Inert Gas Protects Bus Fuel

in Paris

An inert gas, largely nitrogen, is kept in contact with the surface of stored fuel both in the main fuel supply station and in the various operating garages

By Henry W. Blake
Senior Editor "Electric Railway Journal"

Photo by Brown Bros.

Place de la Concorde, Paris, looking north. This is a busy traffic center. Two buses are shown loading at the right. Near the foreground is a double electric railway track which crosses the place here on an avenue known as the Quai des Tuileries

IN ALL fuel reservoirs of the Paris tramway and bus system an inert gas is kept in contact with the fluid to reduce the danger of accidental combustion. This plan is followed both in the main receiving reservoirs and in those of the various operating garages where the buses are charged with fuel.

As mentioned in a previous article in this paper, the fuel used for buses in Paris is a mixture of gasoline, alcohol and kerosene. Most of this material is received in Paris by rail over the Nord Railway, one of the main steam railroad lines of France. A switch track from this railroad leads into the main fuel storage yard of the S.T.C.R.P., the initials of the company operating the street railways and buses in Paris. There are also branch tracks into this storage yard from the electric railway system. The railroad tank cars holding the fuel discharge their loads directly into the company's storage reservoirs, which have an aggregate capacity of about 1,600,000 liters (445,000 gal.) or a supply for about three weeks. This large capacity is provided to avoid interruptions to the service if delay occurs in the receipt of fuel. From these storage reesrvoirs the fuel is distributed each day to the different garages by means of tank trucks with a capacity of from 4,000 to 5,000 liters (1,000 to 1,300 gal.) each. While in storage, the fuel is kept from the air by the use of inert gas, according to the Rolland and Maurice system.

Under this system the greater amount of the inert gas is used indefinitely, additions to it being necessary only to compensate for small losses which occur from various causes. The general arrangement at the main storage reservoir is shown in Fig. 1. The arrangement consists

Digitized by Google

essentially of a group of tanks, *R*, and a compressor, *C*, which is operated by an electric motor, *D*, which, in turn is controlled by an automatic switch, *E*.

When a railroad tank car arrives to discharge its contents, as shown at *V*, the air pump, *C*, is put in operation, exhausting the inert gas contained in the tank, *R*, through the piping, 5, and storing it in the accumulator, *A*. The amount of inert gas taken out is equivalent in volume under atmospheric pressure to the amount of fuel in volume admitted into the tank reservoir. When the tank car has discharged its contents no air is allowed to enter the system, as the receiving pipe is automatically shut off by a valve which is located on piping system No. 1.

To transfer fuel from the underground tank to the tank wagon the inert gas in the accumulator, *A*, is admitted under pressure to one of the reservoirs *R* through a pressure regulator, *M*. The fuel then passes up through pipe 2 and flows out by cock *B*.

In the main storage yard there are 22 tanks, each of 65 cu.m. (about 20,000 gal.) capacity. Each has a diameter of 3.15 m. (10 ft. 4 in.) and a length of 8.50 m. (27 ft. 10 in.). They rest on supports in a large pit, which has a concrete floor. These reservoir tanks are arranged in seven groups. One of these groups includes four tanks, and each of the others consists of three tanks. Each group has a storage inlet and a discharge outlet.

There are five piping systems leading to each tank, and each piping system is fitted with a cut-off valve at the dome of each tank. These piping systems are numbered in the drawing as follows:

1 is the piping through which fuel is admitted into the reservoirs. It is connected with the storing inlet.

2 is the piping through which fuel is taken from the reservoirs. It is connected with the discharge outlet.

3 is known as the safety piping. It is of lead and connects with the piping of the discharge system, as will be explained later.

4 is the piping for admitting the inert gas from the accumulator to the reservoir tanks, *R*. 5 is the piping for removing the inert gas from the reservoir, *R*. At its outer end this piping is connected to the exhaust of the air pump.

All of the cut-off valves mentioned are operated by handwheels located in boxes on the surface of the ground. Each box also contains a gage to indicate the pressure in the tank, and another to give the volume of the liquid contained in it.

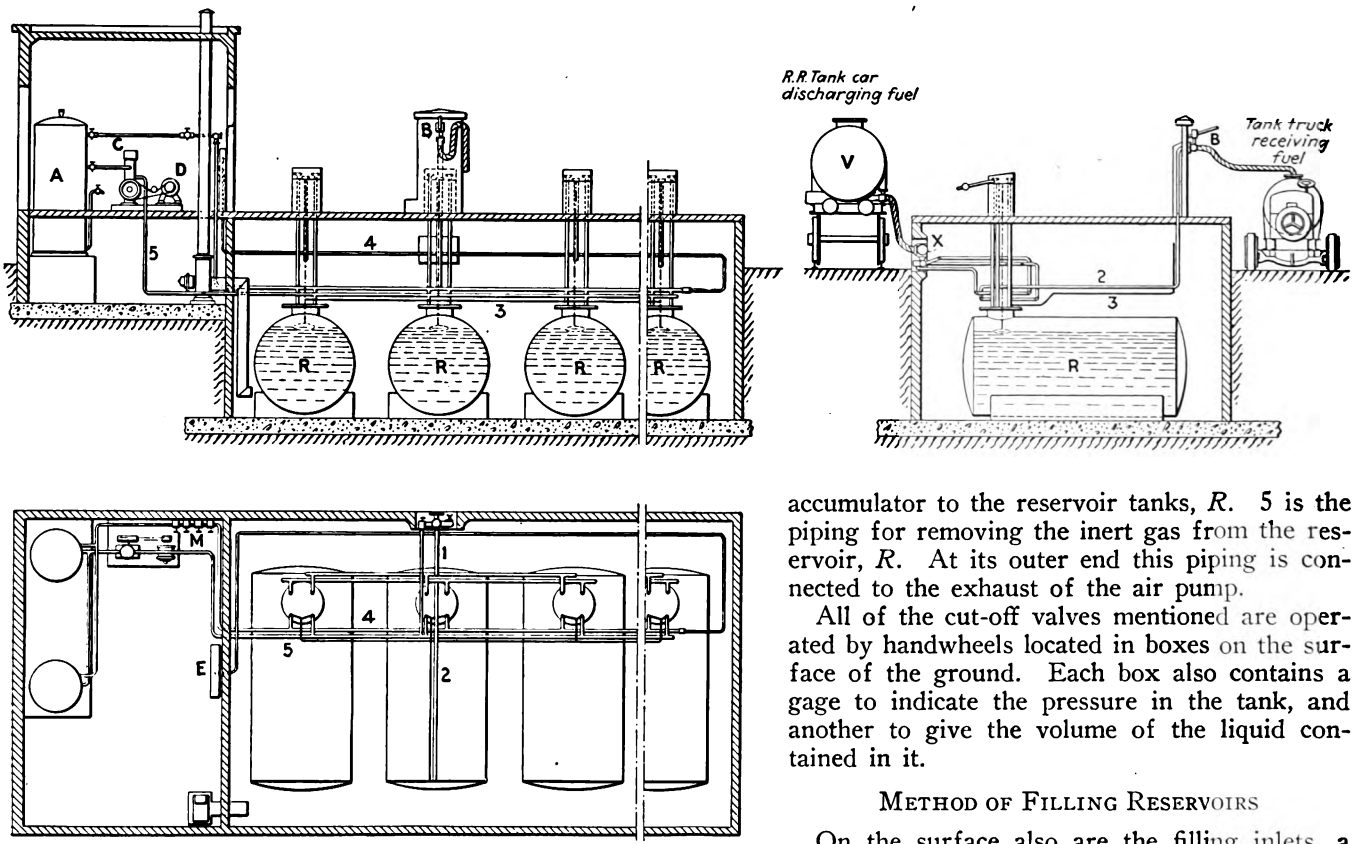

Fig. 1—Plan and sections of fuel reservoirs, inert gas accumulator, piping, etc.

LIST OF EQUIPMENT	LIST OF PIPING
A = Inert gas accumulator	1 = piping for leading fuel from railroad tank car to main reservoirs
B = safety cock	2 = piping for discharging fuel from main reservoirs to tank truck
C = electrically driven compressor	3 = safety piping
D = electric motor	4 = piping for admitting inert gas from gas accumulator to fuel reservoirs
E = automatic electric control switch	5 = piping for exhausting inert gas from fuel reservoirs
M = pressure regulator	
R = fuel reservoirs	
V = railroad tank car	
X = three-way valve	

Method of Filling Reservoirs

On the surface also are the filling inlets, a three-way cock which controls the movement of the inert gas and a safety device to prevent the entry of air into the reservoir when the tank car has finished discharging its contents into the reservoirs. This device, shown in section in Fig. 2, contains a float which lifts a valve when it is completely submerged and permits the liquid to pass through. As soon as the flow ceases a spring draws the valve back on its seat and closes the pipe.

Filling Station for the Motor Trucks

A feature of the equipment for discharging the fuel from the underground reservoirs into the tank trucks is a safety cock, which is designed to avoid any spilling of the fuel if any of the pipes should break. The location is shown at *B* in Fig. 1, shown above, and in detail in Fig. 3, which is a vertical section of this device. In the latter drawing the fuel, discharging from the underground reservoir into the tank truck, flows in the pipe *a*, through the valve *D* into the pipe *a'*. The valve, *D*, is controlled by a piston, *B*, which has an opening, *G*. When the valve, *D*, is closed and the outlet is not in use, this opening, *G*, connects pipe *b* with pipe *b'*. All the

Digitized by Google

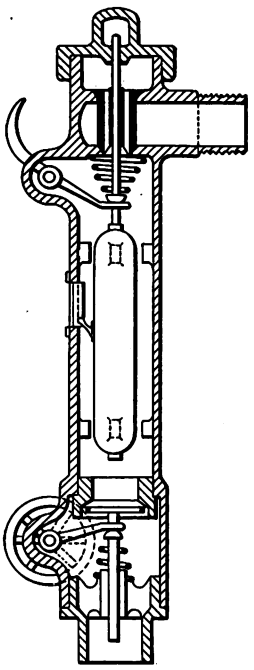

Fig. 2 — Safety cut-off on receiving piping

outlet cocks are arranged in series so that the tube *b* in one connects with the tube *b'* in the preceding cock and so on to the first cock, whose tube *b* is tapped in to the dome of its main reservoir *R*, in Fig. 1. The tube *b'* in the last cock in the series is connected with the end of the fuel piping 2 before it reaches the cut-off valve. The result is that when all the cocks are closed all the liquid in pipe 2 at each outlet exhausts immediately into reservoir *R*.

Piping 3 is in parallel with piping 2. It is of lead and is installed so that if a rupture occurs it will take place in the lead pipe rather than in piping 2, which is of steel.

Engine Room

At the western end of the fuel storage plant is the engine room, which contains ten inert gas accumulators, shown in elevation at *A* in Fig. 1. Each of these accumulators measures about 23 ft. long and 4 ft. in diameter and is fitted with a safety valve. In these accumulators the inert gas can be compressed to about five atmospheres. Adjoining the accumulators is a compressor with its electric motor. There is also the automatic electric control switch, already mentioned and shown at *E* in Fig. 1. Its function is to bring back the pressure in the fuel reservoirs to atmospheric pressure after the pressure has been increased for the purpose of discharging fuel.

Finally, in the engine room there is a blower for ventilating the pit in which the fuel reservoirs are contained. the air from this blower escapes from the pit through four outlets. There is a passageway between the engine room and a pit containing the fuel reservoirs.

The entire property is inclosed on all sides by a wall 11 ft. high and 9 in. thick.

Railway Connections

Two tracks, connecting at one point with the Nord Railway and at another point with the tramway system, permit the entrance of tank cars and provide for their removal after their contents have been discharged.

The rules in force forbid the movement of these cars while within the grounds by either steam or electric tractors. Instead, they are moved by cable. This is accomplished by means of two electrically operated capstans which are located on each side of the depot but outside of it. The apparatus for producing the inert gas is located outside of the main warehouse as shown in the plan of the property. The generating plant consists of an ordinary two - cylinder gas engine driving a compressor used to force the inert gas produced into the accumulators. A second gas engine adjoins the other for use in case its services should be needed.

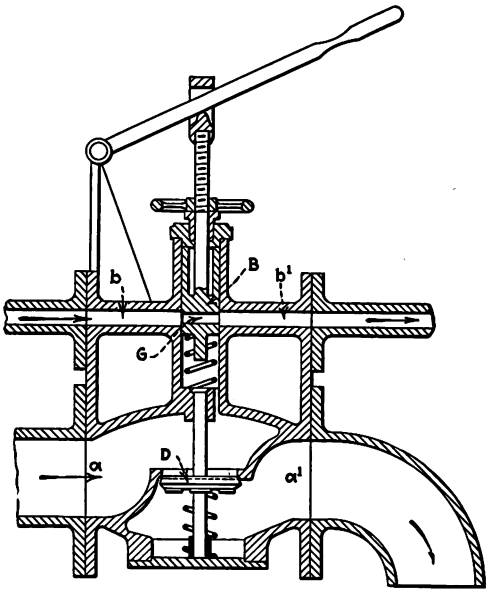

Fig. 3—Safety cut-off on discharge piping

The exhaust from the gasoline engine operating the compressor, when it is running in normal operation, has been found by chemical analysis to consist of 85 per cent nitrogen, 13 per cent CO_2 and 2 per cent CO. The proportion of free oxygen contained in this mixture is so very small that it is practically negligible and the gas so obtained has been found absolutely inert when care is taken to keep the operation of the motor normal. The care thus required is to avoid in the exhaust either an excess of air, which would increase the proportion of oxygen, or an excess of gasoline, which would increase the proportion of CO. This is the inert gas, after it has been purified, which is used to be in contact with the fuel in the fuel reservoirs, and piping.

Process of Purifying the Gas

The method of purifying the gas is shown in Fig. 5. After leaving the motor the exhaust gas first passes into the cleanser, *D*. Here it passes through water and in cooling leaves behind the greater part of any water vapor it may have contained. It then passes through the pipe *d* to the compressor *C*, which forces it through the pipe *g* into the second cleanser, *G*. This cleanser is similar in construction to cleanser *D*. Here it leaves the last traces of its water vapor. Then it passes through a filter, *H*,

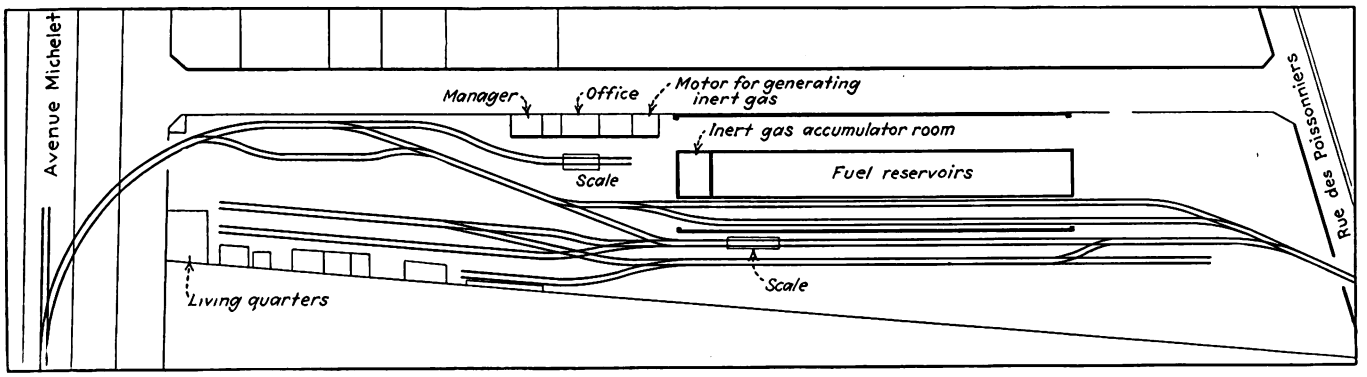

Fig. 4—Plan of central storage area showing position of buildings and switch tracks

Digitized by Google

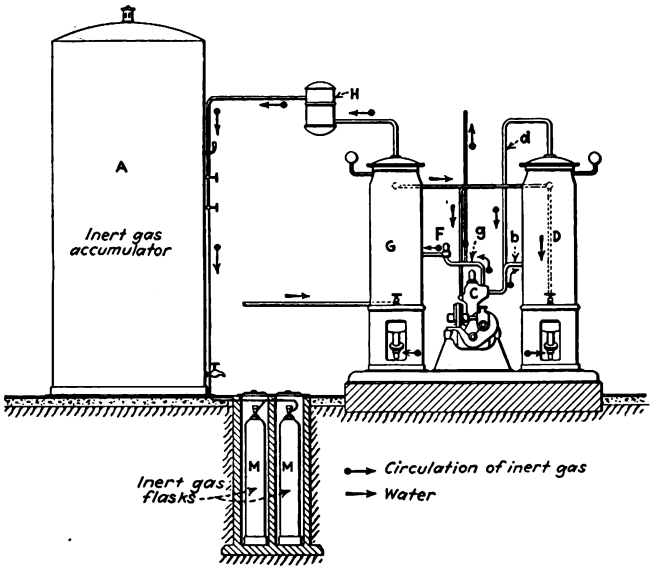

Fig. 5—Vertical elevation of inert gas pump, cleansers and accumulator

into the main gas accumulator, or it can be stored in smaller receptacles at *M*.

Between the force pump and the cleanser *G* is an automatic pressure regulator, *F*, by which the work imposed on the compressor is kept constant. The purpose of this regulator is to provide that in the event of two consecutive failures of ignition in the driving motor there will be no danger that a mixture containing any inflammable gas will pass over into the inert gas accumulator. Should there be such an ignition failure, the power of the motor falls off and it is unable to overcome the resistance provided through the pressure regulator; hence, the motor stops. This action is made more certain by the use on the motor of a very light flywheel. Finally, a cut-out on the motor exhaust pipe allows the motor to discharge its exhaust into the atmosphere for a short time after it has started running. In this way the cylinders are cleared of any air or unburned fuel before the exhaust is led to the inert gas accumulator.

At the plant described 25,000 tons of liquid fuel are passed in and out each year.

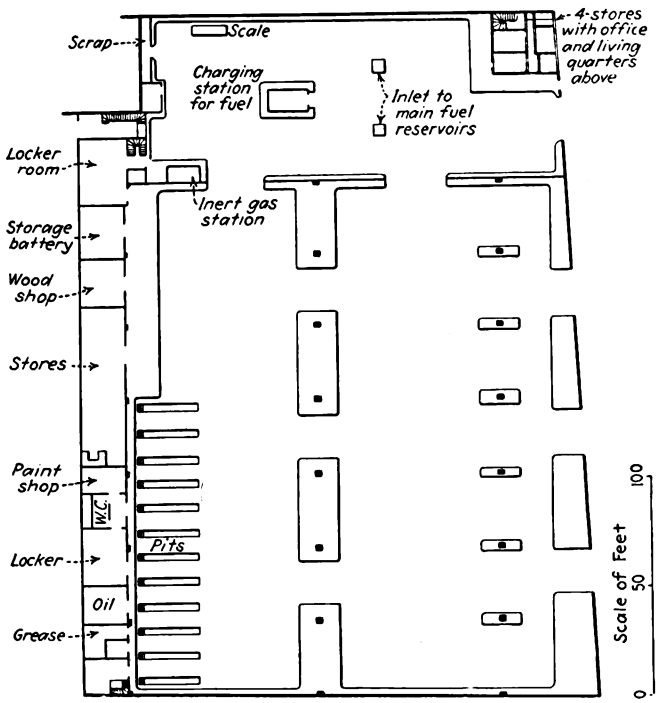

Fig. 6—Plan of Montrouge garage, Paris, with accommodations for 108 buses maximum and 104 buses normal. Like all other garages of the S.T.C.R.P., this one has an inert gas outfit for protecting the fuel supply from accidental combustion

Inert Gas Supply at Local Garages Also

The same system of fuel protection by inert gas is used in the local garages as in the main storage supply, although the equipment is not as complex or extensive as that at the central storage plant. But it is as complete so far as protection from accidental combustion is concerned.

The plan of the S.T.C.R.P. Montrouge garage, Fig. 6, shows a typical Paris garage layout. This garage has a total area of 70,203 sq.ft. and a covered area of 56,484 sq.ft. Its maximum capacity is 108 standard buses and its normal operating capacity is 104 buses. In one corner, as will be noticed, are the living quarters of the depot superintendent and his two assistants. This is a feature of all of the omnibus garages in Paris. In this case the housing quarters contain offices on the ground floor and living quarters for a family on each of the three stories above the ground floor.

Glasgow Adopts Double-truck Tramcars

This Scottish city has purchased for its municipal system 50 cars involving many changes from standard British design. Experimental changes are also being made on six of the older cars

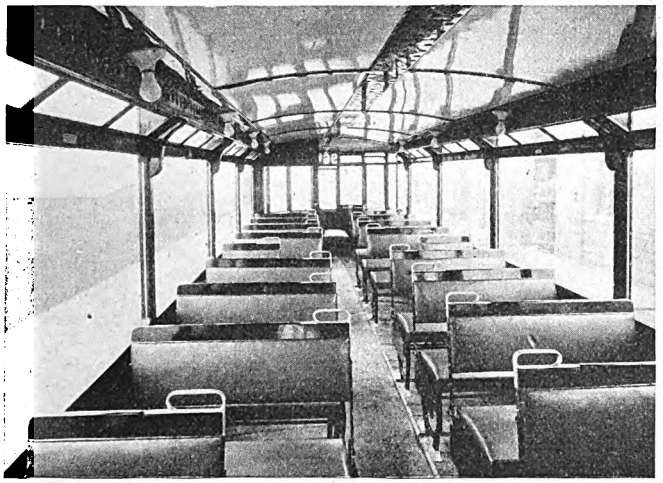
FIFTY new type tramcars are soon to be installed by the Glasgow Tramways, Glasgow, Scotland. At the annual inspection of the corporation's car works by the Tramways Committee on Oct. 13 samples of the new type car, as well as several types of reconditioned cars, were examined. In all of these the objects aimed at are greater speed and greater comfort for the passengers in order to meet bus competition.

The lower deck of the new car is finished in teakwood, the ceiling covered with embossed paper and painted white. This deck seats 30 passengers. Twelve are cared for by six cross seats in the center, three on each side of the aisle. Sixteen passengers are seated in the longitudinal seats at each end. The body width externally has been increased by 5 in., but by introducing a specially reinforced side pillar the inside width of this deck is increased 9 in.

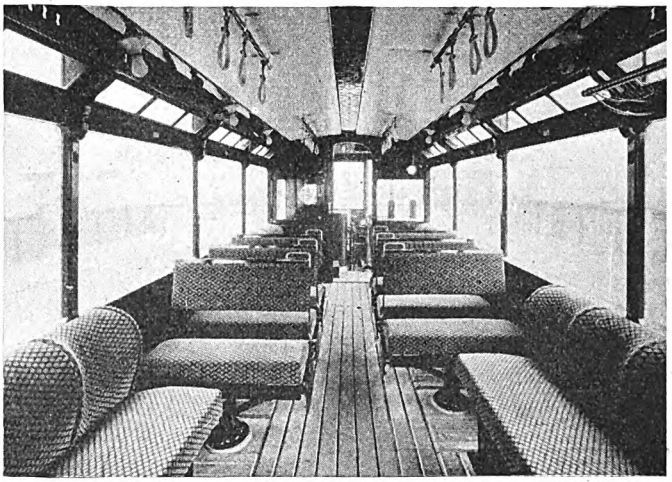
The upper deck is also finished in teakwood, the ceiling covered with ply-wood and painted white. The top deck is completely inclosed. A partition and folding doors are fitted around the stairhead to prevent draughts passing through. All seats face forward except four, where the passengers sit with their backs to the staircase. Two single seats in the center permit passengers to pass each other in comfort. Ten lamps of 40 cp. each are fitted in the upper saloon and eight in the lower.

The body is mounted on two bogies of the maximum traction type, thus departing radically from the former Glasgow standard four-wheeled car. The driving wheels have a diameter of 27 in. and the pony wheels 22 in. The wheelbase of the body is 4 ft. 2 in. and the distance between bogie centers 13 ft. 6 in. Each of the 50 new

Digitized by Google



The upper decks of the Glasgow cars are entirely inclosed. This is also an innovation in British design



By careful design the lower deck of the new Glasgow tramcar has an interior 9 in. wider than in the previous cars

cars has two 50-hp. light-weight ventilated motors with contactor controllers.

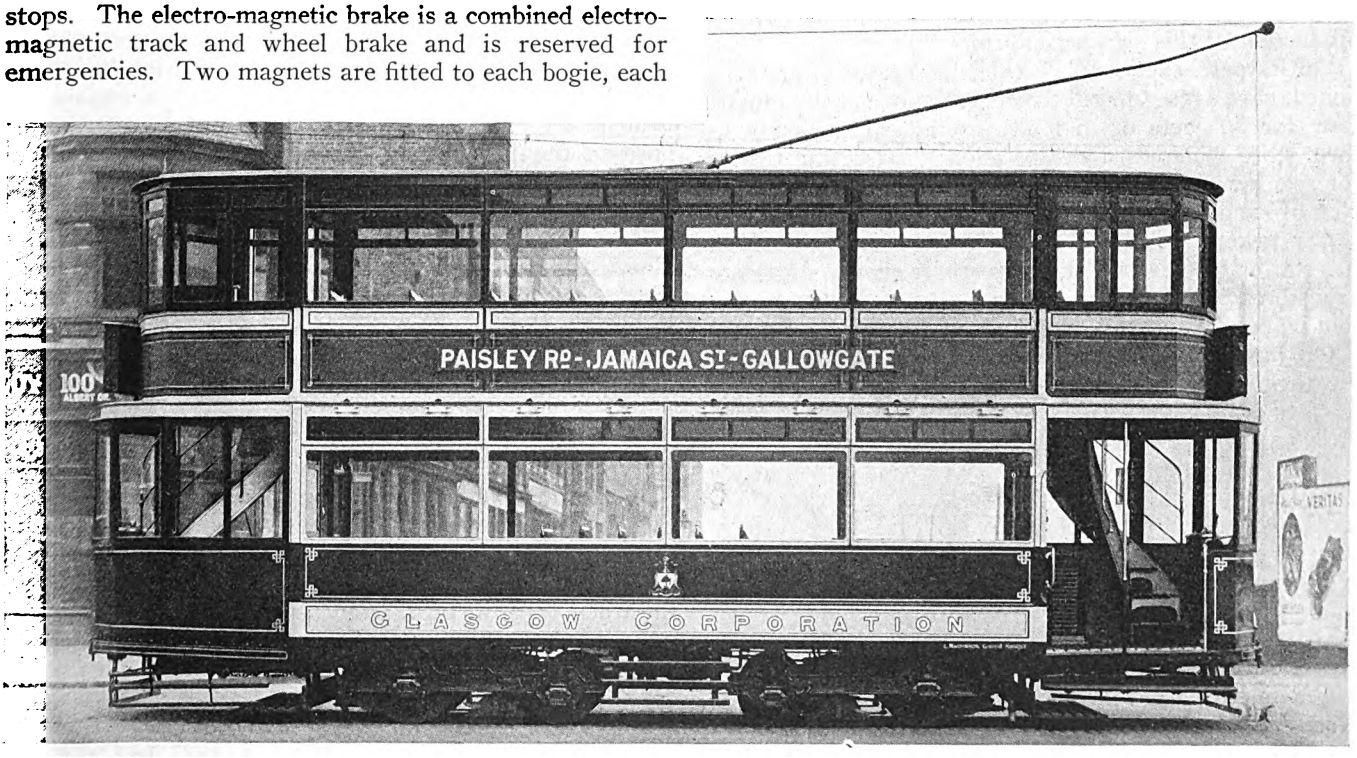
The car is equipped with hand, air and electro-magnetic brakes. The air brake, which operates the hand brake gear, relieving the motorman of the physical strain of braking by hand, will be used exclusively for service stops. The electro-magnetic brake is a combined electro-magnetic track and wheel brake and is reserved for emergencies. Two magnets are fitted to each bogie, each being capable of exerting a vertical pull on the rails of 2 tons. On each platform there is installed a simple cock which will set the air brake when opened. By this means the brakes can be set and the car stopped, either by conductor or passenger. On the driver's air brake handle is a trigger which opens an air-valve when depressed and forces sand under the wheels.

New Car		Old Car
20 ft. 6 in.	Length of body	17 ft. 0 in.
6 ft. 0 in.	Length of platform	6 ft. 0 in.
33 ft. 0 in.	Length over platform angles	29 ft. 6 in.
7 ft. 2 in.	Width of body over panels	6 ft. 9 in.
7 ft. 3 in.	Width of body over molding	6 ft. 10 in.
6 ft. 10 in.	Width inside lower saloon	6 ft. 1 in.
6 ft. 10½ in.	Width inside upper saloon	6 ft. 8 in.
6 ft. 3 in.	Height of lower saloon	6 ft. 4½ in.
6 ft. 0 in.	Height of upper saloon	6 ft. 1¼ in.
2 ft. 7 in.	Height of car floor from rail	2 ft. 8 in.
15 ft. 10½ in.	Height over all from rail	16 ft. 2½ in.
30	seats, lower saloon	24
38	seats, upper saloon	38
68	Total seats	62

The combined destination and route indicator is mounted over the lower canopy, the destination letters being 5½ in. deep and the route letters 4½ in. deep. Under the top canopy the route number is shown in figures 6½ in. deep. This is a distinct advance on the present type of destination indicator.

Exterior and interior views of the car are shown in the accompanying illustrations.

The principal dimensions of the new car compared with the former standards are given in the accompanying table.



The first of 50 new cars for the Glasgow, Scotland, municipal tramway. These are the first double-truck cars to be used on the property

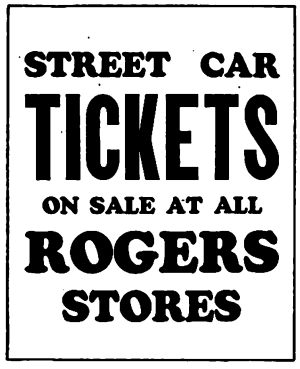
Car Tickets at One-Third Off

Discount allowed by Atlanta grocery store to customers who return bread wrappers— Tickets also sold through druggists

HOUSEHOLDERS in Atlanta are being offered a novel inducement to purchase loaves of bread made by the Southern Grocery Company. This organization owns 150 grocery stores, known as Rogers' Stores, in Atlanta and surrounding territory. Beginning Jan. 1 it has been giving an Atlanta street car ticket for two returned bread wrappers and five cents, or two car tickets for four bread wrappers and 10 cents, etc. As the car ticket sells for 7½ cents (or two for 15 cents), this means a reduction of one-third on all tickets or else 1¼ cents for each bread wrapper returned, which ever way the transaction is figured.



Dash sign carried on Atlanta cars to advertise sale of tickets at chain grocery stores

The grocery company gets no reduced rate for tickets bought from the railway company operating in Atlanta, the Georgia Power Company. It pays 7½ cents for each ticket obtained. The only consideration which it received was that at the beginning of the sale the railway company advanced to the grocery store $1,500 worth of tickets. This number the stores replenish daily for cash. At the end of the campaign the stores will naturally account to the railway company for the $1,500 worth of tickets advanced at the beginning of the sale. In addition, the company carried a dash sign for a few days reading "Street car tickets on sale at all Rogers stores." A reproduction of this sign accompanies this article.

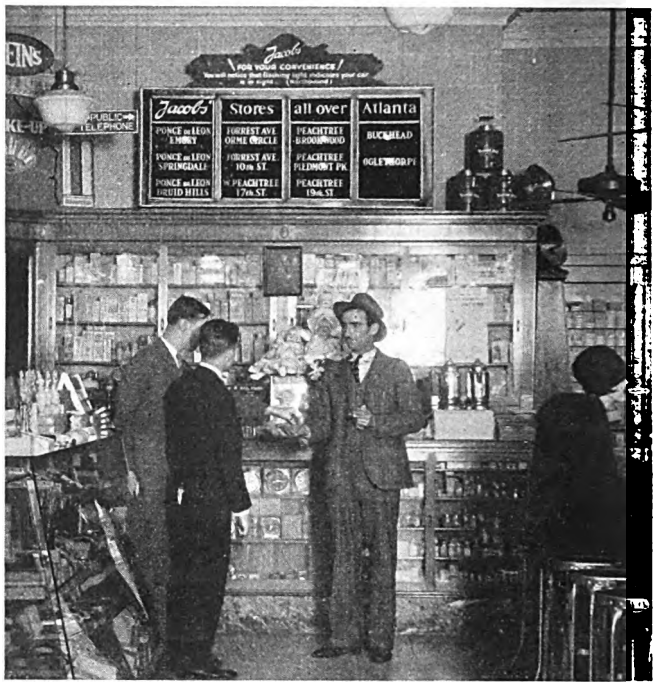
On its part, the stores, beside the special offer mentioned, have agreed to sell tickets to anyone at the rate of four for 30 cents or in multiples thereof, to carry in their store windows a card reading "Street car tickets for sale here" and to advertise in the daily papers their plan of exchanging bread wrappers for car tickets.

Car tickets are also on sale at the company's office, the starter's office, company stores, a chain of private drugstores and at another large store. They are also sold by conductors and one-man car operators.

On Jan. 30 the store proprietors reported that during the month their sales of bread had increased 400 per cent since the campaign was started and that they considered the plan highly successful.

Up to this time the principal outlet for tickets outside of the cars and the company's office was through a chain of fifteen drugstores in Atlanta, known as the Jacobs' stores. The only expense to which the railway company is put in connection with the sale of these tickets is to carry a dash sign occasionally on its cars, similar to that illustrated but reading "Use car tickets. On sale at Jacobs' stores."

On its part the drug company in its principal downtown store, which is at a busy intersection, has posted in a conspicuous place an illuminated car destination sign to indicate the route of approaching cars. It is operated by a colored porter in front of the store who pushes the appropriate button when any car comes in sight, thus apprising the store patrons of the fact. The accompanying view shows the position of this sign and how the arrivals are indicated. The cost of the sign and its running expenses are defrayed by the drug company.



A popular drug store in Atlanta operates a car route sign for the benefit of its patrons

In a recent interview with a representative of the ELECTRIC RAILWAY JOURNAL, the manager of the drug company said that the illuminated sign and dash car card on the railway company's cars were considered excellent advertisements. The effect of the sign was to induce street car patrons to utilize the store as a sort of waiting room, especially on rainy or sultry days. This is considered an advantage because in looking around the store they undoubtedly saw and bought articles that they would not have come in to purchase. While unable to estimate the extent to which the plan had increased the business the management stated that no doubt the additional amount so obtained more than repaid the investment and maintenance cost of the sign.

These two outlets for tickets are considered advantageous by the company because they relieve the conductors and one-man car operators from selling tickets.

New Carhouse and Housing Plans in Turin, Italy

CONSTRUCTION of a new carhouse to accommodate about 300 cars has just been finished by the municipal electric railway at Turin, Italy. Adjoining the carhouse is a track yard which will be served by a bridge traveling-crane with a span of about 48 ft. Adjoining the track yard, in turn, is an apartment building, being erected to house the employees operating from this depot. This housing undertaking has 430 rooms, divided into apartments of different sizes.

The Turin electric railway system has grown rapidly during the past twenty years and in 1927 had a total of 555 cars. The passengers carried in 1927 were 203,322,000.

Training school of the New Orleans Public Service, Inc., showing the school car, the controller platform and the electric circuit board

Well-Trained Motormen Create Good Will

Co-operation between the instruction department and the rolling stock and shops department of the New Orleans Public Service aids in training motormen

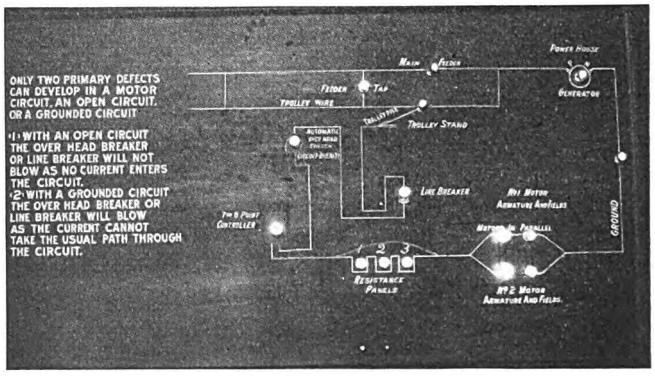
By E. J. Murphy
Superintendent of Instruction and Employment
New Orleans Public Service, Inc., New Orleans, La.

This article gives details of the instruction methods of this company, which has made a remarkable record of freedom from failures. It is based on a paper presented by the author at the meeting of the Electric Railway Association of Equipment Men, Southern Properties, held at New Orleans on Jan. 25-27, and supplements information published in this paper for Aug. 2, 1924.—EDITOR.

GOOD equipment and well-trained operators mean good service to the public, as well as increased earning power for the company. As practical electric traction men, we understand in a general way what a pull-in of a defective car means, particularly during the peak; the havoc it creates in headway, causing patrons to wait an unnecessary length of time to board a car, and also the disarranging of schedules. This kind of service does not help build a good public relationship, which today is a matter of vital importance.

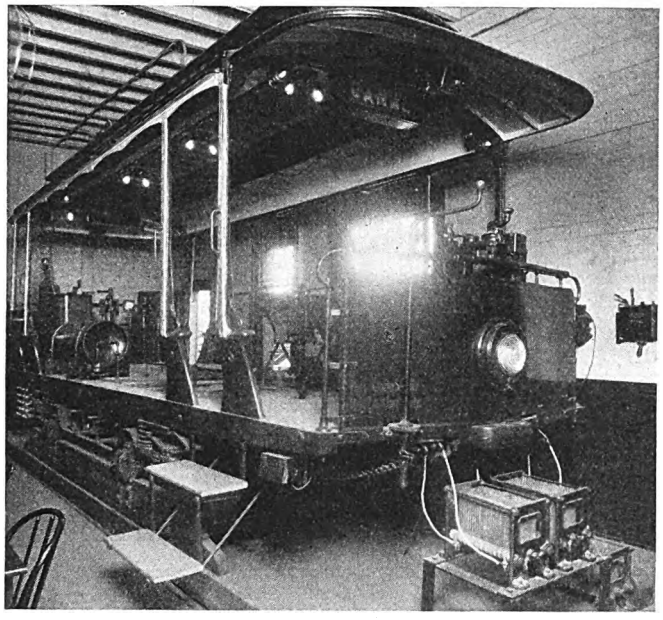
Frequently after an investigation of a defective car pull-in, causing a long delay, some trivial defect was found the cause of all the trouble and very easily could have been eliminated had the motormen been trained properly. In 1921, with this problem still unsolved, we decided to make every reasonable effort in New Orleans to decrease our defective car pull-ins, and with this object in view our motormen were checked in the operation of their cars.

The training school was established and all new men entering the service were instructed thoroughly in locating and eliminating nominal defects, and shown the path of the current through the electrical apparatus of the car



An electric board is used in explaining the electrical circuit and defects which develop in the circuit. The motors can be shown either in series or in parallel

Digitized by Google



The school car, fully equipped for operation, is mounted on a stationary platform. Note how all equipment is exposed

by competent instructors. The improvement noticed in the handling of the electrical equipment by new operators became so noticeable that we decided to bring in all our regular motormen on the company's time to train them the same as new men. The response to this request was remarkable. Many of our old motormen willingly grasped the opportunity to learn more of the equipment they were handling. During this period we found 75 per cent of the old men in need of such instruction. The result has been a source of satisfaction. The initial cost has been amply repaid to the treasury in competent operators and first-class equipment.

Co-operation of Departments a Helpful Factor

Our superintendent of rolling stock and shops and his men have co-operated to the fullest extent in our efforts to improve our operators. At various times he has made new installations in the training school. Whenever a new device is installed in the electrical equipment of the cars in service a similar device is installed immediately at the training school. A great deal of our success in training men can be attributed to the good feeling existing between the two departments.

A definite course of instruction is followed in training the motormen. New employees enter the training school the morning after being accepted by our medical examiner for employment. The students are then taken in hand by one of the instructors at the training school and told the company's policy to the public and to the employees. Particular stress is laid on courtesy, cleanliness, loyalty and honesty. The talk is supplemented by reading copies furnished by the superintendent of transportation of a number of commendatory letters from patrons received by trainmen already in our service. Although this instruction requires but one-half hour, the students acquire a good idea of the policy of the company concerning their duties as motormen, a very important part of which is to make every passenger satisfied.

After this instruction, the students are assigned to a stationary platform equipped with one type K-36-J and two type K-11 car controllers. Here they are trained to handle the controllers. Four rows of five lamps each are connected to one of the K-11 controllers to illustrate the functioning of the resistance. On the first point, the entire cluster of lamps is illuminated, indicating that all the resistance is in the circuit. The lamps are extinguished by rows until in the running position, the lamps are all extinguished, showing the starting resistance is no longer in the circuit.

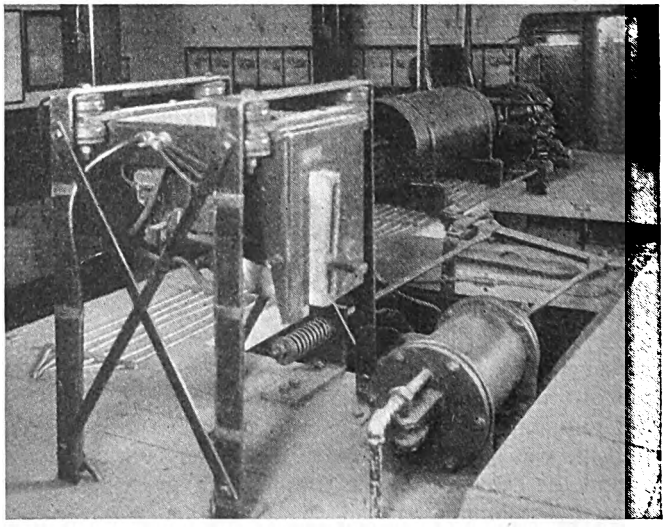
Electric Board Shows Complete Trolley Circuit

The course of the electric current from the power house through a car and return is explained next to the class. For this purpose an electric board shows by lamps and heavy white lines the several parts of the circuit. The board measures 3x7 ft. and is mounted on the wall in plain view. The flow of the current is traced from the generator at the power plant through the main feeder, feeder taps, trolley wire, trolley wheel, trolley pole, trolley base, trolley lead, automatic line breaker, overhead circuit breaker, controller, resistance, motors in series or in parallel, motor ground leads and the rails back to the power house. Each unit of the electric apparatus is illuminated by small lamps controlled by switches handled by the instructor.

Following the electric board instruction the students are assigned to the school car, an old stationary car, fully equipped. The car has a K-68-A controller on one end and a K-35-JJ on the other. The resistance is an ordinary grid resistance and is supported on a stand on the floor, with all wiring in plain view. The resistance can be grounded or open-circuited by the instructor at will. The air equipment is mounted upon the floor of the car where its operation can be explained and observed more easily. A d.c. voltmeter on the side of the car is used in the discussion of line voltage. An ammeter is used also to show the difference in the current required with proper and improper handling of the controller.

All parts of air-brake equipment are explained fully while the car is in motion.

Each student is stationed on the platform of the car and given further instructions in handling the controllers and the air valves. This trial operation takes place with the car entirely clear of defects. The instructor then opens or grounds a part of the circuit and requests the student to repeat his former operation. The car is equipped with levers, with which any of several defects can be placed in the circuit. Instruction is given in the



The air-brake equipment is mounted upon the floor of the car and can be inspected easily

Digitized by Google

method of locating the trouble and making the necessary repairs. As many as three or four defects are thrown in the circuit at one time and the student is expected to discover them.

After the preliminary instruction each student is assigned to a platform instructor and is expected to operate cars on various lines. During the entire period, usually fourteen to eighteen days, he is followed up by a representative of the instruction department.

The student is expected also to return each day to the instruction department for further study in preparation for the final examination, which is conducted by the superintendent of instruction. It includes the locating and repairing of all defects. If the student passes, he is assigned to the station and his name placed on the extra board. Thirty days later he is sent back to the training school by the station master to take a written examination of 81 questions pertaining to his work. He then is followed up constantly for 60 days by three road inspectors or follow-up men, who make reports on his progress in the handling of cars.

Steel Bridge Replaces One of Concrete

REPLACEMENT of a concrete arch bridge with a 114-ft. steel bridge weighing 100 tons was the difficult and unusual task just finished by the Portland-Lewiston interurban division of the Central Maine Power Company. The new bridge was placed in position during the interval between the time the last car went over the old bridge at midnight Wednesday night, Dec. 14, and daylight the next morning. Work of lowering the heavy structure into place continued through the day and the first car passed over the steel at 2:20 in the afternoon.

The only semblance of inconvenience to passengers was for a few hours during the morning when they were transferred from the cars around by bus. By noontime approaches to the bridge had been built on an incline to serve as a temporary track while the old concrete bridge below was being blasted out and the new steel dropped finally into its permanent resting place.

Although concrete is ordinarily replacing steel in modern bridge work, the reversal of that custom in this instance is due partly to extraordinary conditions which resulted in the acid-bearing waters of the Presumpscot River causing unusual decomposition of the concrete during the seventeen years of its existence.

A feature of the engineering work was the moving of the steel bridge, mounted on two standard gage railroad car trucks, from the siding about 2 miles away, where it was completely assembled, to the river site. It was necessary to proceed slowly because clearance of the telegraph poles on the side of the roadbed was scarcely enough to allow the huge "car" to pass. The trip took one hour and ten minutes.

No difficulty was encountered in setting the new bridge into place. The trucks were run across the old concrete bridge and after the ends had been jacked up and the trucks removed the span was dropped down on the temporary abutments which had been prepared for it. A temporary supporting arch had been placed under the bridge to guard against possible accident until the new span could be set up. Preparations for replacing the bridge had been made for three weeks. The work was done under the direction of the Sanders Engineering Company and Webster & Libby, consulting engineers.

Effect of Unsprung Car Weight on Track Wear

Berlin Surface Lines measures vibrations produced at rail joints and crossings by cars with motors having different kinds of mountings

EFFECTS of reduction of unsprung weight on rail wear, particularly at joints and in special work, in connection with electric cars equipped with bevel gear drive, have been studied by the Berlin, Germany, Surface Lines, which operates a number of such cars. Measurements were made with a vibration meter to determine the extent of the blows delivered by the wheels of cars of about the same total weight but with different

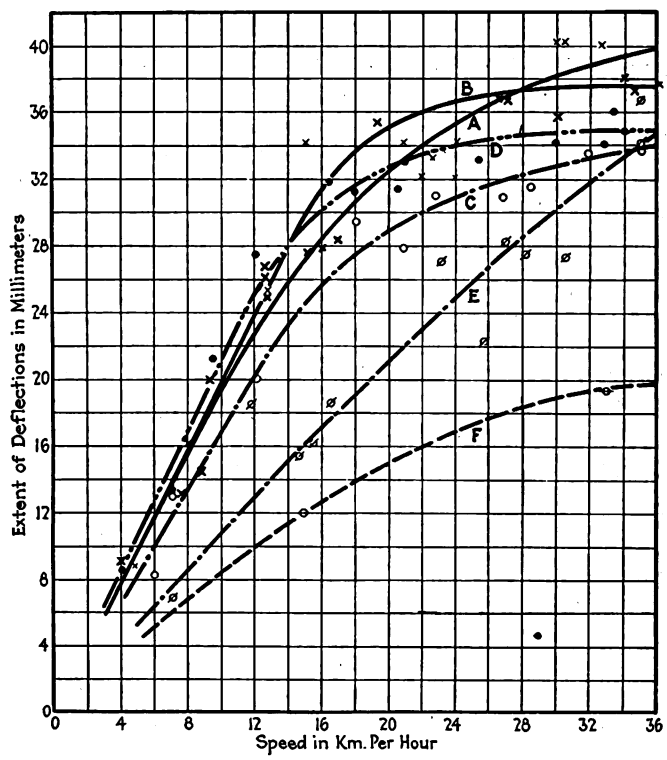


Chart showing the geometrically added deflections in the direction of the three components (vertical and two horizontal) for various cars at various speeds, viz.: A, axle-suspended motor car, empty; B, same with 500 kg. extra unsprung weight; C, beveled-gear motor car, empty; D, same with 3,000 kg. regular load; E, maximum-traction truck car; F, four-wheel trail car

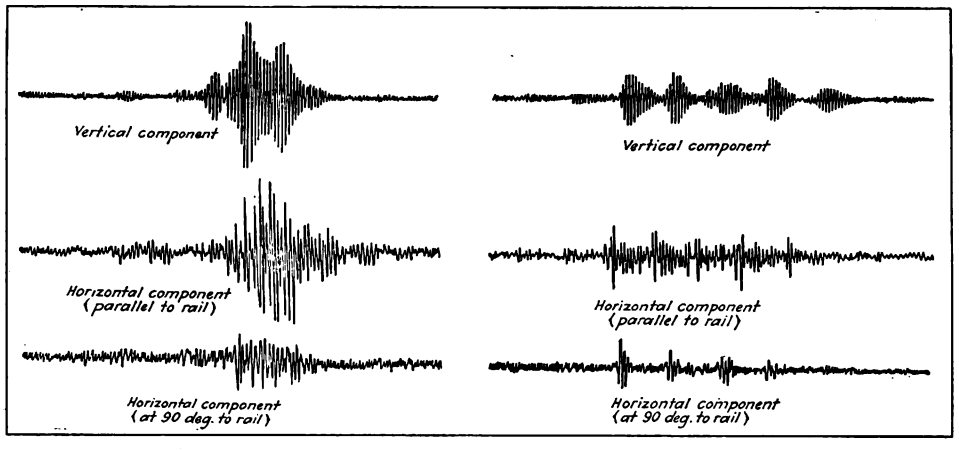
proportions of unsprung weight. The results are given in an article by Ph. Kramer, one of the engineers of the Berlin Surface Lines, and published in the issue of Jan. 28, 1928, of the *Zeitschrift des V.d.I.*

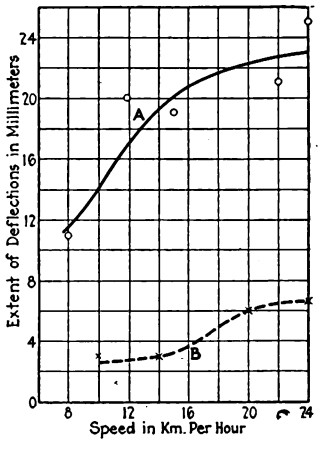
The tests were made by operating cars of different types across an electric railway over steam railroad crossing. The electric railway rails at this point are flange-bearing, so the electric car wheels run on their flanges up to the point where the groove in the steam railroad rail occurs. Here the electric railway wheels, which were of 28.4 in. diameter, in passing over the steam railroad groove with a width of 1.57 in., were able theoretically to drop a maximum of 0.006 in.

The cars tested were of the following types:

1. A single-truck car with motors suspended in the usual way from the axles. The weight of the car empty

Digitized by Google





At the left are reproductions of typical records obtained with the vibration meter when a car passed over the crossing. The three at the extreme left were made with the car traveling at 27 km. (17 miles) an hour and the second group with the car traveling at 8.8 km. (5½ miles) an hour. The chart at the extreme right gives a comparison of the blows on the motor when (A) it is supported on the axle and (B) when it is fully spring supported and equipped with bevel gear.

was 24,640 lb.; the gear ratio was 1:5.92; unsprung weight per axle, 2,486 lb.; wheel diameter, 28.4 in.; wheelbase, 9 ft. 2 in.

2. A car similar in type, spring support, etc., to the one just mentioned, but with spring-supported motor and bevel gear with double reduction. The gear ratio was 1:6.03 and the total weight was 26,114 lb., of which the unsprung weight, including gear cases and axle journals, was 2,182 lb. per axle. The wheel diameters and wheelbase were the same as in the first car.

3. A car mounted on two maximum traction trucks drawing an empty four-wheel trailer. The data of the maximum traction truck car were: wheelbase, 51 in.; truck base, 18 ft.; wheel diameters, 31½ in. and 22 in.; total weight 33,880 lb. The trailer data were: total weight, 15,400 lb.; wheel diameter, 28.4 in.; wheelbase, 9 ft. 2 in.; unsprung weight, 1,320 lb. per axle.

The vibration meter, which was somewhat similar in design to a seismograph, registered the vibrations in a vertical and in two horizontal directions. The diagram on page 403 shows the result of a number of readings in which the ordinates are the geometrical sum of the vibrations in the three different directions (vertical and two horizontal), measured in millimeters, and the abscissas are the speeds in kilometers per hour. Tests were made with both loaded and empty cars, as shown in the table. It will be seen from the tests with empty cars that the car with bevel drive caused less vibration than the one with axle suspended motors, and with loaded cars this was the case for speeds of more than 7¾ miles (12½ km.) per hour.

DATA OF CARS TESTED

Type of Car	Total Weight — Metric Tons	Total Weight — Pounds	Unsprung Weight Per Axle — Kilograms	Unsprung Weight Per Axle — Pounds
Car with axle suspended motors	11.2	24,640	1,380	2,486
Car with axle suspended motors and 500 kg. extra unsprung weight	11.7	25,740	1,380	3,036
Car with beveled gear motors	11.87	26,114	992	2,182
Car with beveled gear motors with 3 tons load	14.87	32,714	992	2,182
Maximum traction car	15.4	33,880	.....	.....
Trail car with four wheels	7	15,400	600	1,320

Up to speeds of 21¼ miles (34 km.) per hour, the double-truck car caused considerably less vibration then either of the others, though the number of blows was, of course, twice that of the four-wheel cars. The trailer naturally gave the most favorable results. The data of the cars tested are presented in the accompanying table.

One great merit claimed for the spring support of the motors is that it reduces the shock to the motors themselves, as compared with the method of supporting one end of the motors on the axles. Tests to determine the extent of these blows were also made in conjunction with the State Railway Department, with a somewhat different type of machine. The cars were the same two four-wheel cars used in the other tests and were operated over the same crossing. The curves reproduced show greatly reduced shocks on the car with spring supported motors, as compared with a car in which the motors were sleeved on the axles.

$1,956,600 Stock Sold by Virginia Company in One Day

OFFERING for sale nearly $2,000,000 of its 6 per cent cumulative preferred stock on one day last September and selling entirely by the close of business the same day was the unique experience of the Virginia Electric & Power Company, Richmond, Va. "A week before," writes A. H. Herrmann, director of public relations, "we had offered our employees the opportunity to take as much of the issue as they wanted and, based upon past campaigns in which they had subscribed to about 1,700 shares, we fixed the quota this year at 2,000. Their actual subscription totals 2,127 shares."

As remarkable as was the success of this sale, it was not achieved without some lively work on the part of officials in the matter of extensive publicity, both through the mails and through newspaper, car and bus advertising mediums. Under date of Sept. 17, President W. E. Wood, in one of his regular letters, offered stockholders the opportunity to absorb some of the new issue, prefacing the offer with the following statements:

We have now completed the high-power transmission line extension from Suffolk into Elizabeth City, Hertford and Edenton, N. C. We have also completed other extensions into northeastern North Carolina, whereby we have added to our service a number of additional towns and, incidentally, many new customers. The latest towns to be added include Rich Square, Ahoskie, Winton, Aulander, Severn, Milwaukee and a number of others. At this writing we are nearing completion of the extensive addition made to our Reeves Avenue steam power station in Norfolk, at a cost of about $5,000,000.

The co-ordination of our street railway and motor bus transportation in the several cities served is working out most satis-

Digitized by Google

Newspaper "ammunition" used by Virginia Electric & Power Company in stock-selling campaign

factorily and the new buses and street cars purchased have added greatly to improving and popularizing our service. You will also be interested to know that we have just formed a new Benefit Association for our employees. This in place of the former Relief Association. The new association is larger in scope than the old one in that it also includes all employee welfare activities, whereas the former association was confined to the payment of sick and death benefits. These benefits under the new plan are just about doubled. The new association will be of great service to our employees and will be the means of promoting still further the already very excellent *esprit de corps* in our company.

Through the confidence and co-operation of those whom we serve the Virginia Electric & Power Company during the two years under Stone & Webster management has spent approximately $20,000,000 in providing, improving and expanding its facilities in Virginia and northeastern North Carolina. Thus, we are continuously making additional expenditures for further improvements and expansion.

Being a stockholder in our company, you will be interested in the additional issue of $1,965,600 of 6 per cent cumulative preferred stock which our company is now offering to its employees, its customers and the citizens of tidewater Virginia and northeastern North Carolina, and this letter is sent you inviting your participation with us in our plans for further expansion to meet the greater demand for our service in this growing territory.

In the newspaper advertising, of which there are reproductions on this page, purchasers, both employee and otherwise, were given the privilege of buying the stock on the installment plan at $7.50 as the initial payment and $10 per month installments. With a par value of $100, those buying the stock outright and making payment as of Sept. 20 acquired the shares at $97.50. The proceeds from the stock sale are to be used in increased service throughout the company's territory and for additions and betterments.

Safety Practice Shows Results in St. Louis

STREET cars in St. Louis, Mo., were involved in 1,675 fewer accidents in 1927 than in the previous year, according to a report made to the St. Louis Safety Council by the St. Louis Public Service Company. Accidents in 1927 totaled 17,097, the lowest for any one year since 1920. In 1920 there were only 61,782 motor vehicles in St. Louis compared with about three times that total now.

The average number of car-miles per accident was 2,450 in St. Louis compared with 2,380 for 57 street railway lines reporting to the American Electric Railway Association.

Collisions between street cars totaled 229 in 1927 and 312 in 1926, and collisions with motor vehicles 9,606 against 10,526 in the previous year. Collisions between street cars and pedestrians number 368 compared with 485 in 1926.

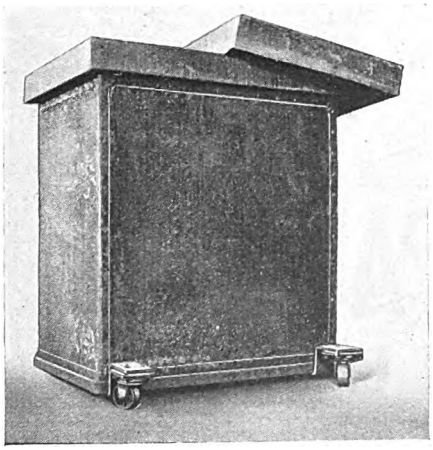
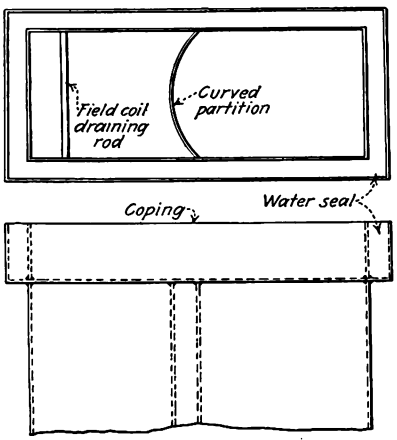
Maintenance Methods and Devices

Two-Compartment Portable Dipping Tank

WHERE lifting facilities are limited it is advantageous to have a portable dipping tank which can be transported to the chain hoist to deposit or remove an armature and then be returned to its place of storage. It was found necessary to construct such a tank in the shop of the Binghamton Railway, Binghamton, N. Y. This tank is made of $\frac{1}{8}$-in. sheet iron which is welded to 1-in. angles. It is 36 in. long, 23 in. wide and 42 in. high. It is mounted on two $\frac{3}{8}$-in. x $3\frac{1}{2}$-in. flat bars, each end of which is fitted with a swivel wheel 3 in. diameter and 1 in. face.



Two-compartment dipping tank in shop of the Binghamton Railway



Construction details of tank

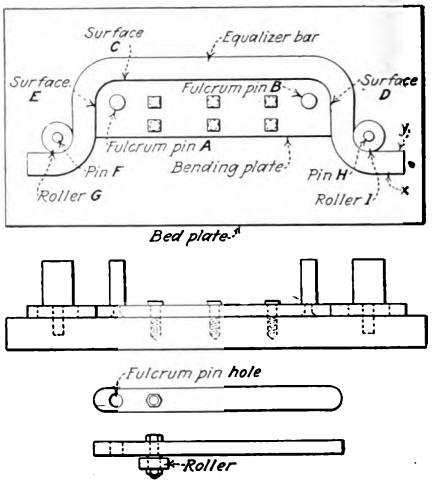
The tank is constructed with a No. 16 galvanized iron coping $3\frac{3}{4}$ in. high, which projects $1\frac{3}{4}$ in. on all sides. This coping is made with a double wall and the space is filled with water. The edges of the cover drop into the space, which acts as a heat seal for the cover. The tank is divided into two parts by a curved iron sheet. The portion of the tank on the concave side of the partition is used for the dipping of armatures whereas the other section is used for the dipping of fields. This permits the use of one grade of varnish for the fields and another grade for the armatures at the same time.

The field coils are drained by suspending from a $\frac{3}{4}$-in. round rod fastened across the top of the field compartment. The armature is drained by suspending on a chain hoist over the armature compartment.

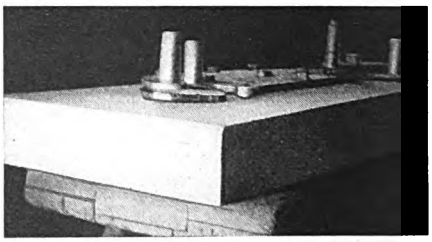
Equalizer Bar Bending Form

BENDING of equalizing bars so that all surfaces are parallel is done in a bending form designed and constructed in the Woodside shop of the New York & Queens County Railway, Long Island City, New York. This was designed by Thomas V. Campbell, superintendent of maintenance for Fisk & Roberts, managers of the property. The radii are identical and the distances between the curve centers are the same on all bars. Considerable trouble was experienced in making the bars symmetrically before this form was put in service. The form consists of a bed plate, form plate, radius rollers, and fulcrum pins. The cast-iron bed plate is 2 ft. wide, 6 ft. long and 6 in. thick. A $\frac{7}{8}$-in. plate, 10 in. wide and of the correct length is bolted to the center of the bed plate, and the upper corners are rounded for the desired radius. Two 2-in. x $4\frac{3}{8}$-in. steel pins are riveted on either end of the plate, and are used as fulcrum centers for the shaping bar shown in the sketch. A movable 2-in. x 4-in. pin installed at a predetermined distance from either end of the form plate, and designed with a $3\frac{1}{4}$-in. roller, obtains a proper radius on the short end of the bar.

The hot bar is clamped to the bed plate in close contact with surface *C* of the form plate while the radius pins *F* and *H* are removed. The bar is then sledged toward both ends of the form plate. The shaping bar is then slipped on the fulcrum pins *A* and *B* alternately and is given a rotary motion to permit the rollers to give the outer surface the correct radius. Pins *F* and *H* are then reinstalled, and the ends of the bar are sledged upward against the rollers. Another shaping bar of a slightly different radius than the one used on pins *A* and *B* is used on pins *F* and *H* alternately to obtain the proper radius of the lower corners. The bar is then sledged downward on the bed plate to make the surfaces parallel. It is then removed from the form and the short end surfaces, *X* and *Y*, are paralleled on the bed plate surface.



Equalizer bar bending form



Details of bending form

One Man, Not Two

IN THE description of an oil heater for thawing frozen switches as used by the Toronto Transportation Commission and published in the Maintenance Data Sheet section of the JOURNAL for Feb. 18, the last sentence read "Only two men are required for operation." A feature of this device is that but one man is needed for successful working.

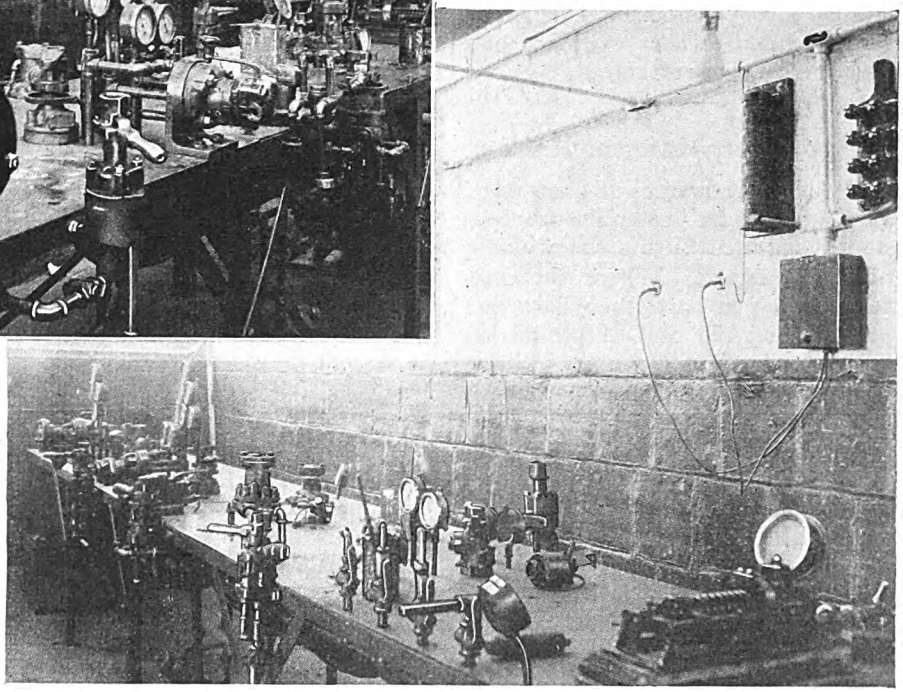
Careful Tests of Air Brake Equipment Insure Correct Operation

PROVISION for testing all the types of air brake equipment used on its cars is made by the Brooklyn-Manhattan Transit Corporation in its DeKalb Ave. surface repair shop. Cars coming into the shop for overhauling are stripped of all air brake equipment which is then sent to the air brake room for overhauling and testing. The first step for the air brake repairman is to take the equipment apart, wash it with kerosene and then blow it off with compressed air so that all ports and parts are cleaned thoroughly. The parts are then overhauled, after which all valves are put on the test bench and tested for leaks and to see that they operate properly. When found O. K., the valve is taken from the test bench and is ready to be put back on the car again.

Governors are cleaned, overhauled, tested for leaks and also readjusted. Compressors are cleaned and dismantled by the air brake repairman's helper and are then sent to the repairman, who overhauls them, after which they are given a good test before leaving the air brake room.

The test bench in the air brake room of the DeKalb Ave. surface repair shop is made for the following tests: motorman's operating valves, triple valves and emergency valves, foot valves, pilot valves, shut-off valves, double-check valves, air



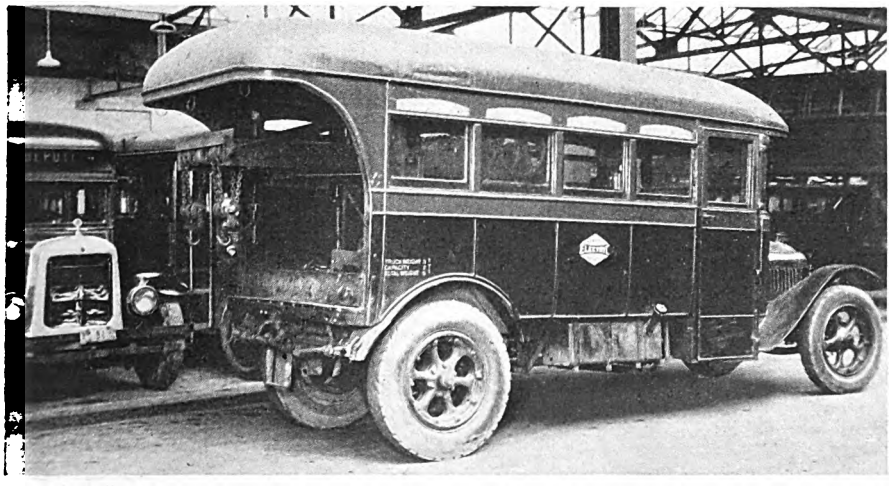
Two views of the air brake test bench in the B.-M.T. surface repair shop

Old Buses Utilized as Work Cars

PURSUING a policy of putting its older buses, which have been withdrawn from passenger service, to some practical purpose, the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has rebuilt in its own car shops a number of such vehicles as work trucks. The illustration shown below indicates what has been done in revamping one of these older buses for use as a wrecking car.

The rebuilt bus is equipped with a Manley crane installed on a sliding framework which permits its extension several feet out from the rear of the body. As shown, the crane can be pushed into the car where it is completely out of the way when not being used. Included in the mechanical equipment of the wrecker is a hand-operated winch. A number of compartments are built into the framework of the truck at accessible points. This permits carrying a fairly comprehensive set of tools and supplies with which to facilitate the work to which the truck may be put in an emergency.

Systematic repairs — increase fares.



Milwaukee rebuilds buses such as this for use as service trucks

Rack for holding miscellaneous armature winding material

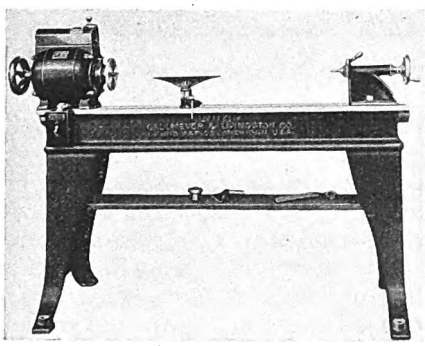
gages, governors, slack adjusters, door engines, all kinds of cocks, safety valves, conductor emergency valves, circuit-breaker cylinders and door engine magnet valves.

Armature Material Rack

MANY small pieces of fiber, mica, and similar materials are constantly required during the winding of an armature. Where this material is not at hand there is a loss of time and the cost of production is increased. This is not all. Where provisions are not made for the proper care of this material much of it finds its way to the floor and is swept out. This has been overcome in the armature room of the Binghamton Railway, Binghamton, N. Y., where a rack constructed for such material is placed within easy reach of the worker. This receptacle is an open-partitioned box, made of No. 16 gage galvanized iron. It is 13 in. long, 5 in. high and 10 in. wide. All of the parts are acetylene welded. A hole in the back sheet provides a convenient means for carrying.

New Equipment Available

Lathe Equipped with Multiple Speed Motor



Speed lathe with direct-connected motor

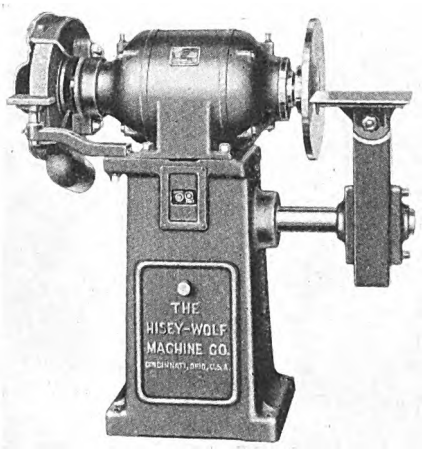
MULTIPLE speed control with a Union motor built in the head of a speed lathe is announced by Gallmeyer and Livingston, Grand Rapids, Mich. The multi-speed ball bearing motor of ½-hp. capacity provides for spindle speeds of from 570 to 3,450 r.p.m. The machine handles work up to 12 in. diameter over the bed and up to 9½ in. over the tool rest. Heavy cast legs provide a rigid support to the bed, eliminating vibration. A shelf is located below the bed in a convenient position.

These speed lathes are equipped with a rigid tailstock which may be located in position or released by a half turn of a special wrench furnished with the machine. The 1 5/16-in. tailstock spindle is bored to a No. 2 Morse taper. Adjustments are made by means of a hand wheel conveniently located, and the spindle is held rigidly in place by a quarter turn of a lever.

The tool rest is adjustable vertically and swings at any desired angle. The rest may be moved to any point on the bed and locked in the desired setting.

Combination Disk and Floor-Stand Grinder

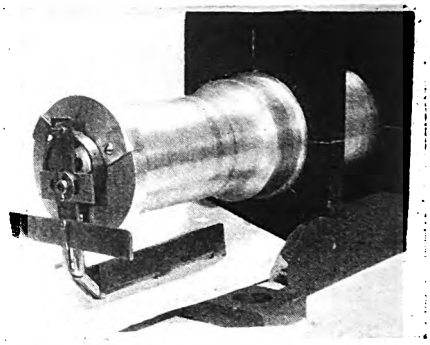
FLOOR-STAND grinders arranged with a combination disk are announced by the Hisey-Wolf Machine Company, Cincinnati, Ohio. The spindle is mounted on two ball bearings which take radial load only. A double-acting, self-aligning thrust bearing is provided to take all end thrust. The spindle, made of special tough steel, is of extra heavy construction, and a work table 8¼ in. x 9½ in. is standard equipment.



New combination grinder

Splash Lubrication for Car Journals

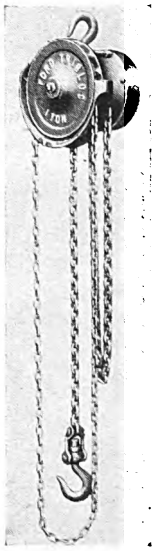
SPLASH lubrication of car journals is the purpose of a device announced by the Hinge Car-Axle Oiler, Toledo, Ohio. It is intended to take the place of the waste and oil arrangement of present journal boxes. The splash oiling arrangement attaches to the end of the car axle and dips into the oil placed in the ordinary type journal box. An arm raises the oil and spreads it on the axle as it rotates, thus keeping the bearing supplied with lubricant.



Splash oiling device attached to end of car journal

Chain for Lifting Heavy Loads

ELECTRICALLY welded chain of high carbon content is announced by the Ford Chain Block Company for its Triploc hoist. Each link is proof tested with special instruments. When the chain is assembled, it is tested again to make certain that it has strength of more than 50 per cent above its rated capacity. Hoists are built in capacities from ¼ to 20 tons. The chain must have great strength and ability to withstand wear, and must not stretch to any extent under heavy load.



High-carbon electrically welded chain fitted to Ford Triploc hoist

Association Activities

Uniform Vehicle Code Urged

DISTRIBUTION has just been made of the address on the uniform vehicle code made by A. B. Barber, manager transportation and communication department, Chamber of Commerce of the United States, before the Illuminating Engineering Society on Jan. 11. Colonel Barber points out the extent to which the automobile with defective brakes, lights or other essential equipment is not disclosed by any available statistics. He is of the opinion that many accidents charged to recklessness or inattentive driving really are due to faulty maintenance. As an indication of this he points to the large number of vehicles that may be observed with defective head lighting equipment observable anywhere on any night.

In order to reduce the accident toll and to bring about betterment of traffic conditions there are three lines of approach: (1) provision and maintenance of adequate facilities, which embraces the highway and the vehicle; (2) education in the safe and proper use of the facilities, and (3) exercise of public authority in the administration and enforcement of laws and regulations governing such use.

The third of these means of traffic improvement, Colonel Barber points out, is being furthered in preparation of the uniform vehicle code. This is one of the principal results of the 2½ years of work of the National Conference on Street and Highway Safety. The code as finally completed has been endorsed by the American Bar Association. The code is having rapid acceptance, considering that it was only completed in August, 1926. Outside of the North Atlantic region, which already had systems of automobile administration substantially as provided for in the code, some ten states took favorable action in 1927. Three other states adopted modifications.

A point of special importance is that of clearance lamps on trucks, buses and trailers having a width in excess of 80 in. The code requires one such lamp with a white light located at the front and another with a yellow or red light located at the rear, both on the left side of the vehicle. Serious accidents have occurred due to failure to maintain such lights, and similar accidents have resulted from absence of tail lights on smaller vehicles.

Beside the uniform code work on a model municipal traffic ordinance is in progress. Secretary Hoover last summer appointed a committee, of which William E. Metzger of Detroit is chairman, to study and report on this question. The work has been divided into six subjects, as follows: (1) Vehicle movement and registration; (2) pedestrian facilities and regulation; (3) traffic signs, signals and markings; (4) parking, garages, terminals, loading facilities and street obstructions; (5) public motor vehicles, railroads, street cars and emergency vehicles; (6) traffic organization and enforcement. Each of these subjects was assigned to a subcommittee. As a result a tentative draft of a model ordinance has been drawn up and will shortly be given widespread distribution for public criticism and suggestion.

Central Master Mechanics to Meet in Erie

ERIE, PA., has been selected as the next meeting place by the Central Electric Railway Master Mechanics Association. The sessions will be held on May 9 and 10.

New England Club to Meet in Springfield March 22

SPRINGFIELD'S experimental car and the results developing from its actual use during a period of months in city service will be described by W. L. Harwood, engineer of power and equipment Springfield Street Railway and Worcester Consolidated Street Railway, at the March meeting of the New England Street Railway Club to be held in Hotel Kimball, Springfield, Mass., on March 22. Treadle door operation, particularly with respect to the Springfield and Worcester cars, will be the subject of a paper by J. H. Van der Veer, sales engineer of the National Pneumatic Company, New York. These papers will feature the afternoon session, to open at 3:30 o'clock. They will be illustrated with motion pictures and slides and will be followed by general discussion.

Howard F. Fritch, Massachusetts, vice-president of the club, will preside at the afternoon meeting and also at the dinner, which is set for 6:30.

E. G. Buckland, vice-president of the New York, New Haven & Hartford Railroad, will speak at the dinner. His subject will be "Co-ordination of Transportation in New England." Other speakers will be Capt. Ralph Earle, U. S. N., retired, president Worcester Polytechnic Institute, and Robert Burlen, Boston. The toastmaster will be Major Frederick J. Hillman, executive vice-president of the Springfield Chamber of Commerce.

During the dinner there will be an entertainment by the Fisk Time-to-Retire Boys and Orchestra in person, sent directly from New York.

The program for the meeting is arranged by the Springfield and Worcester companies under the supervision of Clark V. Wood, president of the companies.

Transportation will be provided by Springfield Street Railway buses for club members arriving by the Boston & Albany and New York, New Haven & Hartford Railroads between 11:45 a.m. and 5:25 p.m., these buses operating between the Liberty Street side of the Union Station and Hotel Kimball.

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 13-15—Oklahoma Utilities Association, annual convention, Tulsa, Okla.

March 14-15 — Illinois Electric Railway Association, Springfield, Ill.

March 21-22 — Central Electric Traffic Association, Seelbach Hotel, Louisville, Ky.

March 22—New England Street Railway Club, Springfield, Mass.

March 23—Maryland Utilities Association, annual meeting, Emerson Hotel, Baltimore, Md.

March 30—Executive Committee American Electric Railway Association, 292 Madison Avenue, New York, N. Y.

April 6 — Metropolitan Section, A.E.R.A., 39 W. 39th Street, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City, Mo.

May 2-5—Southwestern Public Service Association, Dallas, Texas.

May 6-12—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.

May 9-10—Central Electric Railway Master Mechanics' Association, Erie, Pa.

June 6-8—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.

June 20-27 — American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.

June 21-22 — American Railway Association, Motor Transport Division, Atlantic City, N. J.

June 28-29—Central Electric Railway Association, Cedar Point, Ohio.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

July 25-27—Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.

July 27-28—Central Electric Railway Accountants' Association, Detroit, Mich.

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

News of the Industry

Lower Rates on Pacific Northwest Traction

Reduced rates between Seattle, Wash., and Vancouver, B. C., were put into effect on March 1, by the Pacific Northwest Traction Company and are good on either interurban coaches or buses. With the beginning of the new rates, the company will double its service between Seattle and Vancouver, making four return trips instead of two as at present. The new rate will be $1.95 one way to Seattle, compared with $3, the former rate; the return rate will be $3.65 against the old rate of $4.65; between Bellingham and Vancouver, the new rate is $1.50 one way, against $2.15, the old fare, and a round trip charge of $2.25 compared with $3.65 formerly charged. The fares provide first-class passenger observation coaches, with full baggage allowance, and a full 30-day limit. Proportionate reductions for towns en route are announced.

John Hickok, railway superintendent, states that a further attraction will be offered in the reduction of running time.

Columbus City Council Revives Rail-Light Franchise

The Columbus, Ohio, City Council voted unanimously on March 5 to reopen franchise negotiations with the Columbus Railway, Power & Light Company. Members of the Council went into the reasons for the resumption of the negotiations at this time. The 25-year franchise with the Columbus company expired in 1926. Negotiations were broken off a year and a half ago by the company when it refused to accept the draft of the revised ordinance after it had been approved by the Council. The company considered certain terms as proposed at that time not to be in line with the trend of similar grants made in recent years.

Patronage Increases in Rochester's Subway

An increase of 11 per cent in February over January in passenger traffic of Rochester's new $12,000,000 subway in the bed of the abandoned Erie Canal is shown in the report made public by James F. Hamilton, president of the New York State Railways, which operates the line. The underground trains carried 106,730 passengers in February and 95,840 in the preceding month. Part of this gain is accounted for by the starting of service on the west side of the railroad and by the diversion of Rochester, Lockport & Buffalo interurban cars into the subway during the month.

High speed schedules are not yet possible because of incomplete feeder installation and repairs to be made to the roadbed. By April 15, President Hamilton told the ELECTRIC RAILWAY JOURNAL representative, it is expected that the railways will be able to give the public of Rochester real high speed service over the 8 miles of subway railroad from the suburb of Brighton on the east to the western limits of the city and through the heart of the downtown section.

Under terms of a proposal submitted March 5 to the Interstate Commerce Commission, the Buffalo, Rochester & Pittsburgh Railroad will extend service over the 9-mile line of the subway railroad located entirely in the city of Rochester. The subway is owned by the city.

The existing contract between the railroad and the city provides for the interchange of traffic and for payment by the railroad of costs of haulage over the subway lines. By the new arrangements, the Buffalo, Rochester & Pittsburgh will be enabled to deliver and receive shipments direct from important industrial establishments.

New York Company Firm

Interborough refuses to budge from its determination not to treat with Amalgamated. President Hedley in letter to Mayor indicates company's position

STATEMENT and counter-statement have followed fast from both sides in the case involving the issues between the Interborough Rapid Transit Company, New York, and the Amalgamated which early in the week threatened an immediate strike. The union's official explanation of its failure to call a strike on Tuesday night to protect men alleged to have been discharged on account of their Amalgamated affiliation was that it did not "intend to be made the tool of the Interborough management in a campaign for a 7-cent fare," and that the company was trying to compel the strike for the purposes of strategy.

On March 2 Mr. Mahon addressed a letter to the Mayor, which, except for its salutation, follows:

Some 21 men have been discharged for seemingly no other reason than having joined the Amalgamated Association. In addition to that the company is preparing to lock out all members of the association. This is evident from the fact that the company is equipping its shops with bedding, cooking utensils and other paraphernalia to take care of strike breakers and employing strike breakers. This, of course, is exciting the employees who are members of the Amalgamated Association.

I think you know that the Amalgamated Association is desirous of seeing this matter brought to a speedy and satisfactory settlement without any strike or disturbances, and on the part of the Amalgamated Association I am hereby making suggestions that, if carried out, will bring about a settlement without any disturbances or interruption of work.

You stated to us in the conference this morning that the company had claimed to you that the 21 men were dismissed not for joining the Amalgamated Association but because of other reasons. On the part of the Amalgamated Association we believe, and the 21 men were told, that they were discharged for no other reason than that they were members of the association.

I therefore suggest that the company agree to submit the question of the discharge of all these men to you, as the Mayor of the city of New York, or to the Transit Commission of the city of New York, and that all the facts in connection with their suspension or discharge be submitted to you or to the Transit Commission of the city of New York by representatives of both sides, and if the men have been discharged or suspended because of their membership in the Amalgamated Association that they be reinstated and paid for the time they have lost. That during the time these matters are being considered by you or the Transit Commission the company cease hiring strike breakers and remove the strike breakers from its properties.

I assure you the Amalgamated Association will abide by your decision or the decision of the Transit Commission on these matters. We expect the company should agree to this plan by Tuesday evening, March 6.

The position of the company in the matter is made plain in the letter of President Hedley of the Interborough to Mayor Walker dated March 6. It was in reply to Mr. Mahon's letter. Mr. Hedley said in part:

Our discussion was amicable and I think I am warranted in saying that your affability went a long way to inspire in everybody the desire to discover a reasonable basis for action which might avert a strike. A plan was devised for an examination by our law department into the facts upon which the Brotherhood had acted in expelling certain employees, thereby causing their suspension by the management pending an investigation to satisfy the company whether there was just cause for such expulsion. The Brotherhood members had assured you that the men had been expelled not only because they had become members of the Amalgamated Association contrary to their pledge to their Brotherhood and their agreement with the company, but because in addition they had been guilty of

Digitized by Google

stirring up strife through bad language and disorderly conduct towards their fellow employees. You were assured that if any injustice had been done it would be righted. You seemed to have confidence in the good intentions of everybody to that effect. Upon leaving your office steps were taken at once to carry out the program suggested.

However, it seems that the Amalgamated Association was not content to let the Mayor of the city proceed in his own way to avert a strike. That association insisted that it be made a party to the proceedings as a condition of withholding its threatened strike. That insistence entirely changes the situation. No suggestion that the Amalgamated should supervise the proceedings was made at our meeting with your Honor. But that is the demand of Mr. Mahon in addition to undertaking to dictate what this company must do about hiring new men.

Mr. Mahon's letter refers to a "dispute" between his association and this company. There is no such dispute.

This company does not recognize any right on the part of Mr. Mahon or of the Amalgamated Association to represent any employees of the company. Therefore, no attention will be paid to any of his suggestions about procedure. Nor will this company cease hiring new men (called strikebreakers by Mr. Mahon) or remove such newly hired men from its properties at the demand of Mr. Mahon or of his association.

On the contrary every effort will be made by us to maintain a reserve force of competent men to take the places of such employees as may be dismissed or are persuaded to strike, or "get beyond the control" of the Amalgamated leaders, or leave the service for any reason whatever. We intend to continue to take every precaution to see that the public suffers as little as possible from the efforts of the Amalgamated organization once more to disrupt our service.

For your information I desire to say that we have carefully looked into the cases of the men who were expelled. In each case there was evidence of misconduct of the character related to your Honor. I have no confidence in the further usefulness of those men and it is my intention to dismiss them from our service. We must respectfully decline to permit any further supervision of our relations with our employees by outside parties.

I cannot be responsible to the public for the safe operation of our railroads unless I am left with a free hand to determine what kind of employees shall be depended upon for such safety.

We desire to avoid trouble, but we do not intend to purchase peace at the price of permitting the Amalgamated Association any longer to keep our working forces in a state of turmoil. The attention of our men upon whose carefulness the safety of the public depends must not be distracted by the agitation fomented by the Amalgamated people.

I trust that it will be plain to your Honor and to the public from the letter of Mr. Mahon that what he and his followers are seeking is domination and control over our employees. The Court of Appeals has decided that this company "may refuse to employ workers who will not accept a condition or make an agreement that they will not join a particular union or combination of workers while in the plaintiff's employ."

The Amalgamated has sought unsuccessfully to break down that legal right through agitation, strikes and threats of strikes for the last twenty-three years, during which time our loyal employees have rendered safe service to the public. All they ask now is to be let alone.

I desire to avert a strike which, as I have heretofore stated, may bankrupt the company, but I cannot safely operate this property partly Amalgamated and partly Brotherhood.

I thank you for your very fair conduct of this matter at all times and assure you of my great regret that I can see no other course to take.

A statement by the Brotherhood said in part:

The Amalgamated Association is threatening to call a strike on the Interborough lines.

At a special meeting of the general committee held this date, the executive committee was directed by resolution to notify every member of the Brotherhood that any employee who answers a call to strike will never again be admitted to membership in our organization, which means he cannot be re-employed by the Interborough Rapid Transit Company.

The Brotherhood intends to live up to the preamble of our constitution, which guarantees to the people of this city continuous, efficient railroad service.

Since Tuesday both sides have been marking time.

High-Speed Line Plan Before Milwaukee Council

Plans for the construction of Milwaukee's first subway, combined with an interurban service on private right-of-way were announced by S. B. Way, president of the Milwaukee Electric Railway & Light Company, and have been approved by the Mayor of Milwaukee and the Association of Commerce.

Mr. Way states that the company proposes to build a half-mile subway from the Public Service Building at Third and Michigan Streets to Eighth Street and St. Paul Avenue, to be connected with a new double-track system, partly elevated, tying in with its west-end rapid transit interurban lines at Fortieth Street. The entire length of the new system would be 2.8 miles. The cost of the project is estimated at $4,000,000.

The Common Council will consider the proposal at its next meeting. If approved, Mr. Way stated that construction work would begin as soon as possible.

The project has been reviewed at length in the issues of ELECTRIC RAILWAY JOURNAL for Feb. 25, page 311, and March 3, page 351.

Special Rates Continued in Tacoma

Another 90-day extension of the special street car rates in Tacoma, Wash., has been filed with the department of public works by the Tacoma Railway & Power Company, continuing the rates until June 4. The special rates provide for three tokens for 25 cents with universal transfer privilege and weekly passes for 30 cents entitling the holder to ride for 5 cents.

Negotiations for Wage Contract in Memphis

Wage scale differences between the management of the Memphis Street Railway, Memphis, Tenn., and 450 employees are being worked out in accordance with plans mentioned in the March 3 issue of ELECTRIC RAILWAY JOURNAL. From a week to ten days will be spent in hearing testimony.

The men are asking for an increase of 9½ cents an hour for operators on two-men cars and 20 cents an hour for operators of one-man cars. The company is asking for a flat reduction all down the line. A two-year contract on which the present arbitration is functioning expires April 1.

New York Learns About the Mitten Plan Through the "Sun"

The New York *Sun* sent a reporter to talk with Thomas E. Mitten and to study the workings of the Mitten Management Plan. The results of that talk and study were set forth in four articles the first of which appeared in that paper on March 6. The series was announced by the *Sun* in an editorial headed "Can Philadelphia Teach Us?" as follows:

Sixteen years ago the transit lines of Philadelphia were in ruins. Strikes had impoverished the company, angered the men and antagonized the public. Bankruptcy was in plain sight. Then Thomas E. Mitten took charge to put into effect an idea—to take the workers into partnership with capital—make them allies instead of opponents in operating a public utility. He sought to set the men at work for their own prosperity.

Today Philadelphia's transit workers are paid more than any others in the United States. A stock once nearly worthless sells considerably above par. Dividends of 8 per cent are paid annually on the common stock. The Philadelphia public boasts about the service it has through a co-ordinated system of trolley cars, subway, elevated roads, motor buses and taxicabs.

Another study of Mr. Mitten was published in the New York *World* of March 8, 1928, under a heading "Trends in Industry."

Franchise Extension for Dallas Interurban

An extension until Dec. 31, 1928, of the franchise of the Dallas Southwestern Railway has been granted by the City Commission of Dallas, Tex. This company was organized several years ago for the purpose of constructing an interurban electric railway between Dallas and Irving. E. P. Turner is president and chief promoter of the project. The line would proceed through the West Dallas industrial district to Irving, about 15 miles.

Several times the company has been ready to proceed with construction and each time some difficulty arose to hinder it. Officials are convinced that they will be able to complete the line during the present year. Upon this representation city officials extended the franchise.

Digitized by Google

Would Increase Rate on Washington Line

An increase from 20 to 25 cents for a round trip fare on its line from the Treasury to the golf course, and Hains Point in East Potomac Park, has been sought by the Capital Traction Company, Washington, D. C., of the office of public buildings and public parks of Washington. Lieut. Col. U. S. Grant, 3rd, director of the office, said that it had been represented to him that the line was losing money, and that he did not want to see transportation facilities to that large recreation area abandoned on account of the losses. In his opinion, the increase was a reasonable one, amounting to less than 5 cents a mile for the 5½-mile round trip.

Another Franchise Extension in Chicago

Another day to day extension of the franchises of the Chicago Surface Lines, Chicago, Ill., was approved by the City Council on Feb. 29, as the fifth successive extension of the street car franchises expired. Like the previous extensions, the new one is on a day-to-day basis and not to exceed 31 days.

Active Welfare Work in New Jersey

How far the Public Service system, Newark, N. J., goes in administering comfort to its approximately 20,000 employees is outlined in a special article in the Feb. 15 issue of *Public Service News,* the official publication of the company. The Welfare Department has a well-defined duty to call upon those disabled, carrying a message of the company's interest, making pecuniary advances when necessary, bringing the case to the attention of a physician, arranging for admission to hospitals, sanitariums or state institutions, and attending to many other matters which the exigency of the case may require. Special emphasis is laid upon the prompt and full payment of benefits, cases of illness falling under the Welfare Plan for the payment of sick relief and cases of injury being cared for under the state workmen's compensation act.

A service annuity or pension is provided, the terms of which are so liberal that one may retire at the age of 65, after 25 years of service, upon a competence virtually amounting to half pay, while provision is made for those who become broken in health after being 12½ years in the employ of the company.

In addition the Public Service creates for the employee an estate through the welfare plan death benefit and the group insurance and further by compliance with the workmen's compensation act when death is the result of industrial mishap.

It was explained that with these forms of protection, Public Service workers are assured of the equivalent of an estate fully administered and sufficient to carry the family over the adjustment period to the time when the economic status of the household becomes again firmly established.

L. S. Storrs Criticizes 5-Cent Zone Plan for Key System

Called as an expert witness by the Key System Transit Company at a fare hearing before Railroad Commissioner Clyde Seavey in San Francisco, Cal., Lucius S. Storrs, managing director of the American Electric Railway Association, characterized the proposed 5-cent zone plan for the East Bay cities as a hazardous experiment unless backed by a large treasury surplus. Mr. Storrs said the basic cash fare rate of a majority of American electric railways was 10 cents and he knew of no instance where a company had increased its net revenue by reducing the basic cash fare. The hearing was a resumption of the rate case which started last November when the Key System appealed the California Railroad Commission's 5-cent zone order, claiming that its effect would be bankruptcy.

Mr. Storrs took sharp issue with A. G. Mott, chief engineer of the commission and author of the 5-cent zone plan. Mr. Mott had testified that the 10-cent cash fare and $1 weekly pass plan of the company would result in the loss of 75 per cent of the company's short riders. To which Mr. Storrs' rejoinder was that he could not see what justification Mr. Mott had for saying that 75 per cent or 21,200,000 short haul passengers would be lost by operation of the plan. He opined that not more than 5 per cent of short riders would be lost. R. T. Sullivan, manager of the Tacoma Railway & Power Company, another expert witness called by the company, testified that a higher fare would raise net revenues even though there was a falling off in patronage.

The final session of the hearing will be held March 16 in San Francisco.

Rearrangement of Stops Asked in Atlanta

A rearrangement of street car stops in Atlanta, Ga., to eliminate stops in the middle of the block is being asked by the North Boulevard Park Civic League of the Georgia Power Company and the matter has been taken to the Georgia Public Service Commission.

According to statements by the league officials, many of the stops are now located in the middle of the block, and away from street corners. These stops, they declare, often make "jay walking" compulsory if one is to catch a street car, and are very dangerous to children because of the heavy and rapid traffic at many of the stops as now located.

They favor the elimination of these stops in favor of those at street corners.

Relief for Rainier Valley Line

The City Council of Seattle, Wash., has passed a bill modifying the railway franchises of the Seattle & Rainier Valley Railway, relieving that company of future payments of 2 per cent gross earnings tax and of furnishing free transportation to policemen and firemen. The bill was introduced in the Council last December, about the time the arrangement was made whereby the Rainier Valley company agreed to honor transfers from the city lines and to sell tokens on its lines at the same rate as charged by the city. The bill had been held up pending efforts of Councilmen to get the railway to pave between its tracks on Rainier Avenue. Representation by Walter M. Brown that the company could see no time when it would be financially able to meet the costs of paving caused the Council to drop the attempt.

About $75,000 owed to the city as back earnings taxes is being gradually wiped off the books through an agreement whereby patrons of the valley line are given transfers to municipal cars on token or 8½-cent fares.

New York Fare Case Put Over

Supreme Court Justice Callahan on March 2 adjourned until March 9 the hearing in connection with the three suits brought by the Transit Commission and the City of New York in the Supreme Court to restrain the Interborough Rapid Transit Company, New York, from putting 7-cent fare schedules into effect. The adjournment was granted at the request of E. D. Kyle, of the office of William L. Ransom, special counsel for the railway.

Baltimore Company's Vehicles to Aid Red Cross

The United Railways & Electric Company, Baltimore, has responded to a call sent out by the Baltimore Chapter of the American Red Cross and has offered that organization the use of a majority of its 110 passenger buses and 45 motor trucks in case of disaster in or near Baltimore. A Disaster Corps is being organized and the Red Cross is attempting to get truck and bus owners to offer the use of their vehicles.

St. Louis Prefers Pay-Enter

By a vote of 191,289 to 112,345 the patrons of the St. Louis Public Service Company, St. Louis, Mo., on Feb. 27 expressed a preference for the rear-entrance pay-as-you-enter system of collecting fares as against the present plant of front-entrance pay-as-you-leave. The vote was taken on the 949 cars of the old front and rear entrance type. A total of 1,129,189 passengers were carried during the day, but only 303,634 voted. Officials of the company said they would be guided by the vote.

Rapid Transit for Cleveland

$40,000,000 System Being Discussed to Embrace High Speed Lines to All City Sections

Negotiations are under way between the Cleveland Railway, Cleveland, Ohio, and the Van Sweringen interests for a $40,000,000 rapid transit system tapping practically every section of Cleveland and the territory immediately adjacent.

O. P. and M. J. Van Sweringen are the developers of Shaker Heights, exclusive Cleveland suburb, and railroad operators and owners. They are now building a $60,000,000 railroad terminal in Cleveland, in connection with which they are planning rapid transit facilities.

They have asked the Cleveland Railway to submit propositions for the operation of five rapid transit lines radiating from their Public Square terminal. One is along the Nickel Plate right-of-way to the east, another is the existing rapid transit line to Shaker Heights, owned by the Van Sweringens and now operating partly on city tracks and partly on a private right-of-way, the third is along the right-of-way of the Erie Railroad to the southeast, the fourth is along the right-of-way of the Big Four Railroad to the southwest and the fifth is along the right-of-way of the Nickel Plate Railroad to the west.

One of Two Propositions Expected

The engineering firm of Coverdale & Colpitts has made a study of the situation for the Van Sweringens, while the firm of Parsons, Clapp, Brinkerhoff & Douglas is preparing a report for the Cleveland Railway, in which it is expected to make one of two propositions: (1) to lease the rights-of-way, lay the tracks, buy the necessary equipment and operate the rapid transit lines as part of the Cleveland Railway system, or (2) to offer to operate the rapid transit lines as a separate system on a cost plus basis.

Recently the Cleveland Railway concluded an agreement with the Van Sweringens to operate the existing Shaker Heights rapid transit lines on a cost plus 10 per cent basis. There are no transfer privileges between this line and the city car lines and the fare is 10 cents.

The projected rapid transit system will permit the abandonment of some street car lines and the shortening of others which are now losing money because of the length of the haul. New motor coach routes will have to be established to feed traffic into the rapid transit lines. The carrying out of the project will involve the purchase of millions of dollars worth of new equipment, including high speed trains, and must of necessity involve a mammoth grade crossing elimination program on the part of the railroads, particularly the Nickel Plate.

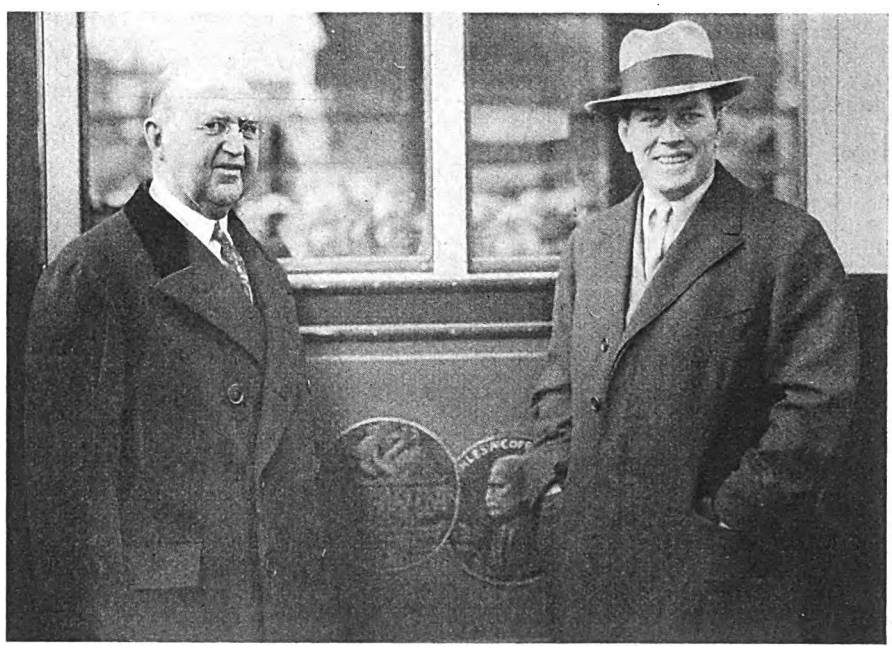
The survey being made by Parsons, Clapp, Brinkerhoff & Douglas started last August with traffic counts. Their report is due about April 1. It is expected to tell what effect the rapid transit lines will have on present electric railway and motor coach traffic, how many passengers can be expected to utilize the rapid transit lines at the start and their origin, what changes in routing of street cars and motor coaches can be made to best advantage, what type of rapid transit trains will be most suitable and what rate of fare ought to be charged.

Cleveland has been talking about rapid transportation for years, but the proposition now under consideration appears to be the first that can be worked out to give adequate service on a satisfactory cost basis. Ten years ago the city awarded a subway franchise to a group of capitalists and established a rapid transit commission which had power to make tax assessments, but the entire proposition was voted down at a referendum.

Tunney Rides the Trolley in Grand Rapids

Gene Tunney, world's heavyweight champion, paid the electric railway industry a very pretty compliment recently, while visiting in Grand Rapids to address 10,000 boys on living clean lives. As he was greeted by Martin C. Carmody, chairman of the reception committee and supreme knight of the Knights of Columbus, Gene said: "This is the first time I was ever met by a reception committee and escorted through the city in a street car. I feel complimented."

The mighty mauler of the heavyweight division was so pleased with the electric rail coach to be used as his private car that he requested a photo of himself standing beside it in company with Mr. Carmody. Noticing the Charles A. Coffin medal insignia gracing the side of the coach Mr. Tunney smiled and said: "You might call this picture 'When Three Champs Meet'."



"When Three Champs Meet"

Then Gene was escorted through the crowd from the Union station in his spic and span coach for his ride to the Pantlind Hotel. During the ride the champion commented on the soft seats, the refinements of the coach and the easy riding qualities. He then went into the smoking compartment where he stood and waved greetings to the throngs on the sidewalks. The car proved its superiority over other vehicles for such receptions since it permitted the entire reception committee to ride in ease and converse with their guest during the trip.

After the trip Gene paid this tribute to street cars:

These cars certainly are in the championship class and the best I ever rode in. They are a "knock out" and a compliment to both the company that operates them and the city whose people they serve. With this car at my disposal I feel complimented.

Research Fellows to Be Appointed at Wisconsin

Two research fellowships in engineering are to be appointed on April 30 by the University of Wisconsin. Candidates must be graduates of engineering colleges of recognized standing, and preferably, should have had one or two years of graduate study, of teaching, or of engineering experience. Applications will be received up to April 15. Information and application blanks can be obtained from Dean F. E. Turneaure, College of Engineering, Madison, Wis.

The appointments will be for a period of two years, subject to satisfactory service, and the salary will be $900 for the first year and $1,100 for the second year. A fellow will be expected to devote not less than half time to assigned research in the College of Engineering, but will be given an opportunity to complete the requirements for a master's degree within the two-year period. The period of service will be the usual academic year, including the short vacations.

Failure Predicted for New York Unification Legislation

Political wiseacres say that with the Legislature scheduled to adjourn on March 15, the prospect of action on the transit bills drafted for its consideration is far from promising. The plan of reorganization has been agreed upon by the Transit Commission and the Board of Transportation, and the provisions of unified operation of the rapid transit facilities of New York have been approved by representatives of the B.-M.T. lines. The bill embodying the proposal has not even been introduced.

Hearings on Illinois Terminal Case to Be Resumed

Hearings on the applications of the Illinois Terminal Company to lease the St. Louis, Troy & Eastern, St. Louis & Illinois Belt Line, St. Louis Electric Terminal and the main division of the Illinois Traction, Inc., will be resumed here on March 16, according to an announcement of the Interstate Commerce Commission. This action was taken to enable the receivers of the Chicago & Alton Railroad, who have intervened in the case, to prepare various exhibits in opposition to the lease.

Chicago Traction Negotiations Postponed Until April 10

Members of the Chicago City Council sub-committee on local transportation voted recently to discontinue their hearings on the proposed traction legislation until after the primary election on April 10. The subject was said to have become too deeply involved in politics to warrant any further effort to complete the draft of the legislative bills and to frame a new ordinance. Because of the committee's decision, it is now thought improbable that anything more can be accomplished toward settling the problem until the next regular session of the legislature in 1929.

32,000 Bought Sunday Passes on Feb. 26

The fact that only 23,000 persons purchased 25-cent unlimited ride tickets on Washington's Birthday, Feb. 22, has caused officials of the St. Louis Public Service Company to conclude that the patrons do not desire a concession of this kind on week-days. The passes were tried out on Weshington's Birthday with a view to obtaining an expression from the car riders. The passes are being used on Sundays by an increasing number of car riders. On Sunday, Feb. 26, more than 32,000 persons purchased the 25-cent tickets. On the first Sunday the passes were sold only 20,000 used them. The plan has now been in vogue for six weeks and each week has shown a gain over the preceding Sunday.

Good Response to "Suggestion Letter" in North Carolina

The best "suggestion letters" from employees of the North Carolina Public Service Company in the Greensboro, High Point and Burlington districts were rewarded recently with three prizes of $15, $10 and $5. Fifty-one suggestions were turned in. M. P. Bullard, order dispatcher, W. F. Hammer, electric line superintendent, and S. J. Rink, railway operator, were the winners in the January contest.

Traffic Study Planned in Baltimore

Plans to organize for the purpose of making a study of traffic conditions in Baltimore, Md., including the subject of one-way streets in the downtown section, are being made by a special commission appointed by Mayor William F. Broening. The United Railways & Electric Company, is represented on the commission by Dean J. Locke, staff engineer. Charles F. Goob, chief engineer of the city, has been designated as chairman. Appointment of the commission was authorized by the City Council.

One of the first acts of the body will be to make a study of the report made by Kelker, Deleuw & Company, Chicago, traffic experts who made a survey of the city a few years ago. A large part of the expense of this survey was borne by the United Railways & Electric Company.

Positions Abolished in Retrenchment in Detroit

In line with a recent announcement that economies would be effected by the abolishing of positions in the organization of the Detroit Department of Street Railways, Detroit, Mich., the duties of which overlapped those of other positions, the position of chief investigator held by John Moritz has been abolished by the department. It is understood that the work formerly done by Mr. Moritz is being assumed by Rufus G. Lathrop, secretary to the Street Railway Commission and chief of the insurance distribution branch of the municipal railway system. In addition to acting as head of the department's investigation division for the past two years, Mr. Moritz has done special investigating

work for the corporation counsel's office. The position of staff engineer, formerly held by Charles E. Hewitt at $8,000 per year, has also been abolished. This position was created about a year ago at the suggestion of one of the commissioners, but according to other department heads has not been justified.

The reorganization which has been going on during the past few months is expected to result in a saving of nearly $300,000 per year in salaries alone.

$1,225,000 Improvement at Oklahoma City

Local railway to build electrified belt line to help increase freight revenues. Location of industries along belt line encouraged

ONE OF the big improvements to be completed by the Oklahoma Railway, Oklahoma City, Okla., within the next few months is a freight-carrying electrified belt line extending around the northwestern, western and southern environs of Oklahoma City. This line will connect the company's Oklahoma City-El Reno interurban with the line from Oklahoma City to Norman eliminating the necessity of hauling through freight along the former route on Classen Boulevard in Oklahoma City. The line is to cost approximately $1,225,000. The company now has cars sufficient to meet the requirements of the new line.

The proposed line is a result of a desire of Hubert Hudson, president, and other new owners of the company, who purchased it while it was still in receivership, to increase revenues from freight sources and also to please residents along Classen Boulevard who had objected to the interurban tracks on that thoroughfare being used for freight hauling purposes.

When the receivership was lifted and the new owners assumed control late last year, the plan for the belt line was worked out and finally financed. The matter was taken up with the City Council early in January, but the many complications over right-of-way and other matters caused a delay in the approving of the contract by the City Council until Feb. 15.

After the contract was approved by the Council some of the Classen Boulevard residents discovered that the contract, while it provided for removal of through freight traffic from Classen Boulevard, retained for the company the right to haul its own materials on the line and provided for the retention of a freight spur near 25th Street and Classen Boulevard. The Classen Boulevard objectors, insisted on having freight hauling eliminated entirely from this street. About 50 of these objectors appeared before the City Council and the Mayor promised to withhold his signature until this matter could be adjusted.

Although all other disputes and difficulties had been settled on March 3 the adjustment between the Classen Boulevard people and the railway had not been accomplished and the contract was still unsigned. The railway, however, showed its faith by beginning to assemble material and starting construction at some points.

The belt line was desired by the city authorities, the railway and practically all residents of Oklahoma City, but many difficulties had to be overcome before an agreement could be reached. Many of these pertained to securing the right-of-way. A few months ago Oklahoma City voted $10,000,000 in bonds for the removal of the tracks of the Chicago, Rock Island & Pacific Railway from the business center of the city to a location farther south and for straightening the river channel, building bridges and viaducts and other improvements. The southern portion of the Oklahoma Railway belt line project will extend into the district where the Rock Island tracks are to be removed and where some of the river channel and bridge work is to be done.

The first disagreement arose between the Rock Island Railway and the Oklahoma Railway over the locations of lines, rights of building switches to certain industries and other conflicting matters. Included in the bond issue was a provision for a viaduct on Exchange Avenue which is to be constructed at or near the point where the new right-of-way of the Rock Island Railroad and of the Oklahoma Railway belt line would be located. Finally it was agreed that the Rock Island Railroad, the Oklahoma Railway and the city should join in the expense of constructing the viaduct. The city owned titles also to several parks, one of which had been held in trust by the city to be used exclusively for railroad terminal purposes. As the title to the city contained reversionary clauses applying in case the property was not used for railroad terminal purposes, it was necessary to file condemnation suits to clear the titles. The company has also filed several other condemnation suits involving land owned by individuals.

The matter of locating the belt line far enough from the city limits to prevent it from becoming a menace to future growth of the city was also considered and adjusted. Objections raised by some of the residents of south Oklahoma City against grade crossings at certain streets near the river caused another delay. The Oklahoma Railway, however, promised to separate the grades on these streets and the difficulty was removed.

The new belt line will also be utilized by the Oklahoma Railway to transfer freight to steam railroads passing through the city. Cheap industrial sites have been arranged along the belt line to encourage the location of industries and increase freight revenues.

Bandits Rob Columbus Employees

After kidnapping two truck drivers and a watchman, employees of the Columbus Railway, Power & Light Company, four masked robbers drove them to an alley of Franklin Park South, Columbus, Ohio, on March 4, and stole 10,000 detached street car tickets and about $150 in cash. The money and tickets were the receipts for the preceding day from the Main and Neil and Oak lines. Later in the day the tickets, some transfers and money boxes were found along the roadside near Agler and Burwell Roads.

Fare Decrease in Muskogee Granted

Authority to reduce the city railway fares in Muskogee from 10 cents cash fare, 3 tokens for 25 cents, to 10 cents cash fare, 2 tokens for 15 cents was granted the Muskogee Electric Traction Company on Feb. 24 by the Oklahoma Corporation Commission. The application had the endorsement of the city manager and the chamber of commerce of Muskogee.

Foreign News

Glasgow to Allow Ads in Cars

After holding out for nearly 40 years against allowing advertisements on its street cars, the Glasgow Town Council, Glasgow, Scotland, recently voted to consider bids for advertising rights on the corporation street cars. An offer has been made which represents a payment of practically $5,000 weekly for exclusive rights. The sub-committee has recommended acceptance of this offer, stipulating, however, that the advertisements shall be confined to the upper partitions of the inside windows and must be of a transparent character.

The committee recommends that sanction be refused to any announcement containing scripture texts, political matter, or reference to alcoholic liquors. It is expected that with these reservations the corporation will accept the offer.

Trackless Trolley Line for Prague

Trackless trolleys will be installed in Prague, Czechoslovakia, on a route where the former street car service has been discontinued, according to the president of the board of directors of the Prague Electric Railway Administration.

The new cars will be so arranged that they can turn out five meters, almost 16½ ft., on either side of the trolley wires. If they prove successful it is expected that their use will be extended.

Electrification in Natal, South Africa

The largest main-line electrification in the British Empire is said to be a route mileage of 175 on the main line between Glencoe and Pietermaritzburg in Natal. According to the report of Sir William W. Hoy, general manager South African Railways and Harbors, electric locomotives on this line are showing notable superiority to the former steam equipment. They are available during practically 90 per cent of the time as compared with not more than 50 per cent for the steam locomotive. They are averaging 7,000 miles per month as compared with 2,700 for the steam locomotive, and some of the units have already done 75,000 miles without heavy overhaul. Steam locomotives frequently had to be withdrawn from service for heavy repairs after a run of from 25,000 to 30,000 miles.

Republic of San Marino to Construct Railway

Plans are now being made for the construction of an electric railway connecting the capital of the Republic of San Marino, Italy, with the city of Rimini on the Adriatic Sea. The cost of the railway is to be borne jointly by the governments of Italy and San Marino.

San Marino which was founded in the fourth century, is said to be the world's oldest independent state. Hitherto access to the republic has been by carriage or motor, the road distance from Rimini being about 20 miles. The new line will facilitate commercial and industrial relations between the ancient republic and the surrounding kingdom.

Buses Installed in Beira

Trolley services in Beira, Portugese East Africa, are to be augmented by buses. The Urban Commission of Beira has asked for bids for the privilege of operating a bus line in the city and its environs.

The new bus service, which is planned to eventually replace trolley service in the city, provides for eight buses for whites and two for colored, with one to be held in reserve. The franchise is to be exclusive for a five-year period, unless the licensee is fined for breaches of the provisions of the contract three times, in which event it becomes void. The fares are to be approved by the commission and all employees in contact with the public are to be white Portuguese.

Birmingham Development

The tramway and bus department of the city of Birmingham, England, has opened a new depot with accommodation for 70 tramcars and 30 buses. The new building is required on account of tramway and bus developments. The cost of the depot, which covers 2 acres, is £37,000.

Recent Bus Developments

Permit Refused for Staten Island

Commission insists bus company awarded franchises from city shall prove its financial and operating responsibility

APPLICATION made by the Tompkins Bus Corporation for a certificate of convenience and necessity to operate buses on eighteen routes in Staten Island was denied on March 7 by the New York Transit Commission. The company sought a certificate after it had been granted franchises by the Board of Estimate last July. Issuance was opposed chiefly by the Staten Island Rapid Transit Company, which protested that the new lines would duplicate its service. Commissioner Godley said:

In my opinion, this commission should not grant the certificate to and approve the exercise of a franchise by a corporation which neither has nor can procure sufficient funds to finance the enterprise. The people of Staten Island, if they are to have legalized bus operation, are entitled to have the operation conducted by a company of sufficient financial ability to furnish modern equipment and efficient service.

The president of the applicant company testified that if the certificates were granted the applicant intended to issue $500,000 in equipment notes to be sold at a price to net the company about 96 and $500,000 in 7 per cent preferred stock to net the company 90. With the money thus secured, the applicant intended to spend $600,000 for new equipment; about $125,000 for new garage facilities and, after the payment of certain equipment notes now outstanding, have left $100,000 for working capital.

Although the applicant promised from time to time to produce responsible people who would undertake the financing and although numerous adjournments were granted to enable it to produce such proof, the evidence was never offered and the applicant finally rested with the production of its balance sheet as of Nov. 15, 1927.

The balance sheet referred to showed that the company, which has been operating buses on the proposed routes for some time, had quick assets of $62,677 and quick liabilities of $42,077. But, it was shown, a claim of $30,000 had been made against the managers, the value of which was not made clear and that the company owed $147,000 on equipment in use.

Minthorne T. Gordon, Jr., president of the company, admitted that most of this equipment still unpaid for would have to be replaced with new equipment to be purchased by funds raised under the proposed financing plan. The old equipment had been either purchased on conditional sales agreements or rented with an option for purchase.

The opinion concluded:

In short, the proof adduced shows that the applicant has no funds with which to finance the operation which it has undertaken under its franchise and has no definite plan for procuring such funds.

In my opinion, no certificate should issue unless the applicant shows such ability and resources as will give some assurance that the operator will furnish efficient service commensurate with public needs. I therefore recommended that the application be denied.

The Tompkins Bus Corporation is now serving at a 10-cent fare parts of the territory where once the city's municipal trolleys operated at a 5-cent cash fare but at a cost to the taxpayers of 12 cents for each passenger handled.

Wherry & Wight were counsel for the railway and Fisk & Roberts were the consulting engineers.

Regulations Drawn Up By Georgia Commission

A list of important regulations has just been drawn up by the Georgia Public Service Commission and submitted to the different bus operators in the state for their consideration before being definitely put in force.

One regulation provides that a bus driver who drinks liquor on or off duty forfeits his right to employment as a bus driver within the state. Another requires that all drivers be carefully examined and their ability to drive a bus tested. A third provides for the careful inspection of every vehicle by a competent mechanic between each trip. Other regulations provide for a speed not to exceed 40 m.p.h.; that drivers give their undivided attention to driving while on duty, making it unlawful for them to talk to passengers or for passengers to talk to them; that, in case of a breakdown, provision be made to transport the passengers to their destination, and that accidents be immediately reported to the commission.

Other clauses include indemnity insurance for the protection of passengers and property, the filing of fare schedules and operations. and the submitting of regular fiscal reports to the commission. Some weeks ago the commission asked all operators of bus lines in Georgia to file reports giving necessary details of their business.

Decision Hits Illinois Gas Tax

Illinois' brief experiment with a 2-cent state gasoline tax, enacted by the 1927 Legislature, came to an abrupt end recently when the State Supreme Court rendered a decision that the law under which the tax was collected was unconstitutional. The court held that the statute violated the state constitution on several grounds; namely, that it was discriminatory, that it amounted to a double tax on motorists, and that it was misleading in that it failed to state that the levy was upon users of the highways and not upon gasoline. In conclusion the court characterized the tax law as "an unintelligible piece of legislation," and declared that those upon whom the

Digitized by Google

law imposed the duty of collecting the tax "could not tell their duties from reading the law."

It is estimated that since the law became effective last August, motorists have paid in to the state treasury more than $7,000,000, approximately $3,400,000 of which was collected in Cook County, the seat of which is Chicago.

Regulation Requested in Tennessee

Regulation of buses and trucks by the State Railroad and Public Utilities Commission was requested in a petition filed with the commission recently by Richard D. Gleaves, attorney for the Tennessee Motor Carriers Association. The petition, after citing various laws which apply to the authority of the commission, asks:

1. That the commission exercise the jurisdiction given them by the various statutes.
2. That it assume control, regulation and supervision of all the public utilities engaged in the business of transporting freight or passengers for hire in the state.
3. That it require all companies to operate vehicles on regular schedules.

The petition states that several recent accidents may be traced to the fact that buses operating in competition have been run at excessive speed in order to arrive ahead of their rivals, and that this has become a practice dangerous to the passengers as well as other vehicles on the roads. The petition was accompanied by an opinion from L. D. Smith, attorney-general of the state, to the effect that the state commission had authority to exercise regulation over the bus lines.

Debate on Bus Bill in Virginia Legislature

By a vote of eighteen to four, the Virginia Senate on March 3, passed the rate-fixing bus bill which nullifies the value of certificates as the basis of rate fixing, except the actual cost thereof.

The bill now goes to the house for concurrence but in view of the fact that the house committee already has twice refused to report out the identical bill, action of the lower body is problematical. In practical effect, the bill would prohibit the state corporation commission, in fixing the bus rates to be charged patrons, from placing any value on the certificates issued beyond the nominal actual cost of the transaction which supporters declared to be $1.50.

Coach Permit Sought in San Diego

The San Diego Electric Railway, San Diego, Cal., has applied to the Railroad Commission for authority to operate auto stage service connecting La Mesa, Lemon Grove and intermediate points.

Bus Expansion for Ohio Valley

Sale of the Interstate and Cannon Ball Bus companies to the Southern Gas Securities Company, Chicago, a subsidiary of the Central Public Service Corporation, has been concluded. The Central Public Service Corporation recently purchased the Ohio Valley Electric Railway, the Portsmouth Public Service Corporation, and the Ohio Valley Bus Company from the American Gas & Electric Company by virtue of the bus purchase completed at Portsmouth. It now controls all of the urban and interurban transportation systems in and between Huntington and Portsmouth. Its bus lines connect Charleston and Columbus, Ohio, Huntington, Portsmouth and Chillicothe, Ohio. The total mileage of the several companies is 202 miles.

Solution of a serious transportation problem will be afforded by the transaction, Mr. Brady, vice-president of the Central Public Service Corporation, indicated. For some time a rate war had been waged with the Cannon Ball and the Interstate bus companies and the Portsmouth Public Service Company, with what Mr. Brady characterized as the usual disastrous results. He said that that section of Ohio Valley had a great industrial future, and that there was a necessity for dependable and adequate transportation. The two services would be co-ordinated with the Portsmouth Public Service Company and the Ohio Valley Bus service between Portsmouth and Huntington on both sides of the river and a thorough study made of the needs of the various communities served. Fred W. Samworth, formerly general superintendent of the Ohio Valley Electric Railway and of the Ohio Valley Bus Company, was made district manager of the Ohio Valley Electric Railway and of the Ohio Valley Bus Company and would also be manager of the Cannon Ball and Interstate bus companies.

Mr. Samworth indicated that no changes in the service in Huntington were contemplated. The three bus lines will continue to operate separately. No curtailment of electric interurban service is proposed as far as the Ohio Valley lines are concerned. However, it will be the policy of the company to curtail electric railway service between Ironton and Portsmouth and increase bus traffic.

15-Cent Bus Fare May Be Asked in Kansas City

The Kansas City Public Service Company, Kansas City, Mo., is preparing to submit to the City Council an outline of its plans for a more useful routing of buses, coupled with a 15-cent fare for the trunk lines to make them self-supporting. It is planned to leave the bus fare on feeder and crosstown lines at 10 cents, with a transfer privilege to street cars.

The policy of the company from the start has been to develop feeder lines in unserved districts, but to seek trunk lines which would pay their own way. The company takes the stand that where bus and rail lines parallel, bus riders should pay a fare that will make the vehicle self-sustaining.

In all probability there will not be radical changes in the routings. It is expected that the Country Club Express, with a 25-cent fare, will be replaced with a Broadway bus line, with regular equipment and regular fare. This line may bend eastward at 55th Street to replace the south end of the Warwick line, which it is believed would pay if it did not extend south of 47th Street.

Past patronage makes it doubtful whether the railway will continue the northeast bus line under the 15-cent fare plan. Another northeast line extended along some eastern traffic lane may replace it, to tie in all railway lines in that section. A crosstown line some distance south of 39th Street has been discussed, and home owners on South Oak Street have sought a feeder line.

Substitution on Line in Quincy

Authorization has been given the Illinois Power & Light Corporation by the City Council of Quincy, Ill., to abolish railway service on the Fifth Street line and to substitute bus service. Ralph E. Carley, general manager, of the western division of the utilities corporation, has petitioned the Illinois Commerce Commission to approve the change and as soon as it is formally granted the tracks will be torn up and bus service started. The company has agreed to repave the streets along which its track has been located.

Opposes Curtailment in Atlanta

Citizens of the South Boulevard, Sylvan Mills, and Center Hills sections of Atlanta, Ga., have entered a protest with the Atlanta Coach Company against any curtailment of service. The present schedule on week-days begins at 5.30 a.m. and continues until 11.30 p.m., but the company proposes to change to a schedule beginning at 6.20 a.m. and continuing until 8.45 p.m. On Sunday it is proposed to operate the buses between the hours of 11 a.m. and 7 p.m.

The Georgia Power Company, which is operating the buses, states that the amount of traffic secured does not justify the schedules now maintained. On the other hand, citizens of these sections claim that curtailment would be very inconvenient, if it did not actually work a hardship upon many.

New Line Wanted for South Bend

Petition for the establishment of a new bus line which will serve the recently developed section on the west of South Bend, Ind., has been presented to the Indiana Public Service Commission by George R. Green, general superintendent of the Chicago, South Bend & Northern Indiana Railway. The new line will be an extension of the city electric railway service.

Financial and Corporate

Sioux City Property Sold

The plant and equipment of the railway at Sioux City, Ia., has passed from the control of the United Gas Improvement Company to that of the American Electric Power Corporation, New York, in a $10,000,000 deal. The transaction also included the new $3,500,000 power plant at Riverside, a Sioux City suburb; a $1,000,000 addition now under construction; all wire and plant facilities in Sioux City, the gas plant and main system, the new $300,000 service building at Dace and Court Streets, and several hundred miles of high tension power lines serving approximately 100 towns and cities in northwest Iowa.

The Sioux City properties and outside power lines were operated by the Sioux City Gas & Electric Company, a subsidiary of the United Gas Improvement Company, while the New York corporation, which made the purchase, operates in Iowa under the name of the Iowa Public Service Company. Its headquarters are at Fort Dodge.

The United Gas Improvement Company has held a majority of the stock of the Sioux City Gas & Electric Company since 1889.

C. I. Crippen, vice-president of the American Electric Power Corporation, has announced that W. J. Bertke, president of the Sioux City concern, will continue in that capacity.

R. M. Feustal a South Shore Director

At the annual meeting of the Chicago, South Shore & South Bend Railroad in Chicago on Feb. 28, Robert M. Feustal, Fort Wayne, president of the Indiana Service Corporation, was elected a member of the board of directors. He succeeds P. A. Erlach, resigned.

Preferred Dividends in Gary Quarterly

Dividends on the class "A" preferred stock of the Gary Railways, Gary, Ind., subsidiary of the Midland Utilities Company, will hereafter be paid quarterly at the rate of $1.80 per share on June, September, December and March 1 to stockholders of record of the twentieth day of the preceding month. Previously monthly dividends of 60 cents were paid.

Interstate Issue Offered

An offering of $12,554,000 first mortgage and refunding 4½ per cent gold bonds, series F, of the Interstate Public Service Company, Indianapolis, Ind., due March 1, 1958, has been made by a syndicate headed by Halsey, Stuart & Company. The bonds, due March 1, 1958, are priced at 94½ and interest. Proceeds from these bonds will be used toward reimbursing the company for refunding bonds bearing higher coupon rates and for other corporate purposes. The issuance of these bonds has been authorized by the Public Service Commission of Indiana.

Maturing Note Issue of North Shore to Be Converted

The Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., has called a special meeting of stockholders for May 15 to vote on a proposal to convert $2,684,208 of non-interest bearing notes due June 30, 1928, into 6 per cent non-cumulative preferred stock.

Claims Questions Up in Indiana Interurban Settlement

Claims against the Union Traction Company, Anderson, Ind., due to deaths or injuries were heard in Circuit Court at Anderson, Ind., following a hearing on an agreement of three classes of other claims. Some of the claims were for persons killed or injured in a collision of interurban trains near Alfont, Ind., on Feb. 2, 1924. A proposition by bondholders to many creditors, and said to have been approved by the court, provides that 87½ cents on the dollar be paid on $238,000 of claims that accrued six months prior to the appointment of a receiver for the company on Dec. 31, 1924; 20 cents on the dollar on claims that accrued more than six months prior to the receivership, of which there are $73,000 and 10 cents on the dollar on $23,500 of claims that accrued more than a year prior to the receivership.

Net Income Increases in Philadelphia

$13,010 transferred to surplus of P.R.T. in 1927. 961,618,543 passengers carried on all types of equipment, including bus and taxi

AFTER providing for all charges including a 7 per cent dividend on its preferred stock and an 8 per cent dividend on its common stock $13,010 remained to be transferred to the surplus of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for the year ended Dec. 31, 1927. The net income was $3,782,184, compared with $3,027,694 in 1926. These facts were disclosed in the annual report to the stockholders dated Feb. 29, 1928.

Passenger revenue for 1927, including subway-elevated, street car, bus and taxicab, was $56,070,709. Operating expenses and taxes were $43,321,422. Gross passenger earnings were $1,125,901 less than 1926. This is accounted for partially by a natural local reaction following the Sesqui year, and partially by the condition of industrial depression which began to be felt during the past summer.

At the close of 1927 the company was operating 664 miles of surface track, 39 miles of elevated and subway track, 243 miles of city bus routes, 1,285 taxicabs, and a fast growing system of intercity bus routes. By thus co-ordinating every phase of Philadelphia's public transportation, Mitten Management protects the joint city-company system against the inroads of competitive operation.

The Philadelphia transportation system has become a vast combination of many lines serving many communities. Pennjersey bus lines, owned jointly by P.R.T. and Public Service Railway of New Jersey, extend across the Delaware Bridge to serve the residential

sections of south Jersey tributary to Philadelphia, thus minimizing the occupation of the Philadelphia streets by independent bus operators. The P.R.T. and P.S.R., through this joint ownership, share equally the receipts and expenses applicable to what might be termed the local Philadelphia and Camden territory. P.S.R. stipulates the timetables for the suburban territory beyond Camden, and, under a special operating agreement, assumes the receipts and expenses thereof.

Bus service over the Delaware Bridge was started in the belief that it would eventually be a valuable aid to the P.R.T. city-wide system. Such service is justified, for the reason that if P.R.T. had not itself supplied the service, independent operators would have increasingly invaded the Philadelphia territory.

The acquisition of the Yellow Cab Company in 1926 served to preserve to the city-wide transportation system the revenue from the profitable short riding business which the cruising taxicabs were winning from the surface car lines, and at the same time capitalized the growing desire of the traveling public for a speedier and more personal type of service. During the year the company added the Cunningham and Diamond cab companies. These companies are being merged with the Yellow Cab Company, thus assembling virtually all local taxicab operations under one management and paving the way for substantial benefits and economies which are already going far toward offsetting losses from bus operation.

The report refers to the Public Service Commission studies of Philadelphia's transportation system and to the recommendations since carried out by the company.

On the subject of traffic congestion the report mentions the vast improvement since the elimination of taxicab cruising. The company put forth intensive efforts to maintain the speed and regularity of its service despite bad conditions of traffic. Its parking areas established at the suburban termini of the Market-Frankford elevated line have proved popular. In these parking areas the motorist may for a fee of 25 cents park his car and receive without added payment a 15-cent ticket entitling him to ride downtown and back on subway-elevated or street car. During the year 1927, 135,000 automobiles were parked in the 69th and Market Streets parking area, an increase of 55 per cent over the year 1926; 75,000 automobiles were parked in the Frankford Avenue and Bridge Street parking area, an increase of 27 per cent over 1926. In the latter part of the year arrangements were made with the Camden Bridge Garage whereby motorists might park their cars in this garage and receive, in return for a nominal fee, tickets entitling them to ride via Pennjersey buses from Camden to the Philadelphia business district and return.

Based upon the experience gained and the great advantage already secured in now keeping more than 1,000 motors each business day out of the downtown district, and preparatory to the operation of the Broad Street subway, this management has made plans for the early erection of a garaging-terminal building at the Olney Avenue end of the subway. This garage will be modern and efficient in every respect, will have a capacity of 500 cars, will be constructed over the top of the company's present surface car loop, and will afford convenient access to the subway station directly beneath the building. The company is also urging the use of the public garages so that the public thoroughfares be left free for public transportation in vehicles which efficiently utilize the highway space.

In spite of the greatly increased congestion of the streets due to the increasing use of motor vehicles, the company has established during the past year a noteworthy record in the reduction of accidents. Accidents on the surface system have been reduced 21.2 per cent under the record of 1926. Accidents per 100,000 car-miles in 1927 were 52.76 compared with 63.98 in 1926, a reduction of more than 17 per cent. The record of cars pulled in for mechanical failures was but 0.335 per cent of cars operated. Car collisions, a type of accident already infrequent on P.R.T. system, were still further reduced 49 per cent during the year. There were 139—including a period of ten consecutive—no-collision days.

The increasing need for new and modern general shops to replace the present shop facilities and permit more economical handling of maintenance and repair work has been felt by this management for some years. This much needed facility has been postponed from year to year to permit the use of available funds for extended and improved service to the public. P.R.T. has now acquired a tract of land admirably suited for this purpose located near Second Street and Olney Avenue, and will develop its general shop plans forthwith.

P.R.T. general offices were established in the new Mitten Building at Broad and Locust Streets on June 1, 1927. The centralization of all office work under one roof releases many quarters heretofore so used throughout the city and has already made possible substantial economies and efficiencies. Mitten Building also houses the Mitten Bank Industrial Section, Mitten Bank Securities Corporation, and Mitten Management.

The company has been in the forefront of the movement toward a wider distribution of the ownership of industry among the people served. By this means a more enlightened attitude on the part of the public toward P.R.T. and toward industry generally has been secured, resulting in a better understanding of the problems. There is no question that public indorsement of the complete co-ordination of street car, bus and taxicab has been due as much to the wide distribution of resultant dividends to car riders as to the greater service which co-ordination has made possible.

The 7 per cent cumulative preferred stock is held by 40,000 small investors, most of them car riders, many of whom have purchased the stock at the rate of $1 per share per week payable on P.R.T. cars. On Dec. 1, 1927, all of the $23,000,000 authorized preferred stock had been absorbed. The City Council on Dec. 17, 1927, gave its necessary assent to the issuance of $7,000,000 additional 7 per cent preferred stock, needed to refund outstanding indebtedness and finance additional maintenance facilities and service extensions recommended in Dr. Snow's report to the Public Service Commission. The stockholders authorized this additional preferred stock issue at a special meeting held on Feb. 6, 1928.

STATEMENT OF INCREASED RIDING IN PHILADELPHIA

The report goes into detail on the status of the stockholders. The stockholders from 1902 to 1911 had never received return on their stock subscription of $30,000,000. In 1910 they saw their property threatened with receivership, through being unable to meet its fixed charges. The stock, par $50, was selling at $7 a share. It is now selling on the market at $60 a share, and pays 8 per cent.

The property of P.R.T. stockholders has been completely rehabilitated. From a condition of no reserves and no surplus, adequate reserves and surplus have now been provided against known needs of the future.

Supplementing its statement on the increased riding the report states that in 1910 the average Philadelphian rode in P.R.T. cars only 288 times a year. Per capita riding had been built up by 1920 to 501. In 1920, when increased costs made added income necessary, Mitten Management sought to retain the basic 5 cent fare, urging that a flat increase would lose the profitable short-ride business and lead to still higher fares. The Public Service Commission did not agree, and ordered a flat increase to 6¼ cents.

The following year, 1921, P.R.T. lost 100,000,000 short-ride passengers and has never since reached the high per capita riding of 1920. A further fare increase was from this cause made necessary in 1924.

Accompanying the statement on wage trends the report explains the market basket basis and compares the present management-men relationship with the status of the employee in the dark ages of industrial democracy.

Officers and Directors of Hocker Line Elected

At a meeting of the organization committee of the Kansas City, Merriam & Shawnee Railroad held in Kansas City, Feb. 27, officers and directors were elected.

Officers are Herman Sonken, president; W. K. Paul, Merriam, Kan., vice-president and general manager; L. G. Galamba, secretary; F. P. Dixon, treasurer; J. D. Cornell, general traffic manager; W. S. Barton, assistant traffic manager.

Members of the new board of directors are: A. M. Summermour, chairman; George McAnany, A. A. Sharum, A. M. Meyers, E. G. McDonald, F. P. Dixon, L. G. Galamba, W. K. Paul, W. F. Blanton, H. J. Miller, John Sanders, L. W. Wilson, Dick O'Brien, Herman Sonken, Herman Galamba, W. S. Barton, Fred Jackson, all of Kansas City; James E. Smith, Topeka, Kan.; W. W. Gordon, Kansas City, Kan.; A. E. Faulkner, Lincoln, Neb.; C. Neiman, Shawnee, Kan.

The electric line is the old reorganized Hocker line. A petition for a charter was filed in Topeka by Fred Jackson, general counsel.

Reorganization details have been published in these columns previously.

Book Reviews

Where Shall They Park?

National Safety Council, Chicago. 18 pages, 25 cents, with reduced prices for copies in quantity.

The subject of automobile parking is considered in this book primarily from the standpoint of accident prevention, i.e., the best way of parking where that practice is permitted, rather than the best way of stopping parking. Nevertheless, the pamphlet clearly brings out the constantly increasing demand upon street space for moving traffic, its primary right to such space, and the desirability in many cases of limiting parking and even of prohibiting it. The opinions of many merchants where this has been done are quoted to show that limitation or prohibition has not injuriously affected retail business.

The Port of New York Authority

Annual Report for the Year 1927. 70 Pages.

In the annual report of the Port of New York Authority, created by compact between the states of New York and New Jersey and ratified by Congress, it is said that progress has been made toward the solution of the problem of transporting passengers commuting between New York City and the suburbs. Part 1 covers the development of the port; part 2 interstate bridges; part 3 suburban transit and part 4 financial operations. In its conclusions on suburban transit the report states that conclusions contained in the sub-committee reports embodied in the preliminary report of the Suburban Transit Engineering Board of Jan. 11, 1928 are sound. The report also recommends concurrent legislation by New York State in support of this program.

Industry's Coming of Age

By Rexford Guy Tugwell. Harcourt, Brace & Company, New York, N. Y. 274 pages. Price, $2.

Not long ago a keen Frenchman, André Seigfried, made a study of this land and called it "America Comes of Age." Just now a well-known economist, Rexford Guy Tugwell, surveys industry and sees it coming out of the adolescent stage. The question which both books provoke is—what is in store for America?

In "Industry's Coming of Age" a wealth of facts is marshalled to prove the astounding growth in our productivity since 1914. The author says we are in the midst of a new industrial revolution which calls for intelligence in furthering and controlling business trends for human welfare. In treating the ills of industry a popular fallacy appears in thinking that almost anything can be done or in thinking that nothing at all can be done. Neither those who claim eternal prosperity for America or those who flee industrialism by exile in Europe contribute very much to an understanding of the changes which, if not controlled, in Dr. Tugwell's opinion will not always make for one's betterment.

In his discussion of the progress of productivity Dr. Tugwell proceeds to the general and technical causes for our virility. Among the general causes, great emphasis is placed on the spread of education, the inheritance of and addition to the racial store of technical skill and knowledge, progress toward the more complete division of labor and the consequent mechanization of industrial processes and the recent capitalizing on the possible productive contribution of women. Among the technical reasons he lists at the top the discovery and spread of scientific management and the elimination of rule-of-thumb, with standardization of many basic materials and processes.

Dr. Tugwell sees barriers to productivity in the persistence of depressions and weak spots even in good times. Herein is the reason for stock taking of American life and business now that the latter has reached its maturity. He makes a convincing and forceful plea for a better understanding of the economic forces at play so that adjustments can be made to care for the needs and desires of men.

Mr. Siegfried, who sees America at maturity, concludes with a declaration that the discussion resolves itself into a dialogue between Ford and Ghandi. Dr. Tugwell sees achievement in recognition of trends so that we can work for attainable results.

American Universities and Colleges

Edited by David Allan Robertson. (The American Council on Education). New York and London: Charles Scribner's Sons. 884 pages; price, $2.50.

The character, scope and organization of higher education in the United States is reviewed in Part I of this volume. Part II presents condensed information regarding each of the universities and colleges on the accredited list of the American Council of Education. Supplementary information regarding thirteen classes of professional and fifteen classes of graduate schools is given in Part I. For some unexplained reason, engineering schools have far less space in proportion to their number than the other schools. Thus 130 engineering schools are given less than three pages, consisting mostly of names of schools by states, while twenty-five schools of economics are given eleven pages, with a list of professors, their degrees (by institutions), the subjects they teach, and, in some instances, other information as well. The book is valuable merely as a compilation.

Personal Items

H. J. Woodard Succeeds F. A. Brine at Atlanta

F. A. Brine has resigned as general auditor of the Georgia Power Company, Atlanta, Ga., because of ill health. His service record with the company covered 27 years.

This post has been filled by H. J. Woodard, who has been with the company for many years in which he has served in every capacity in the accounting department and in the auditing of every department. He joined the company as a clerk.

J. J. Esch Rejected as I. C. C. Member

By a vote of ten to seven the Senate Interstate Commerce Committee voted to reject the renomination of John J. Esch of Wisconsin for the Interstate Commerce Commission on March 6. His defeat comes after many years in public service work. Although as a result of the Senate's failure to act upon his renomination he automatically went out of office on Dec. 31, 1927, President Coolidge reappointed him on Jan. 3 to act during the recess of Congress over the holidays and until that body could pass upon it.

Mr. Esch was nominated on March 11, 1921, by President Harding for appointment to the Interstate Commerce Commission. He had been chairman of the House Committee on Interstate and Foreign Commerce and had manifested a special interest in railroad and transportation affairs in Congress. At that time he was appointed for a full term of seven years to succeed Robert W. Wooley, whose term expired on Dec. 31 of that year. As a member of the House of Representatives he was co-author of the transportation act and was reappointed by President Coolidge on the expiration of his first term as a commissioner.

O. J. Shaw Resigns at Lincoln

O. J. Shaw, former general manager of the Lincoln Traction Company, Lincoln, Neb., who became operating executive for the Lincoln Public Service Company when it purchased the gas and electric properties of the utilities, has resigned to devote his time to two industries of which he is the chief stockholder. Mr. Shaw has long been connected with the railway in Lincoln. The properties are now owned by the United Light & Power Company, operating through two local corporations.

Mr. Shaw joined the Lincoln Traction Company in 1911 serving in the contract department. Later he was made assistant secretary and in 1913 he became secretary. For several years prior to his becoming general manager in 1920 he had charge of the company's overhead lines, the steam heating plant, the commercial department and the accounting department. He is a graduate of the University of Nebraska.

A. J. Fink in St. Louis as Transportation Engineer

The tireless efforts and indefatigable services of A. J. Fink have found their medium in St. Louis, Mo., where as transportation engineer of the St. Louis Public Service Company, Mr. Fink will have an unusual opportunity to capitalize on his traffic studies and experiences gained in Pittsburgh. He was appointed on March 1 to his new position.

A. J. Fink

Mr. Fink is another "up-from-the-ranks" officer and knows the business of transportation. He has served as conductor—and so knows the employees' viewpoint—as traffic checker on the sidewalk and as time-table compiler. Eight years ago Mr. Fink went to Pittsburgh and worked with Thomas Fitzgerald, who at that time was consulting engineer for the Philadelphia Company, on the reorganization of the Pittsburgh Railways. After the multitudinous details of this work were completed, Mr. Fink was appointed assistant to the general manager in 1924. In this capacity he served until November, 1926. At that time the new form of railway supervision was instituted by the Pittsburgh Railways based upon a policy of making each executive assume entire responsibility for his own departmental activities. It solidified and systematized the entire structure of the organization. In line with this policy J. M. Loftis, superintendent of transporation, was placed in charge of three district functions of electric railway transportation, namely, traffic and schedule, car operation and trainmen's instruction, with a superintendent appointed to head each branch. A. J. Fink was appointed superintendent of the traffic and schedules reporting to Mr. Loftis. To him was assigned the responsibility of seeing that the service was carried through.

Mr. Fink was born in Cincinnati, Ohio, and was educated in the schools there. In 1905 he entered the service of the Cincinnati Traction Company, and was employed in the operating department until 1920 when he went to Pittsburgh.

With the St. Louis Public Service Company Mr. Fink's chief task will be to carry out plans already in operation and to determine the best arrangement of traffic and schedules. One of the factors in this work is the new transfer system put into effect Jan. 1 by which the company is able to study the direction of its patrons and ascertain which locations are the most popular.

E. H. Maggard Succeeds W. S. Palmer at San Francisco

With the retirement early in April of W. S. Palmer as president and general manager of the Northwestern Pacific Railroad, San Francisco, Cal., attention is again directed to E. H. Maggard, elected by the board of directors to succeed in that post. Mr. Maggard's experience in railroading covers a period of more than 35 years. During that time he has held responsible posts in the south and in California but is known especially for his services with the Petaluma & Santa Rosa Railroad of which property he has been general manager since 1916 and president since 1925. In 1926 he was elected president of the California Electric Railway Association.

Prior to his association with the California property, and at an early age, Mr. Maggard entered the service of the Missouri, Kansas & Texas Railway at Denison, Tex., as call boy. In 1893 he resigned to accept a position with the Southern Pacific at Houston as clerk in the freight office. In this capacity he remained until 1900 and then he entered the service of the El Paso & Northeastern Railway at El Paso, Tex., as chief clerk in the freight office. Soon he was promoted to agent of the company and from agent to superintendent of terminals. It was from this property in 1907 that he resigned to go as general freight and passenger agent with the Petaluma & Santa Rosa Railroad.

Mr. Maggard was born at Meridian, Miss., in 1875. He moved to Texas with his parents in 1877 and was educated in the public schools at Corsicana and Denison. His appointment to the presidency of the Northwestern Pacific Railroad which operates 41 miles of electric lines and is controlled by the Southern Pacific Company is expected to aid the Southern Pacific and Santa Fé in their application now pending before the Interstate Commerce Commission to acquire the Petaluma & Santa Rosa Railroad.

W. S. Palmer, the retiring president was made general manager of the Northwestern Pacific Railroad in 1907. Seven years later he became president and general manager. He entered railroad

Digitized by Google

service in 1876, following his graduation as a civil engineer from the University of California. He worked many years with the Central & Southern Pacific as an engineer of construction and in 1901 became superintendent of the Sacramento division. Following the joint acquisition of the Northwestern Pacific Railroad by the Southern Pacific and Santa Fé Mr. Palmer went with that property.

Promotions at Rome Division

Three changes in personnel of the Georgia Power Company, Atlanta, Ga., affect operation at the Rome Division. These promotions were announced by W. E. Mitchell, vice-president and general manager.

T. S. Sloan, who recently resigned his position with the Central Georgia Power Company, became division manager, effective March 1.

J. H. McCombs, former distribution engineer in Atlanta, has been promoted to division superintendent of operations, effective March 1.

J. M. Flanigen, appointed division superintendent in December, is scheduled for Atlanta.

William Siebert of Brooklyn Honored

William Siebert, superintendent of transportation of the surface lines of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., has rounded out 40 years of service on the Brooklyn railway lines, twenty of which have been spent in his present position of superintendent of transportation of the surface lines. In recognition of that event more than 130 of his associates and friends gathered recently at Prospect Hall, Brooklyn, to congratulate him on his many years of well-performed service. The affair was in the nature of a surprise.

Most of those at the dinner were men who have worked with Mr. Siebert in the Brooklyn companies for many years and cherish their friendship and association with him, and as a small token of their affection and esteem, they presented to him a sterling silver beverage set and tray.

County Clerk William E. Kelly was the toastmaster of the evening and the speakers were Supreme Court Justices Stephen Callaghan and Edward J. Byrne, President W. S. Menden and Vice-President Travis H. Whitney of the B.-M. T. System; Vice-President Clinton E. Morgan of the Brooklyn City Railroad and Mr. Siebert himself.

Mr. Siebert began his railroad career in 1887 as a conductor on the Nostrand Avenue horse car line. His advance through the ranks was steady until he finally was in charge of the Ridgewood Depot. Mr. Siebert told the story of his appointment to the post of superintendent of transportation of the surface lines in 1907. He said:

One day about twenty years ago Mr. Menden sent for me to come downtown and see him. When I got into his office he told me he wanted me to take the job of superintendent. I told him I did not want the job as nobody seemed to last long in that job and I had a family to take care of. He said he thought I would be able to handle myself satisfactorily in the job and finally told me to take a week to think things over and then come back to see him. I went back a week later and told him again that I didn't want the job. But I didn't know he had been talking with Harry Crowe and some of the others who knew me downtown and they had told him just to tell me to try my hand at the job and I would stick at it. At any rate, when I told him I still didn't want the job, he simply said he'd have to have someone downtown and asked me to go inside and help him out temporarily. That was twenty years ago and I'm still helping out.

He summed up the basis of his success when he declared:

I want to thank every man in the surface transportation department for the splendid loyalty and support they have given me at all times. One man cannot run a railroad. We sometimes say we are running it but that isn't true. We must have the co-operation and support of every man in the organization from switchboy to president and unless we have that our efforts to run the railroad to satisfy the public and the management are bound to fail. I have been fortunate in having enjoyed that loyalty and support in a generous degree and I owe all of whatever success I have achieved to each and every one of you.

Changes on Ohio Property

L. N. Bennett, Port Clinton, has been promoted to the superintendency of the Ohio Public Service Company with headquarters in Oak Harbor. He succeeds R. S. Huber, Oak Harbor, who fills another post with the company.

Obituary

George McQuaid

George McQuaid, director of public relations for the Central and South West Utilities Company, an Insull interest, died on March 5 at his home in Dallas. In 1922 he was employed by the public utility organizations of Texas and was placed in charge of the Texas Public Service Information Bureau in Dallas. The bureau issued a weekly news bulletin giving current news and information regarding public utilities operating in Texas. He had been connected with various newspapers in Texas for 30 years serving in different capacities from reporter to managing editor and editor.

The late Mr. McQuaid was born in Virginia in 1875 and was educated at Georgetown University, Washington, D. C., receiving both the A.B. and B.L. degrees. After his graduation he entered newspaper work in Oklahoma and shortly thereafter became managing editor of the Guthrie *State Capital*. Later he joined the staff of the San Antonio *Express* and was managing editor of this paper from 1905 to 1910. His next move was to Galveston as editor of the Galveston *Daily News*. There he remained for three years being forced to give up this position on account of failing health.

After recuperating in El Paso for more than a year Mr. McQuaid went to Oklahoma City as correspondent for the Dallas *Morning News* in charge of the news service in Oklahoma. While in Oklahoma he made a record for building up a news-gathering organization. Two years later he returned to Dallas and was put in charge of the oil development news of the Dallas *Morning News*, serving in the field as oil editor and staff correspondent. He left newspaper work then for about a year but returned as managing editor of the Dallas *Morning News*. This position he held until December, 1921. At that time he purchased the Mexia, Tex., *Evening News* and edited and published that paper until he sold his interests and accepted a position with the Texas utility organizations.

Nels Jenson

Nels Jenson, master mechanic of the Wisconsin Valley Electric Company, Wausau, Wis., and well known in utility circles died Feb. 17. He had been working on Feb. 16. Mr. Jenson entered the employ of the Wisconsin Valley Electric Company in the summer of 1907 and for the past eighteen years had served as master mechanic. He was born in Denmark April 13, 1863. He had been in this country approximately 40 years. Mr. Jenson was known among his associates both in and out of the company as the "Grand Old Man."

ROY ROACH, superintendent of the Eighteenth and Olive division of the Kansas City Public Service Company, Kansas City, Mo., died recently. Mr. Roach had been in the employ of the company since January, 1906, serving as trainmen and superintendent at the various divisions. He was born at Everett, Kan., in 1883 and received his early education there and at Enid, Okla. In 1901 he took his first position as a messenger boy for the Chicago, Rock Island & Pacific Railway. .

CLYDE V. FUNK, for 28 years a traveling representative of the Ohmer Fare Register Company, died at Boston, Mass., Feb. 3. Mr. Funk had a wide acquaintance among electric railway and bus officials throughout the country, especially in New England and along the Atlantic seaboard. He was born in Dayton, Ohio, 57 years ago and entered the employ of the Ohmer Fare Register Company during the early years of its existence.

Manufactures and the Markets

Nashville Railway Improvements

Nashville Railway & Light Company, announces that it will expend about $750,000 in extending and broadening its service in 1928.

More than $100,000 has been set aside for improvements in street railway facilities, safety devices getting a substantial part of the budget. New street paving on the company's street railway lines takes up a large part of the budget, and an automatic railway substation will be installed to give increased power to the Finn Street section of the city.

Public Service and Brooklyn City Order Fare Boxes

Public Service Co-ordinated Transport, Newark, N. J., has ordered 200 Type J electric fare box equipments for its new buses from the Johnson Fare Box Company, Chicago, Ill. The Brooklyn City Railroad of Brooklyn, N. Y., has also ordered 144 Type J electric fare boxes for its regular trolley cars.

Public Service Redecorates Cars

The Public Service Railway, Newark, N. J., has just completed refitting and redecorating the cars operating on the Perth Amboy line. The interiors have been repainted in a cream color and the seats have been reupholstered in leather.

C. E. Beardsley President of Bridgeport Brass

Bridgeport Brass Company has elected Charles E. Beardsley, president of Beardsley & Wolcott Manufacturing Company, as president and director, succeeding Carl F. Dietz. George T. Wigmore, Ralph E. Day, Paul D. Hamilton and Rowley Phillips replaced directors who had resigned. George T. Wigmore was elected treasurer and also succeeded R. I. Reithercut as secretary. Walter Blatz, general manager, retired.

Virginia Electric & Power Company Improves System

Virginia Electric & Power Company, Richmond, Va., has planned expenditures of $4,000,000 for improvements to its properties. $1,000,000 will be spent on rebuilding tracks and paving, shop equipment and improvements to street cars and buses.

Westinghouse Air Brake Report

In the report of the board of directors of the Westinghouse Air Brake Company and subsidiaries, Wilmerding, Pa., for the year 1927 the net earnings for the year, after deducting all expenses, including adequate provision for depreciation of plants and equipment and reserve for federal and other taxes, were $8,520,009.53, as shown by the consolidated surplus account. Of this amount $5,946,223.25 (70 per cent was distributed to the stockholders in dividends and the balance of $2,573,786.28 (30 per cent) was added to the surplus account. This compares with net earnings of $10,535,062.09 in the previous year, dividends of $6,342,099.00 (60 per cent) and addition to surplus account of $4,192,963.09 (40 per cent).

The new car and locomotive orders placed by the railroads in 1927 were less than in any year since 1921, resulting in a reduced volume of business in air brake equipment and locomotive stokers; however, the sales of signal apparatus and train control equipment of the Union Switch & Signal Company, exceeded the figures for 1926, the best previous year in the company's history.

Tests Made to Demonstrate Air-Magnetic Brake

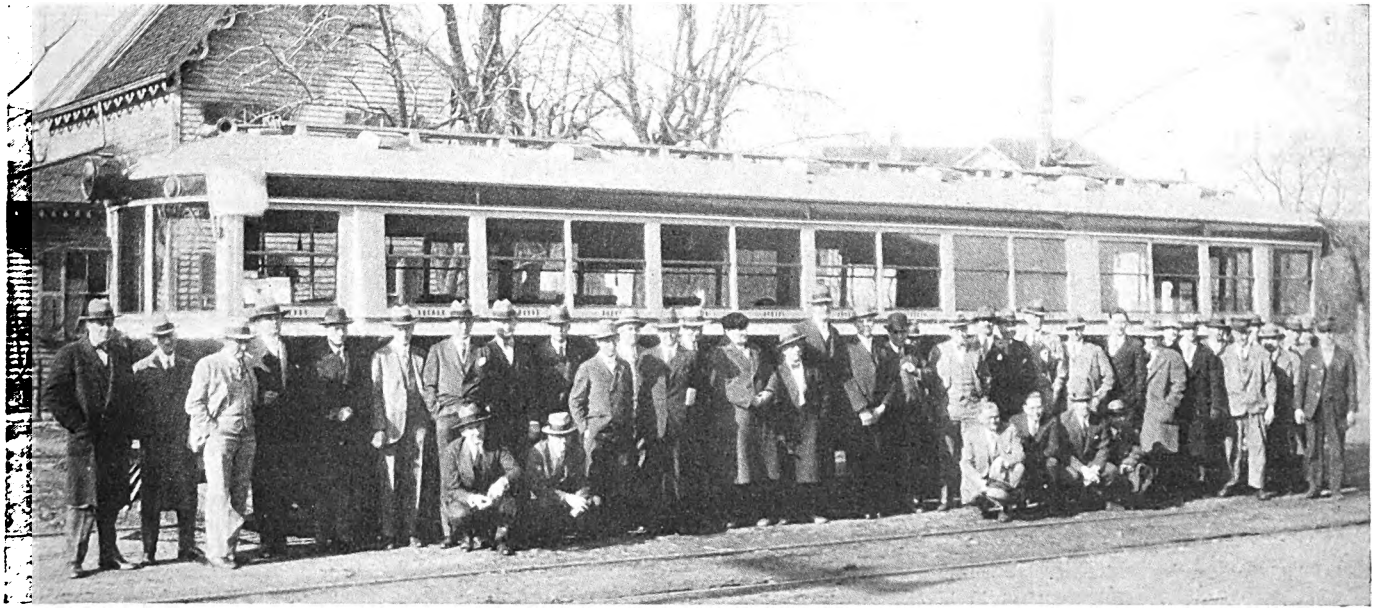
A series of tests to demonstrate the operation and effectiveness of its air-magnetic brake was made by the Cincinnati Car Company on Feb. 21. The demonstration was made on the tracks of the Cincinnati, Hamilton and Dayton Railway, between Hamilton and Trenton, Ohio, under the supervision of the A. C. Nielsen Company of Chicago. A group of approximately 50 operators and manufacturers representatives also witnessed the tests.

The car used was the Cincinnati light de luxe interurban car exhibited at the 1927 Cleveland Convention. A three mile section of track was measured off, the first two miles marked at each mile point and the third mile marked every 50 feet.

The car was started back of the two mile mark, getting up speed, running two full miles and then had the various brake applications made at the beginning of the third mile. The distance required to stop was measured and the time to stop taken. The speed of the car when the brakes were applied was determined by a stop watch and a tachometer.

Two tests were made using the magnetic brake only, two using the air brake only and two using the air and magnetic brakes combined. Then one test of the magnetic brakes, one of the air brakes and one of the air-magnetic brakes were made on a greased track.

The average rate of retardation in miles per hour per second of the two tests made with the magnetic brake only, on dry track, was 1.33 and the average retardation of the air brakes only, was 2.98 while the average retardation of



The Cincinnati light de luxe interurban car used in making the air-magnetic brake tests

*(2) air.....	69	554	49.5	48.0	983	22.5	2.13
*(3) air-mag...	70	575	49.0	50.7	725	15.8	3.21

* Track greased for 800 ft. on last three tests.

COMPARISONS BETWEEN AIR-MAGNETIC vs. AIR BRAKES ALONE AVERAGES FOR TWO RUNS USED IN EACH CASE FOR DRY TRACK)

Brake Used	Speed Stop-Watch	Distance to Stop	Time to Stop	Retardation	Decrease—Air-Magnetic Over Air Distance	Per Cent	Time	Per Cent	Increase in Retardation	Per Cent
(1) mag.	51.4	1,602	38.7	1.33						
(2) air..	49.7	709	16.7	2.98						
(3) air-mag.	52.1	598	13.1	3.98	111	15.7	3.6	21.6	1.00	33.5
*(1) mag.	48.0	1,398	33.2	1.45						
*(2) air..	48.0	983	22.8	2.13						
*(3) air-mag.	50.7	725	15.8	3.21	258	26.2	6.7	29.8	1.08	50.7

* Track greased.

the air-magnetic combination was 3.98.

The decrease in stopping distance of the air-magnetic brake over the air brake only was 111 ft. or 15.7 per cent. The stopping time decrease was 3.6 seconds or 21.6 per cent while the increase in retardation was 33.5 per cent.

On the greased track the increase of retardation was even more pronounced. The retardation of the air brakes only was 2.13 m.p.h.p.s. while with the air-magnetic brakes it was 3.21 m.p.h.p.s., or an increase of 50.7 per cent.

The decrease in the distance to stop by the air-magnetic brakes over the air brakes on a greased track was 258 ft. or 26.2 per cent while the stopping time was decreased 6.7 seconds or 29.8 per cent.

Freight Service Expanded by Interstate Company

Much progress was made by the Interstate Public Service Company, Indianapolis, Ind., during the past year in broadening the scope of territory served with freight service. Through rates and working arrangements were made in connection with the Monon Railroad, the connection being at Indianapolis. This broadened the scope of the territory of the Interstate Public Service Company with through rates and working arrangements of approximately 200 additional towns. The tariff covering this work, to be exact, was effective on Sept. 29, 1927, and for the three months following in 1927 the volume of business handled showed an increase every month. Patrons of the Interstate are very much in accord with this service, as in a great many cases the company is rendering much quicker service in connection with the property and the Monon than they had prior to this arrangement. In addition to this, arrangements were made so that the Interstate Public Service Company is shown as originating, delivering and participating carriers in B. T. Jones' Tariff No. 450, naming class rates between C. F. A. and S. F. A. territory. These rates are to become effective on Jan. 15, 1928, and when once effective give the electric railway through rates and working arrangements with standard steam carriers between points on our property and all points south of the Ohio River and east of the Mississippi.

This is a step in broadening the territory of the electric railway. The feeling is that it will increase the company's business materially, and at the same time assist it in serving patrons a great deal better in the future than has been possible in the past.

Yellow Truck & Coach Moves to Pontiac

The Yellow Truck & Coach Manufacturing Company will begin the complete removal of its general offices and factory from Chicago to the new $8,000,000 plant at Pontiac, Mich., about March 24. The present quarters of the Yellow Truck Company on Dickens Avenue, Chicago, have been leased for occupancy on April 1.

ROLLING STOCK

MONTREAL TRAMWAYS COMPANY, Montreal, Canada, is having an articulated car built for experimental purposes by Canadian Car & Foundry Company. The car will be 81 ft. long with a seating capacity of 90. The leading and trailing trucks will each be equipped with two 42-hp. Westinghouse type 510-A2 motors. It is intended to use the car during rush hours only, and on routes upon which the grades are 6 per cent or less. Delivery is expected in this month.

TRACK AND LINE

PORTLAND ELECTRIC POWER COMPANY, Portland, Ore., will start repairs at once on the electric carlines in the Kings Heights and Arlington Heights district, the city of Portland agreeing to pay the street car company $3,000 since the tracks and lines are owned by the city. The street car company will then lease from the city these tracks and overhead equipment, with the understanding that the service shall be every 30 minutes for eighteen hours a day.

SHOPS AND BUILDINGS

J. GRAHAM BROWN, Louisville, Ky., will construct a bus terminal in that city costing $100,000. The terminal will serve ten bus companies operating in and out of Louisville, including one direct line to Chicago and another to St. Louis.

CHICAGO, SOUTH SHORE & SOUTH BEND RAILROAD, Michigan City, Ind., has opened its new freight receiving and shipping station in South Bend, Ind. The new station will be a terminal for the company's recently established truck-trailer system of merchandise dispatched in the South Bend district.

TRADE NOTES

WATERBURY CABLE SERVICE, INC., Chicago and New York, has a contract covering installation of subway cables on the line of Brooklyn-Manhattan Transit Corporation, Brooklyn, New York. Work of this kind is a specialty of Waterbury Cable Service, Inc., which contracts for installation of underground cables and the handling of all matters from the time cable is received from the cable manufacturers until it is put into actual use. It also contracts for furnishing and installing street lighting systems complete outside of the central station; the installation of conduits, and the marketing of a number of devices for use in connection with cable networks and distributing systems. Waterbury Cable Service, Inc., is the company of which William O. Wood, formerly president New York & Queens County Railway, has recently been elected vice-president, with headquarters in New York.

TAYLOR ELECTRIC TRUCK COMPANY, Troy, N. Y., has increased the board of directors from three to five. G. A. Tupper, M. B. Taylor, W. E. Taylor, H. M. Dibert and E. H. Betts constitute the board. G. A. Tupper is president, M. B. Taylor, vice-president, and W. E. Taylor, secretary and treasurer.

Progress Lags When These Conditions Exist

WHEN one asks the question, "What is the matter with electric railway maintenance?" it seems presupposed that there is something generally the matter. This, of course, obviously is not true. There are many railways that maintain their properties efficiently, and that are keenly alert to new methods and practices that will give improved results. Unfortunately, there are also many instances, particularly among the smaller properties, where several things are decidedly wrong, both in viewpoint and in methods.

First of all, the managements of some railways lack confidence in the future of their own business. Consequently they have hesitated to spend money needed to keep their properties in decent, to say nothing of efficient, operating condition. Cars are decrepit and dirty; the overhead line is subject to frequent breaks; track is bad, and it is impossible to provide a comfortable ride or to maintain a reasonable schedule.

The managements of such properties—and there are far too many of them—must make up their minds or the public will do it for them. A transportation system cannot survive and prosper without the good will of its patrons. That good will and patronage cannot be obtained unless the property can put up a good front. Nothing succeeds like success, and the appearance of failure is soon accepted as evidence of the fact. The physical condition of a property also affects the attitude of its personnel; and thus there is set up a destructive cycle that can have only one inevitable result. The effect of this situation upon the maintenance forces of some properties is nothing less than pitiful. There one finds the type of master mechanic who has patched and scrimped so long that his one remaining hope is that of finding a new job with a management that has confidence in the future of its own business.

In contrast to the road which lacks a leader is the property with surplus shop facilities but inadequate organization, where costs are high and methods inefficient because the man in charge is occupied with other matters than his primary responsibility—maintenance. The problem is one of organization and general policy.

Finally comes the property on which the maintenance executive is self-sufficient and the methods and costs are clothed in secrecy. Little interest is taken in what others are doing and pride of authorship is the dominating impulse. Comparisons of costs, of pull-in records and of track failures with other properties, when they are made at all, are set up not for the purpose of self-improvement but as evidence to make an impression on the management.

In effect these constitute the three general classifications of the answer to the question "What is the matter with electric railway maintenance?" Progress lags when any of the conditions outlined above exists on a property. These are all matters for the attention of the management, for upon the elimination of these conditions depends the improvement of maintenance practices throughout the industry.

Adequate Facilities and Careful Preparation Needed to Secure Good Painting

SUCCESS with any system of painting depends on the care used in preparing the surfaces to be painted and the attention paid to putting on the various coats. Paint is used for two principal reasons; first, as a protective coating to prevent rapid deterioration, and second, to give a good appearance.

Paint or enamel may be put on by brush, spray or dipping. Each has its place and its limitations. Regardless of which process is used, however, too much emphasis cannot be laid on the proper preparation of the job and the correct application of the under coats. Unless the surface and under coats are right the finish coats will fail, no matter how good the materials. Good results can be obtained from a number of standard painting systems, if proper precautions are taken. All sappy spots in the wood should be carefully shellacked. Cleanliness is a prime requisite. Surfaces should be cleaned thoroughly before any painting is done, and metal surfaces must be brushed off to remove rust. To insure a good job sufficient time for drying must be allowed between coats and after the final coat. Many details of shop facilities affect the cost of painting and the character of the finished job. Rolling steps and scaffolding that are easily and quickly adjusted will help speed up the work Adequate lighting is most essential.

Touching up and patching have assumed greater importance due to increased street congestion. Painted surfaces are subjected to frequent scratching and damage. This has led some to advance the suggestion that an extremely long life for the painted surface is not desirable since it will soon be scratched and marred anyway; and so in order to make a good appearing job it will be necessary to paint cars at least once a year.

Car cleaning methods and materials have an important bearing on the life that is obtained from paint. In modern cars steel is used extensively. The many pockets, window corners, etc., accumulate dust which retains moisture and leads to rusting. In the campaign for better appearing cars much attention has been given to various color combinations and cars are being repainted much more frequently than in previous years. Regardless of the particular painting system used, the whole question of satisfactory results is coming to involve more and more consideration of the conditions under which the paint is applied and handled.

Cheap Products Make Expensive Repairs

CONTINUITY of service is the first requisite in the transportation business. It is an old saying that a standing car earns no dividends. Freedom from breakdowns on the road is the greatest factor in keeping the cars moving, and so should be the goal of everyone connected with maintenance work, from the laborer up to the general manager and even to the board of directors. In the very nature of things it cannot be otherwise, for no public utility can hope to survive long unless it gives that character of service the public has the right to expect.

The greatest factor in preventing breakdowns is in doing the work of maintenance as it should be done. It is not enough to patch up a defect so that the car or bus can go out on another trip. It is necessary to know that it can go out and make many trips without the ever-present danger of a failure on the road. When a maintenance executive is choosing between methods or materials he should always keep in mind this need for reliability. Particularly in the purchase of parts and of supplies there is an ever-present temptation to shade off the price. When the salesman tries to sell an article on the basis of price, and still claims that the quality is identical, it is well to keep in mind the slogan adopted by one prominent advertiser: "You can teach a parrot to say, 'Just as good.'" Unless it is a staple product where the quality is invariable this slogan may be remembered to advantage. Even here there often is a chance for shading in one way or another.

The first cost of the best materials and the most efficient labor is not so great as often is imagined. Substitutes seldom have the quality of the original product, no matter how hard the salesman tries to convince the purchaser. Of course, it sometimes happens in the progress of the industry that materials and parts available when the original equipment was built were not as good as those available today. There should be no hesitation in adopting the new and better part if it will increase the reliability of the service. Oftentimes serious defects in the original design have been eliminated in this manner by the railway's maintenance forces. There may also be a chance to reduce the cost of the repair in this way. But there should be no tendency to cheapen the method or the quality of the products used.

Permanent Track Repairs Economical in Long Run

NEARLY as much money is spent each year by the electric railways for track maintenance as is spent for track reconstruction. There is, however, an important difference between the expenditures for the two purposes. Maintenance expenditures are spread over a large number of small jobs no one of which costs very much, while track reconstruction expenditures are made for only a comparatively small number of jobs, each of which is fairly costly and usually is covered by a specific authorization. The result of this situation is that maintenance jobs often receive less engineering attention than do reconstruction jobs, and much good money is wasted in unscientific repairs.

Joints ordinarily are the largest item in track maintenance. Strangely enough, many electric railways follow the same practice in joint repairs today that they did twenty years ago, although they certainly would not use in new construction the same methods that they used ten or even five years ago. Following old maintenance methods is largely the result of a false idea of economy. Although figures differ considerably in various cities, it may fairly be said that it costs about $50 to open up a joint, repair it and restore the pavement. While the work is open the cost of a permanent repair is only a few dollars more than that of a temporary repair. If the repair is not made permanent it will not be long before the pavement has to be opened up and the work done over again; yet many railways continue to make temporary repairs on the assumption that they are economizing. They will open up the joint and make a repair which may last only a year, at a cost of $50, while a permanent repair can be made at a cost of perhaps $60 or less, that would last for many years.

Many other instances of this sort might be mentioned. Temporary repairs to special track work are frequently made with similar false economy. During the course of a few years a railway may spend far more than it would cost to do a good job in the first place—more sometimes than it would cost to install new special work. The idea seems to be that "it's just a small job and we'll do it as cheaply as possible." There is a tendency to forget that the real cost of any track job is measured by the length of time it lasts. Since the total annual expenditure for maintenance is nearly as large as that for track reconstruction, it is obvious that higher standards of maintenance practice offer the opportunity for economies comparable to those which have been effected through improved construction methods.

Deferred Shop Improvements Lead to Bad Practices

IMPROPER facilities in the electric railway shop decrease the quality and increase the cost of railway maintenance. Poor equipment and improper arrangement of working appliances increase the length of time required to make a repair while untidy and uncomfortable surroundings reduce the morale of the entire crew. A dirty and untidy shop cannot keep high grade mechanics.

Will a man inspect a controller and make with his bare hands the close adjustments that are necessary, when the air is so cold they are numbed; or will he spend the proper amount of time and do his work carefully under the car when he is standing in a muddy pit, timbered with rotting boards? Undoubtedly he will not. Neither will he work properly in dark and dingy places.

Some properties require their men to work in barns, not car-houses. Not only are the general working conditions poor but often the tools and equipment have long since ceased to be usable. How can a man tighten a bolt properly if the wrench refuses to grip or has a handle too long or too short? How can accurate machine work be done on second-hand machine tools that have been discarded by others but purchased by electric railways that won't spend the money needed for efficient machines? These conditions soon grow on the foreman as well as the individual workman. The men must then work, not only under bad conditions but without a leader to set a proper standard.

Lack of tidiness has a similar effect. Men cannot work in a greasy cluttered up shop any better than an executive can work in a dingy, messy office. Materials should be properly stored and such things as castings, wheels, lumber and scrap should be in their proper places and not form part of a general clutter. Scaffolding and ladders should be of proper design so as not to hinder

Digitized by Google

the worker and should be convenient for handling. The pit construction should be open and kept clean.

The average workman can be led to take sincere pride and interest in his job, provided he is given proper encouragement. But no man can do good work with poor tools or in uncomfortable or dirty surroundings. There are too many instances where financial difficulties, franchise problems or other unfavorable general operating conditions lead to the total suspension of all shop and machinery improvements. Then, when a reorganization is completed or a new franchise arranged, the pendulum swings to the opposite extreme, a very elaborate shop is built and, to utilize these facilities, the property embarks on a program of home manufacture that is open to serious question. What seems to be most essential is a better understanding of the need for gradually improving maintenance facilities as a means of effecting operating economy. Regardless of how hard pressed a property may be financially, appropriations for needed maintenance improvements must be given attention. Any other policy is obviously false economy.

Attention to Detail is Secret of Freedom from Electrical Troubles

IT IS probably generally agreed among maintenance men that the electrical equipment is the very heart of the electric car, and that freedom from electrical failures is essential to a favorable pull-in record. That being true, one would expect to find that the maintenance costs and troubles on a property are in inverse proportion to the age of the electrical equipment on its cars. Other things being equal, that should naturally follow; and it does follow where the standards of maintenance procedure are comparable on two properties.

Unfortunately, however, there is a wide diversity of maintenance procedure and standards, and one sometimes finds that the property with comparatively modern electrical equipment does not show in full the favorable record of service failures and maintenance costs which is to be expected. What then is the explanation? One does not need to go far for the answer; it can be summarized almost in one word, "thoroughness." Particularly with respect to the maintenance of electrical equipment, attention to detail is the secret of low costs and freedom from service failures.

Examine the practices of the properties that are making the best records on pull-ins and equipment maintenance costs, and one is immediately struck with the care that is exercised in the overhaul of electrical equipment. The parts are stripped from the cars so that they may be thoroughly examined, cleaned, reinsulated if necessary, and tested to make sure that they will stand the same degree of abuse as when they were received from the factory. This applies to motor field coils, armatures, controllers, line switches or circuit breakers, and motor leads. Each of these parts is carefully cleaned and is inspected and tested on the assumption that it conceals a potential service failure. Then it is reinsulated either by merely dipping and baking or by actual replacement of insulation where deterioration is evident. Finally, after the parts are again completely assembled, they are subjected to severe tests in the shop, designed to bring out any hidden weakness before they go back in service.

Of course, on some properties, where the practice of repairing failures has been continued for many years in place of a policy of anticipating and preventing them, the condition of electrical equipment is such that the adoption of a thorough overhauling policy like that outlined above, will cause a temporary increase in maintenance expenditures. But it has been amply proved by the records of properties that have stuck to this policy for several years after once adopting it, that the money spent for putting electrical equipment into good condition is an over-all economy. It is far cheaper in the long run, to anticipate failures rather than to repair them after they occur. Attention to details while the equipment is in the shop for overhaul is the secret of the success of those properties that show consistently favorable pull-in and maintenance cost records.

Close Supervision Essential in Maintenance Departments

ONE trouble with many maintenance shops is that the man at the head of the organization does not really know what is happening in his own department, and among his own workmen. Instructions are issued, but the several departments are not followed up by the man in charge to see that they are carried out. Instructions or orders do little good unless enforced. The maintenance executive is frequently too far out of touch with the practices of his own department to give that quality of executive supervision upon which the performance of his whole department depends.

To get real results from the men actually doing maintenance work requires that the advantages of any improved practice be "sold" to them through their foremen. All doubts that may arise in the foreman's mind as to the desirability of using a particular method or material must be removed at the time that instructions are issued. Ideas are hard to transmit, and for that reason, the complete execution of a policy is achieved only when the head of the department keeps closely in touch with what is being done and with the men in charge of the work.

Some busy executives feel that they do not have the time to maintain direct contact with their forces, or with the work which is being done. This is usually a result of inadequate organization or of an improper conception of the maintenance man's responsibility. Executives should take the time necessary. Direct supervision of shop and carhouse methods is of more importance than the affixing of signatures to reports and documents where the signature of a subordinate would do just as well. Sometimes the lack of proper supervision is attributable to the fact that much of the executive's time is occupied with matters involving the manufacture of parts or equipment on the mistaken theory that an economy is effected. This is probably the chief indictment against "home manufacture"—it occupies the time and attention of the limited supervisory staff at the expense of maintenance.

Along with proper supervision must go recognition of satisfactory work done by individuals. Stimulation of initiative and enthusiasm is possible only when the head of a department has direct contact with the men on the job. Keeping equipment going after it is built has a tendency to become monotonous. Such routine operations as turning wheels, packing bearings, adjusting brake rigging, slotting commutators, tightening track bolts, splicing trolley wire, etc., enlist little enthusiasm unless each man's part in the operation of the property is kept constantly before him. When he is made to realize that inspection is for the purpose of avoiding service failures, and that a car pull-in is a serious matter, his part in the company's success takes on increased importance.

Maintenance Practices That Permit

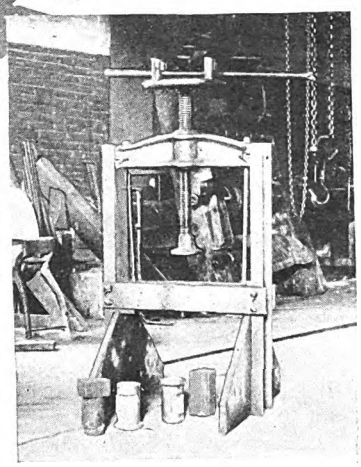
Failures Cost Money

Close supervision, high-grade workmen, modern tools and good materials are necessary. With any of these lacking, improper practices will creep in

By Clarence W. Squier
Associate Editor *Electric Railway Journal*

The practice of driving bearings into housings is wrong—too much force may crush the bearing and cause it to pinch the shaft—A loose bearing soon wears on the outside and damages the keyway

WHILE making a recent survey regarding gaging of wheels the writer visited a number of railways to obtain information as to just what variation was allowed and how closely their wheels were kept to gage. On one property the master mechanic told me that all wheels when tested were exactly to gage. I replied, of course, that there must be some variation, as it was impossible to bring them all to exact measurements, and there must be allowed a certain tolerance. He said, no, there was no tolerance allowed and suggested that we go out and check some. We measured the gage of a number of wheels in the shop which had recently been pressed on their axles. We found a variation of as much as ¼ in. either way from correct gage. He was quite surprised, so we watched the workman who was pressing on the wheels. After he had pressed the wheels on we asked him to test the gage again. Looking at the measuring gage he used I noticed it had a spring attachment at one end. Asked the reason, he said that with a stiff gage if the wheel was pressed on a little too far the gage would be bent or broken, and so might become distorted easily. In order to prevent this he had placed the spring attachment on the end so that if the wheels were pressed on too far the spring would be compressed and do no damage to the gage. He evidently had overlooked accuracy, for the spring attachment allowed considerable play and the gage itself was very inaccurate. Here the master mechanic, who was passing the wheel press constantly, did not know the situation in his own shop.



A bearing press without a gage is little better than the sledging method

One of my visits was to an interurban property where some light interurban cars had been placed in service about a year previously. These cars had been admired as a long step forward in providing passenger comfort and convenience, and the road had been obtaining gains in passenger revenue. Of course I was anxious to ride on these cars and note their condition. In going out to the headquarters of the company where the shops are located, I boarded one of the new cars and took particular pains to notice its condition. I found several of the

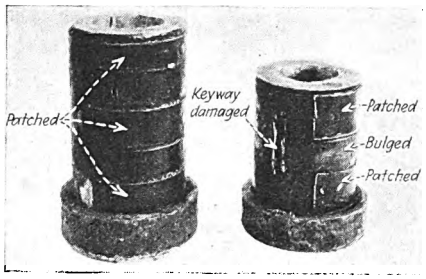
Worn axle caps are a source of danger. Two of those in the illustration are worn more than ½ in.

heaters under the seats were loose. Screws had come out and no attempt had been made to fasten them, so the heaters were shaking and making a disagreeable noise. Also, some of the arm rests of the seats were loose, which did not add to the passenger's comfort, as they were intended to rest his arms on rather than to be a source of annoyance.

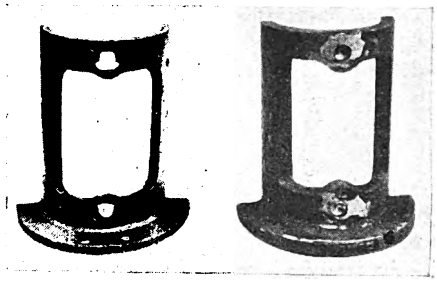
Many other things about the furnishings were in a slipshod condition. While they did not actually interfere with the operation of the car, they gave it an untidy appearance. About halfway to the shop, we came to a siding where a car coming in the opposite direction was off the track. I got out to see what had caused the trouble and noticed that the wheel flanges were very sharp. I then looked at the wheels on the car on which I was riding. These also were sharp. Evidently no attention had been given to the replacement of wheels.

When I arrived at the shop I was not surprised that so little attention had been given to maintenance of the equipment. This particular day was raw. Snow and rain were falling and it was very disagreeable outside. In the shop I found conditions even worse. The pits were just holes in the ground; they were not cemented and the bottoms were filled with mud and water. There were a few lamp outlets along the edge but only about half of them were working. There was no wheel press and no lathe for turning wheels. All this work, I learned, was expected to be done outside. I asked the master mechanic if he was paying any attention to the wheels. He said that he had noticed the flanges were getting very sharp, but the general manager had discouraged sending the wheels away. I told him of the derailment and that evidently this was caused by sharp flanges. He said that perhaps a couple of accidents would impress upon the management the necessity of doing something immediately. This situation was very bad, as some extra fine equipment was allowed to get into bad condition through improper attention to maintenance details.

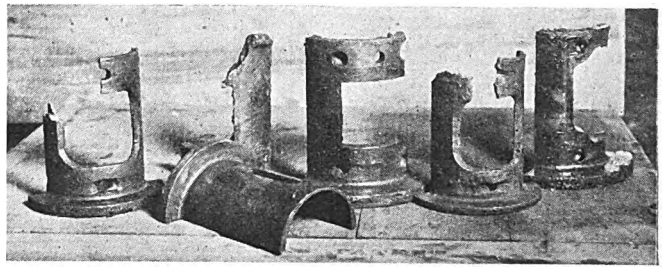
Later this road replaced all of its wheels and in doing so increased the diameter from 26 in. to 28 in. so as to get more mileage from the wheels. The value of low step height, which featured the original design, was forgotten.



Dreadful examples of armature bearings —bulged walls, patched and keyways destroyed



Loose axle bearings cannot be held satisfactorily by dowels. They soon break out



Constant pounding of loose axle bearings soon results in conditions like this

Something About Rewinding Armatures

Speaking of antiques in America, I am reminded of a curious method of winding armatures which I happened to see on one of my visits not long ago. It was in connection with an old motor, so I asked a lot of questions. The workmen were insulating the pinion-end coil support of the armature and were following almost to the letter the original practice. On this particular motor layers of insulation were built up to give the required thickness to fill the space up around the coil. The workmen were using a heavy fibrous paper cut to the required width and length and slotted to conform to the curvature of the armature. To make the paper pliable it was soaked in water and while still wet it was placed on the coil support. Before the paper had a chance to dry out it was shellacked to hold it in place. Just imagine what a nice damp place the armature coils had to rest on and the steam engine effect when the motor went into operation! A property of this kind offers a fertile ground for an engineering investigation.

Another practice which should be relegated to the dark ages is that of cutting out armature coils to avoid rewinding. On one of my visits I asked the superintendent of equipment to show me how he would cut out an armature coil. He looked at me with a merry twinkle in his eye as he said, "Of course, we would only allow such a thing as an emergency measure and see that the car was operated in light service. This practice should be placed among the lost arts, but still there are few armature winders but who know the process well." We then went into the shop and inspected the armature room. Strange to say, the armature foreman was having a coil cut out. The particular armature involved was reported in for an open circuit. Here is the process which was followed: Alcohol was poured in the slot and

Digitized by Google

ignited to soften the insulation so that the coil could be lifted with a minimum of damage. After the coil was raised out of the slot the insulation was stripped off and the open coil located. The ends of this coil were cut off short and taped. The coil was then wound to its approximate shape, reinsulated, and pushed back in the slot. On questioning, the foreman admitted that sometimes as many as three repairs of this nature were made on one armature before it was rewound. Yes, he said, the motor did flash some, but he thought that this procedure reduced maintenance expense, as it saved the price of a new set of armature coils. Can you imagine the expense of removing the armatures from the car, the possible delays in car service, and the general foolishness of the whole procedure?

A Coat of Varnish May Cover a Multitude of Sins

Impregnation of field coils has become an accepted practice by most electric railways. On one property the master mechanic told me about certain economies which he had introduced so as to cut down the time used in impregnating his field coils, and so get the repaired motor back in service sooner. I asked if he was sure that he had not injured the quality of the product, and requested him to have one of the coils opened up. This coil was a revelation. The impregnating compound had not penetrated below the first two or three layers. The inside of the coil was white, indicating lack of treatment.

Anyone knows that if it takes ten operations to do a job right the use of only five of the operations will result in a lower-priced product with a corresponding inferior quality. Poor treatment of field coils results in breakdowns from moisture. Low-grade insulating materials and skimping of the required amount results in breakdowns, expensive delays and costly repairs.

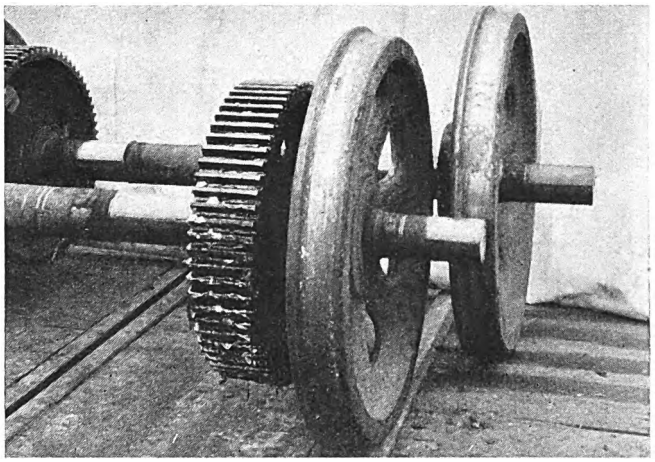
We have heard much about the damaging effects of spread gear centers during the last five years. Superintendents of equipment have attended various committee meetings and discussed the subject; these men, together with their general managers, have visited conventions and listened to papers on the subject, but so far as doing anything on their properties, well, they have promptly forgotten about it. When you talk to these men they all admit that spread gear centers are an evil that should be remedied, but they are almost always of the opinion that such a condition does not exist on their property until they are actually taken out and shown.

How can it be demonstrated that a spreading of gear centers actually exists? One of the easiest methods is to open the trapdoors over the car motors so that their action can be watched, then set the brakes and apply power to the motors by notching the controller on and off the first point. Excessive movement, if noticed, can be accounted for only by excessive wear in axle bearings, between the outside of the axle bearings and the axle cap, between the armature housing and the motor frame, between the armature bearing and the housing, or in the bore of the bearings themselves. As most of the wear of axle bearings is in the top portion, a common method of testing is to lift the motor at the axle suspension by means of a pinch bar. While this is being done, inspection will show how excessive is the movement.

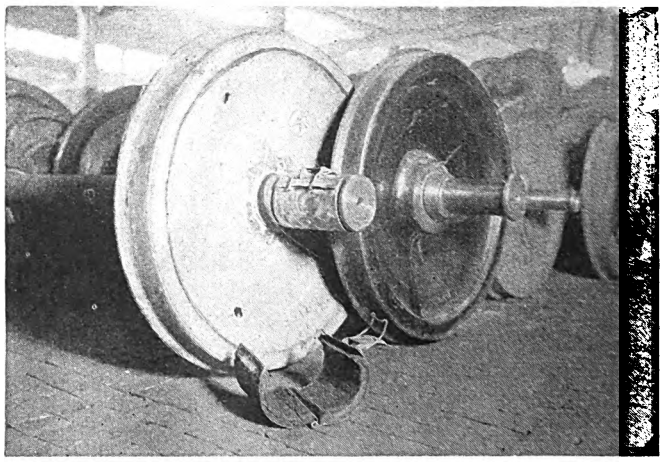
Superintendents of equipment and master mechanics, when asked why they do not remedy these conditions, are likely to give lack of funds as one of the first excuses. They say that if they asked the general manager for money he would immediately turn them down. In order that these men may have some sort of a report to present to the general manager and so convince him of the bad condition of rolling stock, it is desirable to make a test as outlined on all equipment and report the number of cars and equipment showing excessive wear. Of course, such a report should recommend means to remedy the trouble, and include a summary of costs. Axle bearings and the bearing fit of the axle bearing in the motor frames are the worst offenders as they do not receive the close attention that the armature bearings do. Of course, the wear inside the bearings can be taken care of readily by fitting bearings to the axles, and truing these up to proper dimensions.

A common practice is to replace axle bearings at the carhouses whether or not they are held tight by the motor and caps. No check or attention of any kind is given to this important repair and the axle seats are not examined. As long as they run, they are left alone, and attention is given them only if some part of the bearing breaks.

Electric railway managements can see the extent of this evil by requiring that the bearings removed be held for inspection. Then the reason can be determined why the bearings were replaced by new ones.



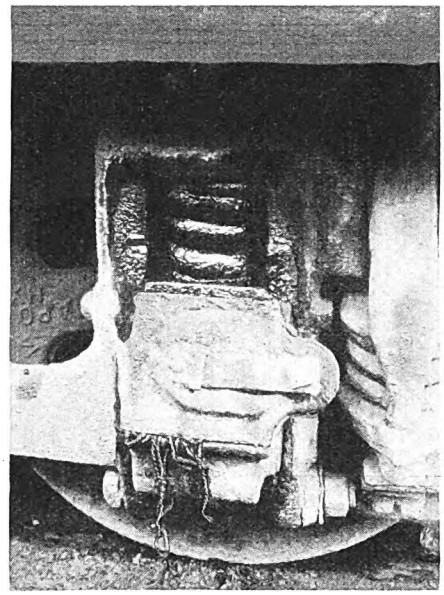
Mounted wheels staggered in storage may damage a carefully finished journal or axle bearing surface by rolling the flanges against the axle seats



The protective covering used in the shops of the Department of Street Railways, Detroit, Mich., prevents damage to journal bearing surfaces and keeps them clean

Digitized by Google

A journal box cover carelessly left partly open may soon result in contamination of packing and oil and bearing failure



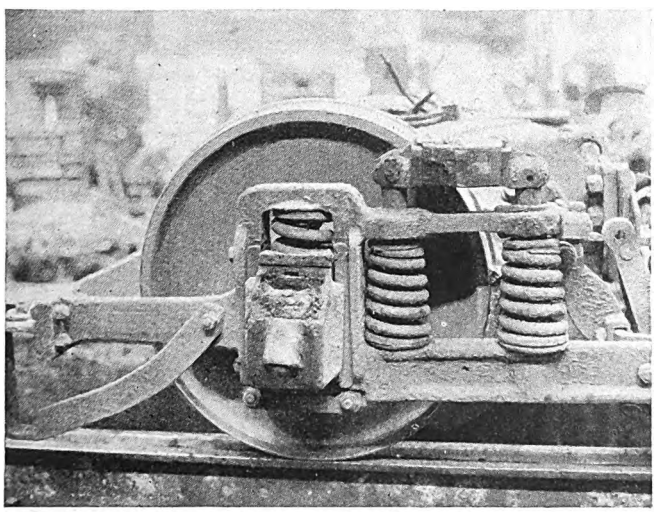
Strands of waste hanging outside journal box may soon siphon off the oil and result in a hot bearing

This shows where much of the gear grease goes. More attention to gear case fitting and axle collar will pay

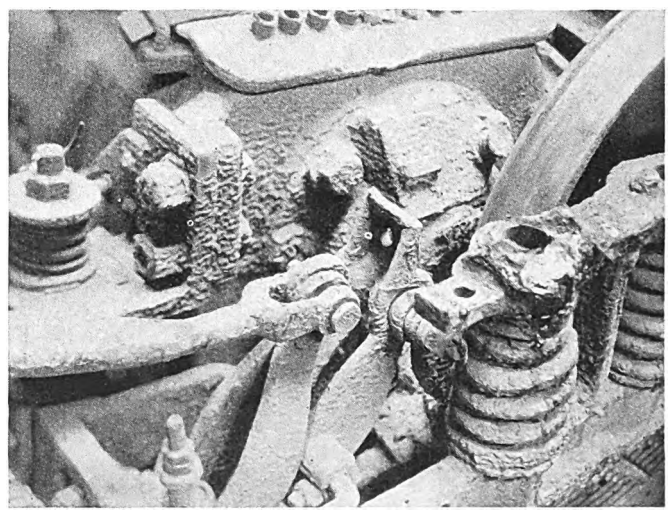
In the course of time motors are welded and rebored because the fits have become so worn that they can no longer hold a bearing and the mileage obtained from the bearings drops to from 5,000 to 10,000 miles. Managements will find it a paying investment to check such conditions at once. It should be ascertained if new bearings when put in motors are tight after the cap is bolted up. Put a set in a motor that is standing on the shop floor and hit it with a wooden mallet. Then take the same motor when it has been placed in a truck and use steel feelers to determine clearances between caps and bearings, also between the bearing and the axle seat. A good strong electric light will help materially in checking clearances. Remove the waste from the axle cap and throw water on the end of the bearing to see what effect wheel wash will have. See how much water enters the caps and what effect this would have upon waste and oil.

To take care of wear on the outside of axle bearings and on the inside of the frame and at the axle caps, two things can be done. On most types of railway motors the axle bearing fit can be rebored to a size slightly larger, probably not more than $\frac{1}{16}$ in. Then oversized axle bearings will give the desired fit. Where the wear is so great that reboring may lessen the strength of the motor support at that point, the best practice is to build up the inside of the frame and axle bearing by welding and then re-machine to standard size. Much of this excessive wear and looseness at the axle bearing support is a direct result of improper use of the clamping fit provided, for originally the axle caps were bored out with shims between the frame and the surface. When bearings were installed and these shims removed the desired clamping is supposed to have been obtained.

The trouble that comes from this practice is due to variations in machining. Suppose the outside of an axle bearing should be 7 in. It may vary a few thousandths from this. Most railways accept bearings with a variation of from 0.005 to 0.010 in. either way from normal dimensions. The same is true of the bore of the axle bearing frame and axle cap fit. When these are machined with the shims in place, there is sure to be a variation in diameter of from 0.005 to 0.010 in. The general



Journal box covers knocked off in service give no protection to the oil and packing. Clean oil and waste are essential if the number of hot bearings is to be reduced



Railway motors are subjected to extremely dirty conditions. Covers should be kept tight and never opened until the surrounding mud has been cleaned off

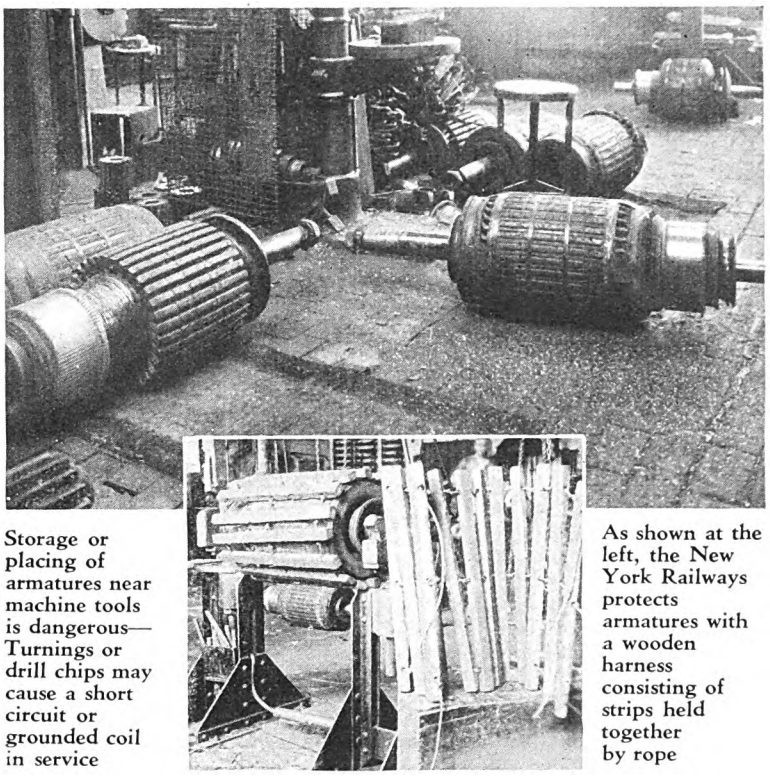
Digitized by Google

practice is to use shims of a thickness to take up approximately from 0.014 to 0.017 in. When these are removed, there are sure to be variations in the fit. On some, the clamping will be excessive, and others will actually be loose at the start.

How can this condition be remedied? In the first place, for all axle bearings a machining tolerance of from 0 to plus 0.005 in. should be specified. No axle bearings should be accepted if the diameter is less than normal. In the same way, the machining tolerances for the bores of the frame and axle cap or the axle bearing fit, should be from 0 to minus 0.005 in. and none with greater than the normal bore should be accepted. A clamping action is then sure to result, and the maximum variations in the clamping will be from 0.010 in. down to normal. With these machining tolerances, distortion of the bearings from excessive clamping will not result, so there will not be danger of bearings running hot due to their being decreased in the bore by tight clamping fits. To obtain co-operation of the management in making a thorough rehabilitation of equipment, master mechanics should get the results of their inspections forwarded to the manager's desk. They should be sure that the reports tell fully what is needed to bring the motors back to a satisfactory condition. At the same time it will probably be advisable to ask for proper tools and some facilities to carry on this work. At the start recommendations for improvements should be made which eventually may lead to better work.

Much of the argument given for axle bearings is equally good for armature bearing fits. The trouble there is not so great since they are watched more carefully and excessive wear at these points is usually taken care of immediately. Otherwise, rubbing of the armatures on the pole faces of the motors and damage to windings is sure to cause large expenditures. As a result, master mechanics and superintendents of equipment have no difficulty in keeping these fits within desired limits, since general managers have come to realize that it is far cheaper to keep the bearings in shape than it is to pay several hundred dollars for rewinding an armature.

One of the greatest



Storage or placing of armatures near machine tools is dangerous—Turnings or drill chips may cause a short circuit or grounded coil in service

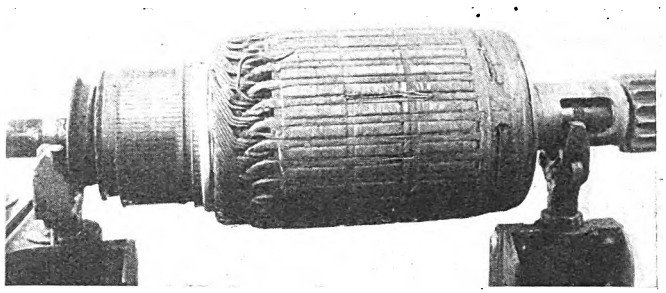
The Eighth Avenue Railway uses a portable crane of this type for handling armatures about the shops

Digitized by Google

sources of difficulty with armature bearings is due to their being placed in the housings loose, or else driven in with too great pressure. This will not happen if every shop has a press with a gage on so as to show the exact force with which armature bearings are pressed into the housings. Manufacturers of the bearings have issued instructions giving the proper force with which bearings should be pressed in. A maximum of 5 tons, and a minimum of 3 tons is good practice for bearings of ordinary size. In visiting various railway shops I have found the most general practice is to drive these bearings in with a mallet. Where there are presses, many are not provided with gages and no attention is paid to the proper pressure.

Contrast this procedure with that used in wheel pressing. On every electric railway the wheel press is provided with gages. Pressures for putting on wheels are watched very closely. If excessive, the wheel is pressed off and the trouble is found immediately so that the pressure will be kept within the desired limits. Graphic records of pressures for fitting the wheels are sent to the office of the superintendent of equipment, and sometimes to the general manager's office for his information. They are scrutinized carefully, and any wrong practice is immediately checked up and the foreman warned. A similar system should be adopted for armature bearings. A record should be kept of the pressure at which each armature bearing is put in. Copies of the records should be sent to the offices of the superintendent of equipment and the general manager. It will thus be evident to all concerned what pressure is being used, and the cause of a loose bearing or a tight bearing will be easy to locate.

I have seen cars with newly-equipped armature bearings placed in service and run less than a single trip before overheating resulted so that it was necessary to turn the car in. Examination has shown that such bearings actually were distorted due to pinching while being driven into the housing. This caused the hot bearing. On one system where it is the practice to spin every motor after new bearings are installed, I asked the superintendent of equipment to flood the housings with oil and run each motor for ten minutes and observe the results. The third motor tested developed a hot bearing. It could not be laid to lack of lubrication since the bearings were flooded with oil. On removal the bearings were found distorted, pinching the shaft.



An armature coil cut out and returned to service may tie up operation and cause several hundred dollars worth of damage

Equipment men are beginning to understand that an excessive amount of oil is cheaper than excessive wear on bearings or their overheating. They probably do not understand that excessive wear happens mostly when they attempt to introduce economies by reducing the amount of oil used. If the general manager, or whoever is responsible for lubrication practice, would sit down with his pencil and paper for a few minutes and figure out just how much a slight increase in oil will cost, he would be surprised. Suppose oil is costing 32 cents a gallon. There are 32 gills to a gallon so the cost would be 1 cent per gill. Suppose also that twice as much oil is used so that instead of taking 1 gill for each lubrication, 2 gills are applied. With the usual method of adding a gill of oil to each bearing every thousand miles, the total amount used per year per bearing would be 1 gal. If this is doubled, the extra cost would be 32 cents per year per bearing. How much do bearings cost? $8 to $10. Which is better, to increase the life of the bearing or to pay a little less for lubrication?

Suppose it were possible by some means yet unknown to supply a barrel of oil to each bearing in a year. The cost of a barrel of oil would be about the same as the cost of one bearing. If the life of the bearing is doubled, there is still a saving of half the price of the bearing.

Of course, the amount of oil used should not be excessive for too much oil may cause trouble as well as too little. General managers should do a little thinking along this line.

At the present time, there is a great deal of talk about reducing noise. Reduction of wear is the surest means of reducing noise, so that whenever a general manager talks of reducing noise he really means reducing the

Digitized by Google

amount of wear. The thing to do is to impress upon maintenance workers that the general managers are willing to spend a little money in reducing this wear and so they will not be afraid of reporting excessively worn conditions.

Money spent for such improvements will ultimately reduce maintenance cost, for high-grade maintenance is an economy. If there appears any doubt regarding this, study the records given out regularly in the statements of the Electric Railway Association of Equipment Men, Southern Properties. Pick out the systems that have the best pull-in records and see if their maintenance costs are excessive.

Usually, it is not fundamentally the fault of the superintendent of equipment or the master mechanic that the excessive wear takes place. These men try to conceal these conditions from the general manager. They know that asking for more money is out of the question so they try to do the best they can without saying anything. If they were made to feel that their general managers want to correct such bad practices they soon would make the effort, for all are vitally interested in keeping equipment up to the highest standard.

Few equipment men take the trouble to find out what

Worn-out hand tools may cause accidents to workmen and damage to expensive equipment

has happened to the oil after it has been in the housings for some time. The superintendent of equipment of a railway recently told of a number of tests on lubrication that had been made and said that as a result he was then using the best type of lubricant that he could get. This meant an increase in the cost of approximately 75 per cent over what he had used previously. He said that the tests showed that the better lubricant was more than worth its price in the length of life obtained, freedom from wear, and freedom from trouble. "That's all very good," I said, "when bearings are newly fitted and filled with new oil, but what is the nature of the lubricant after it has been in service two or three months?" "Suppose we find out," replied the superintendent. We went to a car that had been in service some three months, pulled the waste and took out some samples of the oil, which we placed in bottles and set aside. The next day we examined them. More than half of the contents of the bottles was a thick sediment or water. A large amount of foreign material had been introduced into the oil through improper handling, and through the entrance of dust and dirt, either through openings in the bearings or in the covers of the motors themselves. There is no use of paying a high price for lubricants if they are allowed to get dirty so soon.

Water is thrown up off the streets, and if the parts are loose or poorly fitted it enters the bearings. How many of our electric railway readers would operate an automobile if it had a hole in the side of the crank case? None, I venture to say. Then why operate cars in such a condition?

Careful Training of Workmen Insures
High-Grade Door Maintenance

By George E. Oakley
Consolidated Car Heating Company, Albany, N. Y.

DEFECTS in door operating equipment cause delay, aggravate passengers and crews, and sometimes necessitate taking cars out of service. To minimize these troubles it is essential that the equipment be as simple and reliable as possible and that it be maintained properly. It is a very important part of the present-day car equipment, as quality of service depends to a larger extent on the operation of the doors than with previous designs of cars.

Reliability of the door equipment itself is affected to a large extent by its installation on the car. The apparatus must be located and arranged so as to allow it to function in the manner intended. There must be sufficient clearance provided for the doors, levers, and similar working parts, in order to eliminate binding, and the levers and connecting rods must be laid out so that they will work to the best advantage. Much faulty operation of doors and steps can be traced to a cramped arrangement of the mechanism. It is also important that the apparatus be installed so that it will be convenient for inspection and repair, as experience has shown that operators will slight equipment which is difficult to be reached or seen.

Another thing that is essential to prevent trouble and insure proper operation of the door equipment is education of the men whose duty it is to look after the apparatus. Such instruction should not be confined to the men actually doing the work on the equipment but the foreman in charge should also be instructed so that he fully understands the value of having parts inspected carefully. In fact, in order satisfactorily to maintain door operating equipment, it is essential that the foreman understand the construction and operation of the equipment so well that he knows how and why each component part of the apparatus functions. The foreman will then be in a position to instruct the men working on the equipment and will be able to judge from their reports of trouble found whether the actual causes have been located. If the workmen are none too familiar with the equipment and do not know where to look for the cause of the trouble reported, they are likely to grope around and do something that apparently improves the operation but does not remove the real cause. This results in the car being turned over as ready for service only to be soon again reported as defective.

The instruction of new men assigned to this equipment should be done by the foreman and not by the man who has been working on it or who has had some experience with it. This latter procedure will result in the new man getting only a smattering of knowledge of the equipment and he will not be qualified to do the work properly.

On account of the different types of equipment in service, no attempts will be made to give detailed suggestions of how inspection and overhauling should be done. Instruction books or rules for this procedure can be obtained from manufacturers. However, all concerned should understand thoroughly that co-operation with the manufacturer in this work of instructing the men is most essential.

Proper insulation between trolley circuits reduces spanwire maintenance

Neglected Overhead

Is Poor Economy

Many railways have increased car speeds and weights and added power load without improvements in overhead. Small factors of safety are insufficient when deterioration occurs. A slack trolley wire is the lineman's enemy

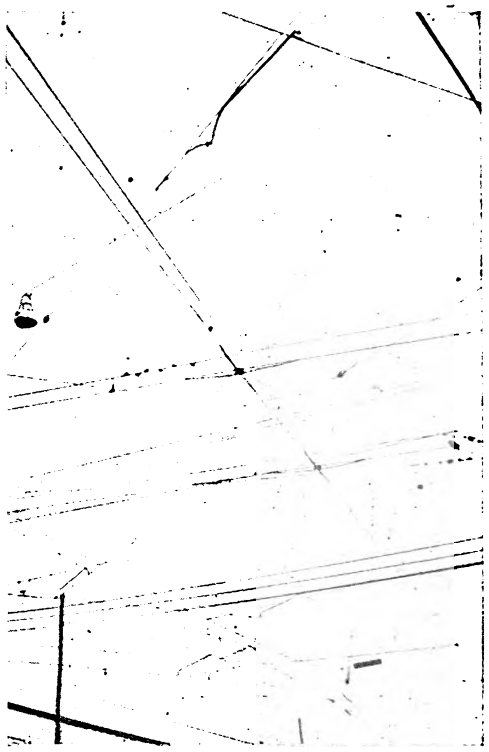
By L. W. Birch
Assistant Manager Railway Sales Division Ohio Brass Company

OVERHEAD line engineers would consider the ideal trolley circuit to consist of a single, straight, unsupported wire paralleling the running rails at the desired height. But in practice there are curves, feeder taps, pull-overs, grades and special work. There are the ears and hangers at frequent intervals for support and insulation.

The direct suspension line almost universally adheres to a 100-ft. pole spacing for tangent track—a 100 ft. of unsupported trolley wire and a hammer blow, another 100 ft. and another hammer blow, and so on. This hammer blow is obtained at the support or attachment, whose function is to support and insulate the trolley wire. In performing these two functions the attachment must provide clearance for the trolley wheel or shoe, must have the maximum life commensurate with the materials employed and size of assembly, and must be as free from pounding as possible. We all know the effects of pounding at the cars—worn trolley wire, worn trolley wheels, dewirements, trolley base trouble, motor trouble and the uncomfortable vibration set up in the car roof. While this pounding is characteristic of all overhead, the degree of pounding is quite variable with different properties. Our problem then may be found on any property. It is to suggest a means of lessening the impact at the ear or support point.

Many properties have attempted to decrease the pounding by using a slack cross-span wire. This method is not always satisfactory, as a slack cross-span wire allows the dead weight of the hanger and ear to develop the maximum blow. With this arrangement the ear and hanger are moved upward through the pressure of the trolley wheel obtained from the springs in the trolley base. A hard blow is the result. Now consider a tight cross-span wire. In order to retain a tension of 1,000 to 1,800 lb. in the span wire (usual tension for tight

Digitized by Google



Supporting catenary in city streets presents many problems for the overhead man

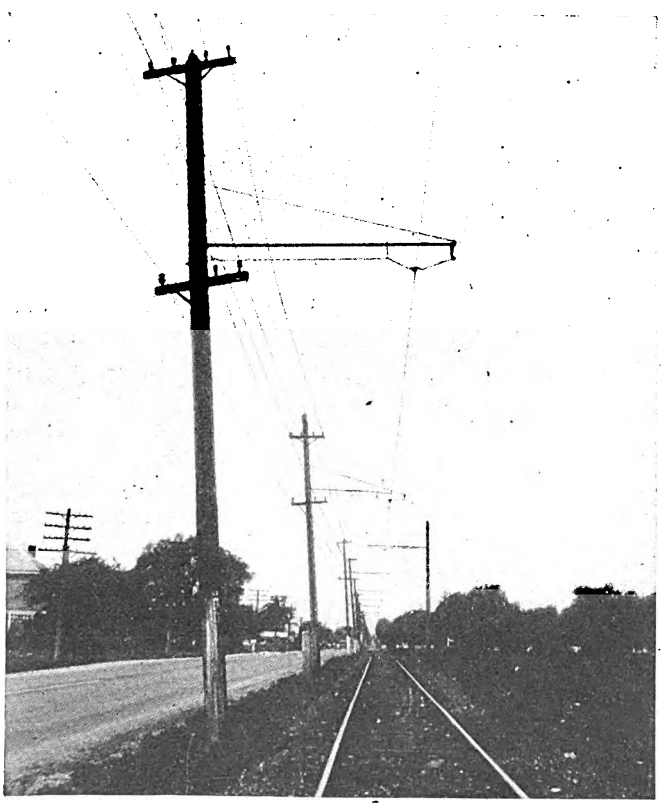
span wire), the poles must be set carefully and, in most cases, guyed. A mechanical tension of this value will tend to deflect the unguyed pole, and with the guyed pole the down guy will be taut. As a trolley wheel approaches an ear there is a tendency to unload the span wire. That is, the upward thrust of the trolley pole decreases the loading at the ear point with a consequent decrease in span-wire tension, which throws a lesser loading on the pole and it tends to straighten up. The pole deflection diminishes. The result is a slight rise in the span wire as the trolley wheel reaches the ear, hence a lessened blow.

Still further relief can be secured through the combination of ear and hanger. On round trolley wire the ear surrounds the wire. The greatest holding power of the ear is secured through the section under and adjacent to the boss. This is evident when it is remembered that the ends are tapered to provide a smooth under-run for the wheel. The long ear will afford this gripping power and easy approach. The short ear (5, 6, 7 and 9 in.) must have an equivalent supporting section which reduces the taper at the ends. Pounding results, and a short life of ear and wire may be expected.

Again, the tilting of the long ear will not aggravate the wheel blow in the same manner as with the short ear. The approach end of the long ear may lift the same distance as the short ear, but due to its length, it will not present such an abrupt angle for the wheel to strike. The hanger is also important. Recent experiments and installations have proved that by using a cushioned stud, a blow on the under side of the ear is partially absorbed by the cushion, or spring, back of the stud. This is important on bracket arm construction where the span wire is only about 9 ft. long and cannot offer further relief to the blow.

With catenary construction there is also a hanger problem which falls in the category of "hard spots and hammer blows." One reason for choosing catenary is its smooth under-run. The early lines were built with rigid hangers, which, although they provide a smooth under-run, permitted some pounding at the trolley wire clamps. This type was replaced by a loop hanger which permitted of an unhampered rise of hanger and trolley wire, irrespective of messenger wire, during a trolley wheel passage. This was a step in the right direction. But another factor contributing to "hard spots" appeared—hanger spacing. A recent inspection of a catenary system with hangers spaced at 50 ft. intervals showed that it was only a slight improvement over direct suspension. Fifty feet of trolley wire supported by short catenary clamps (2 in. long) fostered wire wear and mechanical difficulties in the overhead system. At least one additional hanger should be inserted between the present hangers. And if the railway wishes to maintain operation in the event of a trolley break, two additional hangers should be inserted. This will give 16⅔ ft. hanger spacing so that a broken trolley wire will not reach the ground and anneal.

A slack trolley wire is the lineman's enemy. It can cause more pounding at the ears than any other combination of conditions. The slack trolley wire usually is found over the track with light traffic as the result of



Many roads have outgrown the direct-suspension overhead by increasing speeds, and using heavier trains that require more current

Digitized by Google

deferred maintenance. With a slack trolley wire the first trouble is pounding at the ears. As this increases, ears wear out and slip off and dewirements take place. Due to whipping between cross-spans excessive trolley wheel wear occurs, trolley base repairs start and motor troubles develop. Lastly, the wire wears thin at the ears, breaks, and then a new wire must be installed.

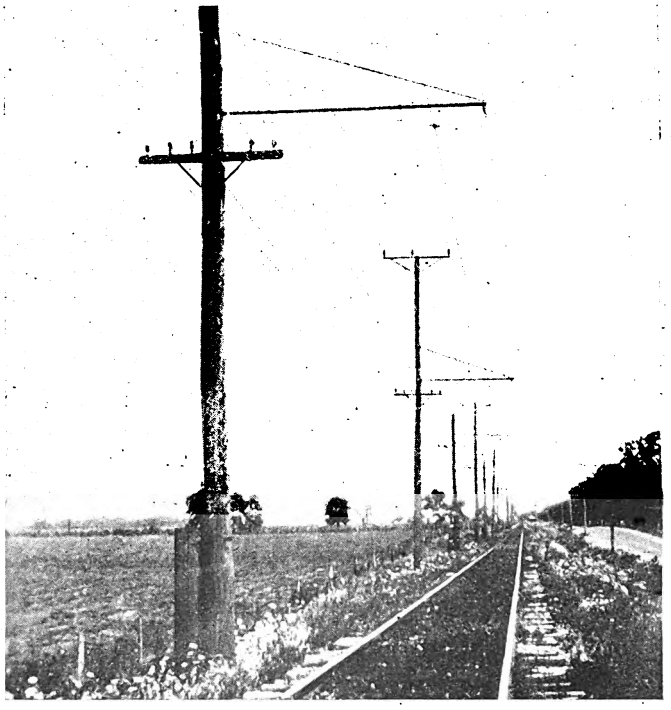
If there are only a few frogs or other special points in the overhead, the slack may be removed by cutting in a splicer, which should serve for a period of years. Due to infrequent service, which means long life for a trolley wire, the cross-span wires may get out of line, with respect to the poles, by cutting out slack. This defect is not serious. The span wires can be realigned during the next ear replacement. It is no exaggeration to say that a splicer used for slack removal may double the life of a trolley wire.

The choice of trolley wire size and kind must be considered by the user for his particular conditions at the time of purchase. For catenary work a grooved wire is preferable. The bump-bump-bump of a wheel over the small clamps or ears on a catenary hanger will not only produce arcing and burning of the wire but will drive the hangers in the direction of the car travel.

Rustproofing Pays

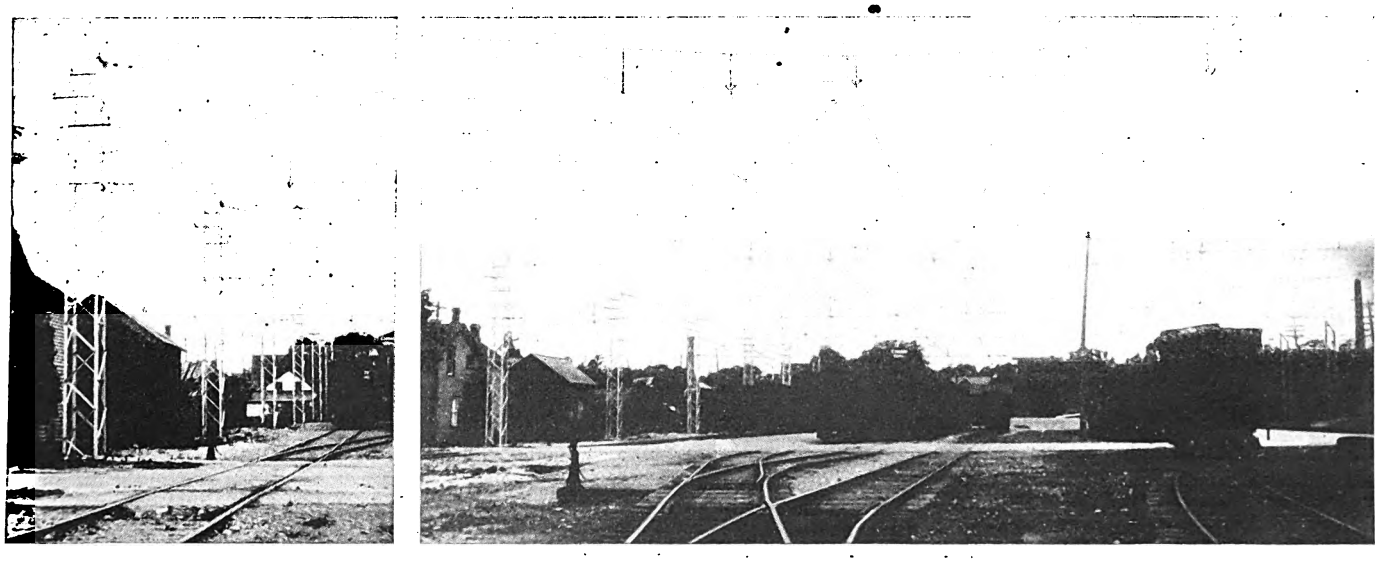
In many instances the blow of a trolley pole striking a bracket arm has crumbled the pipe and dropped the overhead. What did the inspection reveal? The pipe exhibited extreme corrosion. Many bracket arms manufactured with painted C tubing have been erected. The paint does not protect the pipe more than three or four years, when corrosion sets in. Along the open seam in the C tubing, moisture creeps into the interior of the pipe. Corrosion starts there. In a few years the pipe is dangerous. A 100 per cent galvanized job would have cost less than $1 more, and the pipe and fittings would have been protected for many years.

Another trouble develops from the rusty pipe bracket arm. Drip water from the rusty pipe and fittings falls on the insulated hanger and strain insulators in the span wire. Eventually an iron deposit is built up and leakage over the insulation starts. Drip water from rusty overhead also is a problem for the equipment man. Stained car windows, dingy bodies and coated roofs are an eyesore and a hazard. Good galvanizing is an asset to the equipment man.



With this construction, alternate poles carry the high-tension line, thereby eliminating half the high-tension equipment

In this article no attempt will be made to discuss the relative merits of the direct suspension system and the catenary system other than is necessary to emphasize fully the thought brought out in this discussion, that is, "Correcting Common Errors in Overhead Line Maintenance." A comparison in some detail was given in an article by the author in Electric Railway Journal for July 9, 1927, page 59. Each system has its place in the field. With this thought in mind, a logical question may be asked: Have the railways chosen their overhead systems wisely? There are many interurban roads that have built and maintained direct-suspension lines over private rights-of-way where tangent track predominates, where the curves are of low degree, where the time between terminals is being reduced constantly, and where heavy trains require considerable current. Possibly the overhead was erected at a time when catenary overhead was not good enough for consideration. But this does not alter the present-day condition. It usually is con-



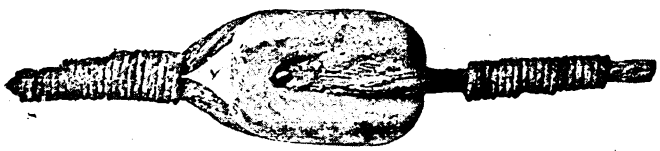
Direct suspension in this storage yard made possible the use of self-supporting steel poles

Digitized by Google

ceded that a catenary overhead system is selected primarily for speed, greater current carrying capacity and conductivity. Factors that may seem secondary, but that are vital, are low maintenance, less abuse to collecting equipment, greater vision, less insulated suspension points and appeal to the public eye.

Span Wires and Span Insulation

There is a tendency on many properties to use single-strand (usually No. 8) galvanized iron wire for pull-overs. True, this wire is of sufficient strength to withstand, with a small factor of safety, the mechanical tension usually imposed on it. But what of corrosion? And what of the shock received by a span wire or pull-



This sample of corrosion was taken from a span in service twelve months along the sea coast

over wire due to the hammer blow of a trolley pole following dewirement? A single-strand galvanized iron wire will not withstand these blows for long, and it will not resist corrosion over a period equivalent to the life of the pullovers. Again there is a needless expenditure.

A piece of $\frac{1}{4}$ in. or $\frac{5}{16}$ in. regular grade messenger wire, with core wire protected from corrosion, will withstand the ordinary blows of a trolley pole for many years. Flexibility is obtained, guarding against fatigue of the strand, and it is easily handled by the line crew. The cost is little more than for the single strand.

In many localities steel strand is not used with success. An excellent example is shown in an accompanying illustration. This insulator and $\frac{1}{2}$-in. galvanized steel strand had been in service exactly twelve months when it was necessary to renew the entire span wire and many others in the immediate vicinity. This wire was taken from a section of overhead paralleling the sea coast but is characteristic of many other localities. After replacing steel strand for many years at the rate of one new set of span wires yearly, this company finally resorted to a bronze span wire which is giving excellent results, and reducing the maintenance on the coast section to a figure which is justifiable. A bronze messenger wire also is to be recommended for coast service.

In many instances span wires over multiple tracks fail to carry insulation between the trolley wires. Usually an insulated hanger is used. However, on many pass tracks and yards an uninsulated hanger is used with insulation at the pole only and none between trolley wires. Insulation in the span wire between trolley wires is necessary to protect the span wire. With no insulation a current will flow between trolley wires through the span wires. This current flow sometimes sets up an electrolytic action and in other cases (due to the presence of acid from smoke) a galvanic or cell action which destroys the strand. A small amount of insulation in the span wire will break up this current flow and protect the span wire.

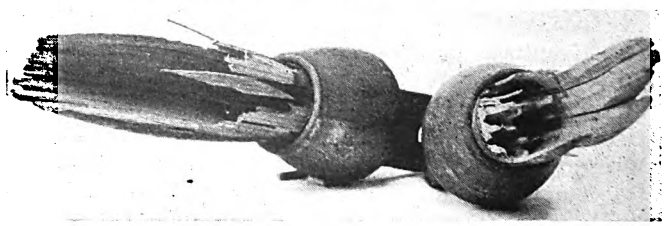
Most of the cell action referred to above occurs first at points where the galvanizing has been removed from the strand through flaking or through injury at the time the lineman served the joint make-up. The iron is exposed and the action starts.

There have been three accepted forms of span wire insulation—wood, composition and porcelain. While all have proved quite satisfactory under normal city operating conditions, wood and composition have their limitations. On coastwise work, wood and composition are not very satisfactory. The example illustrated herewith where steel strand was replaced with bronze was striking in this respect. Previous to the adoption of porcelain, composition insulators were used between trolley wires and wood strains at the poles. The salt deposit in wet weather permitted considerable leakage with the consequent carbonization of wood and composition. A breakdown was the result. Porcelain insulation collects a salt deposit and in time will permit leakage, but it takes the most severe current flow to heat it and break it down.

The majority of interurban lines carry a high-tension feeder circuit on top of the pole that supports the overhead. This line may be any voltage from 6,600 to 44,000 alternating current. The wire size runs from a No. 2 up and most of these circuits are three-phase. For a 33-kv. line with a 100-ft. pole spacing the insulation, crossarms, hardware, and labor for installing will cost in the vicinity of $700 for a mile. If this spacing should be increased to 200 ft. the cost would be halved and, alternate poles could be 30 or 35 ft. in height instead of 40 or 45 ft. Maintenance would be lowered and the leakage and the hazard would be decreased, and where the line warrants catenary, the low poles could be entirely eliminated at a later date. There are many examples of 100-ft. pole spacing on high-tension lines being changed to 200-ft. pole spacing today.

Association Committee Assists in Improvement of Practices

Co-operation of overhead line engineers and manufacturers of trolley line materials through the power distribution committee of the American Electric Railway Engineering Association has improved the standards of maintenance. One purpose of this committee is to formulate standards for overhead materials, equipment



There are many worm-eaten wood strain insulators in the warmer sections of the country. They may be eliminated by using creosoted wood

and wire. Another purpose is to provide a medium for exchanging ideas of those engaged in similar lines of work. The standards created by these committees aid the manufacturer in a house cleaning which results in more attention being placed on a better line of products. However, a good line of products may be rendered partially useless through misjudgment and misunderstandings of the user. Here is where the exchange of ideas is priceless. One member calls another aside and explains how he is having trouble with dewirements on a certain type of frog. It develops that he has located the frog improperly with respect to the switch point. This is just one example of the way improvements are brought about. Another is the study of trolley wire wear. A special committee is conducting a survey that is developing much information about overhead and its care.

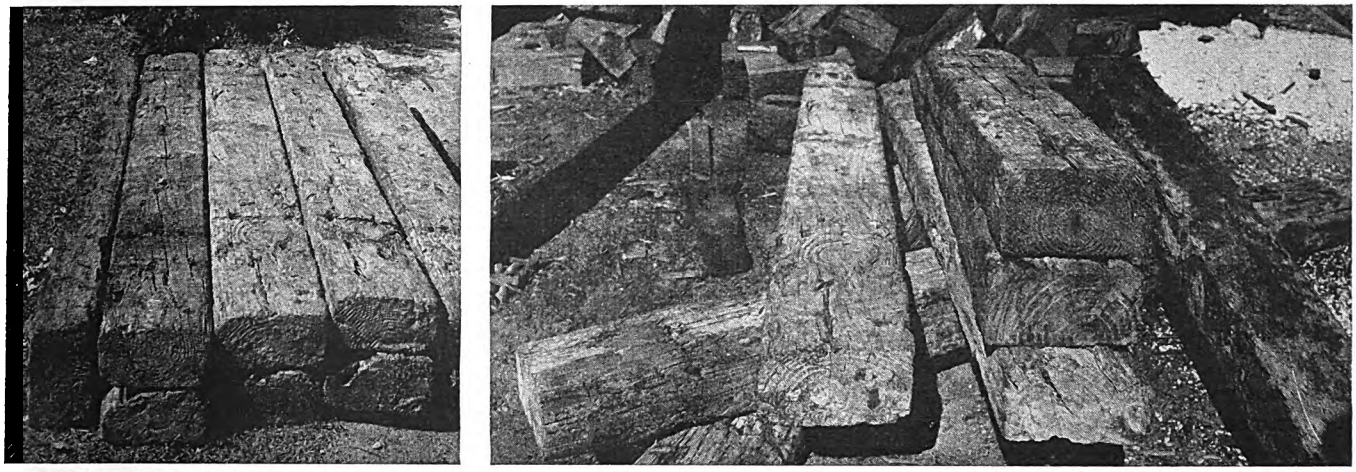
Impregnation Pays

With Wood Tie Construction



Ties removed from tracks of the Georgia Power Company in 1926. A large majority were found to be in good condition after 31 years of service

Georgia Power Company treats wood ties so they will last 25 years against decay and protects them against mechanical wear with steel tie plates. Maintenance cost for 1926 was but $677.50 per mile of track

By C. A. Smith

Superintendent of Roadway Georgia Power Company, Atlanta, Ga.

FOUR primary conditions govern the cost of track maintenance: first, the design of the work; second, the materials used; third, the workmanship and care used in its construction; and fourth, the service to which it is subjected.

In considering the effect which the use of timber ties has on maintenance cost, I will assume that the design of the track is good, that proper section of rail is used together with correct specifications as to manufacture of special work, that the joints have been made as nearly perfect as is possible by welding or otherwise and that they are ground to perfect surface and that the workmanship is first class in all respects.

If the track is laid in a paved city street with pavement constructed so that the water does not reach the subgrade or the subgrade is drained so that it will not yield, then there should be very little maintenance cost during the life of the rail, which should be from fifteen to twenty years, depending on the volume of traffic. This is, of course, predicated on the ties remaining in good condition along with the balance of the track material. In years past much of the track maintenance was caused by the necessity of renewing ties either on account of decay or the gaining of the base of the rail into the tie, where the tie was protected by preservatives against decay but was not protected against mechanical wear of the rail.

We have removed creosoted ties which have been in service for more than 30 years and which were in a good state of preservation chemically, but which were in bad condition mechanically due to gaining of the base of the rail. Our present practice is to preserve our timber ties against decay so that they will have a life of approximately 25 years and further to protect them by use of a steel tie plate against mechanical wear of the rail. This we figure requires a plate of approximately 72-sq.in. area.

On the system of the Georgia Power Company we have 247.73 miles of track, practically every foot of which is now built with creosoted timber or steel ties, there being only a few miles of the latter which were installed the past few years. Unquestionably, for wood construction impregnation pays. We estimate a saving in track maintenance of $1,188 per mile of track per annum over untreated ties where track is laid in a street with paving valued at $3.50 per square yard. With paving at a higher value the saving would be greater on account of the additional cost of tie replacement. Our

Standard concrete beam construction with wood ties used in Atlanta

This is designed for 6-in. pavement and 80-lb. A.S.C.E. rail. The joints are thermit welded. Two 8x9x⅜-in. flat tie plates are placed on each tie. The rails are held with A.E.R.E.A. standard ⅝x5½-in. spikes. The ties, 6x8 in. by 7 ft. 6 in. long, are treated with 6 lb. of creosote per cubic foot.

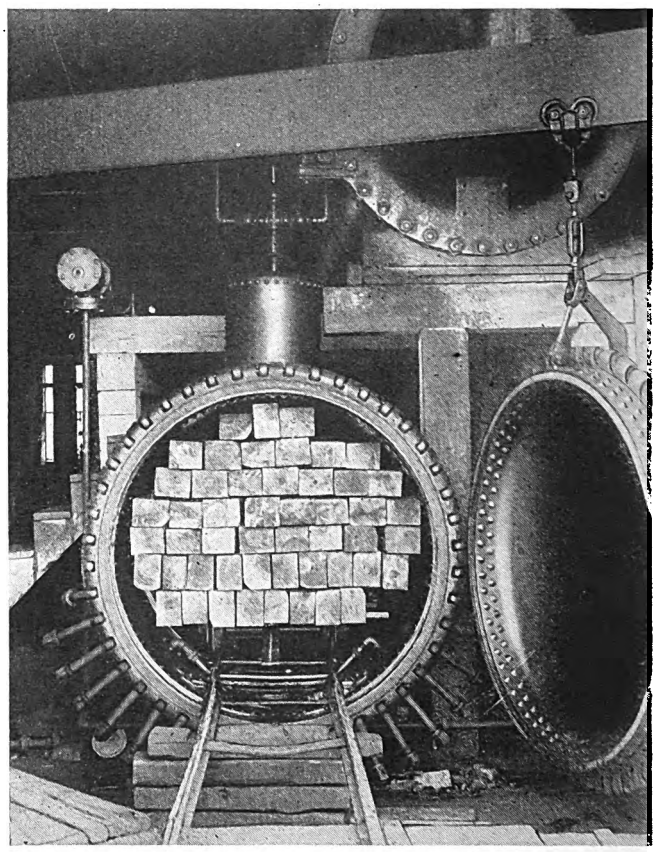
The concrete below subgrade for a 6-in. pavement is 0.143 cu.yd. per foot of track, and for a 7-in. pavement is 0.131 cu.yd. per foot of track. The volume of two 5x9x15½-in. blocks beneath each tie was deducted from the concrete in figuring the above volume. Similar installations are made with Dayton ties.

maintenance cost per mile of track in 1926 was $677.50, which is one of the lowest in the country, some systems costing as high as $2,000 per mile.

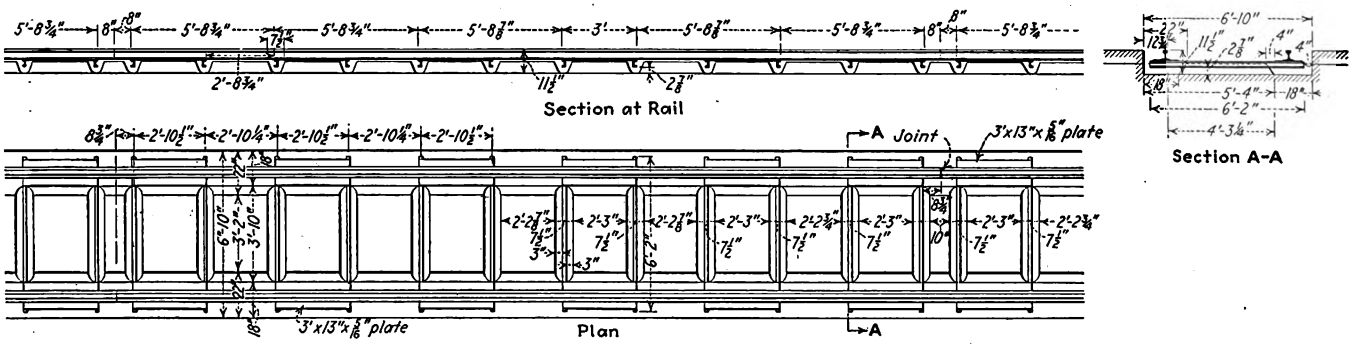
Special care in track reconstruction and improved maintenance practices on the lines of the Georgia Power Company have resulted in lower costs and less troubles. A reduction in total derailments and split switches from 270 in 1923 to 129 in 1926 is one of the evidences of increased reliability of service.

A process of laying track and paving foundation under traffic has enabled the completion of such work in 24 hours time or less. This process is to double tamp thoroughly clean crushed stone 5 in. beneath the tie, after which new crushed stone is added to bring the foundation to the required height for the paving base and thoroughly rammed. The stone is then filled to its surface with 1 to 1½ grout to which 3 lb. of calcium chloride per sack of cement is added. The paving surface is immediately laid and traffic turned on it as soon as ready.

The relative advantages of timber as compared with steel ties depend somewhat on local conditions and local prices. With prices prevailing in Atlanta and with our standard beam construction using 80-lb. A.S.C.E. rail, concrete pavement and concrete foundations for the track, the cost is about equal with concrete at $10 per cubic yard. With higher concrete cost the steel tie is more economical and with the concrete costing less the creosoted timber tie with steel tie plates is more economical. Our designs for these types of tracks are shown in the accompanying drawings. We also have similar installations with Dayton ties.



The tie treating tank at the Atlanta creosoting plant with a load of ties in position for treatment



Standard concrete beam construction with International Steel Ties used in Atlanta

This is designed for 6-in. pavement and 80-lb. A.S.C.E. rail. Joints thermit welded. The concrete below the subgrade for a 6-in. pavement is 0.060 cu.yd. per foot of track, and for a 7-in. pavement is 0.049 cu.yd. per foot of track. The volume of ten 6x8x15-in. blocks beneath each 33 ft. was deducted from the concrete in figuring the above volume.

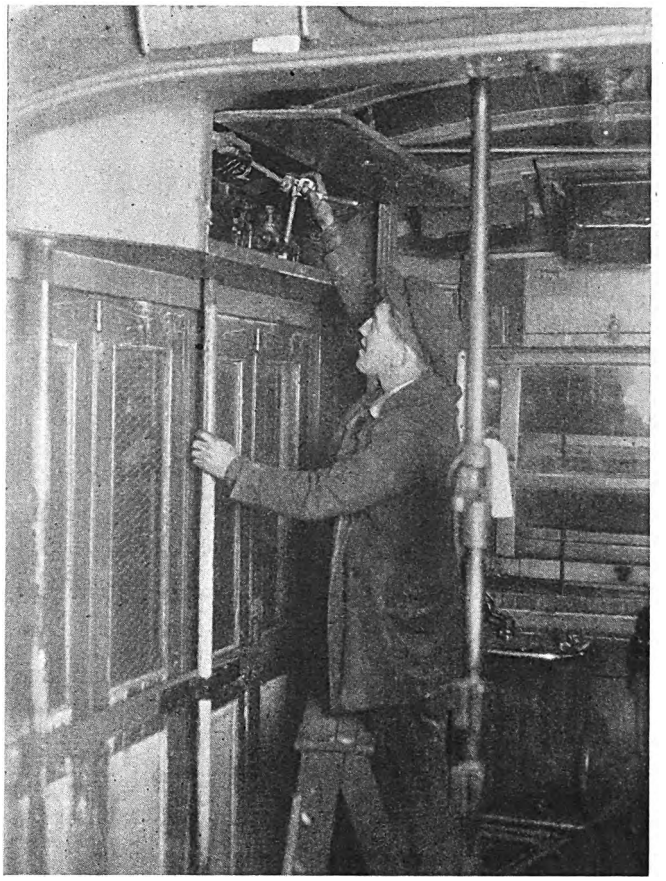
Speedy Service Requires

Efficient Door Mechanism

By Ray S. Frehse
Sales Engineer National Pneumatic Company, Chicago, Ill.



Door engine being removed from the car, dismantled and overhauled on the bench

SUCCESS of the modern street car is dependent in no small measure on the pneumatic door control. This part of the car equipment affects the passenger first when he enters and last when he leaves. When the mechanism is functioning perfectly the car can be expected to give the service for which it was designed. If it is not functioning exactly as it should, the schedule speed is likely to be slowed down and the passengers will obtain a bad impression of the company. However, the door control equipment is one of the easiest parts to maintain in first-class operating condition.

Continued perfect operation of door equipment requires principally careful, periodic inspection. The primary requisite is to prepare a specific schedule of the procedure in inspection so that each part will be tested in turn and none will be overlooked. The inspector should try out all of the mechanism from each of the operating positions in the car as a matter of routine. Once he has learned this procedure by heart so that it becomes a habit, he will be able to check each part very quickly. Unless a definite routine is established, something is sure to be missed which later may develop a failure in service. Like all other car equipment, in addition to the periodical inspection a thorough general overhauling should be made every two or three years.

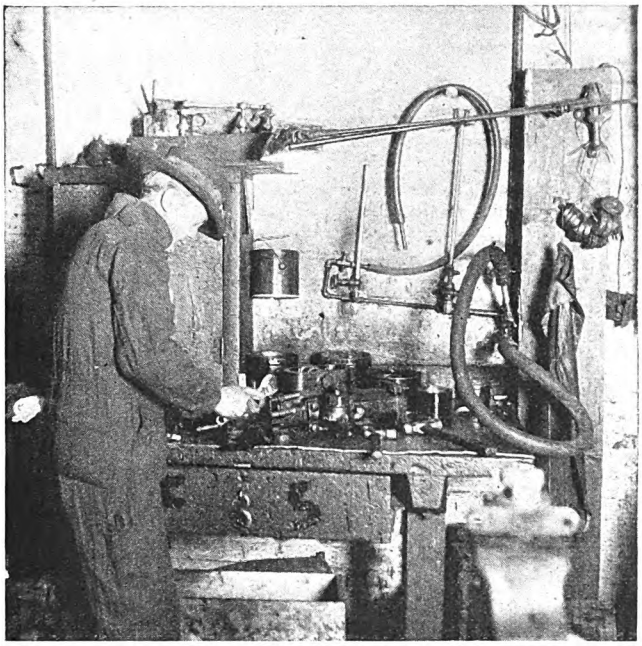
Most of the trouble with door mechanisms comes from abuse or accidents. If the parts are adjusted properly at the regular inspection, which usually comes every ten days or two weeks, any failure to operate as they should is due to something which has happened to the doors or steps and their connections since the last inspection. The procedure then is to look for those points which are most subject to damage from the outside.

Probably the easiest way to outline what should be looked for is to give the procedure which may well be adopted at the periodical inspections. First of all, each door should be opened and closed to make sure that the mechanism moves the door to its proper position and that the steps fold up and open out as they should. The time it takes the doors to travel the full distance should be noted, as this is one of the vital features that makes for high schedule speed. In general, doors are adjusted to open a little faster than they close, but they should not slam in either direction. If these requirements are not met, trouble should be looked for at once. Sometimes the step connecting rods are bent because the car has run over an obstruction which has hit them. At other times connecting rods and shafts are sprung because the trainmen have forced the steps open with switch hooks. The jam nuts should be inspected carefully for tightness, and cotter pins and pivot pins should be in good condition and in their proper places. Inspectors sometimes fail to tighten the jam nuts or leave out pins. Then the levers may slip or the rods work loose so that the mechanism is thrown out of adjustment. Failure to observe these simple rules has been responsible for poor action of doors, so that it is essential to check up at each inspection.

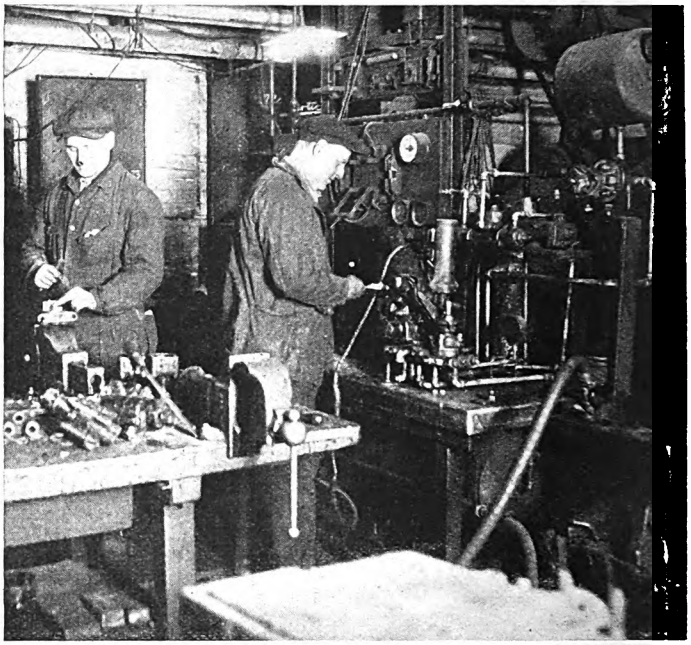
Leaks in piping, gaskets and valves seldom occur and when found they are corrected easily. When they exist, the doors cannot, of course, open or close at the rate for which they were originally set. It is therefore important that the inspector be on the lookout for leaks and see that none remain when the car is released after inspection.

Apart from these points, accessory equipment such as door switches, signal lights, control valves or switches, quick release valves, treadle devices and brake interlocks should be tried out by the inspector and each function observed when they are controlled from every point in the car.

Digitized by Google

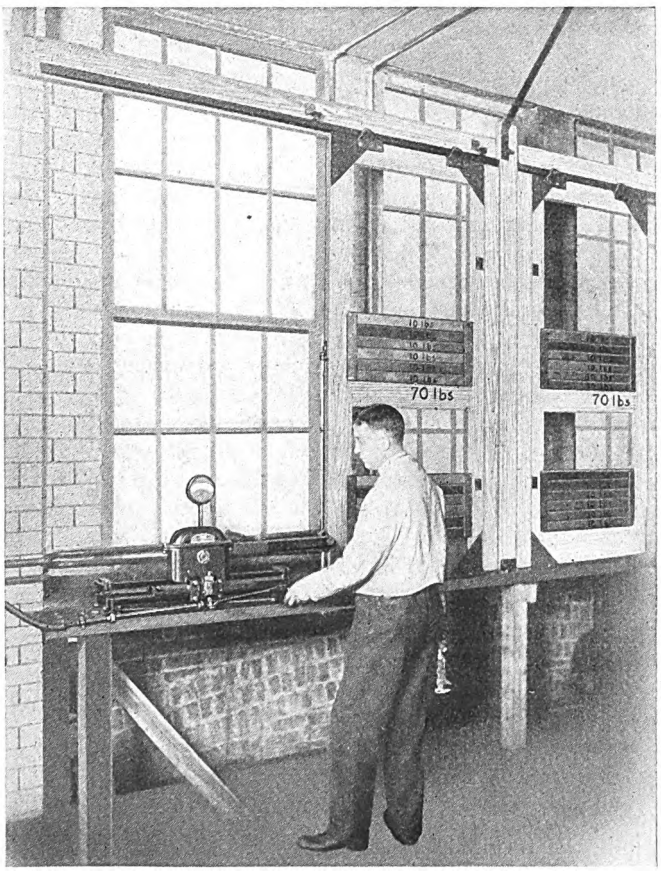


Care in reassembling of overhauled door engines will save time later in making adjustments



Testing the door engine with air pressure to make certain there are no leaks, on the Third Avenue Railway, New York

One of the most common sources of trouble with door mechanisms is oil on the pin connection and grease on the door tracks. In the ordinary control these parts are casehardened to resist wear. Oil is unnecessary and when it is put on it soon collects dirt and grit so that a grinding compound is formed that wears the joints and shortens the life of the parts. When grease is put on the overhead track it not only results in additional wear on the guides, but is apt to drop on passengers.



Final testing of the engine for incorrect operation may save a delay in service. The test bench should be arranged for quick installation and removal

Occasional General Overhauling Advisable

If the periodical inspection is properly done there is little likelihood of failures in service, and the wear on parts will be small. General overhauling, however, is desirable at intervals of one to three years, according to the severity of the service. This gives the opportunity to inspect all parts after they have been dismantled. A mistaken practice sometimes observed is to attempt to do repair work on the car. Naturally it is not possible to do a thorough piece of work and the car will go back into service with the equipment in poor condition. Every moving part should be taken from the car and cleaned, repaired and inspected at the bench under the most favorable conditions. Door engines, control valves, all switches and other pneumatic apparatus, connecting rods, levers and treadles should be handled in this manner.

Difficulties that are encountered in operation after overhaul usually come because proper care was not taken to see that worn parts were either renewed or refinished to eliminate the bad effects of wear. Valves should be taken apart in the air room, cleaned and inspected carefully. Slide and rotary valves wear on their surfaces so that they should be checked with a surface plate and reground, if necessary. Pin valves usually require renewal and their seats should be trued with a tool. For this performance it is essential that after the magnet valves are reassembled, the air gap and travel should be checked with gages that are supplied by the manufacturer. The magnets should be checked electrically to insure that they will operate at the minimum voltage. Balls in ball check valves should be renewed. They cost only a trifle and the installation of new ones will save much trouble, even though the old ones are worn but little. The ball seats should be trued up with a tool.

Grease and dirt in door engines are sometimes sources of trouble. The engines and their passages should be carefully cleaned and blown out with air. Piston packing cups are likely to harden and leak. It is better to renew

Digitized by Google

these packing cups after the second year than attempt to keep them in service, as this is a small expense compared with the failure of a door engine. Ordinarily, a set of packing cups will go from one overhauling to the next one, or a period of two years. Gaskets, likewise, should be inspected and renewed if they appear lifeless.

Renewal of worn pins and bushings is another preventive of trouble later one. Connecting rods often have the threads damaged so that while they are off the car during the general overhaul, it is easy to hand-chase the threads to save time in reassembling.

When the equipment is reassembled on the cars after overhauling, it is quite necessary to check all moving parts for time of operation and adjust them to give the proper speeds. All pneumatic parts should be tested for leakage to be sure that they have been properly seated and tightened. If these precautions have been followed out, the door mechanisms should go back in service after overhaul in practically the same condition they were in when they were new and should function without necessity of more than the regular periodical inspection until the time of the next overhaul.

Automatic Power Supply for Cincinnati Railway

ELECTRICAL apparatus, which will be in operation this year, with a total rating of nearly 30,000 kw. is included in an automatic substation system planned by the Cincinnati Street Railway. It will distribute power to the trolleys by means of nineteen automatic substations, without attendants. The system was designed by the General Electric Company for supplying power automatically.

The new power and distribution arrangement comprises an area having a maximum radius of 8½ miles from the city's business center, in which the automatic substations are located. Power will be supplied by the Union Gas & Electric Company. Substation locations have been selected carefully, with a view of serving the present lines, and providing for anticipated growth of the city and its railway system.

Each station is automatic in all respects. Doors are locked from the outside. Whenever a demand for power arises at any point the station serving the proper area will commence operation and continue to deliver power so long as the load demand exists, after which it will shut down and wait until it is again called upon to function. Should any one of the feeder circuits develop faults during operation, that feeder will be cleared automatically, and after the fault has been removed it will reclose automatically. The station will also protect itself automatically against other irregularities. By this arrangement each station becomes a responsible and dependable element in the system, delivering power whenever required to do so, and checking up automatically for any unusual conditions against which it must protect itself.

Superimposed over the automatic operation of the nineteen stations will be a central dispatcher who will be informed at all times, by means of an automatic indicating system, whether a station is operating, what units in any particular station are running, and what the feeder load and other readings are at any given time. The dispatcher may, if necessary, interrupt the automatic control and govern operation himself, as in the event of a fire or other similar emergency.

The plan calls for the abandonment of one substation, the remodeling of nine, and the construction of ten new ones. Each substation will contain one or two synchronous converters receiving 13,200-volt, 60-cycle alternating current from the public utility, and delivering 600-volt direct current to the railway. Three of the downtown stations will contain two 1,500-kw. converters each. Ten stations will each contain one 1,500-kw. converter, five will each contain one 1,000-kw. converter, and one station a 200-kw. converter.

The substation buildings have been designed to insure continuity of operation in the hottest weather, provision being made to conduct to the outside the heated air discharged from each electric machine. Transformers will be set on gratings through which cool air comes in at the transformer base and flows upward through the radiator pipes and out through ventilating ducts. The appearance of the buildings will be attractive both inside and out.

Each station will function in an automatic sequence as follows: While the converter is idle, a voltage relay is continuously measuring voltage on the direct-current bus, which is always energized through feeder ties from some adjoining station. If the measured voltage drops to a predetermined point, signifying a coming demand for power, the voltage relay passes on an indication to start operation. Immediately a motor-operated drum controller rotates, contact fingers energize control circuits, and the following operations take place: (1) the oil circuit breaker closes, energizing the main power transformer; (2) the starting contactor connects half normal voltage to the converter collector rings for starting; (3) the converter is polarized; (4) the running contactor connects full voltage to the converter when it has reached synchronous running speed, and (5) the converter is connected to the direct-current bus to deliver power. Meanwhile various relays have been checking to make sure the circumstances are correct for running the station, and the converter is not finally connected to the direct-current bus until this check has been satisfactorily made.

Should overload or any unusual circumstances arise during operation, the equipment can limit load or do whatever is necessary to permit continuing operation. Should conditions be sufficiently severe, however, the station will shut down. After the trouble has passed the converter will restart, but if the trouble warrants an inspection before restarting, the station will not restart and the central dispatcher will be notified.

The supervisory control, exercised by one man in an isolated room in one of the substations, is the most extensive ever undertaken. In the supervisor's office there will be a semi-circular switchboard including ten panels, each of which will carry the control circuits and indications for one of the substations. By means of control buttons the supervisor may, if necessary, perform any one or more of six governing operations, and, by means of colored lights, he will have an indication of all important operating conditions at each substation and can see that his commands are carried out.

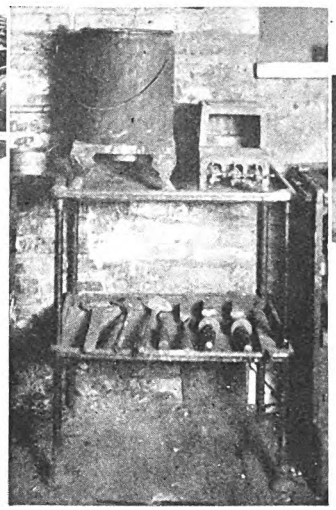
Attention to Gearing

Reduces Maintenance of Entire Car

By E. S. Sawtelle
Assistant General Manager Tool Steel Gear & Pinion Company, Cincinnati, Ohio

Sledging on of pinions should never be permitted



Simple arrangement by which pinions on small properties can be heated readily in boiling water and thus provide a uniform shrink fit

After removing the pinion from the heating tank it is shoved on the shaft with a few light taps

BETTER maintenance of railway gears and pinions will give greater gear life, less noise and less trouble from bearings and associated parts. One of the most common abuses of gearing is the old-fashioned practice of installing pinions with the aid of the sledge. With high-grade hardened pinions brutal sledging is apt to start trouble which some day may develop into a broken tooth or a burst pinion. Many pinion failures on railway motors are caused by incorrect installation.

A rather general belief is that if a pinion is shoved on the shaft and the nuts are tightened, it will remain tight and run satisfactorily. Experience has shown that in order to give satisfaction a pinion should be driven by its shaft through the press fit or shrink fit. The key acts merely as a safety device should the pinion loosen accidentally.

The hot water method of installing pinions has proved most satisfactory. By heating the pinion in boiling water and tapping it neatly onto the shaft, there will be a uniform shrink fit that will hold it against shifting or loosening. At the same time it will not be subjected to undue strains which are apt to lead to failures. I know of many properties on which the loose pinion problem has been solved completely by hot water applications of pinions. By the same method pinion breakages have been cut down.

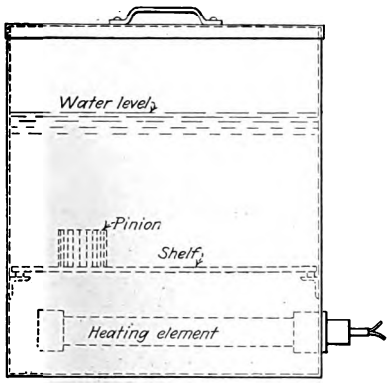
The following points should be observed when putting pinions on railway motor shafts with taper fits. First, the shaft should be cleaned and free from burrs or swellings. Second, the pinion bore should be clean and free from burrs, and third, the fit of the pinion should be in contact with at least three-quarters of the surface of the taper fit on the shaft. This can be checked by rubbing Prussian blue, thin red lead and oil, or thin lamp black and oil on the pinion bore and fitting it on the shaft.

Before the pinion is pushed into position a check should be made to see that its keyway is of proper size for the key mounted on the shaft and also that the pinion does not ride or bind on the top and sides of the key, and will not ride the key when pressed on further. The keyway on the pinion can be 0.002 in. larger but not smaller than the key. There should be at least $\frac{1}{64}$-in. clearance between the top of the key and the bottom of the keyway in the pinion. The corners of the key should not cut into the fillet of the keyway. To prevent this the corners of the key should be rounded.

On some railways pinions are pressed on cold in a vertical press or a wheel press. While this may be considered an improvement over sledging, still the best method for all conditions is that of heating the pinion in boiling water. Pinions up to 3-in. bore should be heated for approximately 30 minutes, and those of 3 in. or larger bore for about one hour. When the pinion has attained the temperature of the boiling water, 212 deg. F., it should be taken out and the bore wiped clean quickly. Without allowing the pinion time to cool, it should be pressed onto the shaft. It should be understood that the pinion is not to go on with a driving fit but only with sufficient pressure to insure a proper fit. After the pinion is in position it should be given three or four light taps, using a heavy piece of wood or copper between the pinion and the hammer, distributed evenly around the circumference. This should be enough to make certain that it is well seated.

Special pinion heating tanks are used on many railways, in which the water is heated either with electric heating units, gas or steam. Where such equipment has not been purchased a substitute can be provided easily by use of a small tank or receptacle in which water can be boiled and into which the pinions can be placed for

Digitized by Google

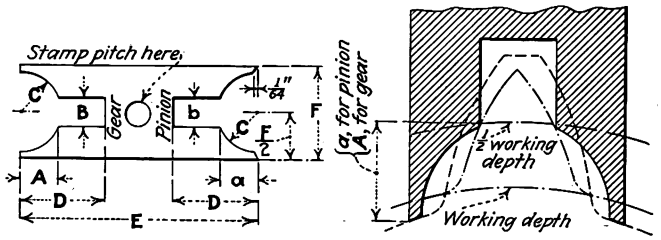


Electrically heated pinion tanks present a neat appearance and boil water quickly for heating pinions

heating. The addition of washing soda to the water in the proportion of ¼ lb. of soda to 5 gal. of water will prevent rusting of the pinions and insure a clean surface at the fit. With this method, it is possible to put pinions on armature shafts so they will stay put and drive through their fit under the very hardest pulling of the motor. Pinions may be damaged in removing by improper methods quite as easily as in their installation. Use of a wedge and a sledge hammer to remove pinions is to be condemned. Many efficient types of pinion pullers are on the market which will not only give increased life to the pinion but also make removal easier. With most of these one man can do the work.

"She is not nearly worn out, leave her for another overhaul." This expression, sometimes heard among maintenance forces, is due to a false idea of economy. When gears are so worn that their teeth lose all semblance to the involute shape it is time to discard them. They are apt to cause undue strain on the bearings and a pinion or gear that wears out in service and necessitates a special shopping of the car will eat up all the savings that might be realized from a dozen other gears that barely manage to survive until the next overhauling period.

In 1926, the American Electric Railway Engineering Association adopted condemning gages to show when gearing should be discarded for wear. In the work of the equipment committee for several years previous replies to questionnaires on gearing showed great variations in life, much of which apparently was due to the removal or scrapping of gearing without working to a definite standard. The committee determined upon a



Discard Gages for Spur and Helical Gearing

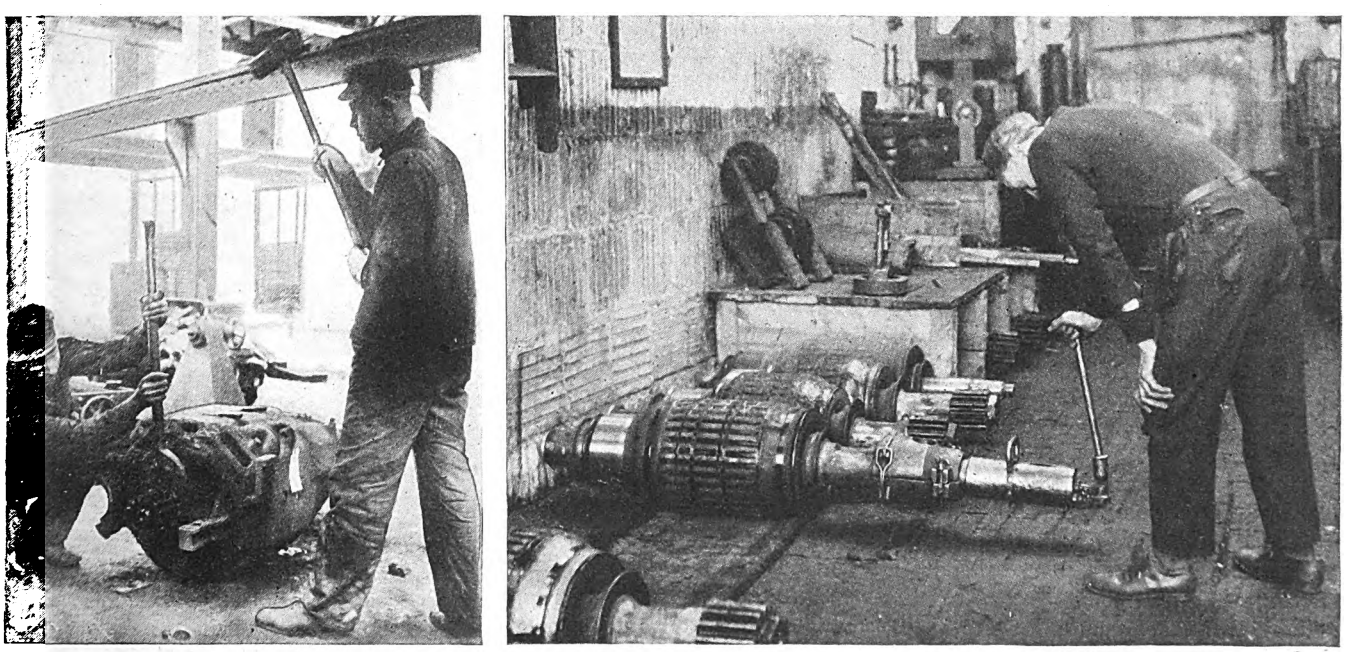
2	0.56	0.62	0.48	0.51	5/8	1⅜	3½	1⅜

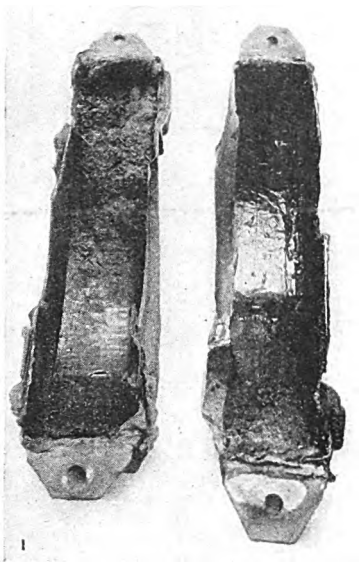
proper method for gaging the wear of the teeth at the pitch line and also the thickness at the pitch line to which the teeth should be worn before discarding. One discard gage was arranged for railway helical gearing (long and short addendum) and the other for railway spur gearing (long and short addendum). Dimensions of the gages, which were given in the 1926 proceedings of the A.E.R.E.A., pages 510-511, are reproduced for the convenience of those who are not familiar with them. It is recommended that every shop be provided with a set of proper gages so that guesswork can be eliminated in the important matter of determining when a gear or pinion should be scrapped.

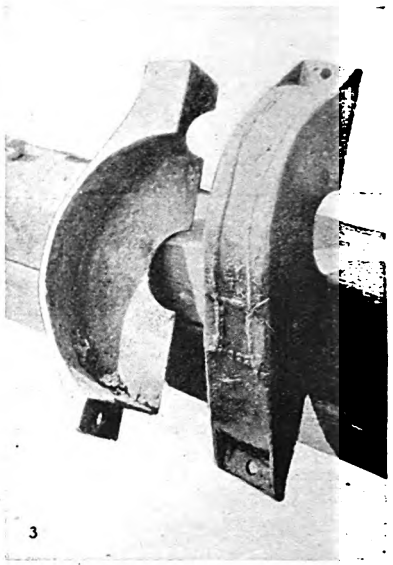
Superintendents of equipment and master mechanics should welcome the use of this gage. The practice of leaving to the judgment of inspectors the decision as to when a wornout gear or pinion should be removed is



As shown at left, pinions and shafts may be damaged by driving a wedge back of the pinion for removal. There are many satisfactory types of pinion pullers (shown at right) that can be used to advantage by electric railways

Digitized by Google





Many troubles will be prevented by keeping gear cases tight

No. 1. The mixture of dirt and gear grease in these cases came from holes and poor fittings

No. 2. Gear cases in a condition like this one cannot be expected to retain gear grease

No. 3. Worn gear cases can be patched satisfactorily by welding

unsatisfactory. The discard gage of the design shown can be used readily for tooth measurements on worn-out gears or pinions. Dimension *B* for the gage used with spur gearing is usually taken as two-thirds of the original thickness at the pitch line of a new gear and pinion. Thus for a diametrical pitch of 3 this would be two-thirds of 0.523, or 0.348 in. The dimension *A* or *a* for the depth is the correct addendum. This varies slightly with the number of teeth.

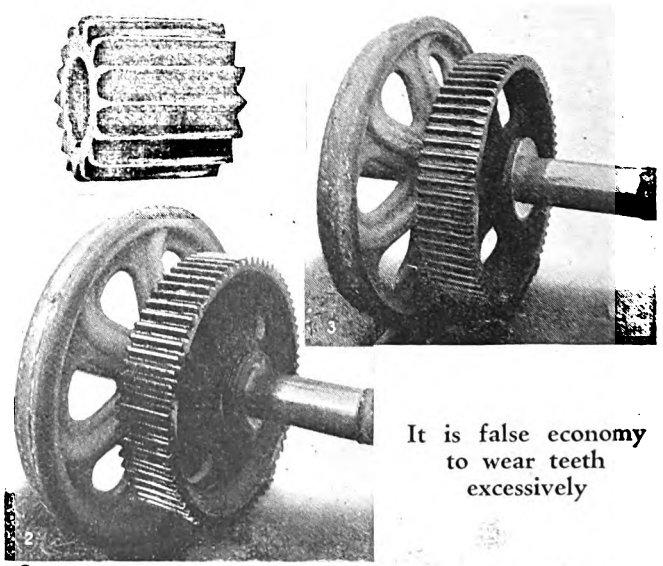
Several of the more modern tooth shapes depart from the B. & S. standard and have higher pressure angles. These include the long and short addendum tooth, the helical tooth and the wisdom tooth pinion. When cut these teeth are broader at the base and narrower at the top than the B. & S. standard, so that frequently they wear to a knife edge before they are worn sufficiently at the center of the tooth to warrant discarding. Such a condition is shown in the diagram illustrating the discard gages. After the gear or pinion is worn to a knife edge at the top it should be discarded regardless of the gage. The A.E.R.E.A. standard gages take their height bearing from the root of the tooth. The vertical legs are of such a length as to make the gage point bear at the center of the working depth and the inside slot of the gage is deep enough to provide a clearance over the top of the tooth. Where it is desired to check actual tooth dimensions the simplest and most accurate method is to get them from the gear manufacturer for each specific type of gear or pinion. If the standard gages are used a considerable number of pinions will be discarded that are now left in service; but with the discarding of the pinions there will also be discarded considerable trouble and high maintenance cost which comes as a by-product of gearing that is allowed to stay in service too long.

The best test of a good gear lubricant is to make an inspection frequently and see if the teeth are actually covered with an oil film. I have seen the lubricant so heavy that in cold weather it piled up on the outside of the gear like the waters of the Red Sea that allowed the children of Israel to pass over without even getting their feet wet. Gear life can be extended greatly with the right kind of lubricant if it is used often enough to keep the gear surfaces well covered at all times. Inspection should of course include the gear cases to make sure that the lubricant is not being lost.

Another source of trouble where the teeth are of proper shape and material and properly lubricated comes from too great spacing between gear and pinion as the armature and motor axle bearings wear. In consequence the teeth, instead of touching at the pitch line, come in contact only at the outer ends with resulting greater wear and noise from backlash.

The wear which causes this spread condition of the gear and pinion may take place not only in the bore of the bearing but also on its outside and in the frame or housing where it is held. Some wear is possible also on the outside of the motor housing. With the worst conditions there is a great increase in noise especially as the car speed changes during a run. When a change in the car speed or reversal of direction causes the gearing to change from engaging on the front of the teeth to the back, or vice versa, there is a great deal of backlash to take up, and also danger that the teeth will break because the great impact is exerted on the small area.

The correct way of course to operate gearing is with the teeth meshing at the pitch line. To approximate this the tolerances for the fit of the bearing on its shaft should be minimized and all excessive wear eliminated.



It is false economy to wear teeth excessively

No. 1. How can correct gear action be expected when pinions are allowed to wear like this?

No. 2. Properly lubricated gearing has the lubricant adhering to the teeth

No. 3. Several teeth in this gear broke as a result of leaving it in service too long. The broken teeth damaged a good pinion

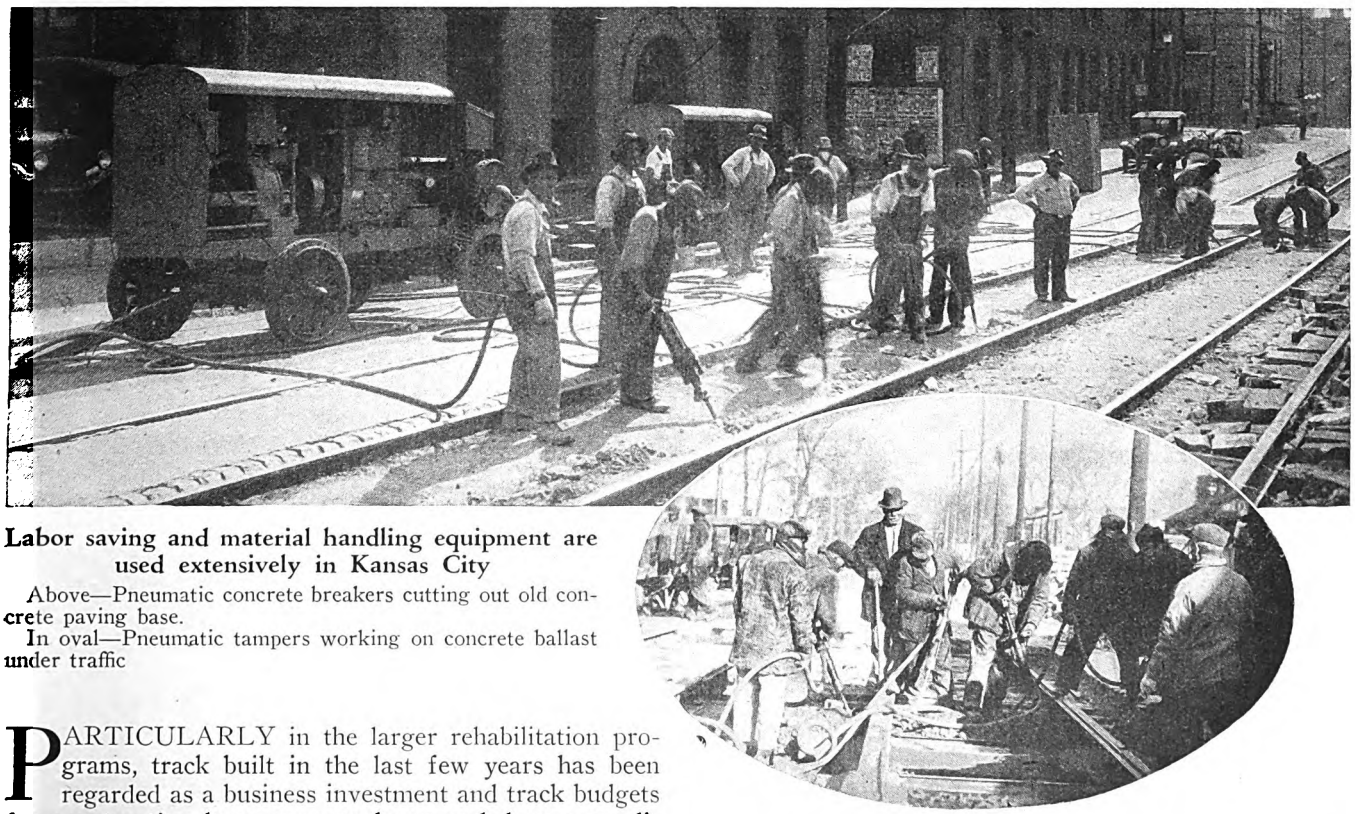
Attention to Details Is the Secret of

Low Track Cost

To reduce paved track maintenance costs the design should be modernized, labor saving methods introduced and material handling equipment used wherever possible

By T. J. Lavan
General Manager International Steel Tie Company, Cleveland, Ohio



Labor saving and material handling equipment are used extensively in Kansas City

Above—Pneumatic concrete breakers cutting out old concrete paving base.

In oval—Pneumatic tampers working on concrete ballast under traffic

PARTICULARLY in the larger rehabilitation programs, track built in the last few years has been regarded as a business investment and track budgets for construction have come to be regarded as expenditures, the control and administration of which should be efficiently handled. During the adjustment period from 1918 until a few years ago the financial outlook justified no complete mechanical and departmental organization of track construction activities. This, because of lack of new capital, the slenderness of track construction funds and because only necessary stop-gap construction was being done with a doubtful future, checked the normal American tendency toward progress and efficient methods.

This lull for readjustment of the whole industry has been followed by the present comparatively optimistic outlook and the consequent release of the latent ingenuity and ability of the leaders of track construction thought in the United States. It is this hopeful indication of the trend, which a national viewpoint indicates, as well as the increased budget estimates for track in the 1928 Statistical Number of the ELECTRIC RAILWAY JOURNAL which inspires this article. If it carries the message of better design, and improved and labor-saving installation methods to those who may not have been touched by the developments that are being rapidly made, its purpose will have been accomplished.

The outstanding trends in the design of paved track in the past season are toward permanently welded rail joints, A.E.R.E.A. standards in rail sections, the increasing use of lower rails, rail tilting, and the use of concrete ballast with the three well known types of steel ties on the market.

An analysis of the reports of paved track laid in 1927, given in the Statistical Number of ELECTRIC RAILWAY

2. Dumping a batch into the mixer skip. The flat car carries eighteen of these batch cars
3. Electrically operated concrete pavement finishing machine
4. Concrete material elevator is used where batch cars are loaded
5. Tamping ties with Johnson electric tampers

Digitized by Google

JOURNAL, indicates that one type of welded joint is used in 60 to 70 per cent of the total track reported. The remarkable trend toward this joint is due in large measure to careful installation supervision by the manufacturer as well as to improvements in the design, methods of installation and improved quality of material. Too much emphasis cannot be laid on the value of field supervision in paved track construction.

The value of Association standards can only obtain full recognition by use, and the trend toward A.E.R.E.A. standard rail sections is encouraging to those whose efforts have provided the new designs. Association standards represent the best thought and a wide experience and they can be followed with assurance of their worth, if properly selected and correctly applied.

Along with the trend toward Association rails is the noticeable use of lower rail sections, usually 7 in. replacing 9 in. The appended table of rail sections, for which Twin Ties were furnished last year, as compared with rails used in 1926, indicates this trend.

Rapid acceptance of rail tilting marked 1927 track design for paved streets. The practice of tilting the rail inward so that the slope of the head corresponds to the coning of the wheel tread increases the area of contact between the rail and wheel and passes the resultant of the load through the rail, parallel with its vertical axis. The life of the rail is increased and pavement adjacent to the rail is relieved of the grinding action and transverse crushing force due to the tendency of a vertically placed rail to dip outward under load. Rail tilting has the approval of the American Railway Engineering Association's committee on track and, considering the well known conservatism of this body, it may well serve as a guide to electric railway engineers considering the tilting of their rails on paved work.

The increasing use of concrete ballast with the three well-known designs of steel ties on the market has come to the attention of all, but only to railway engineers using these track designs and others in close contact with this type of track is it apparent that here also, close field supervision and higher standards of materials and methods of installation have met early objections to steel tie construction.

Early designing in this field was frankly commercial, with wide spacing of ties, and a disregard of conditions such as subgrade and loadings which must guide every installation of track if the results are to be satisfactory. A general rule, by the logical method of design, is for the engineer to apply by comparison his local standards of bearing and drainage, or other subgrade treatment such as rolling, to all such installations and to superimpose these requirements on the manufacturers' maximum and minimum specifications of tie spacing and depth of concrete slab, respectively.

Most of the track which has been built in the last few years has been designed to eliminate to a considerable extent the necessity for maintenance work such as was needed on track built years ago. One of the principal elements in track maintenance is the failure of joints. While modern rail joints made by the welding processes are not immune to failure, there are so few failures that they are practically negligible. Unfortunately the most of the track in service is comparatively old, and the joints are the principal sources of trouble. The track is too good to be rebuilt and methods of repair are essential.

One of the worst practices is the temporary repair of rail joints in the anticipation that the track will fail completely in a few years. On many properties the same repair practices are being followed that were in use twenty years ago, although construction methods so far out of date would not be considered for new track.

The use of old methods is due to a false idea of economy. For instance, when bolted joints get loose and the wheels pound them out of shape, the common plan is to open up the paving, drive some shims or "cobhouse" blocking under the joint, tighten up the bolts and replace the paving. Sometimes where it is possible the ties are tamped and occasionally the joint plates are turned around or upside down and welded onto the rail. The idea seems to be that the plates are there and must be used. No one would think of using a plate that would not fit in connection with a new rail, and the necessity for using a plate that fits is even greater where the rail is worn.

In some of the larger cities it costs between $50 and $60 to open the paving sufficiently to do any kind of work on a joint and replace the paving in permanent form. If the repair itself is not of the right kind and well done it does not last for any time.

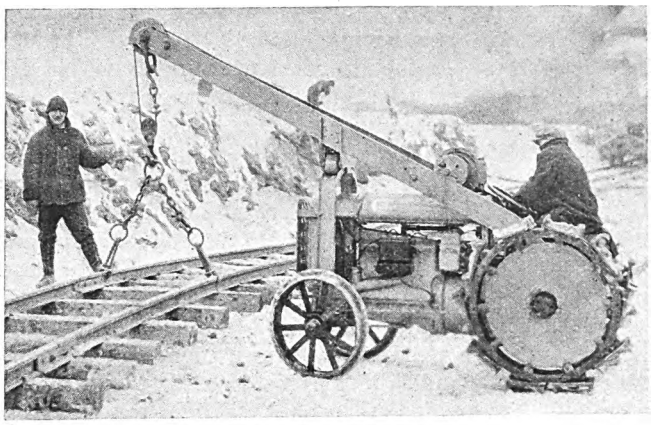
The false economy is in the failure to do the work right when the joint is opened, because the additional cost of the permanent repair over the temporary one is only $4 to $5 at most. In one particular instance the joints were opened up and repairs were made at the cost of about $50 each. Within the last three or four years such repairs have been made on the average once a year. The cost of permanent repairs was considered too great, but had they been made the first time it was necessary to open the joints the subsequent openings would have been unnecessary. Assuming that the original cost of the repair had been increased $10 per joint, making a total of $60, the cost for the past four years would have been only $15 per year. With the system of temporary repairs in vogue the annual cost has been $50 per year. In justification the track engineer usually says that he hoped the repair would be permanent.

On the contrary, on some properties the plan of making permanent repairs has been adopted with excellent results. In two cities the writer has in mind the joints were giving considerable trouble. They were opened up, thermit welded and paved in again. Nothing more has been spent on them although these repairs were made many years ago.

No matter what process is used to repair the rail joint itself the correct plate should be purchased and fitted up, the ties should be tamped properly under the rail so that they support it as the original design called for, and shims and "cobhouse" blocking should be avoided entirely.

A form of so-called repair that has been tried is to build up the top of a cupped joint with the arc welder without going to the expense of opening up the joint. While arc welding is an excellent thing it cannot take the place of a proper repair. It does not tighten up the bolts and it does not put a support under the receiving rail, where it is needed with bolted joints. Where such careless practices are used the welding itself is likely to be careless. While in some companies the superintendents are very careful to instruct their operators, entirely too many of them put arc-welding equipment in the hands of a common laborer and expect him to get results. This attempt to do expert work by common labor, which at best can save only a few cents in the cost of a joint, is another false economy. The building up of rail joints or special work with an arc welder should be done carefully.

Digitized by Google



Tracks that formerly took twenty men with jacks to move are placed now with a 1-ton Fordson crane

Another source of difficulty in welding joints is the use of improper materials. Some superintendents attempt to use any kind of steel for welding in place of the correct welding rod. Many manufacturers are selling welding rods, and the tendency is to purchase the cheapest. There are welding rods on the market that have been tried and proved. The difference in cost of the best welding rod over the period of a year is picayune compared with the damage that can be done by the use of unsatisfactory rods whose merit has not been proved in connection with steel of the type in the rail.

The evil of these poor types of joint repairs does not end with the need to do them over again after a year or so. The rail ends are likely to be damaged beyond the possibility of further repair. When this happens it is necessary to cut the joint out entirely and put in a short piece of rail, making two joints instead of one, and necessitating further opening of the paving. These cut-in pieces are seldom satisfactory and the life of the entire track is endangered.

Another place where there is a good deal of false economy in track maintenance is in repairs to special work. When special work pieces get broken or when the hard centers get loose repairs can be made to a certain extent. Continual patching, or what is worse, patching on the patches, is exceedingly expensive. Sometimes where frogs or switches are broken they can be taken out of the street, taken to the shop and welded so that they will be made serviceable again for years. Here again a real repair pays where patching, shimming and similar practices simply waste the money.

Production Methods Adopted in Construction

In the actual construction the development which is most impressive is in the adoption of mass production methods in the larger programs and their use with practical limitations by the smaller properties. The mechanization of track construction inspires the thought that modernizing methods will affect maintenance by reducing costs and improving quality of track. It is an axiom in mass production that any repetitive operation can be more accurately, uniformly, dependably and economically performed by machine than by hand labor. Use of machinery and handling equipment in paved track construction needs no theoretical justification, as a glance at the highway field will indicate. The ideal in the development of mechanical and production methods in track construction, *i.e.*, the displacement of all common labor by machinery, may never be attained. However, the possibilities are predicted by modern highway construction technique where, in the opinion of road building engineers, the addition of one or two special machines would today make concrete road building completely mechanical.

Development of special track-laying machinery awaits only acceptance of the principles of mass production and their adoption to a greater or lesser extent as the size of the program, local conditions, and the amount of money in the construction budget may determine. A startling comparison with yesterday's methods is seen in a recital of already available labor saving equipment and track machinery which, without doubt, will find wider use next season than it has had in the past.

Drive No Spikes With a Maul

The old familiar plan of driving spikes with a maul is taken as the first illustration because it is being replaced by the latest of the pneumatic track tools, the spike driver. On one steam road, in spiking 39 ft. rails with 26 ties to the rail length the time required with two spike drivers was one minute and 30 seconds per rail as compared to ten minutes per rail length with a four-man gang, spiking by hand. Pneumatic or electric hand tools, while accepted on the many large city properties, have still to find their way into general use on the smaller ones. Yet the savings possible justify their use even on the smallest jobs. Among this class of tools may be mentioned pneumatic and electric track drills, screw spike and joint bolt wrenches, concrete breakers, wire brush cleaners, scaling tools and portable saws. But most important with such tools is their consistent use with standard rules issued to foremen requiring their use on all work with definite performance tasks set.

Tamp No Ballast by Hand

An attractive field for labor saving is in tamping ballast, but a consideration which far outshadows labor cost in building paved track is the elimination of the human element and the assurance of a thorough and uniform contact of the ballast with the bearing surfaces of the ties and filling in all pockets and voids.

The use of pneumatic and electric tampers is so general that it may seem unnecessary to point out their advantages for tamping stone ballast in paved streets; yet it is notable that on many properties the hand pick and

COMPARISON OF THE COSTS OF MACHINE TAMPING VERSUS HAND TAMPING

Based upon the performance of these machines for several months, working exclusively in stone ballast. The cost is given in "tie parts," assuming four parts per tie, one inside and one outside each rail, and the expression "single" or "double" tamping refers to the tamping of a "part" on one side or on both sides of the tie.

Machine Tamping—One four-tool portable compressor outfit.	
Interest on investment, per day, at 6 per cent	$0.57
Depreciation on basis of 5-year life, per day, at 6 per cent	1.61
Repairs (from a 5 months' record), per day	.94
Gasoline, 2½ gal. per hour for 6½ hours at 27 cents	4.39
Oil, one quart, at 50 cents per gallon	.12
Wages, five men at 40 cents per hour, for eight hours	16.00
	$23.63
Number of tie parts double tamped per day	612
Cost per double part tamped	$0.038
Machine Tamping—Four tamping tools without compressor outfit—air taken from existing air line, for which no charge is made.	
Interest on investment per day, at 6 per cent	$0.08
Depreciation on basis of two year life, per day, at 6 per cent	.61
Repairs, estimated	.25
Wages, five men at 40 cents per hour, for eight-hour day	16.00
	$16.94
Number of tie parts doubled tamped per day	612
Cost per double part tamped	$0.027
Hand Tamping—With picks, on a five-man basis.	
Depreciation and repairs, estimated, per day	$0.25
Wages, five men at 40 cents per hour, for eight-hour day	16.00
	$16.25
Number of tie parts single tamped per day	320
Cost per single part tamped	$0.050

The Cleveland Railway has been particularly active in the use of labor-saving equipment in track construction

At top, left—The paving plow in operation on one of Cleveland's streets.

Top, right—An electrically driven concrete mixer with extension boom and traveling dump bucket is used for concreting tracks.

Lower, left—An electric shovel with combination caterpillar tractor and car wheel truck is found convenient.

tamping bar are in every-day use. The savings possible make the equipment an excellent investment. The example of comparative costs given on page 450 is representative.

For concrete ballast the new principle of compression tamping completely mechanizes this operation, at the same time improving the result. The latest machine for compression tamping is driven by a 550-volt motor. It can be connected directly to the trolley circuit and is operated by one man. The theoretical production capacity of the machine is 3,000 single track feet per day, which is ample for the usual concrete mixer, which will control the production speed on work which follows.

A new principle in track construction is involved in compression tamping. While theoretically concrete is a fluid, it is well known that even after thorough mixing it contains air and water pockets and is capable of considerable reduction in volume as produced during the tamping and puddling process. Moreover, this principle avoids mere puddling of the mix, which has a tendency to cause a settlement of the heavy aggregate. The 300 to 500 lb. of compressive force applied by compression tamping, forces the concrete, without disturbing the relative position of the aggregate, into complete and full contact with the tie bearing surfaces.

The labor saving obtained is equal to three man-hours times the number of hours in the working day, for each day's production.

One of the most obvious labor leaks in usual methods of construction is in the moving of ballast materials by hand on the track, either into the track trench or into concrete mixer skip. That savings result by using material handling equipment hardly needs supporting data and, therefore, merely examples of advanced practice are indicated as obviously saving large sums in man-hours of time.

One carefully planned mechanical method is used by the Denver Tramway Corporation on concrete. In the material yards, mechanical conveyors and elevators take material from pits under hopper-bottom gondola freight cars to elevated storage, where it is dropped directly into narrow-gage batch cars of the end-dump type, eighteen of which are carried on a flat car of Denver's standard gage. The flat car floor has three narrow gage tracks and switches, leading to a stub single track at the end of the flat car on which the batch car is in dumping position, over the skip of the mixer. Thus all materials come to the mixer ready batched, with only three men's time chargeable against the handling operation.

A variation of this method is the use of Differential dump cars in getting the material out to the street where it is handled by Haiss batch-bin type elevating loaders and light dump-body trucks direct to the mixer skip. This development was used on Kansas City work in 1927. Commenting on it A. E. Harvey says, "The inclosed statement shows the difference between cost of placing concrete with our mixers which are loaded by hand and wheel barrows at a cost of $2.67 per cubic yard as compared with $1.29 where a 21-E mixer is used and is charged by trucks which are in turn loaded with a Haiss loader. Thus you will note, that the use of the loaders and large mixer makes a saving in labor of 51 per cent."

The detail figures in Mr. Harvey's comparison are given in the accompanying table.

Some practices common in trackwork not only waste time but are apt to cause personal injury. One of these

Digitized by Google

COMPARATIVE COSTS OF PLACING CONCRETE IN KANSAS CITY USING OLD AND NEW METHODS

	Cu.Yd. per Linear Foot, Single Track	Cost of Placing Single Track Per Foot	Per Cu.Yd.
Concreting with old method, using one mixer on base course and one on top course, loading both mixers with hand labor on first half double track..	0.277	$0.74	$2.67
Concreting with 21-E Rex paver on base and top courses, using one Haiss loader on rock and one on sand, loading into Ford trucks and hauling to mixer. Cement was thrown on top of batch truck when truck passed cement car, on second half double track	0.426	0.55	1.29

Note:—No finishing or curing is included in above costs since they would be the same with either method.

Common labor was paid at the rate of 30 cents per hour and trucks $1 per hour.

Average concreted per day with old method, 406 ft. S. T. or 112 cu.yd.

Average concreted per day with new method, 570 ft. S. T. or 243 cu.yd.

All variations of the above methods attempt to replace the shovel and wheelbarrow as completely as possible in handling ballast and concrete materials on the street.

is the handling of rail from the curb or the trench side into the trench by means of tongs. Safety alone dictates the use of a mechanical method for handling rail, but in addition large labor savings are possible on extensive work. Mechanical handling permits the setting of the rail in close alignment and approximately to surface, reducing the subsequent labor. Both simple and elaborate crane equipments are available. A recent adaptation, the Fordson tractor illustrated, offers the advantages of mechanical handling at a cost well within the limits of small property budgets.

Removal of old track and excavation for new construction offer similar opportunities for saving labor. Many improved devices have shown startling economies as compared with hand work. For instance, the concrete breaker was used on old 6-in. thick concrete paving foundation. For one-half the devil strip, between the rails of standard gage track and 1 ft. outside the rail, the machine broke 45.8 single-track feet per man-hour. Hand methods with picks, shovels, chisels and sledges broke the concrete at the rate of 3.48 single-track feet per man-hour:

With the special plow illustrated, which is drawn by a motor car, the removal of granite block was 113.23 ft. per man-hour, while by hand, using bars, the equivalent removal was 2.12 ft. per man-hour. It is unnecessary to give more examples to prove the saving of mechanization of construction. The following example from Kansas City shows the comparative costs of excavation by hand and by machine:

COMPARATIVE COSTS OF EXCAVATION, KANSAS CITY

	Cu.Yd. per Linear Foot, Single Track	Cost of Placing Single Track Per Foot	Per Cu.Yd.
Excavating by hand, first half of double track	0.365	$0.82	$2.25
Excavating with Insley, second half of double track.	0.365	.66	1.81

Note:—No dismantling is included in excavating cost since this would be the same using either method. Common labor was at the rate of 30 cents per hour.

Average excavated per day:	Feet of Single Track	Cu.Yd.
By hand	565	206
With Insley	632	231

The fundamental principle involved may be stated as follows: Human energy can be profitably employed only for the control and guidance of power, never for its supply.

A corollary of this in the construction of paved track is that the power used should as far as possible be drawn from the overhead, that is, electric shovels and electrically driven tools of all kinds should have preference over those of gas or steam. Even on small properties and for short lengths of paved track work the rental of this type of equipment will make a net saving on the removal of old track item.

x—indicates year used.

A notable development of the past season is the general adoption of field control methods for developing the maximum strength of concrete mixtures. Average compressive strengths as high as 3,000 lb. on all concrete placed in the track structure are being obtained in many instances, amounting to an increase of as much as 30 per cent over former results on the same properties.

Such tests include the sieve test for the size and grading of the aggregates; the simple water test for soluble matter in gravel; the slump test for checking the water content and test cylinders for data to serve as a check and control of the quality of materials used and the strength of the concrete and to regulate the time of putting the finished track in service.

A valuable and simple addition to all concrete mixers is a timer for checking the mixing time. Where used, a specification is given for period of mixing, which should be rigidly adhered to. Often this may save time and increase the daily production of concrete. In this way the rapid increase in strength and uniformity of concrete for mixing periods up to two minutes can be taken advantage of on the work.

A development of the past few seasons which is worthy of note is the practice of detaching the inspection department entirely from construction. With this type of organization complete specifications are written on all the track and the inspection department reports directly to an operating vice-president or other executive above the construction department. It results in close adherence in the field to both material and method specifications. It has been suggested the latter might be amplified to include performance or production requirements.

The observations which are presented in the foregoing are in no way intended to be inclusive of all that might be done to improve paved track construction and so reduce the maintenance of such track in the future, but they take their strength as valuable innovations in track practice from the fact that they indicate modern trends and support the proposition that to reduce maintenance the logical place to start is to modernize design and methods of construction.

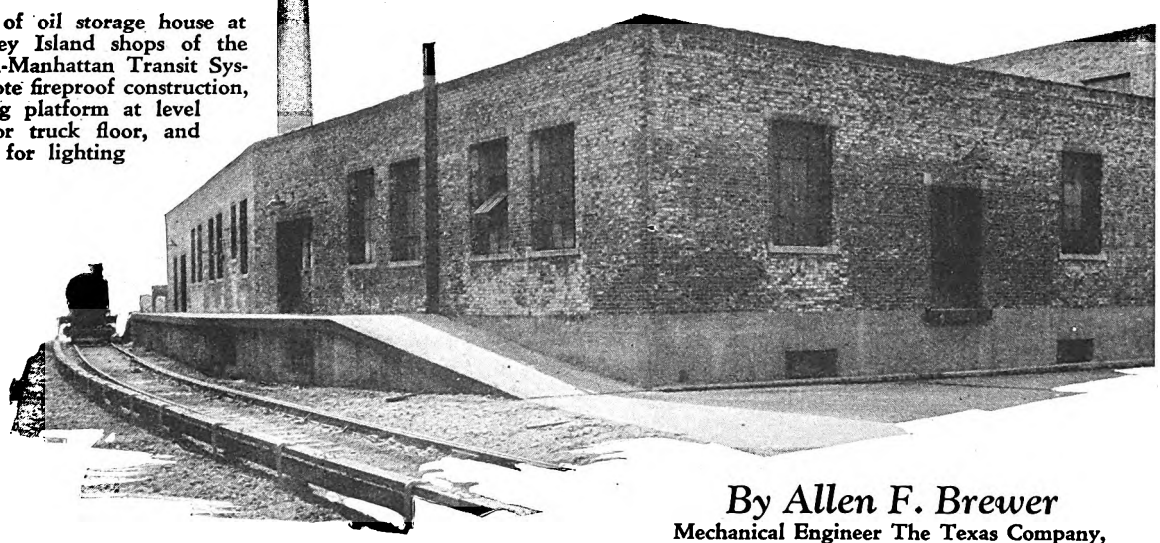
A Good Lubricant can be Ruined by Improper Handling



Exterior of oil storage house at the Coney Island shops of the Brooklyn-Manhattan Transit System. Note fireproof construction, unloading platform at level of car or truck floor, and windows for lighting

By Allen F. Brewer
Mechanical Engineer The Texas Company, New York, N. Y.

DEVELOPMENT of the storage and handling of lubricants has been most interesting. Once oil storage was regarded as relatively unimportant. Usually the darkest, dirtiest corner in the electric railway shop or storehouse was deemed good enough. In fact, there has ever been an association of grease with dirt. Note the common usage of the term "greasy." Yet modern street railway lubricants are among the most highly refined of oil products from the viewpoint of actual purity and freedom from dirt. If they ultimately show contamination, storage and handling practices should be investigated. It is better, however, to make such an investigation a matter of insurance against contamination, rather than a means of correction after it has occurred. Rolling stock and power plant equipment will be protected more completely thereby, for effective lubrication can more nearly be accomplished and maintained.

After receipt the responsibility of the consumer commences. Any lubricant is only as good as the care it is given in storage and handling. Regardless of how carefully any lubricant may be refined or selected, precaution must be taken to preserve its purity prior to use. Just because a compressor oil is obtainable with practically no water or foreign matter content, is no assurance of its ultimately giving satisfactory service if, for example, the shipping container has been handled roughly, allowed to remain exposed to the weather, or stored so that foreign matter can gain entry. This is true especially of wood barrels, where cracking or warping of the staves or heads through weathering or careless handling, will in all probability cause particles of glue to be chipped loose, or reaction brought about between the glue lining and moisture due to entry of the latter through cracks, which finally will get foreign matter into the oil and reduce its value as a lubricant.

Storage and handling of lubricants in the average

Oil Handling Practices That Should Be Eliminated

AVOID improper location of the oil house. Much time and energy will be saved by locating the oil house centrally.

When underground tanks are installed don't forget that an adequate foundation will save much trouble.

Much annoyance will be avoided by seeing that all pipe joints are made up tight.

Neglect of fireproof provisions may prove very costly.

Dirt and refuse are enemies to lubrication storage. Don't employ careless attendants.

Don't allow oil to drip.

The "help yourself" habit will not work out satisfactorily with any well-organized system for keeping records of lubrication.

Water will contaminate a lubricant as well as dust and dirt. Keep all tanks or containers covered to prevent entry.

Don't forget that full barrels or drums are heavy. Use two men to handle where necessary.

Be sure that any accumulation of oily waste is not permitted. Rags or sawdust have no place in an oil house.

Don't forget to keep grease drums covered.

The boring of holes in wood barrels or the reaming out of existing holes should not be permitted.

electric railway system involves certain distinct factors which include:

1. Design and construction of the storage facilities.
2. Type, size and arrangement of equipment, such as pumps, heating coils and gages.
3. Handling equipment available for moving or lifting products and shipping containers.
4. Provisions for measuring oils and keeping suitable records.

Where oil storage tanks must be located in the main store house, the oil room should be partitioned off from the other part as shown here. Only those employees who have to do with the handling of lubricants in storage should have access to the oil room. Other store house personnel should be kept out

5. Methods of distribution to the various units, departments or shops.
6. Management of the storehouse.

The primary requisite for any road using a considerable volume of lubricants is a central storage house, or at least a special room from which lubricating oils and greases can be issued in suitable quantities as needed. Whether or not any road will be justified in going to the expense of constructing an independent oil house will depend to a great extent on its size and the amount of equipment.

There will be considerable expense attached to such an installation. Many roads adjacent to oil supply depots set aside a corner of the main storehouse for lubricants, and keep them in the shipping containers. There is an objection to such oil room storage, in that there is considerable possibility of contamination. Dirt sometimes will be swept into the drip pans and measures. There will also be considerable chance for leakage and wasting of oils unless an unusually careful employee has complete charge and keeps the room locked and inaccessible to all others.

Wherever a detached oil house is warranted or an oil room is set aside, it should be fireproofed with brick, tile or concrete walls and floor, and a tile, metal or slate roof or ceiling laid on steel beams or rafters. The floor should be fitted with drains.

Only recently a railway was inspected which prided itself on its oil storage facilities. An oil room had been laid out, measuring pumps with drains installed, the tanks located below grade, regular lubricating accounts kept and all employees educated in proper lubrication. But, below the main floor there was a basement with a dirt floor, and it was covered with several inches of oil, mud and shavings. In one corner were the storage tanks, in another a heterogeneous mass of broken barrels and junk. Nor was there any provision for heating. This might be considered a good example of how oils should not be stored. There must have been oil leaks, else how came the oil on the floor? Without doubt the tanks ultimately would suffer for water and mud are corrosive.

Light is important. Normally, there should be as few doors and windows as possible commensurate with the amount of light required, and those should be of the steel frame or roller type, fitted with wire glass and automatic closing devices.

The location of the oil house is important. An appreciable time will always be lost in handling heavy lubricant containers and there is possibility of damage both to lubricants and containers if the latter are rolled or tumbled about unnecessarily. When possible the oil room or house should be as close as possible to the railroad siding, dock or street. Thus the containers will be subject to the least possible handling.

Where oil or grease drums or barrels are to be handled from one level to another, hoisting is involved. Hoisting is not only expensive, but entails severe handling. Wood barrels especially will suffer, and warped and cracked heads, sprung seams, or the jarring loose of particles of the glue lining, often will occur. Any damage to the container which may break the seal and lead to entry of water or foreign substances, is serious.

"One-level" handling is best. The platform of the oil house or storage room should be on a level with the car or truck floors. Then the containers can be rolled, trundled on hand trucks, or handled by a portable con-

Digitized by Google

veyor, directly to the filling hatch of the storage tanks or to the hoisting device above the tanks.

As a rule it will be practicable to build an oil house with a basement for the bulk storage tanks. The main floor in such a house would serve as the receiving and delivering room. In many such installations all tankage is kept below the floor level, this area being reserved entirely for delivery pumps and office space.

If but small quantities of certain products are to be stored for any length of time, it will save space and expense to keep them in the shipping containers rather than to transfer them to tanks. For car oils or other bulk lubricants permanent tankage is best.

Lubricants can be delivered to the shop or barn either in bulk, by tank car or boat, or in steel drums, barrels or cans. With bulk delivery, the location of the tanks with respect to the delivery level is naturally important. Usually under such conditions the lubricant is transferred from the tank car or boat through a hose connection. The same hose should never be used for delivery of black oils and lighter lubricants.

Gravity flow is quickest and cheapest. It is necessary to locate tank filling hatches below the level of the outlet valve of a tank car. With boat delivery, pumping generally is necessary. Gravity delivery will also facilitate handling package shipments in drums, barrels, or cans.

When pumping is necessary care must be taken in the location and operation of valves. With a number of tanks there will be a possibility of drawing some inferior grade of oil into the suction line to contaminate a more highly refined product.

Most effective handling of lubricants requires control of oil house and tank temperatures. Where possible basement or sub-surface location for an entire tank or at least the major part of it is desirable as it will not be subjected to as wide variations in temperature, if the building is of relatively solid construction. Frequently the basement can be closed sufficiently for temperature control by sealed trapdoors, and the entire room kept at the requisite temperature for pumping the heavier lubricants.

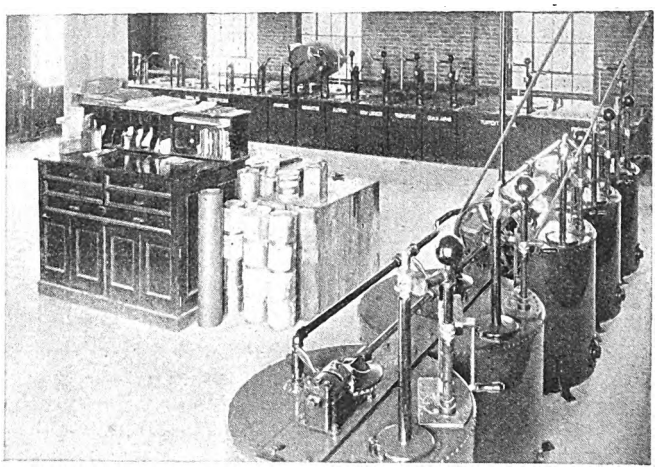
Wide temperature fluctuations may lead to sweating and condensation of moisture within the tanks. Compressor oils and the like can be seriously contaminated in this manner. Yet, retention of heat within the tanks is necessary. It would be folly to spend money on tanks, pumps and other expensive equipment, and set the tanks in a semi-covered basement or exposed to the weather.

In the winter the temperature may drop below the pour test of car oils so they will become too sluggish for the pumps to handle properly. Too often this is the basis of complaint that the oil is too heavy. When heavy, viscous products such as gear lubricants, greases, and compounds are to be stored steam heating coils should be installed in the storage room or surrounding the tanks where temperatures may vary over a wide range. This will permit accurate regulation of temperatures, and overheating will not be so apt to damage certain products. Heating by exhaust steam is most economical.

Accessory equipment such as pumps, meters or other measuring devices and portable elevators for hoisting or lowering barrels, and so on, are always advantageous. Sealed pumps should be used wherever practicable for delivering fluids from storage tanks. Often such pumps measure automatically the amount withdrawn, which facilitates keeping records and checking oil consumption. Considerable time and labor can be saved and the attendants can fill orders promptly. It also insures that the oils are kept free from contamination. Records of daily, weekly and monthly lubricant consumption should never be under-estimated. The effect on the morale and the economies in consumption of lubricants, will be surprising where employees must follow a definite procedure in the obtaining of their necessary supplies.

When barrels or drums must be hoisted frequently to the top of storage tanks or to emptying racks a portable elevator should be installed. This will facilitate handling and reduce the probability of damage, for a dead weight of from 400 to 500 lb. will tax the strength of two average men. A suitable track along the tops of tanks which are to be filled from barrels or drums is excellent. If this is at a sufficient height to facilitate location of the bungs over the filling hatches, there will be little chance for waste.

On certain roads the distribution of lubricants from the oil house or oil room involves a loss of time. On the other hand, effective distribution will tend to prevent contamination. The manner of distribution will depend on the location and number of units served. Where there are a number of shops or departments it may be most economical to deliver by motor truck, covering perhaps the entire yard at one trip. Otherwise hand truck



Oil storage tanks can be arranged in an oil house to leave space for storage of package lubricants and the office desk

delivery will serve the purpose. With car oils it will often be found advisable to supply the rolling stock departments with approximately 50 gal. at a time.

Cabinet type storage tanks, each with a hinged cover, are suitable for car oils. Such tanks are usually fitted with measuring pumps, and built so that any drip drains right back into the tank.

Storage racks for barrels and drums should be built of

A dirt-proof method of handling lubricants from barrels directly to lubricating equipment. This is adaptable to gear lubricants, which are to be subsequently applied by a high pressure compressor as shown. Each turn of the crank measures one pound of lubricant

steel, and so that individual containers may be removed quickly and independently. Good practice is always to store even the cheaper lubricants in the oil house to keep them warm. They should always be stored on the side with the bung down. It is usually inadvisable, however, to use wood barrels for lengthy storage of lubricating oils, on account of the possibility of contamination or loss from leakage.

Wood barrels have an appreciable salvage value, and in good condition they are returnable to the oil distributors, so care should be taken to prevent damage.

Holes should never be bored in the heads nor a bunghole reamed out, nor should a bung be driven entirely into a barrel. Bungs should be removed by tapping the bung stave lightly with a wooden mallet or bung starter and then using a chisel or bung pick.

Wood barrels, when empty, are subject to warping of the staves and heads if stored on end or exposed to the weather especially if water is allowed to collect on the heads, or if they are exposed alternately to the sun and excessive dampness.

Gear lubricants and greases in general cannot be pumped readily at normal oil house temperatures. Perhaps the most extensively used semi-solid product in electric railway service is the straight mineral gear lubricant of comparatively high viscosity. Normally such a product is extremely durable and lends itself readily to bulk storage, and sufficient heating to permit pumping.

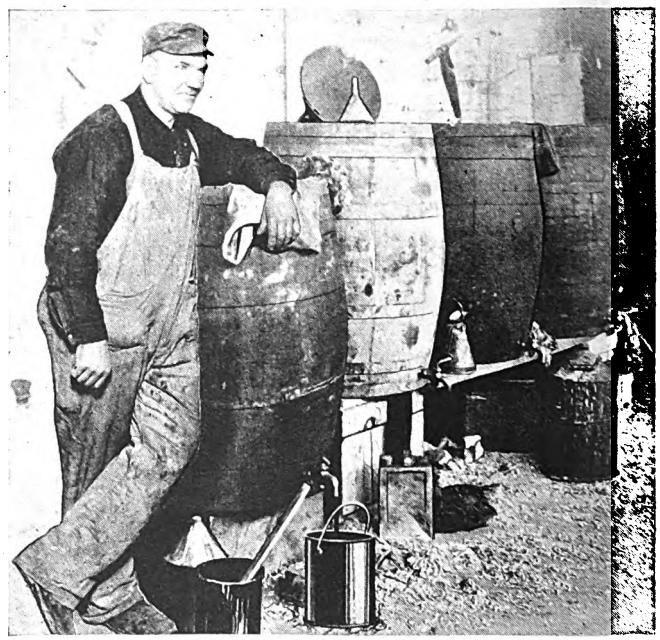
With greases, that is, products composed of a mineral oil and soap, the amounts on reserve should be held to a minimum. Certain greases may separate and revert to the original components, especially when not refined carefully. Separation can be identified by observing that oil tends to collect in depressions in the grease when allowed to stand for any length of time. Heating of certain greases may also promote separation.

In any grease, the lubricating constituent is the oil content. The soap serves chiefly as the carrier. The best grease is that with the most homogeneous mixture. If oil separates from the soap it is logical to expect that effective lubrication cannot be assured. Grease, therefore, should be bought in such quantities that it always is as fresh as possible, and the shipping containers should be stored under a temperature as uniform as possible.

With manual handling care must be observed to protect all such lubricants against contamination. A clean spoon or paddle should be used, and only sufficient lubricant taken for immediate needs. It is easy for the foreman to estimate the quantity that should be issued.

Except when in use, the grease containers should be kept tightly covered. For wooden grease barrels, a sheet metal top will be found advantageous; it can be cleaned readily and kept in proper shape.

In the storage, handling and usage of lubricants best results will be obtained by putting the entire matter under the supervision of the master mechanic, shop fore-



Time may be lost while waiting for an oil can to fill. Overflow under such conditions will of course, be probable, and when it does occur, the floor will become sloppy and the fire hazard increased

man or a capable lubricating engineer. There is a decided advantage in having a lubricating engineer, especially if his experience combines practical operation and maintenance and familiarity with the methods of refinement and the characteristics of the various lubricants. Not only should he reduce waste and keep down lost time, but he can keep proper records, develop specifications, purchase lubricants and test them. Whoever has charge of lubricants should see that products are delivered promptly, maximum cleanliness is maintained, and accurate records kept. Lubricants should be issued only on requisition or order. Excessive quantities should never be issued. Return of unused oils or greases is risky, for contamination may have occurred, especially if the workers are careless or if open containers are used.

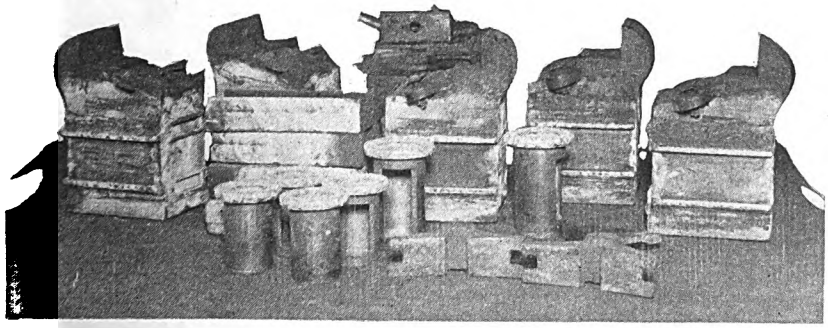
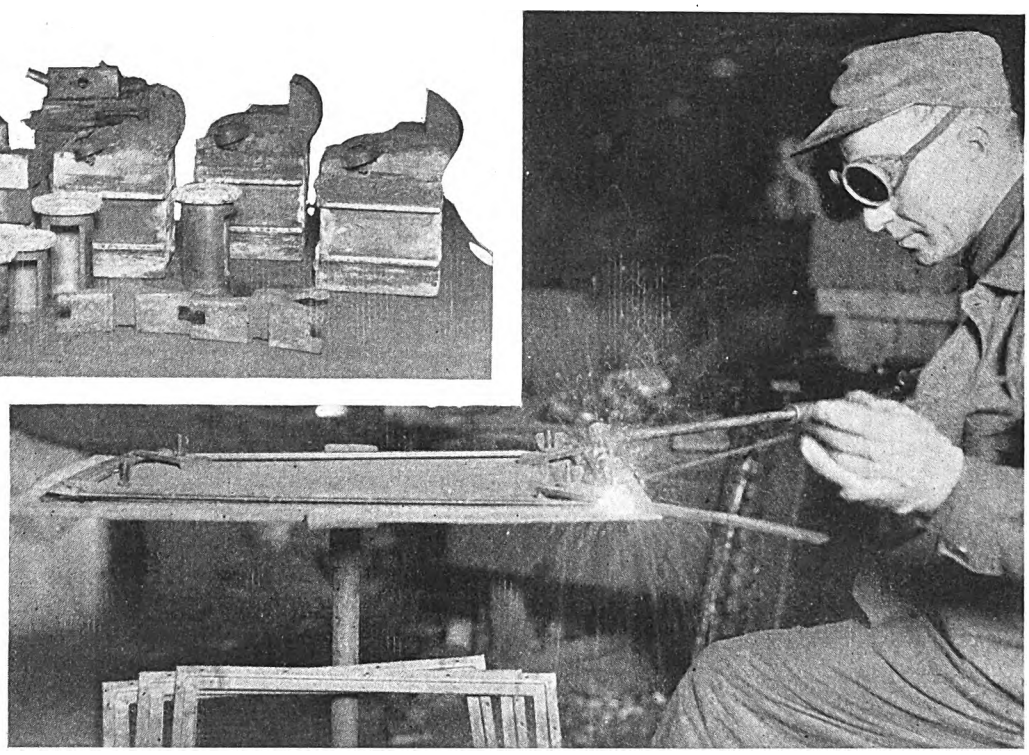
Acetylene Welding
Cuts Maintenance Corners

The process aids in maintaining the entire system from track to trolley and from power plant to shop. Repairs are speeded and large stocks of repair parts are made unnecessary

By W. I. Gaston
The Linde Air Products Company, New York, N. Y.



Armature bearings, worn sections of brakeshoe heads and the pedestal guides on journal boxes form an economical field for building up with bronze by acetylene welding



A revolving table used in welding display card holders facilitates the work

METHODS for maintenance must be chosen carefully in order to secure maximum economy in the operation of an electric railway system, large or small. Each problem that arises in connection with any part of the system probably has one answer that is the best, most efficient and most economical. That solution often may be some form of the oxy-acetylene process of welding and cutting.

In repairing track joints, use of a cutting blowpipe saves time. Rails can be cut and rusty track bolts removed in a fraction of the time required with a saw or chisel. For such jobs as cutting up old rails and laying them as guard rails, acetylene cutting is speedier, and therefore cheaper, than any other method.

For welding the bond terminals to the rails to obtain electrical connections that will permanently retain their high conductivity, no other method has given such satisfactory results as welding. The explanation is simple—other joints are at best contact joints, while the welded joint is a fused connection.

For rapid and thorough overhauling of cars it is necessary either to have a complete stock of replacement parts on hand or to recondition old parts efficiently. When a part is removed from a car it is replaced immediately by one from the stockroom and the worn or damaged part can be repaired and returned to stock for use on the next job. Of course, parts that are not interchangeable or not available are repaired while overhauling is in progress. A great many metal fittings, such as seat frames and supports, find their way to the welding department for repair.

On some large systems trucks are taken apart by cutting all bolts and rivets with the blowpipe. Cutting of bolts might seem unnecessary, but it is a great time saver since most of the nuts are rusted tight and many of the threads would be stripped if a wrench were used. Much hard labor is avoided by the use of the cutting

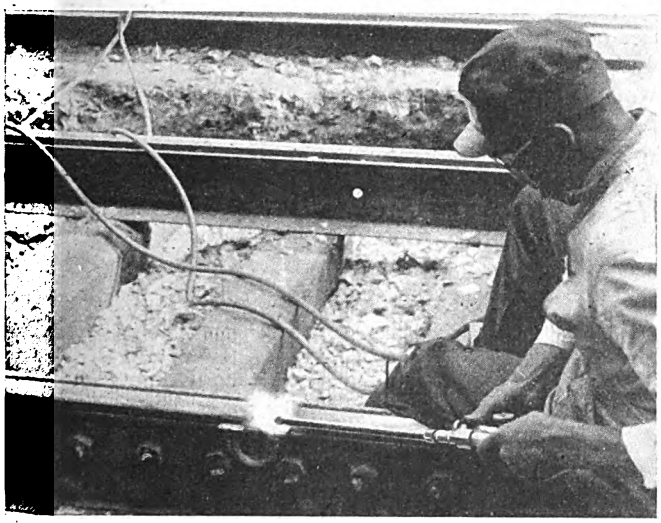
blowpipe. As each part is removed from the truck it is carefully inspected for breakage or wear. If defective in any way, the part is sent to the welding department for reclamation.

The oxy-acetylene blowpipe is used for heating in the repair of side sills and bumpers. When a sill is bent, it would cost a great deal of time and money to remove the whole plate (possibly destroying the bolt threads in doing so), then to carry the sill to a forge, heat and straighten it, put it back and repaint it. It is much easier to wheel a portable welding outfit to the car, heat the bent sill while in place, and force it back to shape with clamps or a sledge. Many bent or cracked bumpers also can be repaired in place. Welding will save a bumper from the scrap pile even if it is broken in two.

No parts under the car are subject to more wear than the brake mechanism. All levers, rods and beams must not only be connected, but they must also be supported with pins or bolts. Since everything must have a running fit it is easy to see that constant use wears the pins and elongates the holes. Levers, rods, beams and hangers are frequently worn at certain spots from continually rubbing against some other parts of the under-car structure. New pins are used to replace the old ones, but money and time are saved by filling in all elongated holes by welding and then redrilling them to correct diameter.

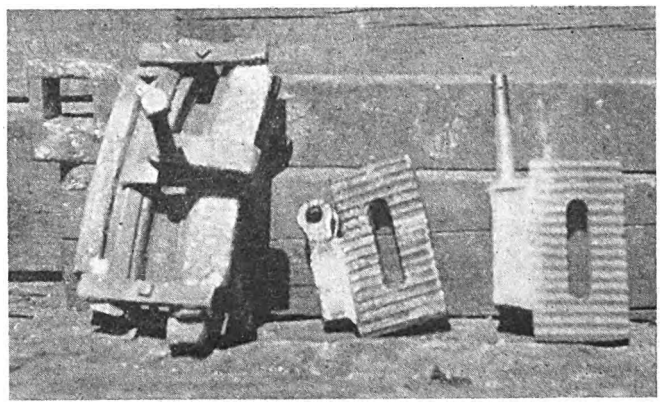


Welding a bond to a section of rail

In some types of braking mechanism a radius or circle bar transmits the force from the pull rod to the truck brake levers. As the brakeshoes and pin holes wear, the radius bar is pulled over toward the pony or idler wheels of the truck, often so far that the flanges rub and wear it almost through. This is another building-up job for the welders. Many of these radius bars are salvaged together with the other levers, rods, beams and hangers.

Repairing air compressor frames is another function of the welding department. Sometimes the side itself is broken, but more often a bearing lug has snapped off. If there is a hole in the frame a piece of plate is cut to fit, the edges of both frame and plate are chamfered, and the plate bronze-welded in. Then the weld is tested with kerosene to make sure it is absolutely tight. Or if a broken bearing lug has brought the shell to the welding shop, the piece is welded back on again. When the lug has been lost, a new piece is worked up from steel by the blacksmith and welded in place.

The dismantling of the truck continues while repairs are being made on the braking system. The motor suspension system makes use of steel bars and yokes and, as in the brake mechanism, holes that have become elongated are filled in for redrilling. Sometimes the vibration of a car throws a gearcase out of line and the gear chews a hole in it. The malleable-iron casting is then sent to the welding shop. A steel plate large enough to cover the hole is cut and bronze-welded over it. This is the simplest and probably the most satisfactory method of making this repair.



Ratchet castings for supporting shoe beams are reclaimed by welding

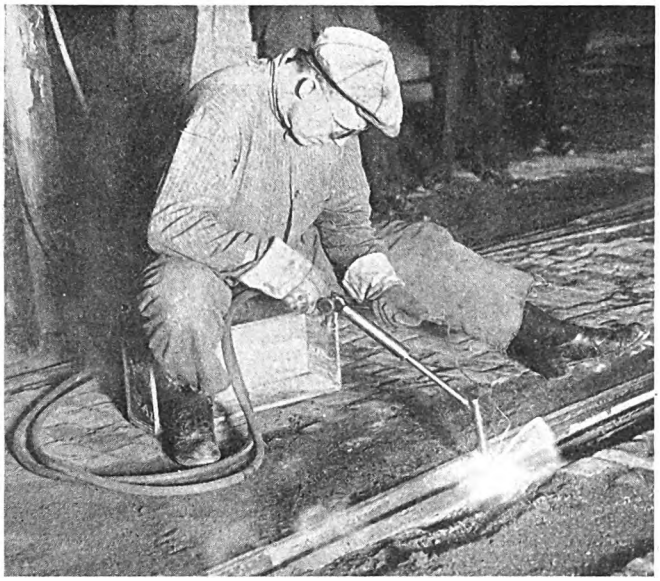
When rivets have been loosened by vibration, rivet holes in the side and end frames of the truck become worn. The same thing happens to the holes in gusset plates. All receive similar treatment; they are filled in by welding and then redrilled. Sometimes truck side frames break at the pedestal. It is common practice to repair them by carefully chamfering and welding the break. Then a piece of bar is forged to fit over the top of the pedestal. When it is approximately in place, it is heated with the welding blowpipe and clinched down tight on both sides. In forging the bar, the edges of the face that fit against the side frame are beveled, so that when the bar is in place there is a groove along its joint with the frame. This is used as a V and the point welded. The frame, because of the reinforcement, is then stronger than it was originally.

Worn and broken parts of seat castings can be easily reclaimed

When it is necessary to scrap a car wheel the axle is often worth salvaging. Sometimes, however, the wheel is shrunk on so tightly that it cannot be removed in the wheel press. Such wheels are cut off with the blowpipe. Starting at the flange the cut is worked inward toward the axle until it is possible to crack the wheel with a sledge blow.

Brush-holders pivot on pins and have springs to keep the brushes in contact with the commutators. The holes in the brush-holders,

Digitized by Google



Building up worn section of track at a switch

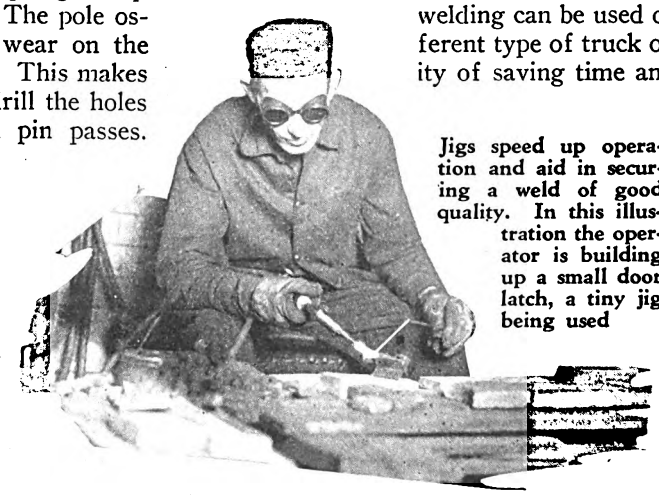
which are brass castings, become elongated. They are easily filled up with metal from bronze welding rod and then redrilled.

In a trolley base strong springs keep the wheel against the wire. The pole oscillates continually, causing wear on the fulcrum of the trolley stand. This makes it necessary to fill in and redrill the holes through which the fulcrum pin passes. The cast-iron lugs by which the controller is bolted to the platform are often broken off and must be replaced by welding.

In subway, elevated and interurban railway maintenance many opportunities for welding similar to those already mentioned present themselves, but there are others due to the different construction of cars and trucks. Long trains have hundreds of parts not required by the single surface car, such as draft gear and third-rail shoes. A frequent repair is made on ratchet castings used to adjust shoes for collecting current from the third rail. There is a bolt fastened to each which holds it in place. On one type this bolt is attached by means of a shackle which is a part of the casting. The pin through this wears the holes which are then filled in and redrilled. Another type of ratchet casting has the bolt welded directly to it. When this bolt wears out it is a simple matter to cut it off and then weld on a new one.

Blowpipes are also useful for the repair of storage batteries used in subway cars. Old plates are taken out and new ones attached to the connectors by the familiar process of lead burning. A series of inverted U-shaped strips attached to a base form a jig to hold plates in position during welding.

Jigs are used wherever possible to speed up the work and aid in securing welds of good quality. An accompanying illustration shows one of these. The operator is building up small door latches. This jig was made easily by welding two short pieces in 1-in. x 1-in. angle iron, heel to heel.



Jigs speed up operation and aid in securing a weld of good quality. In this illustration the operator is building up a small door latch, a tiny jig being used

A table with a revolving top on which the work is clamped is another time-saving fixture. In the illustration the operator is shown welding the corners of a display card holder used on the dashboard. The four sides are cut with mitered ends from the stamped strips, then clamped in place on the table and welded. The corner clamps, which are held to the jig by wing nuts, have their outer ends cut in V shape so that one prong of the V rests on each side of the corner. The weld can be made between them. This is a production job that is frequently encountered in street railway shops.

One street railway operating several hundred cars had a need for special brackets to reduce motor vibration. These were made by welding a 1-in. bolt about 1 in. long to each end of 2-in. channels 2 ft. long.

Certain kinds of fabrication occasionally are done in some shops. As a general rule the engineering departments of good-sized systems are continually experimenting, changing designs and trying out new ones. For fabricating miscellaneous new equipment, or changing over old equipment to conform to new designs, the blowpipe is useful. One alteration job consisted in cutting away a part of each axle cap to make provision for a new oiling system.

The specific uses mentioned are merely representative, being picked at random. They do not by any means cover the whole field. There are hundreds of places where welding can be used on electric railways. Each different type of truck or car offers some new possibility of saving time and money through the process. The repair of shop machinery and the fabrication of special equipment in the power plant and shop need not be dwelt upon at length. Typical applications include mending large and small castings, restoring worn or broken forgings, fabricating steam lines and even constructing small metal frame buildings. When any part fails to function properly or it is considered desirable to modernize a piece of equipment, welding furnishes an easy method of making permanent changes at small cost. There is always room for developing new uses of this sort for the process.

Boston's Maintenance Code

ELEVEN principles which are fundamental to the success of the maintenance department and may be considered as essentials of success generally have been laid down by H. M. Steward, superintendent of maintenance of the Boston Elevated Railway. These were printed in handy form on a 2x6-in. card for distribution in connection with an address given by Mr. Steward.

The principles are as follows:

1. Do work well—100 per cent if possible.
2. Do it on time.
3. Teamwork and co-operation will accomplish much.
4. Be efficient.
5. Be loyal to the department and the railway.
6. Learn to obey orders so that you may give orders.
7. Do not be wasteful of material—or time.
8. Think.
9. Be sure you are right and then go ahead.
10. Treat others as you want to be treated.
11. You do not know what you can do until you have to do it.

Watch the Condition of Your Varnish in Dipping and Baking

By John W. Jackson
Vice-President and General Manager
John C. Dolph Company, Newark, N. J.

To apply tape or string band coat with oil-proof enamel and while still wet wind with cotton tape, painting as it is wound. Wind cord even over the painted tape and then cover cord and ends of commutator bars with another coat of oil-proof enamel

"I WONDER what is the matter with that paint!" These are the words which too frequently come from the many electric railway users of insulating varnish. Reduced to its simplest terms, the problem in many shops consists in deciding upon the proper varnish, knowing and using the correct type of solvent, having specific information relative to the working gravity of the varnish and last but not least giving attention to the preliminary treatment of the objects to be impregnated. Many of the troubles experienced and the wrong methods used are the result of unfamiliarity with the properties of insulating varnish. "Know the Other Man's Job Too" was the caption given a recent article by one of the editors of *Industrial Engineering*. This reasoning is particularly applicable to the problems of insulating varnishes.

Great care may be exercised in the selection of a varnish, only to find later that the results are not as expected. The reasons for failure may be due to more than one factor. I will endeavor to discuss measures of omission rather than those of commission.

In many shops too little attention is paid to preliminaries. The cotton covering of wire, cotton tape and fibrous materials which go into the construction of coils absorb moisture readily, often up to 10 per cent of their weight. Many times this moisture is not driven out before the varnish is applied. It can be done only by subjecting the coils to prebaking at a temperature above the boiling point of water, or at 212 deg. F.

DON'T *try to reinsulate or dip a used armature in varnish until the dirt has been blown off and the oil removed by a benzine moistened rag.*

DON'T *use varnish that is too heavy.*

DON'T *use varnish too thin.*

DON'T *thin varnish near an open flame.*

DON'T *fail to check up gravity of varnish before dipping coils.*

DON'T *try to mix benzine and varnish unless both are at about the same temperature.*

DON'T *expect a varnish to keep itself clean and free from dirt and lint from the coils. Take it out of the tank and filter it occasionally through four to six thicknesses of cheese cloth. At the same time clean out the accumulation of muck and dirt in the tank.*

DON'T *guess at the amount of benzine that may be needed to bring a heavy varnish to the right dipping consistency. Use a thermo-hydrometer and solvent chart and be sure.*

DON'T *try to establish the right dipping consistency of a varnish with a stick or stirring rod. Use a thermo-hydrometer.*

DON'T *fail to provide a close fitting cover for your varnish tank and see that the cover is down when the varnish is not being used. This precaution will save time and trouble and prevent undue evaporation of the volatile benzine solvent.*

DON'T *fail to provide a thermometer for the oven. With this the temperature may be controlled and it will prevent burning up the coils or underbaking the varnish.*

DON'T *neglect to ventilate the oven properly. See that openings are provided at the bottom for the access of fresh air, and openings at the top to carry off fumes driven off the varnish during the baking.*

DON'T *pull an armature from the varnish too quickly. Give it a chance to absorb the varnish and then pull it out slowly, and thus secure a uniform coating.*

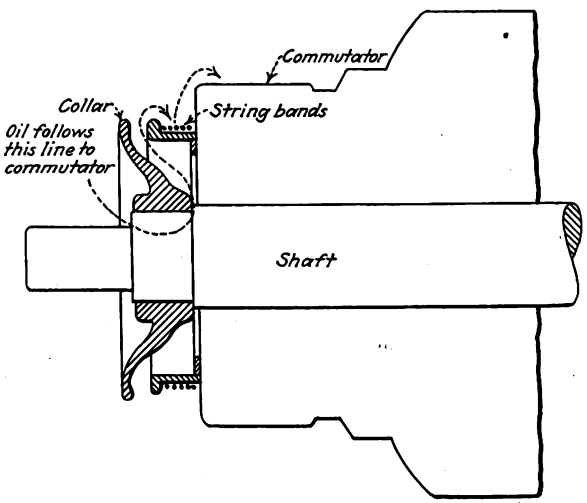
Digitized by Google

Prebaking is of value in other ways. The copper becomes heated uniformly expanding the air in the coil and the varnish penetrates quickly to the inner layers of the windings when the coil is immersed in it. It has also been found that prebaking shortens the regular baking period. The heat stored in the coil tends to assist in the quick expulsion of the solvent.

All varnishes should be maintained at a certain gravity. Gravity is governed by the type of base and the type and amount of solvent. High gravity solvents evaporate quickly, causing the varnish film to set too soon. The heavy coal-tar derivatives, while having high solvent properties, take too long to evaporate from the coil windings.

Solvents or Thinners Should Be Given Thought

The nature of many varnishes on the market make it necessary to use benzol as a thinner. As they become heavy and reach the "go-back," or livered, stage the



Path of oil seepage to string band and commutator

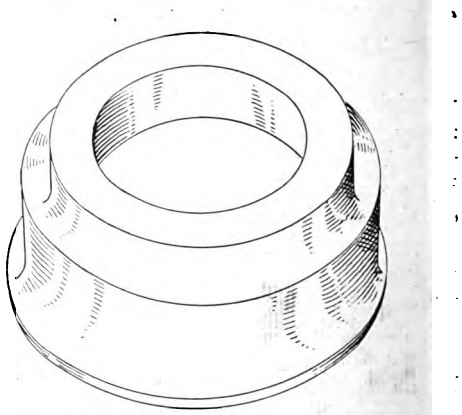
benzol solvents will bring them back to a usable condition. The light petroleum distillates have little solvent effect on varnishes of this character. Many men have found too late that after the so-called thinning of their varnish they have nothing but colored gasoline in their windings. The benzol types of thinner should never be used in any baking varnish. All these types of solvents present an extreme fire hazard, the flashpoint being below freezing. They will positively attack enameled wire. In addition it has been demonstrated that they are injurious to the workmen.

It is surprising to know how many men who are responsible, rely on the old stirring stick when determining the amount of solvent necessary to bring the varnish to its proper gravity. The temperature of the varnish at the time of its thinning should be known definitely. Temperature and gravity should go hand in hand. How many times have you seen men pouring in solvents and watching the flow of the varnish from the stirring rod as an indication that enough solvent has been introduced? Some men who are fortunate enough to have a hydrometer really exercise care in taking the gravity of the varnish but pay no attention to temperatures. Then again others take into consideration that it is necessary not only to take the gravity but are equipped with a hydrometer and a thermometer. Even with both of these it is surprising how much time can be wasted before the necessary amount of solvent is poured into the varnish to reduce it to its proper working gravity. Our company, several years ago, saw that much time could be saved by working out a solvent chart which would indicate the number of gallons of solvent to be added to every 100 gal. of varnish in order to reach the desired specific gravity. A copy of this is reproduced here.

The varnish and the solvent should be at about the same temperature before endeavoring to introduce the lighter gravity solvent into the heavier-bodied varnish. The solvent should be added slowly while stirring vigorously until it is taken up entirely. Addition of large quantities of cold solvent will curdle the varnish, which renders it practically unfit for use. The best time to reduce the varnish is at the end of the day. It is then warm as the result of the continual dipping of hot coils, armatures and fields.

Periodical straining or filtering of the varnish is always advisable. No matter how carefully they are cleaned continual immersing of machines is bound to leave a certain amount of dirt in the varnish.

Use of the thermohydrometer (shown at left) eliminates guess work regarding proper consistency for dipping varnishes



The inside of oil collar should be smooth and free from fine grooves

In the opinion of the writer, next in importance comes the type of slot insulation. It should afford not only dielectric strength but mechanical protection as well. Many shops use untreated wooden wedges together with varied types and construction of slot insulation. Using these materials with no preliminary treatment, very little varnish gets down into and fills the slot. After repeated coats of varnish have been applied and baked in, it is obvious that no oil, dirt, moisture or any other foreign matter can reach the coils provided the varnish is absolutely oilproof.

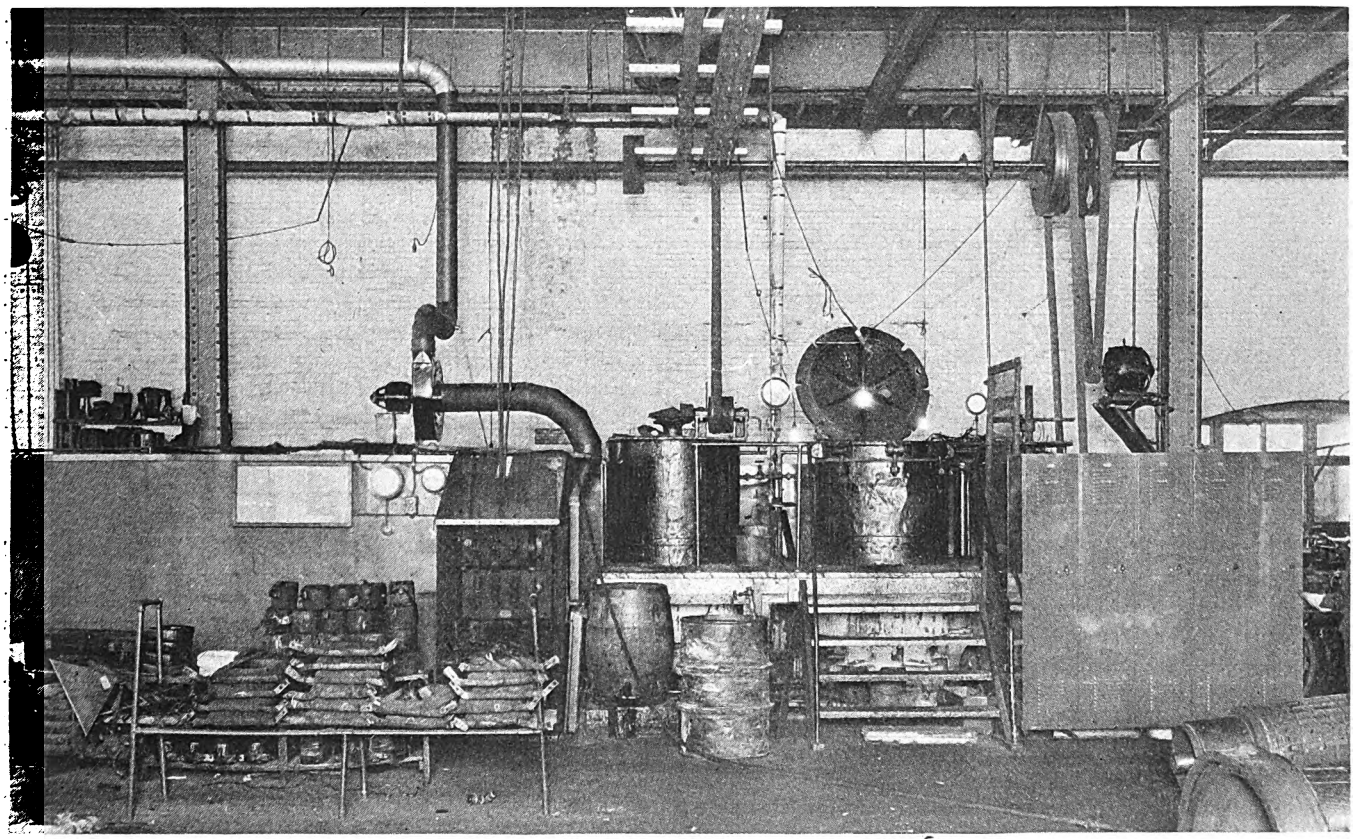
Whether or not a varnish should be oilproof is causing a great deal of discussion today. In this connection our company through its representatives in the field has endeavored to get expressions from the men in the shops as to why motors go down and the causes for such failures in the order of frequency. Naturally first on the list is bearing trouble. Second is commutator trouble on d.c. motors. Third is lubricating oil which finds its way into the windings.

Lubricating oils, by carbonizing windings, cause breakdowns, particularly in compressor motors with splash lubrication using a light oil. Bursting bubbles throw a fine spray of oil into the air; the motor ventilating itself

Digitized by Google

draws this air against the windings. A chemical reaction takes place. The necessary agents for changing oil into carbon and water are present in the motor; they are the copper in the coils, heat from the windings, oil from the bearings, oxygen and ozone from the air. Coupled with heat, the oxygen and the oil, the copper in the coils acts as a catalyzer, breaking up the oil into carbon and water. The water evaporates while the carbon remains in fine particles on the insulation. Additional oil finds its way continually into the windings and if the insulating varnish is not immune it is only a question of time before the oil disintegrates the varnish film and carries the carbon and dust down into the coil windings.

The cleaning of motor windings should receive more attention. It will not only increase the life of the motor but also benefit the impregnating varnish. The cleaner the motor the less dirt and grease find their way into the varnish. Gasoline, benzine and carbon tetrachloride for the windings and alcohol for the commutators seem to have first call as cleaning fluids. Frequent, systematic and thorough inspection of all equipment as part of the routine should be the standard under which every shop management desires to operate.



Carefully arranged dipping tanks and drying ovens will do much to insure satisfaction with insulating varnishes

Control of Oil Seepage from Bearings to Commutator

Oil seepage may be laid to the heat generated and to end play in the armature. Secondary reasons are, first, wearing of grooves in the collar and on the shaft; second, improper removal of the collar, and third, improper fitting of the original collar, causing the first grooves to occur on shaft and collar.

A collar to be placed properly should be heated to approximately 300 deg. F., and placed with a press fit. It should have an inside diameter about 0.004 in. smaller than the shaft. In using this method there is no drag on the shaft and the collar is placed easily and properly.

If there is seepage to the commutator the collar should be removed in the following manner: A gas ring made of ordinary 1-in. pipe with a slightly larger circumference than the collar, should be placed over it and heat applied for an average of seventeen seconds. With a clamp placed securely about the collar, approximately 1 to 1.5 tons hydraulic pressure will remove it. The collar and shaft can then be examined for grooves. These usually are very fine, but with the end play on the shaft they are sufficient to act as a pump, carrying the oil from the bearings under the collar, on the string bands and finally the deposit of carbon particles, dirt and oil cause a short circuit and burning out of the motor. The collar should be built up by welding and the inside surface made free of grooves. The shaft should also be free of grooves after which the collar may be replaced. This method of placing and removal of the collar aids considerably in overcoming the flow of oil from the bearings to the commutator.

"How Much Does it Cost to Insulate?"

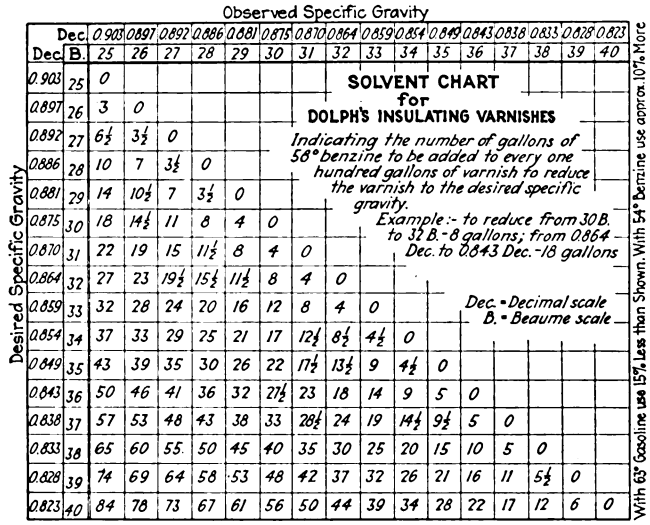
Many insulating varnishes today are bought not because of the protection they give but on account of their price. Such varnishes, no matter how cheap, are costing their purchaser many times their price. Cost records disclose that the cost of insulating varnish used is only a small fraction of the total cost of the rewinding.

Great strides have been made the last few years in an endeavor to overcome bearing troubles. There are still hundreds of motors operating which cause their owners more or less trouble from oil, consequently those motors should be dipped and baked in an insulating varnish which is absolutely immune to oil. Resistance to oil can

Digitized by Google

be obtained only when the coils are baked properly and sealed perfectly with the proper insulating varnish. If two or three dips are necessary to provide the proper seal the time and the small amount of varnish used will more than compensate for the additional trouble by prolonging the life of the machine. Many men, I find, are resorting to several additional coats of a spirit finishing varnish, which in addition to giving protection against oil, dries with a hard, smooth finish. Such a surface will prevent dust particles from adhering or cutting into the insulation. This type of varnish is an insulator only when thoroughly dry, so that if ground tests are made this point should not be overlooked.

Few armature repairmen appreciate the value of an



Solvent chart showing thinner needed for an insulating varnish

oilproof insulating enamel for tape bands and string bands in the V at the end of the commutator. An oil-resisting insulation makes it easy to keep the bands clean and protects the exposed ends of commutators so that many motor troubles disappear. For this purpose there are oilproof enamels available. After the commutator has been turned down and the mica cone is ready for banding a coating of oil-proof enamel, followed while still wet with cotton tape the full width of the mica, can be put on, painting the tape as it is wound in place. Cord wound evenly over the painted tape, pulled taut, fastened securely in place and covered with enamel, will provide a waterproof insulation.

Correct Baking Necessary

The dielectric strength of a varnish depends in a large measure on its correct baking. This requires economical heat distribution and a ventilating system to give proper air circulation. With poor ventilation it is not to be wondered at that baking for a period of from twelve to 72 hours is needed. Not a few persons consider an iron box large enough to accommodate several motors good enough for a baking oven. They introduce enough of heating units to give temperatures from 200 to 250 deg. F. and then arrange a lid or door so that the oven is almost hermetically sealed. Proper drying requires that the solvents which have been driven from the varnish should be carried off. These vapors not only retard the drying but are a fire hazard and sometimes have caused explosions. In any oven a large part of the heat is absorbed by the metal parts of the interior before the oven is brought up to its correct temperature. Unless the metal frame is protected with some good heat insulating material the cost of operating the oven will be high. Too much air circulation retards baking, so the mere placing of openings in an oven for the inlet and outlet of air does not constitute a real ventilating system. The openings should be proportioned and located to provide for the proper air circulation.

New Automatic Power Plant in Operation

WITH the completion of the new automatic power plant at Alouette the British Columbia Electric Railway will add 12,500 hp. to its hydro-electric system on the lower mainland of British Columbia. This new power source cost approximately $2,500,000.

The new power plant is located about 25 miles due east of Vancouver. The nearest point on either roadway or railway was Haney, and the first work to be undertaken by the company after deciding to develop the water power of Alouette Lakes was to establish the necessary transportation communication.

A tunnel has been driven from Alouette Lakes to the Stave River and a dam built to raise the level of the lakes to permit the necessary diversion, and to increase the storage capacity. The new plant will supply power to the lower mainland of British Columbia and is an indication of the confidence which the British Columbia Electric Railway has in the future of this province.

New Color Scheme for Baltimore Cars

FOR NEARLY a year the United Railways & Electric Company of Baltimore, Md., has been operating cars of various colors and color combinations with the idea of learning which colors stand up best and at the same time are most popular with the public. Residents of the city were requested to make suggestions and hundreds of letters were received.

The color scheme, which was adopted for rear entrance cars, is one of the most popular with the people and also has proved to be one that will best withstand the elements. The body of the car is a dark red, the trimming around the windows is cream and the roof is buff.

Since the test was started there have been many letters received urging the company to adopt various shades, one of the earlier leaders being solid green. Careful check, however, showed that this color did not meet the test and after the cars painted this hue were in use for a few months it was found that they appeared to be soiled. For this reason the company decided that another color would be better.

A great many persons favored the combination that has been adopted and when the tests showed that this stood up as well as any of the others and better than most, the officials decided that it should be the combination for all the rear-entrance cars.

Bright red and blue met with considerable favor on the part of the public but in announcing the official action of the company, Raymond S. Tompkins, assistant to the president, said it was found that both of these colors faded. The company will have the new combination of colors used on all the cars to be painted as quickly as possible.

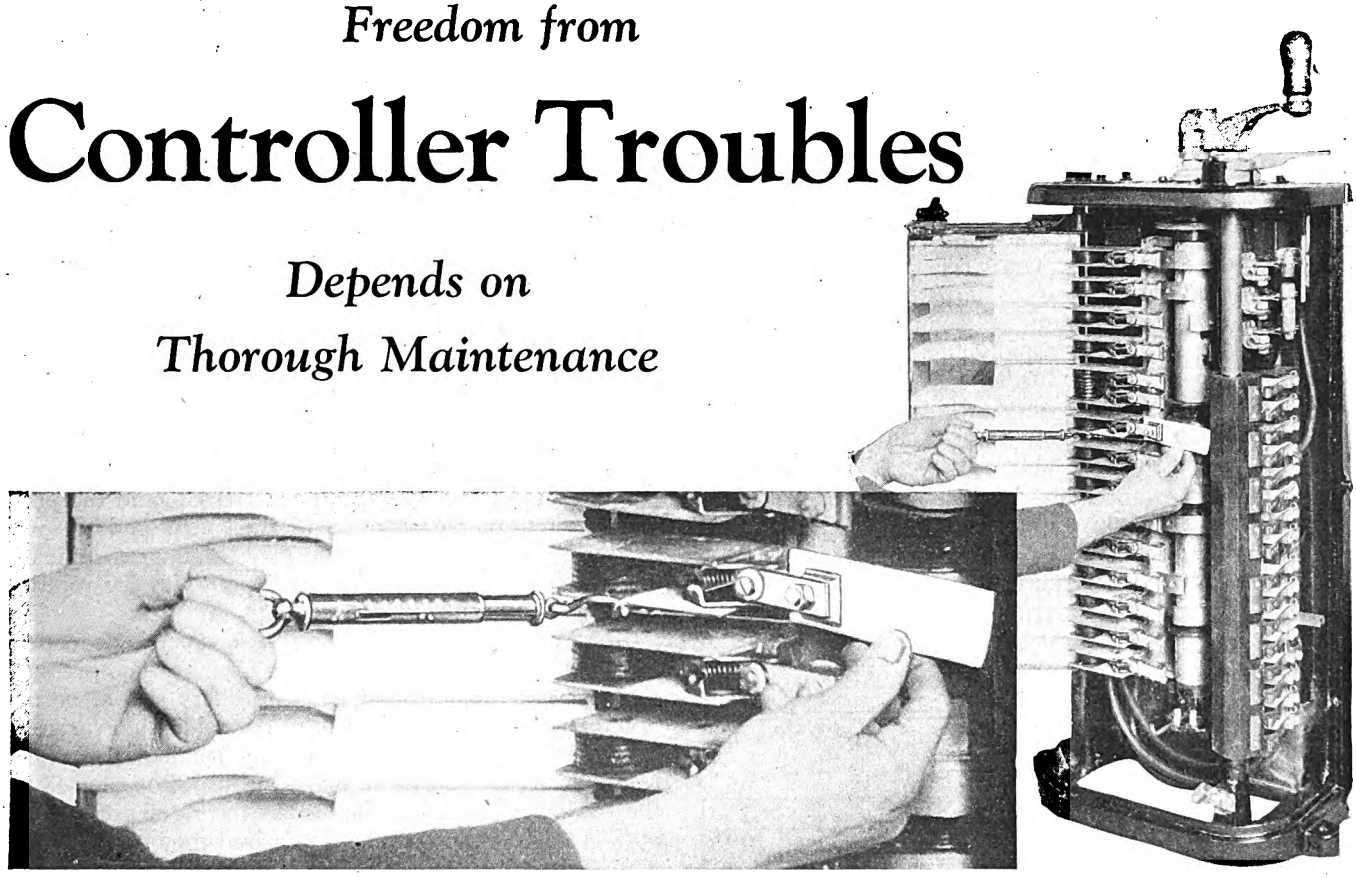
Freedom from

Controller Troubles

Depends on Thorough Maintenance



Contact pressure is measured best with a spring balance and a wire loop. Pulling on a strip of paper between the contacts indicates when the pressure is to be read

Correct pressure adjustment of contact fingers prevents arcing and reduces wear. Records of failures assist in maintenance. Too much lubricant is as bad as too little

By R. S. Beers
Railway Engineering Department General Electric Company

MAINTENANCE of control equipment on street cars is one of the important factors in their successful operation. It seems impossible to put a finger on any one method of maintaining apparatus and say this is "it." Differences in climate, conditions of operation, etc., are the determining factors. Only one type of maintenance has proved unsuccessful wherever tried. It is "deferred" maintenance. In electric railway control devices, dust, dirt, carbon and metal particles are the things that cause trouble, and it really settles down to a question of cleanliness as the price one pays for freedom from trouble.

The best practices are found on properties where overhaul of the equipment is on a mileage basis. At the overhaul periods it is dismantled completely, all parts cleaned and any that would wear out before the next overhauling are replaced. When reassembled the apparatus is tested thoroughly and goes back on the road with the same factor of safety it had when originally put in service. Pull-ins for equipment failures are then very infrequent. The cost for this method is less than on some companies that never overhaul their equipment and only replace parts when they fail in service or are found completely worn out at regular inspection.

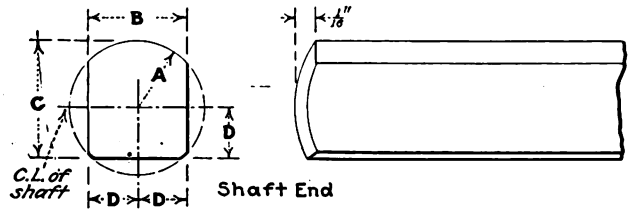
Records may appear a nuisance instead of a help, but when made simple, they serve a purpose that nothing else does. If only one record is kept it should be a pull-in record, showing the miles operated for each pull-in on account of equipment failures. When this is plotted on a graph and circulated about the property a desire to increase the miles per pull-in can be built up. That will point out the desirability of further records, which in turn will make possible an intelligent survey of troubles experienced and also give data for their analysis and correction. In addition they will give reliable information about the life of equipment and renewal parts that may be used by the storekeeper to keep on hand adequate stocks of renewal parts and raw materials.

With the modern K-type controller, inspection should consist of occasional oiling of the bearings; trying the

Digitized by Google

star wheel and drum castings for tightness; replacing worn parts such as star wheel pawls, pins, fingers, segments and arcing plates; examining the cutout switch for contact, making sure the proper mechanical interlocking between main and reverse drums is present; trying contact pressure of the reverse fingers; adjusting the drop of the main fingers; filing roughened segments, and replacing worn-out segments and burning tips.

The two essentials for the successful and economical operation of controller fingers and segments are lubrication and contact pressure. Without the former both finger and segment wear rapidly and the motorman complains that the controller turns hard. The best lubricant is a high flash point oil or grease. For ordinary temperatures a grease of about the consistency of vaseline gives the best results. The tendency is to use a generous amount of lubricant because too little makes itself evident by roughened fingers and segments. When too much is



Part	For Shaft Diam.	A	B	C	D

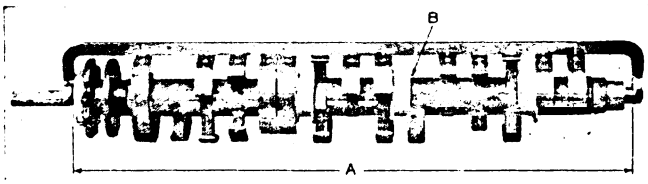
8	1"	.500" +.0000" -.0015"	.759" +.000" -.002"	.8795" +.0000" -.0025"	.3795" +.000" -.001"

Correct broached dimensions for 7/8-in. and 1-in. controller shafts



Template for locating body castings on controller cylinder

used a part of it falls on the surrounding insulation and collects dirt and copper dust with a tendency toward insulation failures. The best practice is to spread a liberal amount of lubricant over the segment, turn the controller drum back and forth several times, and wipe around the fingers and the segments to remove any surplus.

Correct Adjustment of Contact Pressure Is Important

Adjustment of the main fingers is next to lubrication in importance. Usually they all should leave the segments at the same time when turning to the off position from the first notch. This is particularly necessary with the older types of controllers, such as the K-6, K-10 and K-28, where the factor of safety is none too large when rupturing the arcs with the present-day voltages to which they are subjected. After this adjustment the inspector turns the controller to the on position and judges whether the drop of the finger is enough to give good contact on all notches and not sufficient to cause it to stub. The above factors determine the proper amount of drop, which will vary from 3/32 in. to 1/4 in. With new controllers 1/8 in. or less is sufficient, while with worm segments and worn controller bearings the higher value may be necessary. Too much drop makes the controller turn hard, wears the fingers and segments rapidly and, most important of all with flat spring fingers, gives a shock to the finger spring when it strikes a segment that often reduces its life to less than that of the contact tip. A broken finger spring usually means a pull-in.

With the hinged and self-aligning types of controller fingers, where pressure is applied to the contact by means of a compression type coil spring, this difficulty is removed and the operator has more latitude in the adjustment of the fingers. On the other hand, if the fingers are given too little drop there is insufficient pressure, with poor contact between finger tip and segment with the possibility of an arc which not only destroys the finger and segment, but sometimes causes a controller blow-up. It is obvious that, as controller bearings wear, the cylinder does not rotate in an exact circle, and the pressure at the point of contact of the finger and segment varies. It is then necessary to give the fingers sufficient drop to insure good contact at all points in the rotation of the controller drum.

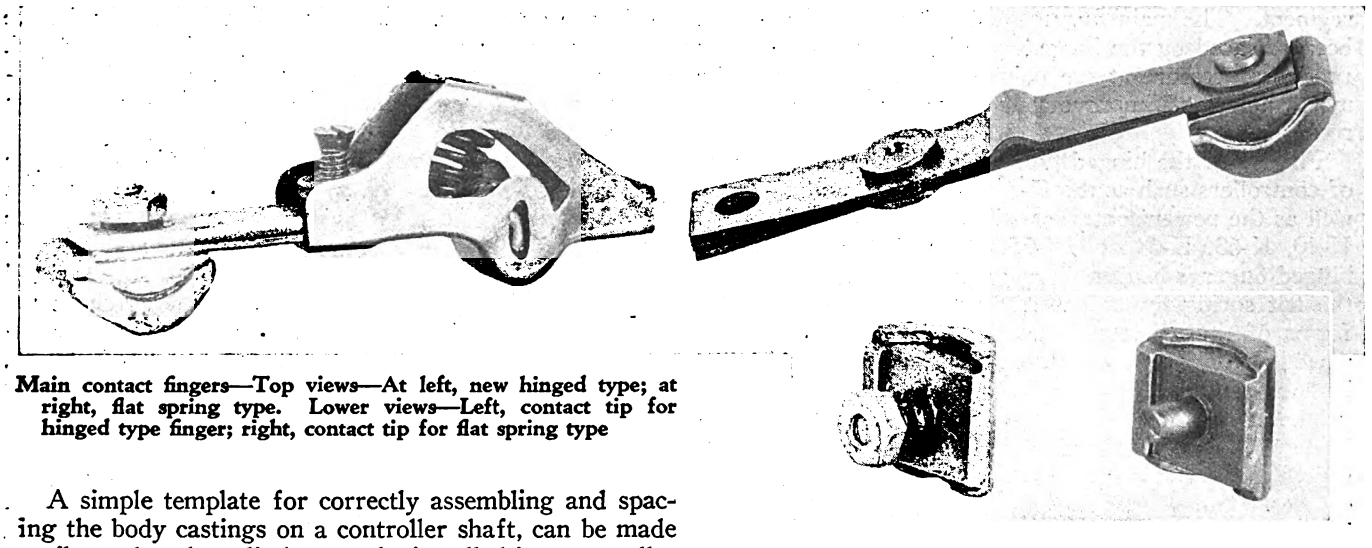
Pressure between the finger and segment is dependent on the shape and size of the finger spring. The pressure of the main fingers on drum controllers should be not less than 4 nor more than 8 lb. A considerable variation in finger pressure can be made by bending the finger spring to a new shape. Usually an inspector can tell by the feel of a finger whether it has the right pressure or not. When measurements are desired they can be made with a small spring balance and a wire loop or stirrup.

Sand Blast Is Satisfactory Cleaner

When overhauling a drum controller it is best to remove it from the car and dismantle it so that the various parts may be examined and repaired. The most important thing in overhauling a drum controller is to clean it. The quickest, easiest and cheapest way of cleaning the insulating parts of the controller such as the arc deflectors, main and reverse finger blocks, and the controller drum is to use a sand blast. A number of satisfactory sand blasts are on the market and it is possible for an operator to make a simple one himself. Wherever air is available, no method can equal the sand blast for cleaning controllers and putting them in good shape. In addition, if the brass and copper parts are dipped in a cleaning bath they will have a much better appearance. After the wood parts have been cleaned, they should be given one or two coats of insulating paint or varnish. The smoke, soot, and dirt which collect in the controller are readily seen on a clear or red varnished surface and wiped off, while on a black surface they remain undetected. The deflector parts on which the arc strikes should not be painted with any kind of varnish. In a number of instances operators have had trouble from this source. When heated paint and varnish give off a gas that burns easily.

The bearings for both main and reverse drums should be examined and when badly worn should be rebushed. The broached end of the main drum where the handle fits should be measured. If badly worn it should have a sleeve put on or else be built up and remachined. Dimensions for 7/8-in. and 1-in. shafts are given in an accompanying diagram. When manufacturing controller cylinders the broached end is made first and the star wheel and drilling of the segment screw holes located from it. By reversing this process the proper location for machining the rebuilt shaft may be determined.

Digitized by Google



Main contact fingers—Top views—At left, new hinged type; at right, flat spring type. Lower views—Left, contact tip for hinged type finger; right, contact tip for flat spring type

A simple template for correctly assembling and spacing the body castings on a controller shaft, can be made easily so that the cylinder may be installed in a controller and turn freely. The space shown as *A* is the distance between the bearings in the controller frame and cap plate. The white lines that register with the segment screws locate the body castings so that the fingers line up with the segments when the drum is put in a controller.

When a controller cylinder is dismantled small felt washers are found separating the ends of the body castings from the insulation collars or space blocks indicated by *B*. These felt washers have an important function in keeping copper dust from working into any crack between the casting and the insulation collar where it builds up a conducting path from one body casting to the next. If felt washers are not available paint, string or asbestos paper may be used to close the cracks. Until recently the controller shaft and its insulation were made in a single unit, making it obligatory to replace both when either failed. Now the insulation is formed in a separate hexagonal tube and may be placed on any shaft.

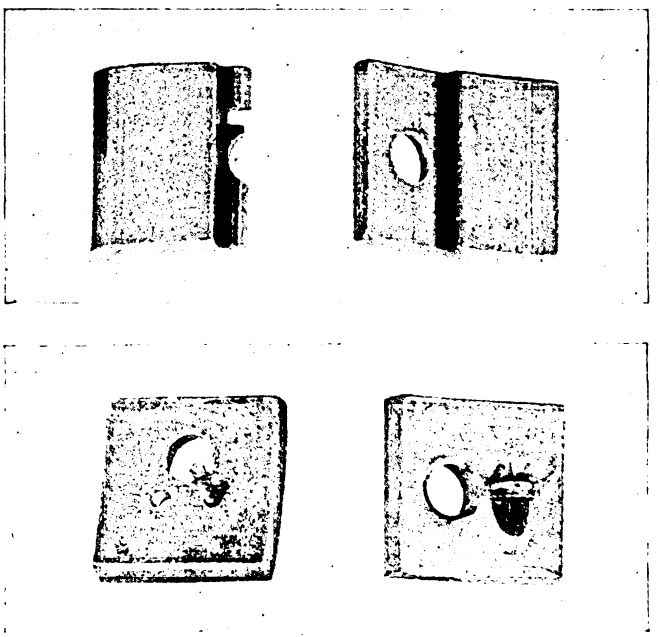
Hexagonal Shafts Prevent the Loosening of Body Castings

Early controller drums were made with a round shaft and insulation sleeves which separated the shaft from the body castings. The jars and shocks received in service often caused the parts to loosen. The only safe method of tightening loose body castings is to renew the insulation, which requires a complicated reheating fixture for each type of controller cylinder. The cure for loose body castings is a controller drum with a hexagonal shaft, a type that has been in successful use for twenty years.

There are no other changes to a controller which will reduce the likelihood of blow-ups as much as replacing steel covers with wooden ones. For years the covers for drum controllers have been made of ash wood and finished with a coat of varnish. Recently the wood was changed to cherry and the finish omitted so that the cover could be stained to match the car interior. A heavy paper shield protects the surface of the wood during shipment.

When overhauling drum controllers the wiring should be examined. If the rubber is in poor condition; that is, hard and brittle from age, or soft and mushy from grease or oil, it should be replaced. Standard cable is preferable to solid wire for this purpose. On controllers using it, the single blowout coil should be removed and treated exactly like a motor field coil; that is, tested for shorted turns, dried out in the drying oven, dipped in insulating varnish and baked.

Frequent improvements are made in the detail parts of drum controllers. Whenever a change is decided on, every effort is made to design the new part so that it may replace the old part without cutting and fitting. Users of drum controllers are furnished 1928 model repair parts for a 1910 controller. As an example let us take the K-35 controller of 1920 and today. The frame has had cable troughs added. The cap plate has been changed to include machined pads for installing an LB control device, TA handle switch or Safety Car Devices handle. The main cylinder has an insulating tube that is renewable instead of being made an integral part of the shaft. Three changes have been made in the segments: First, a better type of burning tip known as the lap type; second, a slight increase in the length of several segments that increases their life several times, and third, elimination of dowel pins in segments. The dowel pin is replaced by a copper key made an integral part of the



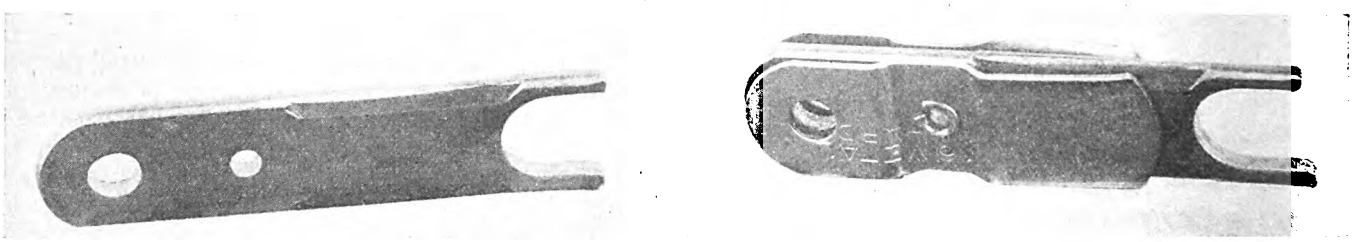
Burning tips—Top views—At left, new style lap type; at right, above—Old style lock type. Lower views—At left, new style with key; at right, below—Old style with dowel pin

Digitized by Google

segment. The main fingers of the flat spring type have been replaced by the hinged type in which a coil spring produces pressure at the point of contact. This is the most important improvement in finger design during recent years.

Fingers of the hinged type are available for old types of controllers such as the K-8, K-10, K-12 and K-28, as well as the newer controllers like the K-35, K-36, K-39, K-40, K-63, K-64 and K-75. The contact tip on the hinged finger is held in place by a nut and a screw, while the flat spring finger has it riveted in place. The two forms of tip are interchangeable, so when tips are renewed on flat spring fingers the nut and screw type can be substituted.

The 1920 model of motor cutout was a simple knife-blade switch. Today the blade is reinforced so that the switch jaws cannot spread and overheat because of poor contact. Today, all cables are soldered to terminals and bolted in place instead of the strands being squeezed under a clamp. The line breaker or line switch has come into general use with K controllers in recent years. Its main functions are to take a large part of the arcing away from the controller fingers in normal operation, making inspection and lubrication less frequent, and to open the main circuit in an overload and protect the equipment from injury. It replaces the usual hood circuit breaker and removes from the car platform all excessive arcing.



Cutout switch blades. At left, old style; at right, new style with reinforcing

Line Breakers Need Close Attention

With line breakers, the parts requiring attention at inspection are the main contacts, all control circuit contacts, the arc chute, loose terminals and worn parts. When the contact tips are held by a single screw, a socket wrench should be used for tightening them. If they do not remain tight, new bases carrying the contact tips should be installed, as a contact tip base or support on which the tip loosens is a potential source of control failure and pull-ins. Contact tips should be replaced when worn half-way through. Roughened contacts should be filed smooth. Control circuit contacts should be cleaned and tried for pressure when closed. Arc chute parts that direct and cool the arc should be free from copper particles. When a hole is burned half-way through an arcing plate, it either should be replaced or the hole should be filled with an arc cement. To obtain successful results with arc cement it is necessary to clean the hole to be filled thoroughly.

In addition to the above, pneumatically operated line switches require that the air cylinder be lubricated, that the magnet valve be tested by air for leaks and the line switch tested for quickness and snap of action by opening and closing the line switch by means of the push pin on top of the magnet valve. Lubrication of the pin bearings of a line breaker is successful on some railways and a failure on others. Whether it is a success or failure depends on the amount and kind of dirt encountered. Often the dirt and oil mixture forms a grinding compound that wears the bearing pins and their bushings faster than when no lubricant is used.

One of the functions of the line breaker is to open the circuit on overloads. When a motor flashes over or a cable grounds and an excessive current flows, the line breaker is called upon to open the circuit and prevent serious damage. This requires that it be kept in good electrical and mechanical condition. For this reason the line breaker should be removed from the car at general overhaul or when the car goes through the paint shop, and be put in as good condition as when new. First it must be torn down and cleaned. The operating coil should be heated, dipped and baked the same as a field coil except that the drying out should last only a couple of hours and the baking not more than six hours. All worn parts, particularly pins and bushings, should be renewed. The contact tip pressure should be measured and new pressure springs installed if needed.

The contact pressure is measured with a spring balance as shown in an accompanying illustration. Pulling on the piece of paper between the tips indicates when to read the pressure. As contact tip pressure varies with each design of line breaker, the correct tip pressure for each type should be obtained from the manufacturer. Magnetically operated line breakers will perform successfully if they have a tip pressure of 7 lb. or more. On a new line breaker the pressure should be considerably more than 7 lb. because the pressure falls off as the tips wear and pins become loose in their bearings.

The overload relay should be tested and set at the correct trip point on the circuit breaker testing rack. In addition the pneumatic operated line breakers should have the piston packing examined and softened or renewed if necessary. The magnet valve stems should be measured for wear. Properly made magnet valves should operate at least three or four years before renewal of valves and valve seats is necessary.

When hood circuit breakers are used instead of line breakers for opening the circuit on overloads and other excessive currents, it is particularly important that they be kept in the best possible operating condition. Like all other control devices, they should be kept clean. Next in importance is the mechanical condition which should be such that the latch and other parts operate when needed. Then comes the arc chute which should be kept free from holes, copper dust and soot. Lastly, the contacts require enough pressure so they do not overheat.

To reduce the amount of flashing in the car when a circuit breaker opens, on some properties small houses are built over the arc chute. This is good practice provided sufficient windows are left open in the housing for the expansion of the arc.

Carefully worked out system for protecting and cleating motor leads. Knuckle joint connectors are covered with hard-fiber tubing and chafing of leads is prevented by spirally wound wire armor

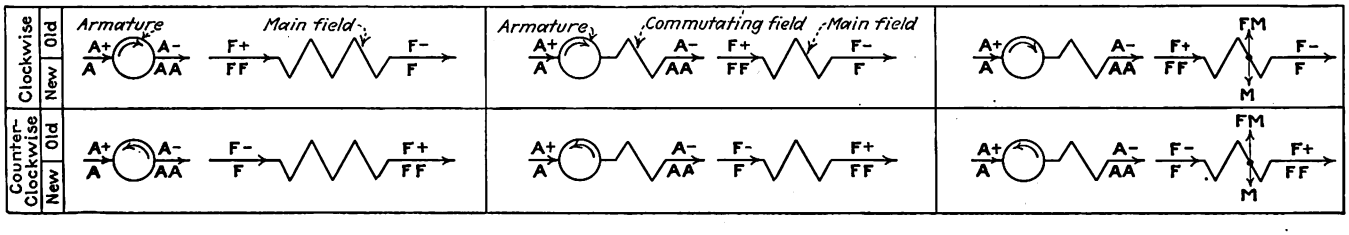
Your Motor Leads

Require Adequate Attention

By John S. Dean
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

CABLE leads on railway motors are a source of considerable trouble. Much can be done to improve their reliability in carrying the working current. First of all, the car wiring should have ample current carrying capacity and be flexible as well as mechanically strong. Thorough insulation is essential to prevent grounding. Leads should be protected where they come in contact with the motor frame and be provided with a reliable connector that can be broken quickly to simplify the disconnecting for motor repairs. Firm cleating to the motor and to the car body will reduce troubles.

Lack of uniform standard sizes and the great variety of stranding of cable for motor leads produced by the several cable manufacturers make it difficult to select an approved definite stranding and insulation of the cable. The accompanying table gives sizes which are satisfactory for different motor horsepower ratings. In listing these, the minimum size recommended by the American Electric Railway Engineering Association has been taken



Old and new markings on railway motor cable leads

At left, markings for standard non-commutating pole non-field control motors; in center, markings for standard commutating pole non-field control motors; at right, markings for standard commutating pole field control motors.

In each diagram the old markings are shown above and the new markings below the center line. The upper diagram in each group is for clockwise rotation and the lower diagram for counter-clockwise rotation. Arrows indicate current direction.

Digitized by Google

into consideration. This table shows the sizes of cables as adopted as standard by one of the large motor manufacturers.

CAPACITY AND DIAMETER OF MOTOR LEADS

Motor Rating Hp.	Cable Size Circular Mils	Dimensions in Inches: Cable Diameter	Dimensions in Inches: Outside Diameter	Length of Lead Outside Motor Frame
Up to 45	29,000	0.20	0.56	4
46 to 80	52,000	0.30	0.66	5
81 to 120	83,000	0.38	0.77	5
121 to 160	110,000	0.43	0.83	6
161 to 210	142,000	0.50	0.90	6
211 to 260	180,000	0.56	1.02	6

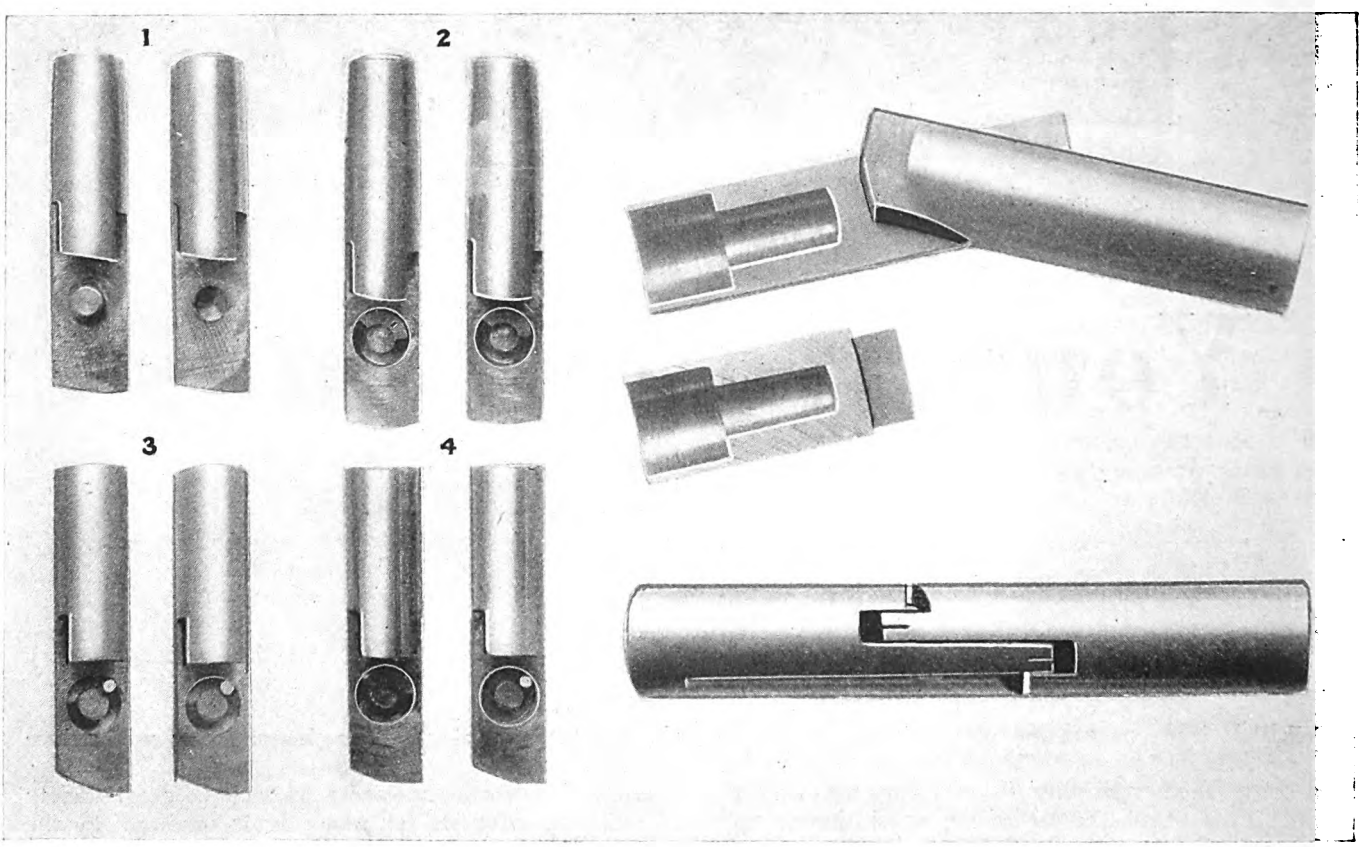
Without dependable connectors of proper design on the cable ends, there is always more or less trouble experienced with loose connections. In an accompanying illustration five methods are shown which are used to join two cable leads by connectors which can be readily separated. The first method, shown at the top, consists of the simple two-way, solid-type connector where both ends of the cable are held in place by machine screws. With this type there is always danger of leads becoming broken. Screws will loosen due to vibration and where the cable is placed in the terminal without an added sleeve, the point of contact of the screw is sure to cut the individual wires and eventually result in breakage.

The second method shows one of the leads soldered permanently into the connector. This is a slight improvement over the first method but still at one end it uses screws which are liable to loosen.

The third method illustrates what has been commonly called a screw connector. Each lead is soldered into an end of the two separate elements of the connector, which in turn are held together by two machine screws. With proper locking of the screws this type can be made very reliable, but it is rather unhandy to disconnect.

In the fourth method a connector of somewhat similar design is made from copper tubing. Results have demonstrated that this is not quite as good as the third type as the insulation over the ends of the cable is not protected by the connector. Bending occurs continually in service and in order to prevent breakage of the strands of the cable, the bending should be distributed over a considerable length, if possible.

The fifth method shows what has been commonly known as the knuckle-joint connector, which is a quick break type. This type of connector is used largely on railways to connect the motor leads to the car wires and has been made in various designs. Four general types of knuckle joints have been used most extensively. The first of these is the old style pin or pivot type, in which a heavy steel hinge pin is riveted in the face of one of the half elements. As will be seen in the illustration, there are a male and a female element, which are not interchangeable.



Various designs of motor lead or knuckle joint connectors leading up to the present standard new style pin type

No. 1—Old-style pin or pivot type. No. 3—New-style pin type.
No. 2—Segmental type. No. 4—Combination of segmental type with new-style pin type.

The second form has been termed the segmental type. In this a small brass segment is riveted in a circular groove in the face of each half element, so that both elements are alike and the two halves are interchangeable. This type has a limited use as it is suitable for connectors of $\frac{3}{4}$ in. diameter or larger.

A third design is the new style pin type. In this a small steel pin replaces the brass segment of each element of the segmental type. Both elements are alike and the halves of the connector are interchangeable.

Digitized by Google

Further, any element of this type is interchangeable with any element of the same size connector of the segmental type. This design was originally developed for connectors of $\frac{9}{16}$ in. outside diameter. However, due to its broader application, it was finally adopted as the most economical construction for all sizes of connectors.

The fourth type, sometimes called the jack-knife or clasp type, is used almost exclusively by two large motor manufacturers on the cable leads of their railway motors. The accompanying table shows the important dimensions of the standard size connectors, and the horsepower ratings of the motors for which they should be used.

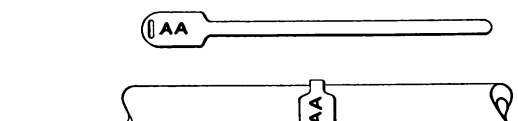
DIMENSIONS OF KNUCKLE-JOINT CONNECTORS

Motor Rating, Hp.	Dimensions in Inches					
	Outside		Counterbore		Drill for Cable	
	Length	Diameter	Depth	Diameter	Depth	Diameter
Up to 45	3 3/4	1 1/16	None	None	1	1 1/16
46 to 80	4 1/2	1 3/16	1/2	1 3/16	1 1/4	1 3/16
81 to 120	5 1/2	1 3/16	1/2	1 3/16	1 1/4	1 3/16
121 to 160	5 1/2	1	1/2	1	1 1/16	1
161 to 210	6 1/2	1 1/8	1/2	1 1/16	2	1 1/16

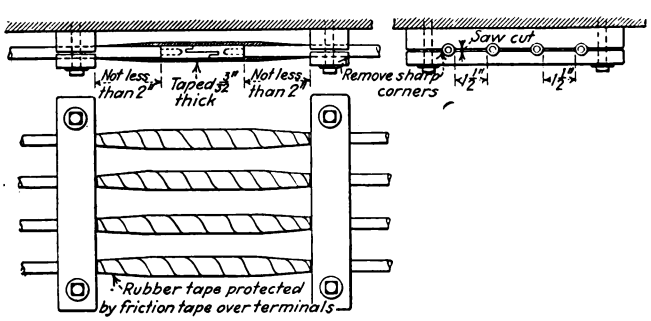
One of the most important advantages of the jack-knife or clasp type of connector is that the quick break simplifies connecting and disconnecting of the motor leads. Slotting of the tips secures a spring action which improves the contact fit of the two rubbing surfaces. To be satisfactory, they must be made from a good quality of brass rod. There must be a large contact surface between the halves finished smoothly and fitted carefully to obtain a good electrical connection. The half elements of the same style must be identical so that all connectors of the same size are interchangeable. Ends of each half element into which the cable conductor is soldered are machined to provide a support for the insulation at the cable end.

Protecting Cable Leads

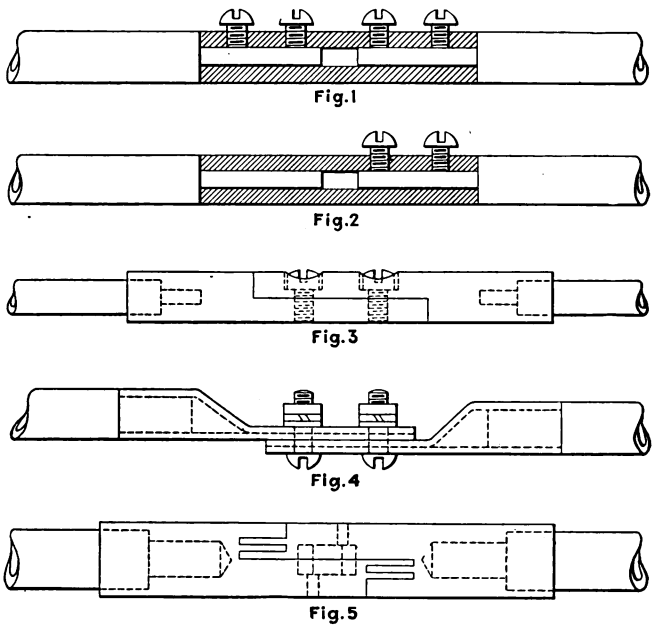
To insure that the motor cable leads give the least possible trouble after connections are made to the car wiring cable, a number of precautions should be taken. Cable leads should be protected where they come out of the motor frame by a semi-hard rubber bushing. The leads must be made long enough to accommodate the full swing of the truck and suitable cleats should be used to hold the leads securely to the motor frame. It is also essential that similar cleats be used to hold the car wiring cable to the body of the car. Leads should be hung so that under all conditions they will swing free to avoid chafing and rubbing on any car parts. If it is not possible to prevent rubbing and chafing of the leads on top of the motor frame, some protection should be provided to keep the insulation on the cable from wearing through.



Marking tag for motor cable leads



Method for insulating and cleating motor leads with knuckle-joint connectors recommended by the A.E.R.E.A.



Types of cable lead connectors

Fig. 1—Solid type connector, each lead held by two machine screws.

Fig. 2—Solid type connector, one lead soldered and the other held by two machine screws.

Fig. 3—Jointed type connector, each lead soldered, halves held together by two machine screws.

Fig. 4—Jointed type connector, each lead soldered, halves held together by two machine screws and nuts.

Fig. 5—Jointed type connector, each lead soldered, halves held together by their spring action commonly called knuckle-joint, jack-knife, or clasp type.

The knuckle-joint connectors should not be placed in the swing loop between the car underframing and the motor. When in place, the connectors should be insulated by using a piece of canvas or rubber hose. This should be taped at the ends to keep out water, dirt and dust. The point of support of the leads from the car body should be as near the truck center pin as possible in order to keep the swing of the leads to a minimum.

In the interest of standardization, both of the large railway motor manufacturers have adopted a common standard for the marking of railway motor cable leads. The following shows the new and old markings on the cable leads for Westinghouse railway motors.

Leads	New Markings	Old Markings
Armature connected to brush holder	A	A+
Armature connected to brush holder or commutating pole field	AA	A—
Main field	FF	F+
Main field	F	F—
Steel control lead	M	FM

All main wiring diagrams of Westinghouse railway motors dating from February, 1925, show both the old and new marking as indicated in the above table. Diagrams made before this date show only the old markings. All main wiring diagrams of the General Electric Company's railway motors show only the new markings.

The leads on the Westinghouse motors are marked with small tin tags, as shown in an accompanying illustration. These are tightly fastened to the cable.

G. R. Fanning

Wins Maintenance Competition Prize for Month of February

EQUIPMENT used for testing pneumatic door engines as used in the shops of the Toronto Transportation Commission receives the $25 monthly prize for February in ELECTRIC RAILWAY JOURNAL'S Maintenance Competition. Honorable mention goes to W. J. McCallum, foreman frog shop, way department, Toronto Transportation Commission, for his description of a machine for grinding heel recesses in switch castings.

AIR operated door engines on cars are coming into general use, and to insure proper operation should be tested carefully at each overhauling. The method used by the Toronto Transportation Commission of providing a model with weighted doors on which the door engine can be placed quickly and be given a test with conditions such as are encountered in service provides a satisfactory means for turning out this work. Installation and removal of the engine being tested is accomplished easily and in a short time.

A description of the test equipment used by the Toronto Transportation Commission was described in the Feb. 18 issue of ELECTRIC RAILWAY JOURNAL by G. R. Fanning, foreman of pneumatic section at the Hillcrest Shops, Toronto, Canada. This was awarded the monthly prize of $25 as the best maintenance item published in that issue.

Another practice used by the Toronto Transportation Commission receives honorable mention. This was the machine for grinding heel recesses in switch castings as described by W. J. McCallum. Switch recesses have a bad habit of wearing so that the heel of the switch tongue fits only where it touches. The device described appears to fill the need for a grinding equipment suitable for doing this work in the field without the necessity for removal of the switches from the track.

April 30 Closing Date for New Material

ACCORDING to the rules for ELECTRIC RAILWAY JOURNAL'S Maintenance Competition, as published on pages 700-701 of the April 16, 1927, issue, twelve monthly prizes of $25 each were to be awarded beginning with the May 21, 1927, issue. Due to the awarding of the capital prizes in September, no monthly prize was awarded that month, so the last monthly prize will be awarded for articles published in the May 19, 1928, issue of ELECTRIC RAILWAY JOURNAL, and as has been frequently announced in these columns, the closing date for material to be eligible for one of the monthly prizes is April 30, 1928.

This means that those who still have material that they wish to get in before the contest closes must send it in at once. Many have already expressed a desire to send in articles, and it is hoped that all maintenance men will avail themselves of this opportunity so as to get their material in promptly. In connection with material already received which has not been published, and material sent in during the next month, there will be an important announcement made in the April 21 issue.

Gilbert Robert Fanning

who won the $25 monthly prize for February in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest, is the leading hand in the pneumatic section at the Hillcrest Shops of the Toronto Transportation Commission, Toronto, Canada. Mr. Fanning left his position in the repair department of the T. Eaton Company, Toronto. in 1915, to enlist in the Canadian Expeditionary Forces for overseas service with the 95th Regiment. Later, he was transferred to the 1st Battalion Canadian Railway Troops, and served overseas until the completion of the war. On returning from service Mr. Fanning entered the employ of the Toronto Civic Railway as a motor and truck mechanic, and continued in this service until the amalgamation of the Toronto Transportation Commission, the Toronto Street Railway and the Toronto Civic Railway. Mr. Fanning was born and attended the public schools in Toronto. His first mechanical experience was in connection with his apprenticeship, which he served in the blacksmith and machinist trades with a carriage manufacturing company in Toronto.

TRACK AND WAY DEPARTMENT—22

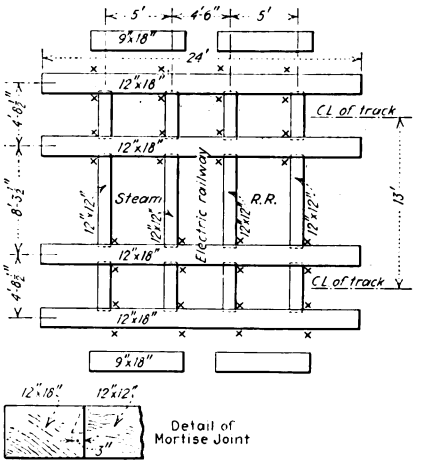
Anchored Crossings That Will Not Drift With Traffic*

By A. E. Gleason

Assistant Superintendent of Construction Louisville Railway, Louisville, Ky.

STEAM over electric crossings can be kept from drifting with steam traffic by use of a method of anchoring that is used by the Louisville Railway, as shown in the accompanying illustration. Timbers of appropriate size are framed into the construction. Crossings are of solid manganese 6 in. deep with 1-in. continuous plates, which are the same width as the timbers on which they rest. The crossings are fastened securely to the timbers with 1-in. bolts.

Excavation is carried well beyond the outside joints to a depth of 5 ft. The concrete slab is poured to a depth of 3 ft., using a 1:2:5 mix. As the slab is being poured 5-ft. lengths of old 9-in. girder rail are placed as shown in the sketch. These are inclined in the direction opposite to travel on the steam railroad tracks. The tops of these rails come to within 4 in. of the top of the running rail. After the slab is set well the crossing is air tamped with dry concrete of 1:2:5 mix. The concrete is then brought up to within 3 in. of the top of the rail paving grade. The crossing is paved with Kentucky rock asphalt or cold patch preparation with asphalt base, making a water-tight job.



Installation used by the Louisville railway to keep crossing from drifting with steam traffic

X Indicates short section of 9-in. rail embedded in concrete and inclined in the direction opposite to travel on the steam railroad.

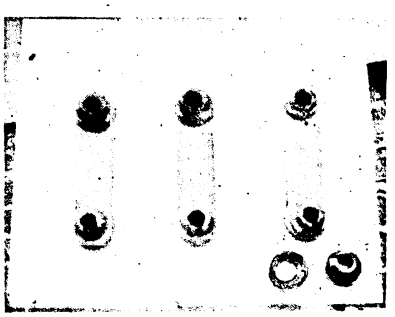
Reclaiming Ball Type Brake Shoe Hangers*

By John McDowell

Foreman Blacksmith Toronto Transportation Commission, Toronto, Canada

REMOVAL of ball type brake hangers on cars of the Toronto Transportation Commission is due principally to the cup bushings becoming worn. In reclaiming these for further use the hangers are machined with a special tool and new cup bushings, forged and hardened, are installed. This effects a great saving of material, as the original hangers can be used several times, only the cup bushings requiring renewal. The accompanying illustration shows a new hanger, a hanger with worn ball and a hanger machined to receive the cup bushing.



At left, new ball type hanger. In center, hanger with worn ball. At right, hanger machined to receive cup bushing

TRACK AND WAY DEPARTMENT—23

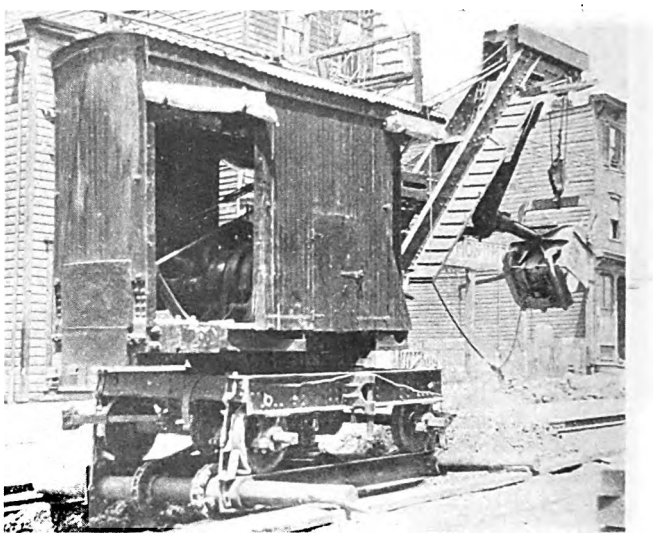
Convenient Mounting for Electric Shovel Truck*

BY J. A. MCCARTNEY
Superintendent of Construction Pittsburgh Railways, Pittsburgh, Pa.

RIGID mounting, such that track obstructions usually encountered will not interfere with the progress of the work is provided in an electric shovel incorporating several novel features that has been developed by the Pittsburgh Railways. This was constructed from a standard shovel truck and the mounting provided enables from 500 to 700 ft. of trench excavation 2 ft. deep per day. It has advantages over the caterpillar type of truck in wet weather and also makes possible the use of short sections of portable track in the trench.

For an electric shovel to operate at maximum efficiency on street railway track construction it must be able to operate in all kinds of weather at full capacity and must not require too many attendants. Frequent adjustment of auxiliary equipment is undesirable and the equipment must be sufficiently flexible so that trench obstructions, such as gate boxes, sewer, water and gas lines may remain undisturbed without slowing up the work.

The truck illustrated weighs about 3 tons. It is transferred from one job to another with the company's 5-ton road crane. As shown in the illustration, the rollers rest at one end on 2-in. planks placed on the street flank, while the other end, which is grooved, is supported by light-weight T-rail sections spiked to the ends of the ties of the adjacent track. The shovel has a drive chain connection at the center of the rear roller. A single adjustment of the length of the dipper handle controls the limiting depth of excavation.



Electric shovel truck facilitates excavation for track reconstruction work

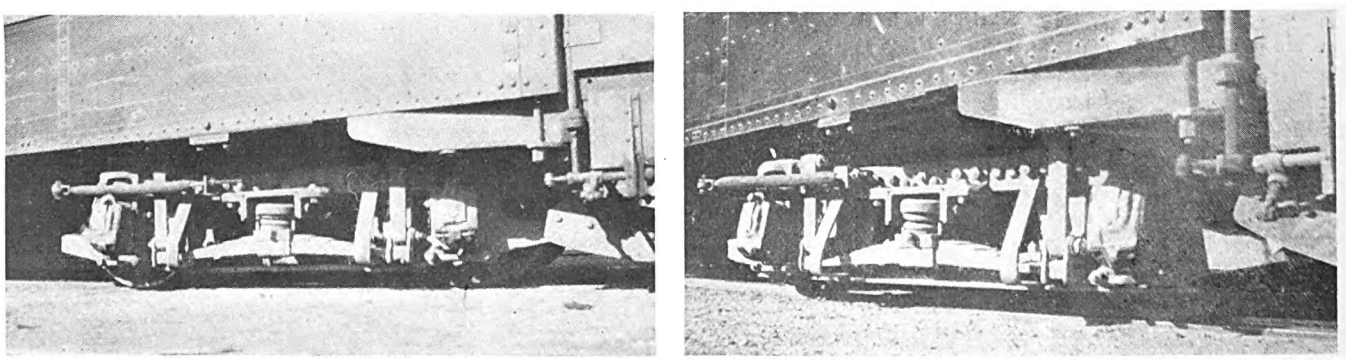
Improved Pedestal Tie Bar Extends Across Truck Pedestal Jaws*

BY R. T. CHILES
Master Mechanic Cumberland County Power & Light Company, Portland, Me.

ON CARS of the Cumberland County Power & Light Company equipped with Brill 77-E-1 trucks the pedestal tie bars originally were clamped to the bottom end of the semi-elliptic spring safety hanger. In order to prevent trouble from pedestal jaws spreading under brake application an improved type of the bar has been installed which is made of a ½-in. x 2½-in. x 2½-in. angle. It is bolted with countersunk-head bolts to the bottom end of the semi-elliptic spring safety hanger and extends across both openings of the truck pedestals.

In applying the angle tie bar it was necessary to form an opening by mashing down the top edge of the angle to permit the semi-elliptic spring seat rocker to swing. It was also necessary to notch out the top edge of the angle ½ in. deep by 6½ in. long to clear the bottom side of the journal box.



At left, original arrangement of pedestal tie bar, which is clamped to the bottom end of semi-elliptic spring safety hanger. At right, improved tie bar extending across pedestal jaws

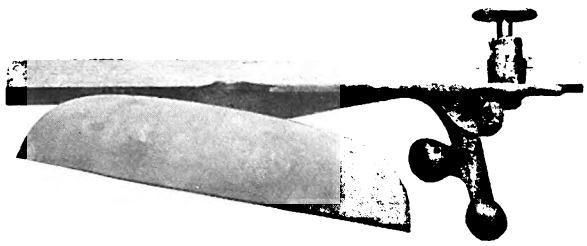
Handy Type of Foot Gong Bracket*

By A. M. Lindsay
Superintendent of Rolling Stock Montreal Tramways, Montreal, Canada

REPLACEMENT of a deflecting foot gong or knocker without taking down the bracket is possible with a type of bracket used by the Montreal Tramways. The bracket is made of malleable iron and is fastened to the car underframing by ¼-in. carriage bolts. The gong is fastened to the bracket by a square-headed bolt, the casting being countersunk so that the bolt is held from turning. The nut is inside the gong and can be unscrewed readily when it is desired to remove the gong.



This foot gong bracket provides for removal of gong or knocker without taking down the bracket

The knocker is pivoted on two arm extensions from the bracket and can be slipped into or out of position from the open end of the slot. To safeguard against possibility of the knocker getting out of its bearing groove a cotter pin passes through the two bearing ribs outside the knocker shank.

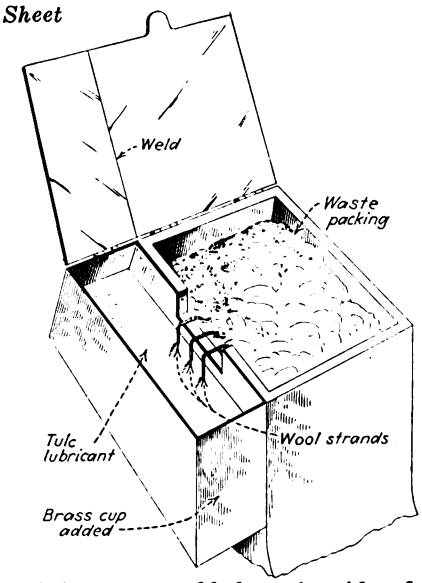
Better Lubrication for Old Type Motors*

By Benjamin H. Hall
Shop Foreman West Penn Railways, McKeesport, Pa.

SOME Westinghouse No. 56 railway motors originally arranged for grease lubrication have been changed over to oil and waste lubrication in the shops of the West Penn Railways. Several different methods have been tried, but the one which has proved most satisfactory consists of fastening a $\frac{1}{16}$-in. rectangular brass cup to the outside end of the bearing housing. This is held in position by two ¼-in. round-head stove bolts. The cups used are $1\frac{3}{8}$ in. x $3\frac{1}{2}$ in. x 4 in. for the pinion end and 1 in. x $3\frac{1}{2}$ in. x 4 in. for the commutator end. The top of the brass cup is flush with the top of the lubrication opening as originally provided in the motor. The stove bolts which fasten the cup to the housing have the heads soldered on the inside of the brass cup to prevent leaking if the bolts should become loose in service. In order to provide a covering for the new cup a No. 14 gage sheet iron extension is welded to the cover.

The original opening is packed with wool waste so as to fill this and bear on the armature shaft. The new cup is filled with Tulc lubricant and this is conducted to the top of the wool waste packing by capillary action through wool strands. There are three of these strands used on the commutator end bearing and six on the pinion end.

To provide space for these wicks to go from the brass cups into the main opening a notch ⅛ in. deep by $1\frac{1}{4}$ in. wide is cut at the top. A lip from the brass cup extends across this notch over into the original opening and the wicks lay on this lip. At the pinion end a partition in the center of the lip is provided so that three wicks lay on either side. When installed the cups are filled nearly full and after that scheduled additions are made.



A brass cup added to the side of the original lubricant opening provides for conducting oil to the top of the waste packing

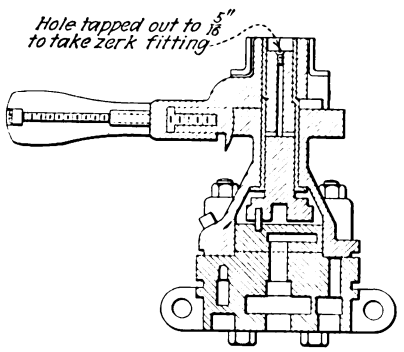
Zerk Fitting Used for Lubrication of Brake Valve*

BY H. C. PRESSLER

Master Mechanic Eastern Texas Electric Company, Beaumont, Tex.

FOR lubricating M-28 brake valves the Eastern Texas Electric Company uses Zerk fittings. A hole drilled in the brake valve top is tapped out to take the standard Zerk fitting. A cap screw is used to cover the fitting. This keeps the grease from blowing back into the operator's face and also keeps the top clean, so as to eliminate danger of dirt getting into the valve. It also prevents an accumulation of grease which might injure passengers' clothing.



Construction used for applying Zerk fittings to M-28 brake valve

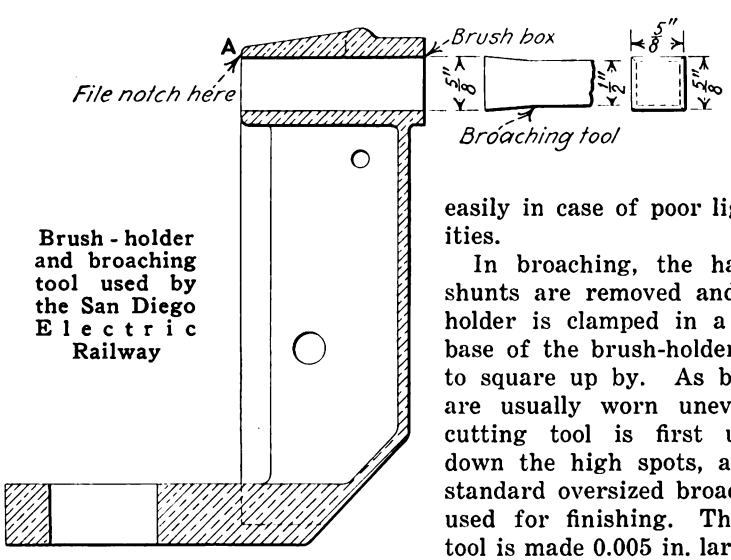
Brush-Holders Broached When Worn*

BY CHARLIE HERMS

General Foreman San Diego Electric Railway, San Diego, Cal.

RAPID wear of brush-holder boxes is caused by sharp particles of sand being sucked into the motors used by the San Diego Electric Railway. Brush-holders are broached out to a size $\frac{1}{16}$-in. larger than originally, when they become worn and a brush $\frac{1}{16}$-in. thicker than the original is used. No difficulty has been experienced from the use of the thicker brush. By this method double the life results from brush-holders, and the cost of broaching is very small.

In order to provide for easy identification of brush-holders that have been broached, each holder is marked by filing a good-sized V-shaped notch in the top center of the brush-holder. This notch is large enough so that the inspector can feel it easily in case of poor lighting facilities.



Brush-holder and broaching tool used by the San Diego Electric Railway

In broaching, the hammers and shunts are removed and the brush-holder is clamped in a shaper, the base of the brush-holder being used to square up by. As brush-holders are usually worn uneven, a small cutting tool is first used to cut down the high spots, and then the standard oversized broaching tool is used for finishing. The broaching tool is made 0.005 in. larger than the brush to provide desirable clearance.

News of the Industry

Bill to Renew Public Control in Boston

A bill is under discussion in the Massachusetts Legislature for the extension of the public control of the Eastern Massachusetts Street Railway for a period of ten years. The measure is substantially the same in its provisions as the act of 1918 which created the present public control of the road, except that it does not ask for any more financial guarantee by the commonwealth. The road is strong enough now to finance itself. The bill is offered by Mayor Ralph S. Bauer of Lynn. It has been indorsed by the Massachusetts savings banks, which hold Eastern Massachusetts securities.

At the first legislative hearing it developed that the mayors and ex-mayors and chamber of commerce representatives, senators and representatives in practically all the cities and towns served by the Eastern Massachusetts Street Railway are in favor of continuing the public control of the road. They declared, without exception, that service by the company is satisfactory, that the trustees are on most cordial terms with the people and public officials in the communities, and that the general feeling is that the present conditions should not be changed. The physical condition of the road is good and finances are encouraging.

The stockholders are making it known to the legislators that they feel the road should be returned to them at the end of the present ten-year period, which comes next January. They maintain, largely through L. Sherman Adams and Boyd B. Jones, that while the trustees have paid some dividends the common stockholders have received no dividends during the nine years of public control, and so long as they have no guarantee of dividends from the public trustees they desire to have the property returned for private operation. The stockholders maintain also, that if there is to be an extension of public control the period should be less than ten years, and the stockholders should have at least one representative on the board of trustees, and it should be made plain that when the dividend is earned it should be paid, even on the common stock.

The stockholders contend that the prospects of the company were hurt when the public trustees entered into a gentleman's agreement with the New York, New Haven & Hartford Railroad and the Boston & Maine Railroad under which the Eastern Massachusetts ceded to the railroads the right to operate buses between the large cities. That is a field the stockholders would like to see developed by the Eastern Massachusetts Street Railway.

The bill is before the committee on street railways. The public control will terminate at this time, unless the Legislature passes a new control bill which meets with the approval of the security holders.

Federal Court to Act on New York Fare Case

Jurisdiction was assumed on March 15 by the Federal Court over the transit problem in so far as the rate of fare which the Interborough Rapid Transit Company may charge and that company's relations with the city of New York are concerned. The special statutory court of three Federal judges began to hear arguments on the Interborough's application for permission to charge a 7-cent fare pending the final decision by the United States courts as to the amount of fare to which it is legally entitled.

Federal Judge William Bondy ruled that the Federal courts have jurisdiction. He continued the order which Federal Judge Francis A. Winslow issued on Feb. 17 and which stays the action of the New York State courts. In effect this order, which now stands until the statutory court decides whether the company may increase the fare, wipes out three injunction suits begun in the Supreme Court by the city and Transit Commission to enforce the 5-cent fare provision of the contract between the city and the company.

Judge Bondy's decision further provided, however, that the I.R.T. might not raise the fare until and unless the statutory court granted its application.

"And Live"

A WRITER once said, in effect, that whenever any of the great sayings were misquoted it generally results in a weaker word being used. Thus, "A little learning is a dangerous thing" is weakened whenever, as quite commonly happens, the word "learning" is replaced by the word "knowledge."

We ran across an exception the other day, but in this case the new word has been introduced deliberately. "Stop, Look Listen," is a slogan that has proved effective, but we admire the genius of the man who has made it read:

"Stop, Look—and Live."

The amended injunction is not for grade crossings and street intersections alone. It has received the magic touch which transmutes the well-known phrase into something close to poetry.—*Ottawa Electric Railway News.*

Baltimore Fare Question Goes to State Court

The United Railways & Electric Company, Baltimore, Md., has carried its fight for a straight 10-cent fare into Circuit Court No. 2. The company seeks to restrain the Public Service Commission from withholding from the United the right to charge a straight fare of 10 cents and also from charging two fares to Halethorpe, a suburban development. The commission recently granted the company a 9-cent cash fare with three tokens for 25 cents and reduced the number of fares to Halethorpe from two to one. The commission must answer within twenty days. When this is done a date will be set for hearing. The original petition by the United sought a straight 10-cent fare.

The United charges that the company's property is being confiscated in contradiction to the fourteenth amendment of the Constitution, the Maryland bill of rights and the public service law. According to the petition the maximum rate of fare the company is permitted to charge under the commission's orders is grossly inadequate to yield a fair return upon the fair value of its property.

It is also charged that the percentage which the commission found would be the rate of return upon the fair value of the company's property yielded by the fares established by said order was adopted by the commission as a fair rate of return solely for reasons and upon considerations that have no true relation to the fairness of a return, and was a grossly inadequate rate of return to compensate for the use of its property in the public service without confiscation of its property.

The petition says the amount which the commission determined would be a proper annual allowance out of earnings to provide for depreciation and retirement of the company's property used in the public service was grossly inadequate for that purpose and was fixed by the commission upon a basis that had no true relation to the amount required for said purposes, that no allowance was made, in determining the present value of the company's property, upon which the rate of return from the rates established must be calculated, for the net additions to its property since Jan. 1, 1924, and that the commission burdened the company with a substantial loss of revenue by requiring it to abolish the second fare upon its Halethorpe line which further diminished the immediate return upon the company's property.

In concluding the petition states that irreparable damage will be suffered by the company unless a preliminary injunction or restraining order is issued.

New York Unification Bill Introduced

Senator Bernard Dowling introduced the Untermyer bill in the New York Legislature on March 14. It provides for creating a Board of Transit Control for the unification of subway lines in New York City. A joint statement of Senator Downing and Assemblyman Bloch said, in part:

The bill introduced is a mandatory 5-cent fare measure, provided the proposition of unified management makes good. It is written into the law "any such plan of readjustment, and any lease or leases entered into hereunder, unless otherwise determined by the local authority of the city and for such period or periods as it may determine, shall provide for a 5-cent fare for one continuous ride in the same general direction on the respective railroads embraced therein; provided, however, that adequate provision be made through priority of payment out of revenues, the establishment and maintenance of an interest and amortization fund or funds and otherwise for the periodic payment of interest and amortization charges payable by the board under such plan or under such lease or leases."

The transit bill is practically the same as the measure sent to Albany several weeks ago. Only a few minor amendments have been made to it. The Republican leaders announced at the time that they would give it serious consideration and if they could agree on it would have the measure introduced by the majority leaders.

Report of Cincinnati Project Expected Soon

His company is ready to take action at once that will speed up the settlement of the municipality's rapid transit situation, according to Walter A. Draper, president of the Cincinnati Street Railway, Cincinnati, Ohio. In his statement, made as the result of a report presented by a committee to the Cincinnatus Association, a semi-public organization, Mr. Draper said in part:

I don't know that anyone can be blamed for delay. In fact, I don't think "blame" is the proper word to use. If there has been delay, it has been due to the consideration of so important a subject. Time has been utilized in getting all the information possible before opening discussion of an operating agreement.

Our company has undertaken an analysis of the Beeler report (an expert's report made some six months ago to the city). I felt that we were justified not only in having our own engineers analyze the Beeler report, but also in having it done by A. L. Drum & Company, Chicago, for two reasons: One is that Mr. Beeler pointed out that the line could be operated without loss only in case a number of things more or less difficult are done, and then only by a very slight margin; the other is, that Mr. Beeler was one of the engineers called in by the city in the development of the lines.

We completed our own preliminary analysis some time ago, and I anticipate that Mr. Drum's report will be ready very shortly.

E. W. Edwards, president of the Rapid Transit Commission, said that as soon as he got word from the railway that it was ready to discuss the matter of a contract for leasing the rapid transit system, he would call a meeting for the purpose. The leasing, as well as bond issues for completing and equipping the system, would have to be submitted to a vote of the people of the city for ratification. Six million dollars has already been spent on the project, and it is estimated that completion and equipment will cost $8,000,000 additional, plus $2,500,000 if it is extended to Fountain Square, the center of the city.

Springfield Host of Three Associations

President Stevens epitomized principles which should guide participation of utilities in civic activities

JUST as busy individuals can take part in civic government with no desire for financial gain but with the certainty that they will have to sacrifice time and money in serving the public, so can the public service company be equally earnest in its citizenship. This is the opinion expressed by R. P. Stevens, president of the American Electric Railway Association, whose personal message to the joint session Wednesday morning, March 15, opened the two-day annual convention of the Illinois State Electric, Gas and Street Railway Associations in Springfield, Ill.

Mr. Stevens could not be present at the meeting and his message was presented by G. W. Welsh, president of the Illinois Electric Railway Association and vice-president of the East St. Louis & Suburban Railway. The remarks of the A.E.R.A. chief executive epitomized the principles which should guide their participation in civic matters. Quoting Mr. Stevens, "The utility is a citizen of its community as large as any individual to whom it renders service. It has a vital interest in everything that affects the community as a whole. It should be a booster, both through the utterances of its officers and through the high quality of the service it renders."

Government ownership was characterized as an attempt to transform the state into a benevolent Santa Claus, by Henry Swift Ives, vice-president of the Casually Information Clearing House, Chicago. He said the "old feudal doctrine that the government should support the people" is having a revival in this country. According to him altogether too many business men and property owners are ardent capitalists when it comes to their own business, but are apt to be just as ardent socialists when it comes to the business of the other fellow.

"There are no problems that can long daunt an industry that has the will to study and the capacity to learn," declared Oscar H. Fogg, president of American Gas Association. Mr. Fogg pointed out the need for fullest cooperation among the utilities if each is to serve to the best advantage and warned that dire days for present managements would come if anything was allowed to interfere with the public utilities' development to meet the needs of the nation.

C. Edwards Thorney, assistant to vice-president of the Chicago, North Shore & Milwaukee Railroad, outlined in the afternoon session the better business campaign in which the 2,000 employees of his company have been engaged for the past two years.

E. E. Soules, manager department of publicity, Illinois Traction System, augmented his paper with the presentation of still film views of advertisements to promote new business used within recent months by midwestern electric railways.

M. E. Hansen, of the Illinois Power & Light Corporation, Decatur, Ill., declared that the trend of motor coach design seemed to be away from the double-deck bus now used in big cities toward the 29- to 40-passenger single-deck bus.

The Springfield Engineers' Club made the conclusion of the first day's session of the convention the occasion for its annual dinner. At this dinner Col. Sidney Story spoke on the American merchant marine.

Council to Proceed with Chicago Subway Plans

Full approval to proceed with the work of drafting ordinance for downtown subway construction in Chicago has been voted to the board of local improvements by the City Council. As passed by the Council the resolution authorizes the board of local improvements to prepare ordinance for one north and south system and one east and west system, after public hearings are conducted, in any streets where property owners are willing to pay for a portion of the cost by special assessment.

According to Michael J. Faherty, president of the board, the first step will be to invite property owners to petition for subways. The board will, meantime, prepare estimates of the cost of construction and will then call a public hearing on the petitions. If the majority agree to the special assessment plan, ordinances will be drawn up and presented to the City Council. Following this Mr. Faherty believes, a test case will probably be taken to the Supreme Court in order to validate the special assessment paper. Once a favorable decision is obtained on this point the board can begin the actual construction.

The procedure contemplated by the resolution passed by the Council is based on the theory that subways can be built under the local improvements acts just as sewers are dug and streets widened—without additional legislation. Local traction officials, however, maintain that the city needs more power to levy special assessments for subway building. One of the set of five transit enabling bills prepared by the city, consideration of which was recently deferred until after the primaries in April, proposed to give the city complete power to finance subways in this manner.

No 10-Cent Fare in Kansas City

Powell C. Groner, president of the Kansas City Public Service Company, Kansas City, Mo., has denied that the company will soon apply for an increase in electric railway fare to 10 cents. Statements had been published to the effect that the company contemplated asking for an increase of fares in June. Mr. Groner said:

I desire to state officially and unequivocably that no such application ever has been considered, discussed or contemplated. The company is proceeding in good faith to carry out to the letter its franchise agreement with Kansas City and expects to continue to do so.

If future conditions should warrant an increase in fares, this company will lay the facts before the City Council at the time, feeling confident that justice will be done all parties, but no such action is now being contemplated.

At the time the company received its franchise nearly two years ago the City Council was promised that no fare increase would be asked.

Continuance of Transfer Charge Authorized in Indianapolis

An order continuing the 2-cent transfer fee now being charged by the Indianapolis Street Railway on its lines in Indianapolis, Ind., was continued by the Indiana Public Service Commission on Feb. 27. The order, written by Commissioner John W. McCardle, provides that the charge shall be continued until further order of the commission.

Negotiations Opened Up in Toledo

The ultimatum of the new city administration at Toledo, Ohio, to the Community Traction Company, to pay a back paving bill of $187,500 with interest from February, 1921, by March 5, has been suspended pending settlement of a new power rate which under terms of the present agreement between the railway and the Toledo Edison Company will be retroactive to July, 1924. Mayor W. T. Jackson and Law Director George W. Ritter have taken the stand that no new negotiations looking toward extension of the present franchise and other things desired by the company will be started until the present Milner ordinance provisions have been complied with and controversial issues settled.

At a recent conference with the Mayor spokesmen indicated that the company was in no position to pay the claim for paving at the present time without resort, at least, to increasing fares: that it would be unable to go ahead with any paving program this summer if forced to pay; and that there were numerous other difficulties such as independent bus competition which, if remedied, might enable it to pay.

During the conference the matter of a new franchise and the previous negotiations were discussed. Company attorneys took the stand that no scaling down of capital value could be countenanced, but city spokesmen took the position that bond owners might be induced to bring in new money to build up the property and restore the value behind the bonds.

Negotiations to settle the power rate will be undertaken at once. Some other minor issues will also be settled following the power rate determination. Mayor Jackson indicated that he was willing to go through with a real settlement if the company would clean up points now at issue in the Milner plan operations.

Old Cars at Worcester to Be Burned

More than 100 cars of the Worcester Consolidated Street Railway, Worcester, Mass., which is rapidly disposing of all its worn-out rolling stock, are doomed to be burned within the next few months. The officials plan to burn two or three a day after the metal in them has been reclaimed. Some of the cars are 30 years old—many of the old single-truck type.

New one-man and two-man cars have gradually replaced many of the old cars, especially under the rehabilitation program of the New York, New Haven & Hartford Railroad.

No-Cruising Regulation Effective in Philadelphia

INTERESTING statistics are shown by a check recently completed by the traffic department of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for the purpose of learning what effect the no-cruising regulation was exerting on the number of empty cabs in movement in the downtown streets. The results of this check, made on Chestnut Street between Juniper and Thirteenth after the beginning of no-cruising, were compared with those of a similar check made at the same season of the year, but before the new regulation went into effect.

A year ago, in spite of the smaller number of cabs, 1,877 empty cabs of all companies passed along this section of Chestnut Street between the hours of 9 a.m. and 6:30 p.m., an average of one empty cab every eighteen seconds. The figures of the recent check show that this number diminished from 1,877 to 630, an average of one empty cab every 54 seconds. This is an average reduction for all cab companies of 66 per cent. Figures for Yellow Cab alone show their reduction to be 69 per cent, three points better than the average figure. This was in the face of the fact that cab companies increased their fleets during the past year.

H. P. Savage in New Rôle

Howard P. Savage, past national commander of the American Legion and assistant general manager of the Chicago, North Shore & Milwaukee Railroad, has entered the race for delegate to the national Republican convention from the tenth congressional district in Illinois.

The petition for the nomination of Mr. Savage was filed by friends over his objection that "business and politics won't mix." He subsequently sent a letter to the secretary of state asking that the petition be withdrawn, but was informed that his name had already been certified and that it was too late to withdraw.

Mr. Savage is identified with the so-called Lowden-Deneen-Emerson Republican faction.

Kansas City Company Drops Objections to New Viaduct

The Kansas City Public Service Company has withdrawn objections to the early construction of a viaduct on Winner Road over the railroad tracks and the Blue River in Sheffield, and will join the city in overcoming the opposition of others, making prospects for the building of the viaduct considerably brighter. As planned the viaduct would be 3,513 ft. long. The total cost, apportioned among six agencies, is estimated at $1,900,000. Under the commission's apportionment, the share of the cost to the Kansas City Public Service Company would amount to $255,360. The three railroads and the Sheffield Steel Corporation have appealed the apportionment of the Public Service Commission.

Omission of Year from Date Misleading

The meeting with the Mayor, Common Council and interested department heads at Detroit, Mich., referred to in the ELECTRIC RAILWAY JOURNAL for Feb. 25, 1928, page 334, under the caption "More Moves to Speed Up Traffic in Detroit" was held on Jan. 24, 1927, not 1928, as a typographical omission made it appear. As the story stated, and as is generally known, the combined express street car and local bus service was placed in service on East Jefferson Avenue under date of Sept. 18, 1927. The date on the bulletin of the police department, reproduced as part of the article, was correct as given, namely, Jan. 26, 1928.

Atlanta School Ticket Sale Rearranged

Certificates are no longer needed in purchasing school tickets in Atlanta, Ga. The certificates signed by the principal or teacher before the car tickets could be sold to the children may now be purchased without identification and in any quantity at the rate

Digitized by Google

of twenty tickets for $1. The new arrangements were made to eliminate the inconvenience to principals in having to fill out the certificates and the inconvenience to parents in being able to purchase only $1 worth of tickets at one time.

Dallas Fare Plea Withdrawn Without Prejudice

Formal steps to end the public hearing on the application of the Dallas Railway & Terminal Company, Dallas, Tex., for a 10-cent cash, 7-cent token fare were taken recently when Joe Worsham, general attorney for the company, read a statement for President John W. Carpenter, formally withdrawing the application at this time without prejudice.

Commissioner Clarence Parker moved that the statement be accepted. This the City Commission did by unanimous vote. After publicly thanking the company for its spirit in taking this action, Mayor Burt paid tribute to John W. Everman, supervisor of public utilities, who will be reappointed to that post.

Seattle Turns Down Mayor Landes

Bertha K. Landes, elected two years ago as Mayor of Seattle, by a majority of more than 6,000, lost re-election on March 13 by a majority of more than 19,000. It will mean her retirement on June 4. Her successful opponent is Frank E. Edwards, politically unknown. Mrs. Landes had taken an active interest in the municipal railway workings and had brought an intelligent understanding to the problems of that department. Recently, she stated that for the first time in the nine years the city owned the system "the future really looks hopeful" and the "railway is making substantial progress toward financial stability." She accompanied her statement with comparative revenue and expense figures for 1927 and 1926.

High-Speed Lines from Outlying Philadelphia Suggested

Proposals submitted by the Transit Department at Philadelphia to the City Council suggest high-speed lines from eastern Germantown and Chestnut Hill, Oak Lane and the wide residential section of the northeast feeding into the northern terminal of the Broad Street subway. At this time they await consideration by the transportation committee.

In its report the Transit Department laid particular emphasis on the proposed route through the northeast. The cost of this extension was estimated at from $5,400,000 to $43,000,000, according to the type of construction. Estimates for the Oak Lane and Chestnut Hill lines were lacking, but both would be shorter than the northeast extension and, therefore, less expensive.

Recent Bus Developments

Louisville Bus Bill Wins Unanimous Approval

With an amendment calling for a 10-cent bus fare for one year the bus franchise bill of Mayor Harrison was passed unanimously by the lower board of the General Council of Louisville, Ky., on March 13. It now goes before the Board of Aldermen and the next session of the Council, to be held March 20.

The earlier proposal for this ordinance insured a straight 7-cent fare for bus and street cars with interchangeable transfers from rail to motor and half fare for children during the remainder of 1928.

John L. Awtry, Councilman and a member of the revision committee, made the announcement that the committee had considered the bill and approved it with the addition of one amendment. That reads as follows:

The holder of this franchise may charge and collect toll during the first year of operations hereunder at a rate not exceeding 10 cents for each passenger carried within the city limits, with free transfers betwen bus lines in the making of single continuous trip. Transportation of school children shall be furnished at one-half fare and to policemen, firemen and park guards, when in uniform, free.

Provided, first, that if this franchise be acquired by a person or corporation operating in Louisville, a system of electrically propelled street cars running on rails, or by a subsidiary of such corporation, then such person or corporation shall furnish the free and reduced fare transportation hereinbefore set out, in addition, shall give and receive transfers for the making of a single continuous trip within the city limits upon terms as follows:

From bus line to bus line, and from bus line to electric car line, free; and from electric car line to bus line not for more than the differential between electric car fare and bus fare. The bus fare for the first year of operation shall not exceed 10 cents, and shall thereafter be controlled in the same manner and upon the same principle as the electric car fare, and

Provided, secondly, that by whomsoever the franchise may be acquired, in the adjustment of bus fare, electric car fare, and for transfer rules and charges, the rate or rates for service shall be such as to yield to the holder hereof a reasonable return upon the fair value of its entire and combined properties used and useful, employed in its city transportation service.

"Good Will" Tour in Virginia

Fifty members of the Virginia State Legislature, now in session at Richmond, were the guests of the Virginia Electric & Power Company Feb. 22 on a 100-mile bus trip to Alexandria, Va., where they attended elaborate ceremonies in honor of George Washington's birthday. President Coolidge was the guest of honor. The party was accommodated in the "Virginia" and "North Carolina," two of the company's de luxe touring units, which are elaborately finished in the colors of the two states.

Coach Lines Proposed for Santa Ana

The Pacific Electric Railway, Los Angeles, Cal., has applied to the Railroad Commission for a certificate to operate coach lines in Santa Ana.

Traffic Growth Provides for New Bus Service in Vancouver

A new bus was recently ordered by the British Columbia Electric Railway, Vancouver, B. C., for the Grandview highway run. The company refused to consider a request for extension of the railway system into the district served by Grandview, and agreed to place the extra bus in operation to meet a condition resulting from a growth in traffic. Half the loss on the operation of buses on this route is paid by the city.

Extra Service in Virginia

Additional transportation service will be furnished Hopewell, Va., citizens under a plan now being perfected by the Petersburg-Hopewell & City Point Railway. A bus has been procured and will be ready for service as soon as details can be arranged and permission obtained from the city.

Illinois Petitions Heard

Hearings on the recent application of the Elgin, Belvedere & Rockford Railway for a certificate to operate a passenger coach line between Rockford and Rochelle, Ill., were held in Chicago on March 13 by the Illinois Commerce Commission. The application of the Northern Illinois Service Company for a local permit for bus service connecting Rockford, Rochelle and Mendota, Ill., was consolidated with the Elgin petition and considered jointly.

Feeder Service in Chicago Extended

Recognizing petitions of more than a dozen local improvement and civic organizations, the City Council of Chicago recently gave its approval to eight new feeder bus lines to be established by the Chicago Surface Lines on the northwest side of the city. Two routes have already been approved by the Illinois Commerce Commission. Coaches of the Chicago Surface Lines have been operating in feeder service over a portion of the Diversey Avenue route for the past six months.

Financial and Corporate

Trustee Acts Against Grand Haven Road

On application of the Guaranty Trust Company, of New York, trustees under the terms of the indenture securing certain bonds of the Grand Rapids, Grand Haven & Muskegon Railway, District Judge Raymond on March 6 signed an order to show cause why the operation of electric cars over the interurban should not be discontinued. It is proposed to increase the operation of buses over the route which parallels the interurban right-of-way.

The Grand Rapids Trust Company is receiver for the railway and the mortgage under which the Guaranty Trust Company acts as trustee secures an issue of first mortgage bonds amounting to $1,500,000, of which interest and principal payments are claimed due.

The railway completed its first year's operation under receivership on July 31, 1927. Its losses during that period were $27,768, exclusive of interest on bonds. These losses have continued, it was explained.

Intervention Right to Chicago Certificate Holders

Owners of series 1 certificates of the Chicago Railways on March 6 won the right to intervene in the bankruptcy and foreclosure proceedings now pending against the company.

The victory, limited to bare intervention, was won when the United States Circuit Court of Appeals ordered the issuance of a peremptory writ of mandamus, directing the U. S. District Court to grant permission to Orville E. Babcock, representing a protective committee of series 1 certificate holders, to file an intervening petition.

The plan behind the intervention proposal is said to be that purchasers of the certificates were guaranteed an 8 per cent cumulative return. They are seeking a share in the surplus of $6,000,000 now in the treasury of the Chicago Railways Company.

Approval of Terms of Cab Purchase Sought by P. R. T.

The Philadelphia Rapid Transit Company, Philadelphia, Pa., has agreed to pay $1,825,000 for the Quaker Cab Company and three suburban bus lines. This was disclosed in a petition filed by the railway with the Public Service Commission for approval of the purchase of the four carriers. The proposed deal includes the purchase of 5,000 shares of the outstanding stock in the Quaker City Cabs, Inc.; 4,510 shares of the Montgomery Bus Company, Inc.; 1,000 shares of the Philadelphia Suburban Transit Company, and 200 shares of the Doylestown & Easton Motorcoach Company. What price is to be paid for each of these four properties was not disclosed, as the four are joined together in one sale. Action on the matter has been postponed pending completion of an appraisal of the four properties.

Brazilian Utility Is Sold

The South American Power Company, a subsidiary of American & Foreign Power Company, Inc., has acquired control of the South Brazilian Railways, Ltd., from the International Light & Power Company, Ltd.

New Director in Norristown

Thomas Newhall recently resigned as a director of the Philadelphia & Western Railway, Norristown, Pa. He is succeeded by Edgar C. Felton.

Sale of Morris County Traction Approved by Commission

The State Board of Public Utility Commissioners of New Jersey on March 10 approved sale of property of the bankrupt Morris County Traction Company, Morristown, N. J., to George R. Hann for $280,000. The sale was negotiated by Receivers Joseph P. Tumulty and Joseph K. Choate. The Public Service Co-ordinated Transport will operate buses over the routes formerly covered by the company's lines.

Merger Hearings Concluded

Railways in Washington willing to accept $50,000,000 valuation with 7 per cent return although found value is $62,000,000 without bus allowance

MARCH 13 saw the close of the hearings at Washington, D. C., started in February with the purpose in mind of bringing about a consolidation of the Capitol Traction Company, the railway properties of the Washington Railway & Electric Company and the Washington Rapid Transit Company, operating the local bus lines. The plan in detail, previously adopted by the directorates of the several companies, was formally laid before the Public Utilities Commission on Feb. 15, with a petition for its approval by that body, with favorable recommendation to Congress for the legislation necessary to effect the change.

Unification of Three Systems Planned

The project involves the unification of the three corporations, with one of them maintaining a separate existence for stockholding purposes, with a capitalization of $52,400,000 and a valuation of $50,000,000 for rate-making purposes, the new company stipulating the right to earn a return of 7 per cent. This valuation of $50,000,000 is regarded by the companies to be a considerable concession, since the Capital Traction officials hold to a value of $26,000,000 for that property alone. A conservative value for both railways has been placed by company officials at $62,000,000.

At the outset of the proceeding William McK. Clayton, chairman of the public utilities committee of the Federation of Citizens' Associations, made a motion that provisions in the merger agreement referring to the bus company be stricken from the petition, but objections by William Gibbs McAdoo, chief legal counsel for Harley P. Wilson, principal owner of the Washington Rapid Transit Company, and S. R. Bowen of the legal staff of the Washington Railway & Electric Company were sustained by John W. Childress, chairman of the commission.

The demand for a merger has been expressed by various interests for the last twenty years and in order to meet that demand several previous attempts were made to bring about a consolidation. They failed because the parties thereto could not come to terms. The demand for a merger has been more insistent in the last few years and as a result the present plan was drawn up.

At one stage of the proceeding W. F. Ham, president of the Washington Railway & Electric Company, said:

> We have accepted the $50,000,000 not because we are not, in our judgment, entitled to a larger valuation, but upon the rather insistent demands of Mr. Wilson for a merger even if accomplished at some sacrifice to the companies and in the belief that the commission could easily satisfy itself that the property was worth in excess of $50,000,000. We have in the past been of the opinion that the value should be determined under the provisions of the public utility act.

He also is quoted as having said:

> It would further appear that no one can question the reasonableness of a 7 per cent return. The customary rate is 8 per cent. There are very few instances where courts or commissions have fixed a rate of return as low as 7 per cent. In a list of recent court decisions covering 23 cases, many of them United States Supreme Court cases, there is one instance of a 7 per cent return three of a 7½ per cent return, and nineteen of an 8 per cent.
>
> But the question before this commission is not whether these figures are exact in every detail, but are such as to enable them to satisfy their minds that the value of this new transit property is at least $50,000,000. I cannot see how it is possible for any one

Digitized by Google

properly informed, to have any doubt upon this matter. You will have noticed that in this computation no allowance is made for the value of property of the Washington Rapid Transit Company, included in the merger.

Review of Valuation Cases

About a year after the passage of the Public Utilities Act in 1913, the Public Utilities Commission proceeded to value the property of all the public utilities subject to jurisdiction. The valuation of the Potomac Electric Power Company having been determined by the commission in 1917, two years in advance of the valuations of the Capital Traction Company and the Washington Railway & Electric Company, it was understood by all parties concerned that the Potomac case should be considered the key case. It was taken first to the Supreme Court of the District of Columbia, with a decision favorable to the commission; then to the Court of Appeals of the District of Columbia, with a decision favorable to the company; then to the Supreme Court of the United States, which refused to take jurisdiction, thereby leaving the decision of the Court of Appeals of the District of Columbia final, and the principles therein outlined binding in other cases pending before the courts. Final settlement of this case was reached by agreement between the commission and the company Dec. 31, 1924, and confirmed by the Supreme Court of the District of Columbia.

With the Potomac case out of the way the Capital Traction Company carried on its appeal, finally reaching a conclusion by decree of the Court of Appeals of the District of Columbia definitely fixing the value of its property, Jan. 1, 1925, as $25,756,880. The Washington Railway & Electric Company had not proceeded with its case, awaiting determination of the Capital Traction case.

Other Case Deferred

Some time after the determination of the Capital Traction case representatives of the Washington Railway & Electric Company conferred with the Public Utilities Commission, at which it was suggested the company figure its value according to the principles laid down in the Capital Traction case and submit these figures to the commission for their accountants to re-check. This was done.

The value of the Capital Traction Company, on Jan. 1, 1925, was $25,756,880, with additions of $267,769 since that date to make a total value within the District of Columbia of $26,024,559, and adding the value of properties in Maryland, $402,731, makes a total of $26,427,290.

Applying the principles of the Capital Traction case the Washington Railway & Electric Company had a value within the District of Columbia on Jan. 1, 1925, of $30,385,263, adding to this additions since that date of $955,401 makes a total value of the Washington Railway & Electric property within the District of Columbia as of Dec. 31, 1927, of $31,340,664, and adding the value of its property in Maryland, $4,360,493, makes a total value of $35,701,157. The two railroads therefore have a total valuation of $62,128,447.

At the concluding hearing President Hanna of the Capital Traction said:

> The only reason our company has not heretofore applied for a higher fare is that we have awaited the outcome of merger negotiations. Last September our board of directors was authorized to apply for a rate increase. We have not abandoned the idea.
>
> If there is no merger we will apply for increased fare. To obtain a fair return on the $21,000,000 to $22,000,000 of the $50,000,000 valuation which will represent our part, will still require an increased fare if there is a merger.

Some Matters for Commission's Determination

Mr. Hanna added that other questions than valuation and rates, including character of service to be rendered, reduced fares for school children and labor policy, were none of them properly to be discussed in the merger hearing. He said they were matters for the board of directors of the new company and the public utilities commission to take up after a merger has been effected.

Cognizance Taken of the Investment Value of Electric Railways

HALSEY, STUART & COMPANY, INC., New York, specialists in public utility securities, all of whose literature bears the imprint "The strength of the Utilities" have just completed an advertising campaign in national media in which 24 advertisements were used to tell, in language readily understandable, something of the scope and importance of the utilities — their far-reaching contribution to social and economic progress, and their remarkable growth in recent years.

The ads were in nowise intended to be a comprehensive report or study, but the discussions do, in a measure, interpret the utilities from the point of view of both public interest and business enterprise. As the company itself has expressed the matter it is its "hope that they (the advertisements) may help further to promote the public good which the utilities now enjoy, and increase the widespread confidence in well established utilities as a field for investment." The ads have been reprinted in booklet form. They are exceedingly interesting, both as to text and illustrations.

Telling the investor about the electric railways

$279,075 Received from Ottawa Electric

In submitting their fourteenth annual report covering the year ended Dec. 31, 1927, the directors of the Ottawa Traction Company, Ottawa, Ont., report that $279,075 was received from the Ottawa Electric Railway during the year. With this amount was paid the usual quarterly dividends of 1 per cent, and a bonus of 1 per cent.

Twenty new modern P.A.Y.E. cars were purchased during the year and are now in operation. Several track jobs were renewed with heavy steel.

Will Hear Case of Maine Abandonments

A hearing is scheduled for April 10 on the proposal of the Cumberland County Power & Light Company, Portland, Me., which operates the Portland Street Railway under lease, to abandon several unprofitable railway lines. Opposing patrons are planning to present their side of the question to the Public Utilities Commission. An attempt will be made to restrain any order allowing abandonment with no replacement guaranteed. The operating company claims a heavy deficit has been accumulated due to operating these non-paying lines.

Shareholders of Nova Scotia Tramways Submit New Plan

Shareholders of the Nova Scotia Tramways & Power Company, Limited, Halifax, Canada, dissenting from the company's proposed refinancing program, have unanimously adopted the proposal of Edmund F. Stevens, objecting to any disturbance of the present bond issue. By this means it is claimed the proposed refinancing can be accomplished at practically no cost to the shareholders.

It was pointed out that the time was too short for any concerted action in the matter, but that the shareholders would strengthen their position if they registered a complaint with the company. This committee put forward its arguments and plans to the management of the company and stated, if, after inquiry, any change of policy was decided upon another meeting of the shareholders would be called to discuss the question, before presenting the case.

A statement as to the management's proposed plan, and the program adopted by the meeting presented the new capital structure in the management's refinancing scheme as follows:

First Mortgage 5 per cent bonds	$3,500,000
Cumulative preferred 6 per cent stock	750,000
No par common stock, 32,013 at 30	960,390
No par common stock, 2,510 at 30	75,300
Total	$5,285,690

In place of this it was suggested by the meeting that the present bonded indebtedness be undisturbed, and the capital structure be as follows:

First mortgage 5's	$2,250,000
General mortgage 7's	1,432,500
No par common stock, 2,510 at 30	75,300
No par common stock, 32,013 at 30	960,390
Total	$4,718,190

(In treasury, no par common stock 5,477; Total, 40,000.)

Comparing the present capital structure with that proposed by the company it was pointed out that the interest charges on old securities total $212,775 as compared with a total of $220,000 for interest on the new securities as proposed in the refinancing scheme, an annual difference of only $7,225.

Montreal Distributes Lost Ticket Fund

The City Council of Montreal, Quebec, Canada, has approved an arrangement under which the city and the Montreal Tramways will distribute a fund of $1,165,000, now in the hands of the company which represents lost or unused tramway tickets.

The arrangement, will be made subject to approval by the Montreal Tramways Commission. It provides that $500,000 of that amount shall remain with the company as a permanent fund against tickets lost or unused. Of the remaining $665,000, 50 per cent, or $332,500, will go to the fund destined ultimately to reduction of local fares; 30 per cent, or $199,500, will go to the city and will be used for parks and playgrounds, and the remaining 20 per cent will go to the company as profits.

For ten years, now, this question of the fund has been actively before the administrators of the city. At the time the new tramways contract was signed in 1916, no clause governing disposal of the sums coming from unused or lost tramway tickets was put into the agreement principally because the fund was negligible when the contract was under discussion. As years went by, however, the fund has mounted until now it stands at $1,165,000.

Results in Denver Before and After Allowing Depreciation

A report issued on the results of 1927 operation by the Denver Tramway, Denver, Col., showed $4.60 per share was earned on the preferred stock after allowing for depreciation. According to the Denver *Post* by figuring the net profit for the two years on the same basis a balance of $9.46 a share was earned in 1927, available for the preferred stock before allowing for depreciation. Due to a change in the method of bookkeeping the earnings of the company were reported at less than half as much as shown in 1926, but an analysis of the statement discloses a slight difference. The discrepancy occurs through the charging off of the depreciation item, understood to be $500,000, before making allowance for bond interest in the 1927 report, whereas this item had previously been deducted from the net profit figure, after all other expenses.

Using the 1926 method of figuring, gross operating income, less expenses and taxes, would be $1,467,884 for 1927, compared with $1,624,258 the preceding year. Interest on the underlying bonds was earned more than seven times, a showing even better than was made in 1926, as the bonded debt was smaller than in 1927. Interest on the general and refunding bonds was earned almost four times in 1927, compared with about 4.25 times in the preceding year. Balance available for preferred stock dividends and depreciation was $982,164, a decline of only $29,212 from 1926.

The 1927 income statement as issued by the company, together with the revised statement used in the comparative analysis, and the 1926 statement accompany this account.

INCOME ACCOUNT OF DENVER TRAMWAY AND DENVER & INTERMOUNTAIN R.R.

	Company Statement 1927	Revised Statement 1927	Statement 1926
Total operating revenue	$4,390,016	$4,390,016	$4,565,251
Operating expenses	*$2,940,084	$2,440,084	$2,452,131
Taxes	523,460	523,460	543,029
Total operating exp. and taxes	$3,463,544	$2,963,544	$2,995,160
Net operating income	926,471	1,426,471	1,570,091
Miscellaneous income	41,413	41,413	54,498
Gross income less operating expenses and taxes	$967,884	$1,467,884	$1,624,589
Interest on underlying bonds	207,064	207,064	249,959
Balance	$760,060	$1,260,060	$1,374,630
Interest on general and refunding bonds	322,100	322,160	322,175
Balance	$437,964	$937,064	$1,052,455
Net profit and loss credit less amortization of discount on funded debt	44,200	44,200	41,071
Balance for dividend requirements on preferred stock and depreciation	$482,164	$982,164	$1,011,383

* Includes depreciation.

Judgment in St. Louis Satisfied

St. Louis, Mo., through Associate City Counselor Dolan on March 1 acknowledged in the St. Louis Circuit Court satisfaction of the $2,431,868 mill tax judgment it obtained against the now defunct United Railways. The city accepted 16,212 shares of preferred stock issued by the St. Louis Public Service Company, the successor to the United Railways and foreclosure and reorganization, and $28,371 in cash, representing a 7 per cent dividend for the last quarter of 1927 in full settlement of the old judgment.

Capital Stock Tax Suit Lost in Boston

The Boston Elevated Railway, Boston, Mass., lost in its suits to recover the capital stock tax which it paid to the federal government during the first four years of public trusteeship, according to a recent decision of Judge Morton in the U. S. District Court. The suits for recovery were based on the contention that while the road was under public control it was not taxable by the federal government under the capital stock tax law. Approximately $50,000 in taxes, which have been paid under protest, are involved in the suits.

J. B. Hollister a Cincinnati Director

John B. Hollister, attorney, was elected to the board of directors of the Cincinnati Street Railway, Cincinnati, Ohio, at the annual meeting of stockholders held recently. He is the only new director. Mr. Hollister succeeds the late Albert J. Becht.

Personal Items

Appointments on Illinois Traction System

H. A. Tuohy, assistant traffic manager, has been appointed acting freight traffic manager in charge of all freight matter.

W. H. Wylie, who has been traffic manager, is retiring from that position, but will continue with the company as special traffic representative.

E. E. Kester, assistant traffic manager, continues in charge of all passenger traffic matters.

These changes in the Springfield office were announced recently by D. W. Snyder, vice-president of the Illinois Traction System.

W. W. Kennedy New Assistant in Birmingham

Walter W. Kennedy has been appointed assistant to J. S. Pevear, vice-president and general manager of the Birmingham Electric Company, Birmingham, Ala. He has been an employee in the executive department since 1925. Prior to his affiliation with the Birmingham Electric Company, he practiced law with the firm of Bradley, Baldwin, All & White. He was commissioned an officer in the United States Army during the World War and has served two terms as president of the Junior Chamber of Commerce.

Mr. Kennedy was born in Birmingham. He was graduated from the University of Alabama as an L.L.B.

R. W. Kelley Superintendent at Ottumwa

R. W. Kelley has been appointed superintendent of transportation of the Ottumwa Street Railway and of the bus system of the Iowa Southern Utilities Company. He was assistant superintendent of transportation in Burlington and has extensive training in both bus and railway operation. Mr. Kelley succeeds O. E. Steiner, who has resigned after eighteen years of service.

Changes in Winnipeg

Promotions and changes on the Winnipeg Electric Company, Winnipeg, Canada, are as follows:

A. E. Parker, formerly managing secretary of the Winnipeg Board of Trade, has been appointed assistant to the president of Winnipeg Electric Company, in charge of public relations and publicity, effective March 1.

Lawrence Palk, who heretofore occupied the position of assistant to the president and secretary of the company, has been appointed assistant general manager, in charge of executive matters. He continues as secretary.

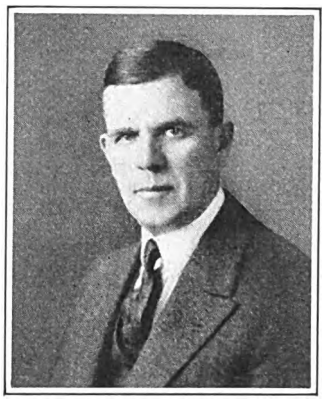
C. H. Dahl, who served as assistant general manager, had his title changed to assistant general manager in charge of operation, effective March 1.

H. C. Howard, who has been publicity manager for a number of years, has left the company's service.

John Hurley, a local newspaper man, has been appointed publicity manager, reporting to Mr. Parker.

J. A. Nilan Manager at Poughkeepsie

J. A. Nilan has recently been appointed manager of the Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y. Mr. Nilan was connected with the New York Telephone Company and Brooklyn *Standard Union* from 1906 to 1907 as junior accountant and from there he entered the employ of the Central Hudson Gas & Electric Company, Poughkeepsie, N. Y. In this work he was engaged from 1907 to 1909.



J. A. Nilan

In the last-mentioned year Mr. Nilan accepted a position with the Poughkeepsie & Wappingers Falls Railway under the late Capt. J. W. Hinkley, Jr., who was then the president and manager of the company. He was appointed auditor in 1913 and assistant manager in July, 1927. The Poughkeepsie & Wappingers Falls Railway operates 20 miles of line. It is being operated by Hemphill & Wells, engineers, 43 Cedar Street, New York City.

Mr. Nilan was born on March 22, 1884. He was graduated from Eastman Business School, Poughkeepsie, N. Y.

A. C. Baker Succeeds His Father at Birmingham

Arthur C. Baker has been recommended by the Birmingham Corporation Tramways Committee to be general manager of the Birmingham Tramways, Birmingham, England, succeeding his father, Alfred Baker, who is retiring. The new manager has been through a long and exhaustive experience in engineering. Since 1920 he has been chief engineer of the Birmingham Tramways. The Municipal Tramways & Transport Association last year awarded him first prize for an essay on tramway engineering.

W. W. Trench Succeeds M. F. Westover

Myron F. Westover, secretary of the General Electric Company for the past 34 years, retired on March 1 and William W. Trench, assistant secretary, has been elected by the board of directors to succeed him.

Mr. Westover has been actively identified with the electrical industry for 40 years, his first position being secretary to the late Charles A. Coffin, then treasurer and manager of the Thomson-Houston Electric Company. He was associated with Mr. Coffin until Mr. Coffin's death in 1926.

Mr. Trench, the new secretary, is a native of Staten Island. He is 36 years of age, a graduate of St. Lawrence University and the Brooklyn Law School and was admitted to the bar in 1916.

JOHN ALDWORTH, general manager of the Nottingham Corporation Tramways, England, has resigned after 30 years' service with the city in that position. The Tramways Committee has expressed its high appreciation of Mr. Aldworth's services, and proposed that he be retained as a consultant.

Obituary

SAMUEL P. GOULD, for eighteen years assistant secretary of the Selden Motor Truck Company, Rochester, N. Y., died recently at his Rochester home. Mr. Gould was widely known in the automotive industry in which he was a pioneer worker. It was on land owned by Mr. Gould that the Selden Motor Company plant was built. He was the company's first secretary.

HENRY A. ROBINSON, who was counsel of the Metropolitan Street Railway, New York, for many years, died at his home in Yonkers, N. Y., on March 12, at the age of 68. His demise was caused by pneumonia. Mr. Robinson had lived in Yonkers for more than 40 years and during that time had figured prominently in civic affairs. He was a trustee of the First Presbyterian Church and for twenty years had been head of the governing board of St. John's Hospital. While he was with the Metropolitan Street Railway he took a great interest in association activities and had a wide acquaintance among electric railway operators. After severing his connection with the Metropolitan Street Railway he was identified in a legal capacity with a number of prominent corporations, among them being the Pennsylvania Railroad and the American Telephone & Telegraph Company.

Manufactures and the Markets

New Bridge Proposed to Connect El Paso with Juarez

Plans for a new bridge across the Rio Grande to connect El Paso with Juarez have been submitted for approval to the Department of Public Works of the Mexican Government by the El Paso Electric Company, El Paso, Tex. Upon the approval by the Mexican government, the plans will be submitted to the United States Congress for similar action. The proposed bridge will cost $250,000 and will replace the present structure on the Santa Fe Street crossing. The structure will be largely of steel and will be longer and wider than the existing bridge. Other improvements by the company, amounting to an additional $265,000, will include a new bus garage to cost $35,000.

Larkin Packer Buys Davis Boring Tool Company

Larkin Packer Company, St. Louis, Mo., has purchased the entire property and assets of the Davis Boring Tool Company, St. Louis. The Davis Boring Tool Company will preserve its identity as a division of the Larkin Packer Company. No changes are contemplated in the products of either plant at this time but sales territories will be thoroughly revised to include capable representation in every principal center.

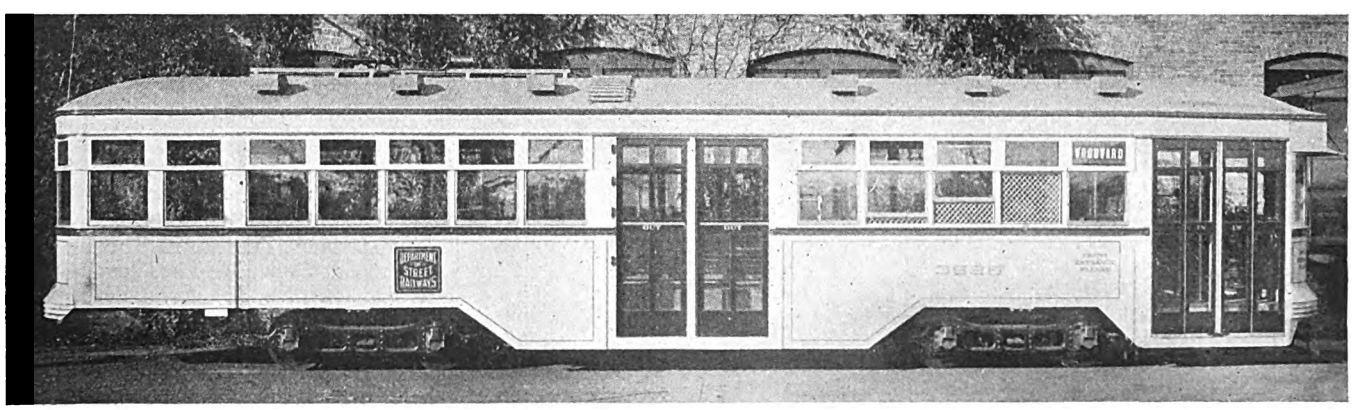
Supreme Court Upholds Interborough in Car Door Patent Case

The United States Supreme Court has upheld the decision of the Circuit Court of Appeals, Second Circuit, in the case of Samuel T. Walkup vs. Interborough Rapid Transit Company. This was a suit for alleged infringement of patent 1,379,583 on means for operating car doors. Reference to the Court of Appeals suit appeared on p. 37 of the issue of this paper for Jan. 7, 1928.

Shipment of 125 Detroit Cars Completed

Shipment of 125 new Peter Witt type cars for the Department of Street Railways of the city of Detroit, the order for which was noted in the JOURNAL of July 23 and Oct. 1, was completed about the first of the year. These cars have a length over all of 48 ft. 5 in. They are of single-end type and have a total weight of 36,000 lb.; a seating capacity for 52 passengers; are equipped with rattan seats and the interior trim is in cherry.

Name of Railway	City of Detroit, Department of Street Railways
City and State	Detroit, Mich
Number of units	125
Type of unit	Peter Witt two-man, motor, passenger, city, single-end, double truck
Number of seats	52
Date of order	June 20
Date of delivery	Oct. 18, first car
Total weight	36,000 lb.
Bolster centers	23 ft. 9 in.
Length over all	48 ft. 5 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	10 ft. 10 in.
Body	Semi-steel
Roof	Arch
Doors	Center and end
Air brakes	General Electric & Westinghouse straight air
Armature bearings	Plain
Axles	Heat treated
Car signal system	Faraday
Compressors	CP-27 and DH-16
Control	K-35-KK
Curtain fixtures	Curtain Supply
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Cleveland
Finish	Lacquer
Gears and pinions	Grade M. & B.P.
Glass	D.S.A
Hand brakes	Peacock staffless
Hand straps	Rico 7
Heaters	Gold electric
Headlights	Golden Glow
Headlining	Agasote
Interior trim	Cherry
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Electric Service Supplies
Motors	GE-265 and Westinghouse. 510-A
Roof material	Poplar T. & G.
Sash fixtures	O. M. Edwards
Seating material	Rattan
Steps	Stationary
Step treads	Kass
Trolley catchers	Ohio Brass
Trolley base	Ohio Brass
Ventilators	Railway Utility
Wheels, type	26 in. steel
Wheelguards or fenders	H.B.



One of the new 125 Peter Witt cars for the Department of Street Railways of the city of Detroit

Exhibitograph No. 4

FOUR weeks from the date of this issue of ELECTRIC RAILWAY JOURNAL applications will go out from the headquarters of the American Electric Railway Association for exhibit space at the convention to be held in Cleveland Sept. 22-28. Do not await the receipt of the blank. It is in the prospective exhibitor's interest to make his plans now, so that the application will not be delayed in reaching headquarters within the 30-day limit set for filing.

International Railway Installs Ohmer Registers

The International Railway, of Buffalo, N. Y., has just installed Ohmer printing fare registers in all of its city cars. The order called for 566 of the No. 22 type Ohmer registers, arranged to record three classes of fares, and operated by a pedal. With the new city installations, which have been recently completed, the entire electric railway system of the city of Buffalo, as well as all of the interurban lines feeding it, is now 100 per cent Ohmer equipped.

Seattle Plans Track Extension Program

Plans formulated by D. W. Henderson, superintendent of the Municipal Railway Department, Seattle, Wash., for a $1,077,668 track extension program for the municipal lines in various parts of the city, have been submitted to the City Council. Among the extensions planned are: double-tracking around Green Lake, estimated to cost $216,685; double track on Seventh Avenue N. E. and Fifth Avenue N. E., estimated cost $330,240; double track on Tenth Avenue N. E., $54,497; extension on 35th Avenue S. W., to serve the West Seattle district, to replace the buses now operated in that district, $164,401; Fifteenth Avenue N. E. extension, $44,513; Eighth Avenue N. W. extension, $193,680; additional track on the South Seattle line, $61,733; four additional storage

Digitized by Google

tracks in the Fremont carhouses, $11,914.

If all these extensions are made, 50 additional street cars will be required, Mr. Henderson said. To date all efforts of the city to purchase new equipment have been halted because of conditions adverse to the placing of equipment trust obligations.

Columbus, Delaware & Marion to Build Shops in Delaware, Ohio

On Dec. 15, the shops of the Columbus, Delaware & Marion Electric Company, located at Stratford, Ohio, were destroyed by fire. As this location was beyond the city limits it was often difficult to secure labor and it was to the advantage of the company to locate the shops in Delaware.

As building in Delaware would mean additional investment the Delaware Chamber of Commerce subscribed $6,400 for preferred stock enabling the company to build new shops and carhouses within the city.

ROLLING STOCK

MUNICIPAL STREET RAILWAY, Monroe, La., will refinish its cars after the order of one just completed. The exterior of the car has been repainted a dark orange and the interior walls have been finished in oak color with woodwork in national maple, floor in maroon and ceiling in white enamel. The car has been completely overhauled mechanically.

NORTHERN OHIO POWER COMPANY, Akron, Ohio, has received delivery of seventeen twin coaches from the Twin Coach Corporation, Kent, Ohio. Eleven of these coaches are mechanical-drive, street car type and six are parlor coaches. A gas-electric urban type coach remains to be delivered.

HOUSTON ELECTRIC COMPANY, Houston, Tex., has ordered four more twin coaches from the Twin Coach Corporation. Delivery is expected the latter part of March, making 21 Twin Coaches in Houston.

SHOPS AND BUILDINGS

BIRMINGHAM ELECTRIC COMPANY, Birmingham, Ala., has nearly completed its new carhouse and repair shop. The carhouse is expected to be ready for occupancy within a month.

EASTERN TEXAS ELECTRIC COMPANY, Beaumont, Tex., is remodeling its carhouse and erecting a new Truscon steel bus garage at a cost of approximately $12,500.

TRACK AND LINE

KANSAS CITY PUBLIC SERVICE COMPANY, Kansas City, Mo., has started work on constructing a loop at the end of the Fifteenth Street line and repaving tracks on Jackson Avenue. The curves and crossings at 31st and Holmes Streets are to be reconstructed and the tracks on Fifteenth Street from Elmwood to Cypress Avenue are to be repaved.

LINN COUNTY LOGGING & LUMBER RAILWAY in the Albany district, Oregon, has applied for a permit from the Interstate Commerce Commission to build 68.6 miles of railroad to tap new timber interests in the Albany region, which will include 40.6 miles of standard main-line construction, at a cost of approximately $1,000,000, and the construction of four branches to cost $750,000. Connection with the Oregon Electric Railway is to be made 2 miles north of Albany, Ore.

TRADE NOTES

PANTASOTE COMPANY, New York, N. Y., has appointed H. G. Mastin, formerly with the Locomotive Stoker Company, assistant to W. A. Lake, manager of the railway and marine department.

PERFEX CORPORATION, Milwaukee, Wis., builder of heavy-duty industrial engine radiators, announce the opening of a Cleveland office in the Leader Building. A. C. Owen, formerly located at New York, will be in charge of this office, taking over all the Ohio territory in addition to the Eastern states which he formerly covered.

NATIONAL CARBON COMPANY, INC., has moved its branch sales office and factory of the carbon sales division from its former location at 357 West 36th Street, New York, to new and much larger quarters at the company's plant at Fourteenth and Henderson Streets, Jersey City, N. J. This change more than doubles the size of the former plant and considerable additional manufacturing equipment has been added to meet the increasing demand for its brushes and carbon products in the eastern district territory.

WATSON-STILLMAN COMPANY, New York, has elected William B. Updegraff, vice-president in charge of sales. For the last fifteen years Mr. Updegraff has been engaged in various engineering and sales capacities with this company.

WHITE COMPANY, Cleveland, Ohio, has appointed Stanley P. Seward, assistant to vice-president Saunders Jones. Mr. Seward will continue his direction of the advertising department in addition to the new duties he is assuming.

ELECTRO-NITE CARBON COMPANY, Philadelphia, Pa., announces that A. G. McMann is now in charge of its Michigan office, located at 307 Basso Building, 7338 Woodward Avenue, Detroit.

ADVERTISING LITERATURE

CROUSE-HINDS COMPANY, Syracuse, N. Y., has issued two bulletins, No. 2109, "Flood Lighting" and No. 2106 "Floodlights and Industrial Units." The bulletins cover the use of floodlights in commercial and industrial activities as well as for decorative purposes.

CHISHOLM-MOORE MANUFACTURING COMPANY, Cleveland, Ohio, has just issued a new complete catalog on electric hoists. The bulletin is No. 31 and is one of a series being prepared on material handling equipment.

WALTER A. ZELNICKER SUPPLY COMPANY, St. Louis, Mo., has just issued a new bulletin No. 354 giving descriptions and prices of equipment for handling sand and gravel.

SANGAMO ELECTRIC COMPANY, Springfield, Ill., has issued bulletin No. 67 describing the Sangamo type H C meters.

ELECTRIC RAILWAY MATERIAL PRICES—MARCH 13, 1928

Metals—New York

Copper, electrolytic, cents per lb	13.825
Lead, cents per lb	6.00
Nickel, cents per lb	35.00
Zinc, cents per lb	5.65
Tin, Straits, cents per lb	50.25
Aluminum, 98 or 99 per cent, cents per lb	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	57.00
General service	31.50

Bituminous Coal

Franklin, Ill., screenings, Chicago	1.825
Central, Ill., screenings, Chicago	1.675
Kansas screenings, Kansas City	2.125

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅞ in. and larger, cents per lb	2.75
Tie plates (flat type), cents per lb	2.25
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.85
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (24 gage), cents per lb	2.90
Sheet iron, galvanized (24 gage), cents per lb.	3.65
Galvanized barbed wire, cents per lb	3.35
Galvanized wire, ordinary, cents per lb	3.10

Waste—New York

Waste, wool, cents per lb	16-20
Waste, cotton (100 lb. bale), cents per lb.:	
White	16-19.50
Colored	11-16

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.2
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal	$0.64
Putty, 100 lb. tins, cents per lb	5.50

Wire—New York

Copper wire, cents per lb	16.125
Rubber-covered wire, No. 14, per 1,000 ft.	5.30
Weatherproof wire base, cents per lb	16.50

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ½-in., carload lots, N. Y., per cu.yd	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ½-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	11.50
Light copper, cents per lb	10.125
Heavy yellow brass, cents per lb	7.125
Zinc, old scrap, cents per lb	3.125
Lead, cents per lb. (heavy)	4.875
Steel car axles, Chicago, net ton	$16.25
Cast iron car wheels, Chicago, gross ton	14.25
Rails (short), Chicago, gross ton	15.75
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

Volume 71 New York, Saturday, March 24, 1928 *Number 12*

Getting Results from Employee Education

REALIZATION is growing that increased patronage for the transportation utilities is dependent in a measure on special training of employees. Street railway companies are finding themselves in an increasingly competitive business. It has been repeatedly observed in such business, other things being equal, that the greatest volume of patronage gravitates to the concern possessing the best trained employees. Consequently, the change in the transportation business from a monopoly to a competitive enterprise has emphasized the need for employees or "salesmen" so educated to an understanding of the business as to qualify them to create and maintain a cheerful contact with customers, both actual and prospective.

What, essentially, is a transportation "salesman"? Reduced to the simplest terms he would appear to be an employee who renders a class of service which pleases his customers. Training for this result consists of building up in each man's mind an understanding of the importance of three fundamentals: individual prestige, company prestige, and interest in his passengers or "customers." These are the ultimate objectives of electric railway educational work. The exact program to be followed requires a thorough understanding of the human factors involved and can only be developed from actual employee training experience. However, at the start, caution should be exercised against indulgence in too much academic instruction. The great mass of railway employees have not had much academic background; in fact it might be said that their particular aversion to it has some bearing on their present positions. Therefore, a pedagogical atmosphere or academic methods of transmitting an understanding of company policies may be expected to enlist little real interest from men who have an aversion to the class room. On the other hand, it is entirely possible to establish closer contact between operating officials and the men, and through such contacts to transmit a better understanding of the relation between the platform man and the passengers with whom he comes in contact.

This is not to say that the educational or employee training work of transportation companies should not be in the hands of specialists. It seems obvious that success in such work demands the entire attention of men who can devote their whole time to the development of a technique and procedure based upon close study and analysis of experience with employee training—both on their own and other properties. But such work should be conducted as an integral part of management; not as a side issue that can be turned over to an instructor and forgotten by the operating head. In fact, the education of transportation employees must be a part of the operation of the property and to enlist real interest the employee's contact with this work should impress him as an intimate contact with the management itself.

The language of employee education should be the language of operation—not that of the class room. The manager and department heads as well, must play their part in associating the educational work with the actual operation of the property. The work of equipping himself to handle the company's patrons as they should be handled is as much a part of the man's job as is the proper handling of equipment, fares or reports. Only by creating that point of view in the employee's mind can educational work accomplish the results sought.

Taking Time to be a Citizen

APPROXIMATELY two years ago a hard-pressed railway property changed ownership. When the new president arrived in town, a stranger, he found an unfriendly public and a fractious city government. The franchise situation was in a mess. Earnings were unsatisfactory; the company's service was condemned by public and press and the public co-operation necessary to bring about improvement was withheld.

After the short period that has elapsed since the change in management took place, this railway is giving the best service in its history. New franchises have been granted by the city and an *esprit de corps* has been built up among employees that is reflected hundreds of times a day in the contacts between platform men and car riders. The company's chief executive has been publicly thanked by the Chamber of Commerce for his service to the community. Public suspicion and antagonism have given way to confidence and friendliness.

How was this complete reversal in public relations brought about? For the answer, ask the man in the street. He reacts instantly to mention of the railway executive's name. Despite the arduous duties of running such a property, this man has found time to become one of the city's leading citizens. He belongs to five social clubs, the Rotary Club, and is a director of the Chamber of Commerce. In the latter body he serves as chairman of its river improvement committee and as a member of its advertising committee. He is a member of the city's port commission, forward movement committee, special gifts committee of the community fund, and the state higher education association. He is president of the safety council and a director of the retail merchants' association. He has toured the state with public bodies in the interest of good-will campaigns. In his own suburban community he is high in the councils of the citizens' association.

How has he found the time to give attention to all these community activities? He alone knows! But the results accomplished for his property speak for themselves. This man's activity is indeed in strange contrast

Digitized by Google

with that of the utility executive of a decade ago. It is the modern interpretation of the responsibilities of guiding the destiny of a public service enterprise. To be sure, it is a strenuous existence; but it is the price of winning and retaining public confidence. The utility executive of today must operate his property efficiently as a matter of course, but that alone does not suffice; he must take time as well to be a citizen.

Effect of the Open Winter on Railway Earnings

RAILWAY managers look on the very open winter which the East has been experiencing during the last three months quite differently from how they would have done fifteen years ago. Then such a season would have been welcome because of the reduction in cost of removal of ice and snow from the tracks.

The same saving has been made by the electric railways this year, but the absence of snow has also encouraged automobile owners to keep their cars in commission throughout the winter. On most electric railways the consequent loss in gross revenues has greatly exceeded all saving possible in operating expenses by the absence of snow. This helps to explain the lower gross earnings of some companies during the present "freak" winter. They are in somewhat the same condition as the dealers in furs and other winter clothing.

It is interesting to note various corollaries of this effect of the weather on railway earnings. One is that if the storms during the early part of the winter are sufficiently severe to induce the average automobile owner to put his car in dead storage, a great many such cars are apt to remain out of active use until spring really has come. A single storm or two, however, will not drive the automobilist to cover.

Another factor is the effect when the state issues part-time automobile licenses. In some states, a lower charge is made for a nine-months' automobile license, such as one taken out in April, than for a twelve-months' license, or one taken out in January. Where this practice prevails, the automobile owner whose car has remained in dead storage during January and perhaps part of February without a license will often wait until April 1 before taking out his new plates, in order to save a few dollars. In the meantime, the electric railway company gets his patronage for six weeks or two months longer than it otherwise would. But if the automobile owner should take out his license in January, he is apt to keep his car in condition to run the rest of the winter.

Liberalizing the New York Savings Bank Law

GOVERNOR SMITH of New York has before him for signature a bill legalizing the investments available to savings banks by including provisions for the purchase of certain public utility bonds and railroad equipment trust obligations. The passage of the measure represents an effort of years, culminating in recommendations made to the present session by a special joint legislative committee entrusted with the responsibility of making constructive suggestions for the revision of the archaic statutes.

Now that is just what these statutes were. They were archaic. They were well drawn, in fact better drawn perhaps than those of any other state, except possibly Massachusetts, in the amount of protection they afforded for the funds of the small saver, but they took no account of the change of time—an element that has witnessed the great growth of electric light and power and railway industries. So far as the electric railways are concerned, their interest in the matter is only academic as the provisions of the measure, digested elsewhere in this issue, make plain, but the measure as passed does represent the advanced thinking of the day.

There is a plethora of money just now awaiting investment in substantial issues, but the changes in the law, if Governor Smith approves them, may be expected to work to the immediate advantage of the utilities, with the prospects that at some future date they may work decidedly to their advantage. The savings banks of New York are, of course, a mighty factor in their capacity to absorb investment issues of high character, but the problem of the past has been to find such investments in volume and still preserve the balance with respect to the various types of securities in which the funds were placed. The law as now amended should make the problems of the savings bank directors easier since it is estimated that $1,402,536,000 par value of light and power bonds alone will now go on the legal list, and unless money becomes still easier the change should tend to make it possible to preserve the present liberal rate of interest, which in most cases, certainly in New York City, has been 4½ per cent in recent years as compared with 3½ and 4 per cent not so long ago.

The Spirit of Levity in Montreal

CARELESS are the ways of man in little things. If this were not so there would have been no solemn conclave in Montreal recently to decide upon the disposition of a fund of $1,165,000 built up over a period of twelve years which represents money paid for lost or unused tramway tickets. Other companies have similar problems to deal with at times, but with them there is no occasion for comment at this time. With Montreal, however, the case is different.

When the franchise now in effect in Montreal was drawn in 1916, the fund which has grown to such proportion was negligible. If anybody thought about it then it did not make much impression. Weightier things were at hand. In consequence no clause was put into the operating agreement between the city and the Montreal Tramways providing for the disposal of sums so accrued. But the matter eventually became a poser. Even in this age of grandiose sums $1,165,000 is not to be regarded lightly. True, under the disposition now agreed upon and still subject to sanction by the tramway commission only 20 per cent goes to the company as profit.

Since Montreal is under service at cost there are ramifications to the disposition of the fund startling and none the less interesting as a subject of speculation. Because human nature is so frail, the Council has wisely impounded $500,000 of the fund against the possible presentation of lost or strayed tickets. It is just as well. Undoubtedly many of the tickets are not recoverable by their owners. For them they represent a dead loss. On the other hand, it is a fact that attention is being called to the more than $1,000,000 of transportation paid for which never was used. This may result in the search of

Digitized by Google

the pockets of discarded or seldom-used suits of clothes and the unearthing of caches where tram tickets are likely to be hidden, perhaps along with unredeemed cigar coupons and other evidences of expenditure the only present tangible traces of which are printed slips whose values in the catalog are comparable with those quoted in the financial columns a few years ago for German marks.

To lay at the door of the people of Montreal the entire blame for the loss of $100,000 in tickets each year would of course be fulsome. Montreal has many visitors, but since information is lacking in the printed account as to just how much of this sum accumulated in recent years, it is impossible to tell what proportion may be chargeable to wanderers on pleasure bent, who in an excess of spirits have overestimated their transportation needs. Anyway, the tickets stand against the railway as a liability. In the patois of the street the attitude of their holders appears to be "What the deuce do we care," but this very indifference created a problem solemn men were called upon to consider.

There Must be Something for the Stockholders

HEARINGS have been concluded at Washington, D.C., on the proposal to consolidate the Capital Traction Company, the railway lines of the Washington Railway & Electric Company and the Washington Rapid Transit Company, which operates the local bus line. The proposal is not unlike similar ones made during the last twenty years, but it has gone farther in that a unification agreement has been drawn up.

Officers of the companies are agreed that the consolidation is advisable in the interest of greater efficiency and economy of management and for the benefit and advantage of the public and the stockholders. If it can be arranged, the consolidation would undoubtedly be all that those who subscribe to it believe it would be. But while the people in Washington insist that some such plan shall be carried out, they wonder wherein they are to profit. This is a natural human reaction, but no one can tell in advance except in terms of intangibles. The co-ordination of the three services should work to their benefit, but whether it would be possible to reduce fares is another matter. One thing is certain. The railways will have to raise fares if the consolidation is not put through. If, after the economies are realized that can be attained under the consolidation, it is not possible to reduce fares, the public of Washington would still be the gainer even if in a negative way.

As indicated in the JOURNAL for March 17 the two railways are willing to accept a valuation of $50,000,000 with a return of 7 per cent, although the value of the properties found in accordance with the rules of procedure laid down by the court is $62,000,000.

After all, the people of Washington must be brought to understand that any agreement for voluntary consolidation, to be feasible, must be mutually profitable. True, it must be in the interest of the public. But if stockholders are expected voluntarily to agree to a merger the plan must be not entirely against their interests. And the prospect for public benefits are much better under the plan now proposed than it would be with the companies continuing to operate separately.

Presidential Year Pessimists

MOST anything is likely to happen in a presidential year. This is a political axiom. And several things are happening. Perhaps the most significant is the cry raised about unemployment. That unemployment has increased in recent months there can be no doubt, but the situation is not so serious as some would have us believe. On every occasion such as this the old panaceas are trotted out as if nothing had been heard about them before. If the political idealists of one stripe had their way the government—federal, state or city—would at all times stand ready to buy all surplus labor. Whether or not it should similarly be ready at all times to buy surplus farm products is for the successor to the populist to say.

To go back only 30 years, it was the late E. H. Harriman, if memory is not at fault, who propounded the idea that in prosperous times the railroads should as a matter of economy and as a civic duty pile up their earnings so as to apply them and their borrowings to the carrying out of work in slack times. This in a way is just what the utilities are doing that have come forward recently with programs for extensions and improvements to be carried out at once. Among them are the United Gas Improvement Company with its $20,000,000 plan, the Cleveland Electric Illuminating Company with one of $11,600,000, the Public Service Corporation of New Jersey, the Northwestern Electric Company and the Virginia Electric & Power Company, to mention just a few.

It is, of course, well for governments not to compete for labor in a crowded market. But the whole matter has been gone over before, with notable thoroughness during the 1921-1922 period. But no such situation as existed then confronts the country now. To quote just one source, information available to the National Industrial Conference Board indicates that employment conditions in the country as a whole have been improved since December, even though public attention was not focused on the unemployment situation until late in January and in February. The present status of business and industry appears to be well indicated by the fact that record automobile production was established during February by practically all automobile manufacturers with the exception of Ford, that there was record steel ingot production during February, that new building contracts in February were 18 per cent greater than in February of last year, that bank debits of individual accounts were about 1 per cent more than in February of last year and that general industrial activity based upon electrical energy consumed was about 7 per cent over February of last year. Business undoubtedly is being transacted on a lower level of profit than during the similar period a year ago, but it remains true that the volume is at about the same level as the comparable time last year, or not far below the record peak of all times.

Despite the many favorable factors, however, conditions have been considered sufficiently propitious for General James F. Coxey, of Coxey's Army fame, to reappear, for J. Eads Howe, "millionaire hobo," again to put in an appearance and for Mr. Zero to harbor a few migratory guests at his "Tub" in New York. The hitch-hikers know what they are doing. They have picked New York as the greatest show town in the world. And the trick has worked.

Building a
Better Transportation Service
for Kansas City

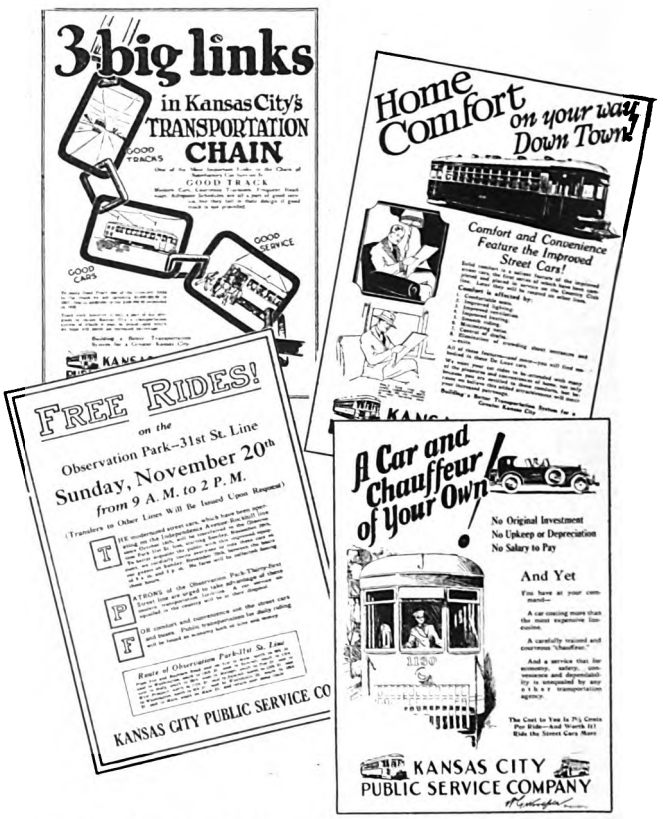
Comfort and convenience feature modernized service. Fleet of 45 de luxe cars used to inaugurate new service on a line a month. One-man operation rapidly extended

REHABILITATION of its street railway property was begun a year ago in a program launched by the Kansas City Public Service Company which has become of outstanding consequence, not alone on the score of a saving in operating costs to the property, but also because it has made possible a much improved street car service as expressed in frequency and car loading. This major rehabilitation program is regarded by the company as an investment in the city's future and as evidence of its confidence in Kansas City's continued growth and prosperity.

Involved in the work of rehabilitation has been a million dollar car rebuilding program, ultimate 100 per cent one-man operation of the modernized cars and an expenditure of another $2,500,000 for track improvement. By the end of 1928, there will have been spent for rehabilitation a total of $6,600,000. The decision to go to one-man operation of all of its cars was encouraged by the progress whch has been made in the design of improved control and safety devices for this type of operation and likewise by the very favorable operating experiences which have obtained since the adoption of a limited number of one-man, double-truck cars in Kansas City in 1919. In the opinion of the management the gradual extension of the one-man operation since that time has made possible the financial results achieved during the period of receivership. The company operated in 1926 a total of 9,287,000 one-man car-miles, or 38 per cent of the total. Had these one-man car-miles been all two-man operated, it is estimated that the additional expense would have been in excess of $500,000 per year.

Experience has demonstrated that there need be no material slowing up of schedules because of the one-man operation where sufficient additional service has been added to distribute the loads properly. Likewise, the accident record has proven better under one-man operation. This is attributed to improved mechanical features on the cars, and to the fact that the entire responsibility for the car operation is centered upon a single operator. As the outcome of the favorable results achieved there have been no protests from either the press or public authorities on the extension of one-man operation.

In inaugurating the new schedules, possible opposition on the part of the public to the one-man feature was avoided by the rehabilitation and improvement of equipment and by increased frequency of service with consequent relatively light loading per car. The public was given a service so superior to what had previously been



The improved service in Kansas City is being consistently advertised, using copy that calls attention to the rehabilitation of the railway property

possible that the advantages of one-man operation were quickly apparent. At the same time, an attractive differential in wage between one-man and two-man operation permitted trainmen to obtain a share in the economies effected. By stretching the period of installation of one-man cars over a sufficient length of time, the normal labor turn-over automatically compensates for the reduction in the number of men required to operate the cars. As each line is equipped with the rehabilitated equipment an increase of approximately 18 per cent is made in the non-rush hour service and 4 per cent in the rush-hour.

A newspaper advertising campaign is being run with advertisements appearing regularly four times a week in the Kansas City *Star* and the Kansas City *Journal-Post*. The copy, which is illustrated in accompanying cuts,

15. Independence, Mo	July 15, 1928	20	26	10	12	21	26

stresses the mutuality of interests between the community and its transportation system, and calls attention to the greatly improved car service which is being given.

A definite schedule calls for the introduction of the modernized cars on about a line a month. In preparation for the extension of one-man operation it was necessary to give the trainmen special training. Men who had been regularly employed as conductors on the two-man cars were moved up to the front platform to work with their motormen as tutors, while men from the extra list replaced and performed the duties of the conductors. This was followed, in turn, by the transfer of the motorman to the rear platform to become acquainted with the conductor's duties. This latter training required only a very short period. Practical instruction of this type was followed by training school work and by operation of one-man cars under the direction of an instructor or supervisor. As shown in the accompanying table, nine lines have been changed over to the new service to date, with six remaining to follow at intervals of about a month.

As the one-man service was introduced on each line it was found advisable for the first few days to augment considerably the number of regular street fare collectors on that line. During the initial period on a new one-man line, men are placed at every important loading point during the rush hour. Their duty is to direct passengers to the proper car entrances, assist them on and off the car, and in other ways explain the new operation. These extra men are used until riders appear thoroughly conversant with the new system.

To facilitate the introduction of the new service, traffic directors are also placed on duty inside the cars. They pass out pamphlets which detail the improvements in the modernized cars. These men assist in no way with the actual operation of the cars and as the public becomes familiar with the service, they are withdrawn. Usually, four days to a week has been found sufficient to insure smooth operation of the one-man service on a new line.

To encourage patrons to give the new service a trial and to inspect the improved cars as they are introduced the Kansas City Public Service Company carries passengers free between certain hours on the first Sunday of the new oper-

Digitized by Google

ation on each line. To inaugurate this service a group of 45 light-weight, double-truck cars, purchased in 1916 and 1917, were completely rebuilt in the company's shops for the specific purpose of introducing the modernized car service on each of the fifteen city lines in succession. In these cars it was the object to show what can be done to make a street car not only an efficient transportation vehicle, but distinctly attractive as well. The floor is covered with a special linoleum over a base consisting of builder's felt and canvas. In the aisle are removable composition rubber runners. The vestibule floors are covered with a metal insert rubber flooring which even in bad weather when ice and snow is carried in, can easily be kept clean. These cars are equipped with skirts on the outside—lined with Celotex. The skirts give a stream-line effect to the cars, are considered to improve the general appearance, and, together with the floor inside, tend to minimize truck noises. A visor on the front of each car protects the operator's eyes from the sun glare, and increases the visibility in case of rain or snow by protecting the upper part of the window.

The 45 cars are completely equipped with safety devices, and in addition have upholstered seats and stream line painting. They are shifted from line to line to introduce the change-over to one-man operation and are then replaced with other rehabilitated cars after the new service is operating smoothly.

Attention is being given to making all rehabilitated equipment comfortable, attractive, and modern, by using new flooring, new ventilators, seat covers and attractive painting. In addition to making some reduction in operating expenses the improved schedules are expected to check the decrease in street car riding which has been steadily apparent since 1922.

Great emphasis has been laid on safety as the outstanding consideration in the operation of the new cars. A distinct effort is being made to gain the absolute confidence of the riding public. In the rehabilitation of the cars no features have been overlooked that in the opinion of the management can contribute to safe operation. The program covers the complete overhauling of motors, trucks, car bodies, controllers, heaters, wiring, piping, and all car appliances, and the addition of many new features such as safety air, folding doors, rear treadle doors, line breakers, back-up control, Economy meters, thermostats, new ventilators, air rectifiers, exit gates, weather stripping, etc.

All cars are being repainted and refinished inside and out, the new color scheme having been worked out by the

Digitized by Google

Kansas City Art Commission. The general scheme calls for orange and apricot on the outside, trimmed in plum with gray roof. The interior finish is a light drab-green above the arm rails, with a darker shade below. The ceiling is white.

All cars are being equipped for one-man, two-man operation, similar to the earlier 1,400 type on Troost Avenue, but with additional features such as treadle exit doors that make handling the loads much easier and give the public more conveniences.

Practically all cars are to be equipped with safety air equipment. Single sliding doors are being changed to double folding doors. The advantages claimed for the folding doors are that as both halves operate at the same time, quicker operation is obtained, and a greater total door width is available for both loading and unloading. National Pneumatic door equipment and treadle operated exit doors are being installed on all cars equipped with safety devices to permit passengers to alight at the rear of one-man operated cars.

The necessity of wyeing cars has been a source of accidents on single-end equipment. In backing cars under such conditions the operator's vision is limited. Consequently, a back-up device is being installed, by which the operator can control both power and air brakes from the rear vestibule of the car at will. Control of power is obtained by a dual line breaker control circuit with a push button on the rear platform. This circuit is operative only when the normal breaker control switch in the front vestibule is thrown to the rear control position. In normal operation the circuit is open and the push button in the rear vestibule is dead. Air brake control at the rear end is obtained by a straight air valve installed there.

All cars have been equipped with Economy meters during the year 1927. These are connected so that only the energy used by the motors is measured. The energy used for lighting, heating and air compressors is not measured. This arrangement was agreed upon in order that the transportation department could institute a competitive system of energy savings among the operators and eliminate the variables due to compressor, light and heat consumption. Spring Gruv weather strips are being installed on window sash to eliminate rattling and to make them easier to open and close in damp weather.

Accident Record Improved

A comparison of accident figures for the past two years on seven divisions of the company's property is afforded in the accompanying table. It is to be noted that the total accidents now charged to the motorman-operator includes types formerly charged to the conductor. Should the present record continue, it is anticipated that one-man operation will show a decided decrease in accidents.

TABLE II—COMPARISON OF ACCIDENT RECORDS 1926 AND 1927

Year	No. operators having no accidents	No. operators having accidents for which not held responsible	Car collisions	Vehicle accidents
1926	65	210	123	5,011
1927	50	220	104	4,997

Labor turnover for 1927 was comparatively normal; in fact there was a 5 per cent decrease in comparison with the preceding year. Yet, in the face of an unexpected declining turnover in labor, it was found possible to introduce one-man operation on one line a month of the fifteen lines on the property and at the same time to hold down to a small number, the active men transferred to the extra lists.

TABLE III—COMPARISON OF LABOR TURN-OVER 1926 AND 1927

Year	Per Cent turnover	No. men hired in Transportation Division	No. men who left service
1926.....	22	309	327
1927.....	17	59	271

Since May 10, 1927 no platform men have been hired.

Summarizing briefly the physical accomplishments to date in the establishment of the modernized street car service in Kansas City, 332 street cars have already been rebuilt up to the first of the year in the shops of the company on a production basis which is continuing to turn out two reconstructed cars a day; nine lines have already been turned over to modernized car operation, the last one of this group having been transferred Feb. 19; and 575 men in the period from June 1, 1927, to Jan. 1, 1928, have completed instruction in one-man operation.

Holds Up Electrification

Committee appointed by the Austrian government to study the financial and technical problems involved

WHEN the present electrifications of the Austrian steam railways are completed no further work will be done for at least some time. This was announced during the latter part of last year by the Austrian government, whose railway system is owned by the state but is independently managed. The railway authorities said that they wanted to see whether the financial results on the existing system warranted further electrification. Among the routes affected by this decision is the trunk line from Vienna to Salzburg which carries the densest traffic of all Austrian lines.

The most serious handicaps to Austrian electrification are the low fares required by the country's economic condition and the high rate of interest which has to be paid on loans required to finance the change. The railway authorities estimated that owing largely to these two factors, the electric operations of the Vienna-Salzburg line would show an annual deficit of approximately $1,200,000. Other arguments against a change are recent improvements in steam locomotive design, resulting in less fuel consumption, and the lower prices for coal in effect at the present time.

According to the European technical press, this decision has met with considerable criticism from various sources. The manufacturers of electrical machinery, expecting more orders for equipment, have considerably enlarged their production facilities and quite naturally are opposed to any decision to stop the electrification. The official figures of estimated loss have been attacked and Professor Seefehlner, a well-known expert in railroad electrification, has published an estimate that instead of a loss there would be an annual profit of $952,000 from the Vienna-Salzburg line for electric over steam operation. The four big electrical manufacturing concerns have offered in a joint bid to take over the whole

Digitized by Google

work at a fixed price so that it would not have to be done by the railroad's own forces.

The latest development in this matter is that the Austrian Parliament has authorized the government to appoint a committee of experts to conduct an extended investigation into all the questions involved.

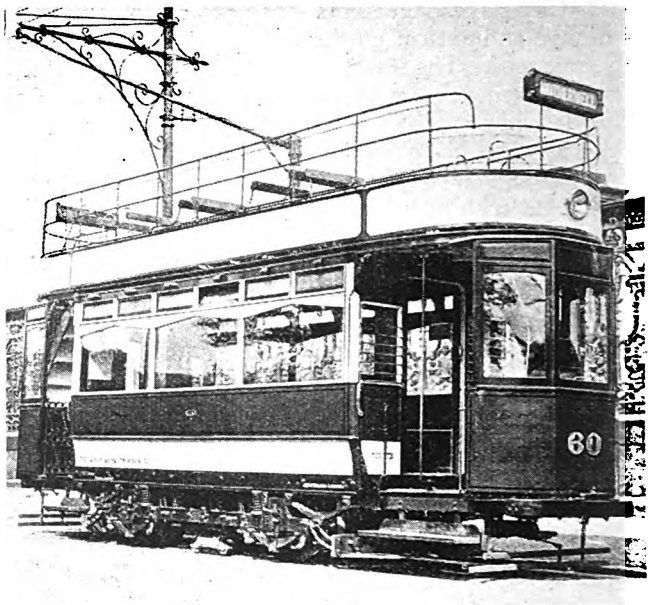
The Vienna-Salzburg line is a very important link in the railway system of Central Europe and connects the western countries like France and Switzerland with the Balkans and points farther east. To meet the needs of complete electric operation, from 138 to 152 locomotives for through service and from 20 to 22 motor cars for local service will be required. The plans call for five substations, each with a capacity of from 3,000 to 7,500 kva. to supply about 94,000,000 kw.-hr. annually. The electrification of this line would save the necessity for the import annually of some 300,000 tons of coal required under steam traction, since ample energy can be developed from available water power.

Light-Weight Double-Deck Car for Scottish Tramway

By G. F. Moller
Bothwell, Scotland

ENGINEERS of tramways in England for some time have been endeavoring to produce a light-weight car to meet omnibus competition. The double-deck car is still in almost universal use in Great Britain, so it is not surprising to find that with the exception of the Bradford high-speed, worm-driven car developments in British cars have been with the double-deck type.

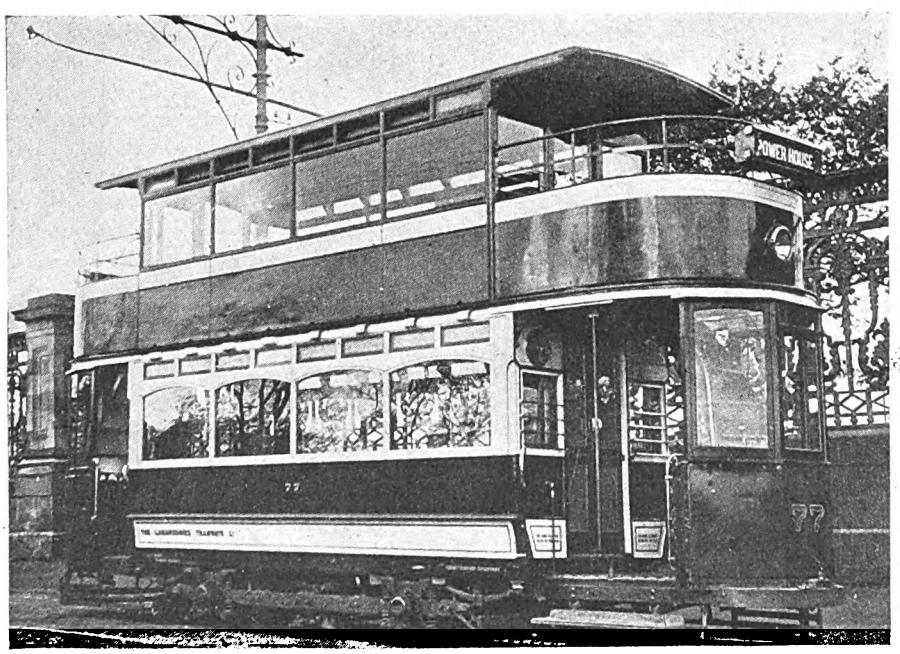
To meet present-day traffic requirements the Lanarkshire tramway system, which is a suburban line linking several large towns to the east of Glasgow has remodeled some of its existing cars to produce a new design of top-covered vehicle. The remodeled equipment was provided with extended platforms, vestibuled ends and front exits. The top-covered cars weighed but 339¾ lb. per passenger seat, which is considered as the lightest for the type of any cars used in Britain.

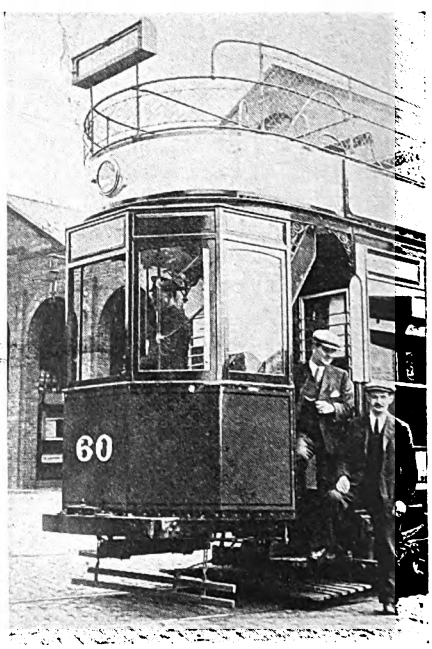


Type of car before remodeling with open upper deck.

The underframe structure is of oak, the side sills having 6-in. x 4-in. sections, reinforced with a 5-in. x 3-in. x $\frac{5}{16}$-in. rolled steel angle. The body framing is entirely of teak with the exception of cant rails and fence rails. In the lower saloon the pillars are secured to the underframe by special malleable iron brackets. Adjustable truss-rod brackets are used. Deep section longitudinal rails are employed, the waist rail being 5 in. deep, while the light rail is arched over the side windows and has a shoulder 7 in. deep on the pillars.

Car bodies constructed according to this design have given excellent results in service despite the poor condition of the track in several of the routes over which they are operated. Roller bearings are employed for both journal and armature bearings. The electrical equipment consists of two 35-hp. British Thomson-Houston light-weight interpole motors with B-51Q controllers. The car completely equipped but without passenger load weighs slightly more than 10 tons and has a center of gravity 4 ft. 2 in. above the rail level.





Double-deck car with inclosed upper deck. End-inclosed vestibules are provided

Terminable Permits *Are Proving Their Worth*

The plan is much to be preferred to the old-time franchise. This is the opinion of the author, expressed to the members of the Illinois utilities associations at their joint meeting at Springfield, March 14-15

By E. R. Dillavou

Assistant Professor of Business Law and Economics, University of Illinois, Urbana-Champaign, Ill.

SIMPLY defined, a local franchise is a permit to use the public streets for the purpose of rendering some public service thereon. There are those who still cling to the idea that it constitutes a gift of untold value. But subjected to effective regulation combined with a true appreciation of the purpose of a public utility on the part of the operators, utility service no longer opens an unusual opportunity for profit at public expense.

The local franchise has had a somewhat varied history. At first the tendency was to issue perpetual grants. This was followed by another period in which it became customary for the legislatures to limit the period for which a franchise might be issued. Provisions were inserted having for their purpose the control of rates and service during the franchise period. Because of the rapid development of the arts and various changing conditions, it soon became impossible to prophesy the future with any degree of accuracy. To meet this difficulty the tendency was to shorten materially the franchise period. This failed to remedy completely the defects in such a scheme of regulation, and from about 1907 to 1913 statutes were enacted in various states creating public service commissions, whose duty was to regulate the public utilities in accordance with the general provisions of the act. Thus, if the short-term franchise was ever a necessity as an aid to regulation it is a certainty that its usefulness expired at that date.

The short-term franchise imposed an exceedingly grave handicap upon utility financing. Investors were unwilling to place huge sums of money in an enterprise unless some provision was made for their repayment at or before the expiration of the franchise. As a result money needed for extensions and improvements often was not obtainable; the ultimate effect was reflected on service. As the franchise neared its end no investor was willing to tie up large sums of money in permanent improvements, when no assurance was given of continued life beyond the franchise period.

Furthermore, the temptation was ever present on the part of the public utility to disregard service, in order that a reserve might be accumulated to amortize the loss in the event a new franchise failed to materialize. To this extent the rate paid was higher than it should have been for the service received. In addition, numerous political upheavals and disturbances were certain to break out during new franchise years. Some of the states amended their laws, so as to place no limit on the franchise period, others adopted terminable permits, while the balance still retain limitations for at least some, if not all, of the utilities.

Principle of Terminable Permit Not New

There is nothing novel or complicated about a terminable permit. It is a franchise which continues indefinitely, unless the utility is purchased by the municipality, or unless the permit is canceled because of misconduct on the part of the company. Such a permit seems to remedy the evils of the short term franchise and, at the same time to protect the public interest, particularly since a public utility is subject to regulation by a state commission. The investor, having faith in the behavior of the management, and realizing that his money will be repaid if the city sees fit to terminate the permit, is ready to supply money from time to time as the progress of the business demands it.

Why is it that the use of the terminable permit has not become more universal? It is customary to state that there are nine terminable permit states, while as a matter of fact in only six of these can it really be said to exist, and in some of the six only certain classes of utilities are entitled to its benefits. The answer lies in a consideration of at least two important problems. Whenever the various interested parties are able to agree on the type of terminable permit law to be enacted and the kind of regulation best adapted to its use, the way will be open for their general adoption.

One of the most important problems confronting any municipal body at the time a franchise becomes necessary is: What duties shall be imposed upon the utility, or what terms shall be inserted in the permit? As the utility takes on a life of indefinite duration, the question becomes doubly important. No utility desires to burden itself, or its customers, with heavy obligations for an indefinite period. On the other hand, municipalities seem most unwilling to surrender this last vestige of control over the local utilities. As a result, wherever term franchises still exist we find various onerous conditions imposed upon the utility in favor of the municipality.

Four possible solutions of this problem have been suggested by the laws of terminable permit states. The laws of Louisiana, which limits the use of such permits to the city of New Orleans, allow the municipality to

Digitized by Google

insert any conditions which may be agreed upon at the time the permit is issued. Oklahoma provides that all new franchises must be for a definite term, but they may be surrendered, at the option of the utility, for terminable permits which embody the terms of the surrendered franchise. The Massachusetts law makes it possible for many of the utilities to have all duties commuted into an annual money payment. Wisconsin is illustrative of a group, the law of which reads that the permit shall be held "under all the terms and limitations of this act." The courts have construed this to mean that each permit is to be like every other permit, the consequence being that all burdensome provisions are eliminated and no new ones may be added.

A clear appreciation by the public of the effect of such burdens might help to solve the problem. Under our theory of regulation, it is clear that the cost of these burdens enter into the rate and become an indirect tax levied upon the consumer. This tax is one which benefits all taxpayers alike at the expense of utility users. A universal recognition of this fact would soon spell the end of such provisions.

Who Is to Regulate?

Perhaps the greatest stumbling block in the path of universal use of the terminable permit is the dispute which continues to rage over which arm of the government is to regulate—state commission or municipality. In Louisiana municipalities are in complete charge, while the other extreme is typified by Massachusetts which has strict regulation by a state commission. The other states fall somewhere between these two extremes. In this connection Indiana and Wisconsin have hit upon a division of authority between the two bodies. In Illinois at present, the practice is the same as that in Massachusetts. All phases of the regulation problem are handled by the state commission. A brief consideration of the Wisconsin scheme of division of authority appears desirable. The following suggestions are in support of this plan.

Uniform accounting procedure, which has been established by the state commission has proven of immense value to both the public and the utilities. It has made possible intelligent and valuable comparisons, and, thus, has proved a great aid in ascertaining the relative efficiency of different companies operating under similar conditions. It has helped to clarify for utility operators some of the problems existing before a well defined procedure was adopted. Clearly the control of accounting procedure must rest in the hands of some central authority.

The same may be said for control of security issues. Security issues are sold throughout the state and often a particular issue is secured by property to be found in many distant communities. Any proposition calling for control of them by the municipalities is absurd. The credit of utility companies can only be maintained when security issues are approved by some central authority entrusted with their strict supervision.

State commissions have been criticized most severely by proponents of local control because of their attitude on rates. These proponents maintain that the foremost purpose of any regulatory system is to see that good service is rendered at the lowest possible rate which is consonant with justice to all parties concerned. They contend that this objective has not been attained by state commissions. The rates are too high, they urge, because of exorbitant valuations and excessive operating expenses. The implication is left that local control will remedy the defects, although more often than not, definite procedure for doing so is lacking.

Occasionally the criticism has been well taken, but I believe in most instances it has been misdirected. Take, for example, the matter of valuation. Undoubtedly, many state commissions personally favor a different method of arriving at a rate base than that adopted by the Supreme Court of the United States. Yet, in the face of the decisions of the federal courts they are helpless. Occasionally the utility operators have, I believe, been guilty of making unreasonable and economically unsound demands. Particularly has this been true with certain of the intangible items. There also are those who criticize severely the use of reproduction cost as a basis for rate making. But even assuming that the majority of valuations are too high, which is still open to proof, it is not at all clear how local control proposes to relieve the situation. The companies will be subject to the jurisdiction of the same courts. The same fundamental principles for determining a return must be used by the city that the state commission has been compelled to adopt.

The second objection to rates granted by a state commission is said to arise from excessive operating expenses. It is said that this results from the lack of any special incentive or inducement offered for efficient management. That too often a utility is given a definite rate of return, without considering adequately its operating efficiency is unquestioned. Any saving resulting from increased efficiency between the rate hearings belongs to management. Therefore, particularly among the large companies, emphasis is constantly being placed on low cost of production and an extension of the utility into new fields of endeavor, in order that added return may be obtained. Furthermore, many of these companies, evincing a realization of their public calling, are voluntarily dividing these profits with the consumers through reduction of rates. It is in such cases that management truly realizes the function which the government permits it to perform. Because some managements do not entertain a high regard for this public trust there is some strength to the criticism. Much could be done by state commissions in working out definite plans to encourage decreased operating expenses by offering a reward for reduced rates. Although municipalities are prone to criticize existing conditions, no definite improvement has been suggested by them.

Two additional reasons are suggested why state regulation of rates is desirable. First, many of the municipalities are financially unable to engage the trained technical help required to solve the rate problem in an intelligent manner; second, the municipality is an interested party in at least two respects. It is itself a user of utility service; and, in addition, the municipal officials represent directly the consumers and form a part of that body. Sound reasoning certainly demands the establishment of rates by some unbiased third party. The state commission seems to fill most acceptably this need.

Service Regulations Differ

It is in the matter of service that we may be inclined to disagree and where Indiana, Minnesota and Wisconsin have departed from Illinois. The State of Illinois has gone to extremes in holding that all matters which in any possible way affect service fall within the purview of the Commerce Commission. The Supreme Court in the Atwood and Northern Trust Company cases held that the municipality had been robbed of its power to regulate

Digitized by Google

at grade crossings and to control such matters as headlights, speed of cars, and the like within the city.

It seems quite evident that matters of police regulation, which affect primarily the physical comfort and safety of its citizens, should rest absolutely with the municipality, even though such ordinances relate to public utilities. Unless some general order of the commission is contravened, the ordinance should be respected.

It is, however, in the matter of the more general control of service that these states depart so radically from others and to which more detailed consideration must be given. There are two distinct phases of service. One relates to the establishment of standards, while the other concerns itself with extension of service. In the matter of standards, these states have granted to the municipality original control, with the possibility of an appeal to the state commission if the utility deems the orders unreasonable. The municipality rules supreme where the problems of extension are involved. Only intervention by some court can interfere with municipal orders issued therefore.

Two Reasons for Local Service Control

There are two rather pungent reasons favoring local control of service; first, the consumer, taken as a group, is entitled to the service his taste calls for, if he is willing to pay the price; second, the extension of service is essentially a local problem and is inextricably interwoven with municipal development. In support of the first contention, I feel that municipal officials are more attuned to the needs and desires of their constituents than is true of an outside body. A busy state commission should not be forced to familiarize itself with an already well-known local demand. Limited only by a willingness on the part of consumers to pay an adequate rate for the service requested, municipal control of service standards appears desirable. Certain difficulties may arise where one operating company serves numerous communities. In an absence of an agreement among them, where different standards are not available because of the uniform nature of the service, some provision for an appeal must be made.

Regarding the second point, it is common knowledge that the orderly development of any city is dependent on the extension of various classes of utility service. A city planning commission cannot function, zoning ordinances cannot be enforced, and paving of city streets must be delayed unless the utilities co-operate. Definite programs relating to municipal development can only be formulated with any degree of assurance of execution when public utility service can be relied upon. By placing the control over extensions in the hands of the body which is directly responsible for the progress of the community, the difficulty is solved. Development of any section of the city is certain to be accompanied by the needed utility service.

In addition, I believe that by placing control over service in the hands of municipal officials, there will evolve a more pleasant and wholesome co-operation. Many problems must of necessity be worked out in harmony with city officials. By delegating to them regulation over service, I feel that a friendlier spirit of co-operation would be certain to prevail. Certainly the replies received from both cities and utilities indicated that municipal and utility relations had greatly improved with the advent of the terminable permit into Indiana and Wisconsin.

There are other matters of importance, such as the surrender of existing franchises, who is to issue the permit, provisions for termination and others, which deserve consideration. In conclusion, merely allow me to make one additional observation. The advantages of a terminable permit apply with equal force to all utilities. At present the street railway industry in Illinois is particularly handicapped by twenty-year franchises. Nevertheless, other utilities are in many instances compelled periodically to bargain for continued existence. A terminable permit law should apply alike to all utilities. The benefits are certain. Neither the investors nor the consumers should be deprived of the advantages which are to be derived from the use of terminable permits.

$200,000 to Improve Philadelphia Cab Maintenance Facilities

IN LINE with its policy to supply the cleanest and safest cab equipment possible, the Yellow Cab Company, affiliated with the Philadelphia Rapid Transit Company, is constructing what is believed to be the largest cab maintenance shop in the world, at 812 Schuylkill Avenue. This shop will have a capacity for handling the entire mechanical maintenance of a fleet of 1,500 cabs.

The Schuylkill-Catharine, or K-T garage, as it is called, is located at Schuylkill Avenue and Catharine Street. A P.R.T. way department shop formerly occupied the adjacent premises at 812 Schuylkill Avenue, and this building is being thoroughly remodeled to meet the needs of the cab maintenance organization. It is planned to have the mechanical equipment ready in 1928.

All cabs on the system will be cleaned, inspected and repaired at this new shop. At regular two-week intervals each cab will be sent to 812 Schuylkill Avenue for a 24-hour stay. The salesman who is driving the cab on the particular day of its appointment with the laundry and dispensary will drive his cab to the Schuylkill shop rather than to its home garage at the end of the day. The cab will first be thoroughly cleaned and washed. It will then be carefully inspected to insure first-class mechanical condition. Any repairs and adjustments will be made at once. A force of shop drivers will return the cabs each night to their home garages. "Trouble shooters" in each garage will, however, make minor repairs necessary between the times of regular inspection.

The cab washing and repair apparatus will be the last word in cab maintenance equipment. A lacquering machine will be installed to add the finishing touch of polish and shine. With the completion of this work and the centralizing of the garage mechanical departments it is expected that the number of street disablements will be materially reduced, and that the cost of keeping the cabs in good operating condition will be considerably lowered.

The operating offices of Yellow Cab, now located at 1734 North Broad Street, will be moved to the second floor of the new shop the latter part of November or the early part of December. In addition, the stores department for all garages will be located at 812 Schuylkill Avenue. The instruction department for new salesmen, their classrooms and the uniform room will also occupy a section of the second floor. In fact, the whole Yellow Cab organization, with the exception of the executive offices, the traffic department and the four garages, which then will do little more than house the cabs, will be combined in the new quarters.

This new project will cost approximately $200,000.

Altoona Modernizes

on a Three-Year Program

Expenditures made after careful analysis to put Altoona & Logan Valley Electric Railway and Logan Valley Bus Company properties on substantial basis

DURING the past three years the Altoona & Logan Valley Electric Railway and the Logan Valley Bus Company have spent more than $1,000,000 for new track and equipment and an additional $650,000 for maintenance of track and equipment.

The extensive program of improvements has been carried out by the railway and its bus operating subsidiary, serving Altoona, Tyrone and Hollidaysburg, Pa., and vicinity. There are 56 miles of rail lines, 26 miles of which are in paved streets, and 40 miles of bus routes. More than $500,000 was spent for new track, paving and under drains, more than $270,000 for safety cars and safety equipment for remodeled cars, and more than $93,000 for buses, a new garage and garage equipment. This paper has carried the news of these various projects from time to time as the work has been announced. The total amounts are given in accompanying tables.

In the paved streets two types of track construction were used, depending on whether it was possible to reroute the traffic. Where the traffic could be diverted to another route during the reconstruction steel ties were used. Both Dayton and International ties were laid. Several of the pictures illustrate the progress of track laying. Track drains of 6-in. to 8-in. diameter, with catch basins or manholes every 350 ft., were in-

Standard type of track with wood ties. This is used where it is necessary to lay the track under traffic

stalled under all new track in paved streets on account of the marshy condition of the soil.

Where it was impossible to divert the traffic the track was laid with treated pine ties. The form of construction is shown in the line illustration. The ties are 6 in. by 8 in. by 7 ft. 3 in. long. First 6 in. of ¾-in. clean stone ballast was tamped and flat rammed by air under and around the ties. Then a layer of 1:2½:5 concrete 6 in. to 7 in. thick was laid for a paving base. On this a ½-in. sand cushion was spread to carry the 3-in. wire-cut lug paving brick. All the rail used for track in paving was of 100-lb. ARA-A section, except in a few special locations where Lorain section LS-122-491 girder rail was used. All the joints were fitted with sole plates and were seam welded.

During the three years in which this modernization program was in progress the company expended $201,596 for street paving or $67,199 annually. With an average daily service of 48 cars this would amount to $1,400 per car per annum paving tax, the company states.

To do the rehabilitation work there were purchased and placed in service one resistance type welder and one motor-generator type welder; two air compressors, one of which is electric driven and one gasoline driven, the latter being mounted on a Ford truck chassis; a set of tie tampers, flat rammers, concrete breakers and other track tools.

All the track in paved streets in which low joints and broken rails had developed was gone over and repaired. Joint repairs were made by installing sole plates, seam welding, surface welding and grinding, tamping four joint ties with dry concrete and relaying paving on the concrete base. Where the ties were cut or rotted under the joints they were cut out and joint boosters installed. Compromise joints are all being built up with plates and welded as shown in one of the illustrations.

In the open track all the joints were gone over, the broken plates were replaced, the bolts were tightened and the broken bonds renewed. The track was surfaced and lined. In the 25 miles of open track 25,000 ties were renewed.

During the past year particular attention was given to the overhead lines. An inspection was made of all the poles and trolley wire. The pole lines were renovated, the crossarms renewed and the wires rearranged. Bad stretches of trolley wire and heavy-duty curves were renewed. Worn splicers and ears were replaced. In doing the work 11 miles of trolley wire and 600 poles were installed. Since the work has been completed interruptions from line breaks and broken poles have been reduced about 70 per cent.

Fifteen sets of two-wire Nachod automatic car-counting signals were installed for city service and fourteen miles of telephone line were built for despatching cars in interurban service.

Thirteen steel-body, light-weight, double-truck safety cars of the latest type and three Birney safety cars have been purchased to give better service and to stimulate new business. One of the double-truck cars is shown in an accompanying illustration.

All of the cars already on the property have been equipped with safety appliances and adapted for one-man operation.

Power distribution has been improved by the installation of substations at various locations on the system. All of the feeders have been rearranged and redistributed, eliminating a large amount of copper, and all of the track bonding has been gone over and brought up to 100 per cent condition. These changes have speeded up the car service.

By agreement with the city of Altoona and the Pennsylvania Railroad the company has constructed a new bridge over the main line of the Pennsylvania. All the track and paving on the bridge approaches has been renewed. All the other bridges, which are owned outright, were sand blasted and given two coats of red lead.

The bus service has also been improved. The company purchased seven 21-passenger Yellow type X buses and two White buses. These have been installed on the 40 miles of bus routes to give better service and to improve the operating conditions. A new bus garage has been built and fully equipped.

IMPROVEMENTS CHARGED TO CAPITAL ACCOUNT

New track, paving and under-drains	$533,436
Thirteen double-truck safety cars	212,065
Three Birney safety cars (transferred)	13,464
Safety equipment for cars	45,376
Substations, feeders, etc.	74,867
New bridges	42,795
Construction equipment—conveyances, welders, signals, etc.	32,095
Seven Yellow 21-passenger buses	43,906
Two White buses (transferred)	11,000
New bus garage and equipment	38,943
Total	$1,047,947

MAINTENANCE EXPENDITURES FOR THE THREE YEARS

Track and roadway	$343,870
Equipment	244,915
Buses	67,482
Total	$656,267

Buses have been used to advantage in extending the routes of the Altoona lines. Some 40 miles of bus routes are in service

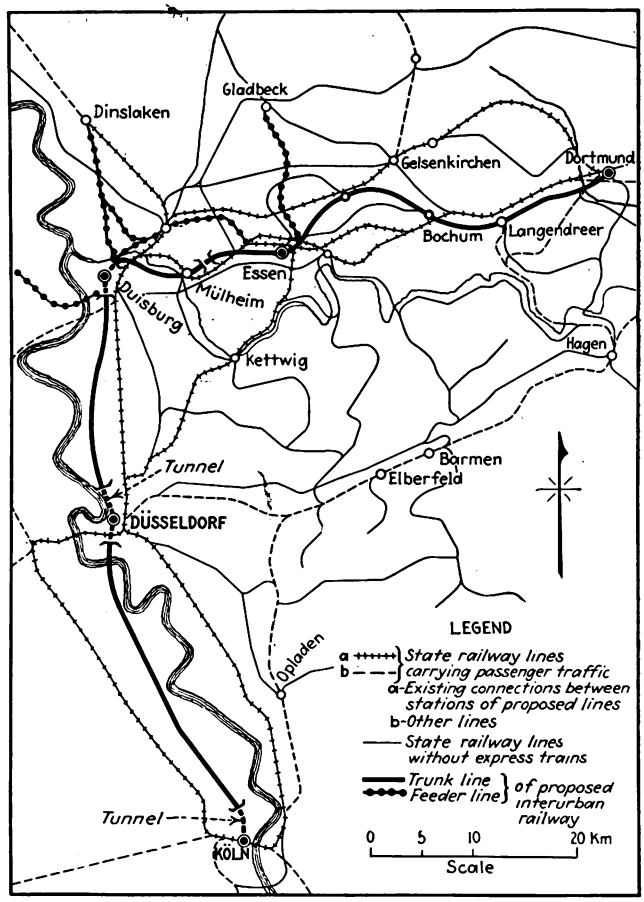
High-Speed Road for Germany

Engineers discuss engineering and financial features of proposed high-speed electric railway in Germany's industrial district. With few stops on grades and easy curves, a schedule speed of 71 m.p.h. is expected

By Walter Breslauer, Ph.D.
New York, N. Y.

DURING the past two years considerable space has been given in the German technical press to discussions of plans for a proposed high speed railway in the Ruhr industrial area in Western Germany. The latest extended contribution to the subject is a very comprehensive study of the engineering and financial possibilities of such a line by Dr. G. Kemmann of Berlin. In this report, besides making definite recommendations, the author reviews and answers adverse opinions to the plan, which came chiefly from another outstanding specialist in the field of city transportation, Prof. Giese, also of Berlin. Dr. Kemmann's report was made at the request of a company organized by the cities interested to study the entire subject of transportation in the district.

The first engraving shows a map of the area and the route of the high-speed railway, as proposed by the company mentioned. The district shown is one of the most thickly populated in Europe and contains the majority of the coal mines and steel mills of Germany, together with a large number of factories of all kinds. On the line of the proposed route there are ten cities with more than 100,000 inhabitants each, and six cities with from 25,000 to 100,000 population. In addition, there are ten other cities of from 25,000 to 100,000 inhabitants with contributory population. Altogether these 26 cities have about 4,000,000 inhabitants.



The proposed line traverses Germany's most developed industrial area

Physical Characteristics of Proposed Line

The main features of the line, as proposed by the company organized by the cities to study the project and by Dr. Kemmann, are as follows:

There will be only nine stations, one each in Cologne (Köln) and Dortmund, the terminal cities, and the others at intermediate points. These stations are to be as near the traffic center of each city as possible. Through each city the road is to be built in subways or open cuts or on an elevated structure. Outside of the cities the road is on its own private right-of-way. There are to be no highway or railroad grade crossings and the grades and curves are to be so designed as to interfere with high speed as little as possible. Besides the main line there are to be several branch lines with shorter distances between stops and lighter construction.

The maximum speed on part of the line, that between Cologne and Duisburg, is to be 81 m.p.h. On the section between Duisburg and Dortmund, the maximum speed is to be 62 m.p.h., partly because there are several grades of as much as 1.66 per cent and partly because the right-of-way passes over many mines, with danger of ground subsidences. On the branch lines the maximum speed is 50 m.p.h.

Trains are to be made up of combinations of two motor cars permanently coupled, each car being equipped with four motors. Electric power will be supplied at 1,500 volts d.c. and the motors are to develop 170 hp. (hourly rating). Multiple unit control will be used, with possibility of field reduction of 67 and 50 per cent for greater speed. Characteristic curves of the proposed motors are shown in the left-hand illustration on page 503.

Research has been undertaken by the Aero-Dynamic Institute of Göttingen University to obtain a shape of car body that presents the least resistance to the air, particularly in subways. A feature of the design, as shown in the accompanying engraving, is a cover for the trucks on the front end of each car.

According to European custom, two classes of passenger accommodations will be provided, corresponding to the second and third classes on the state railways on

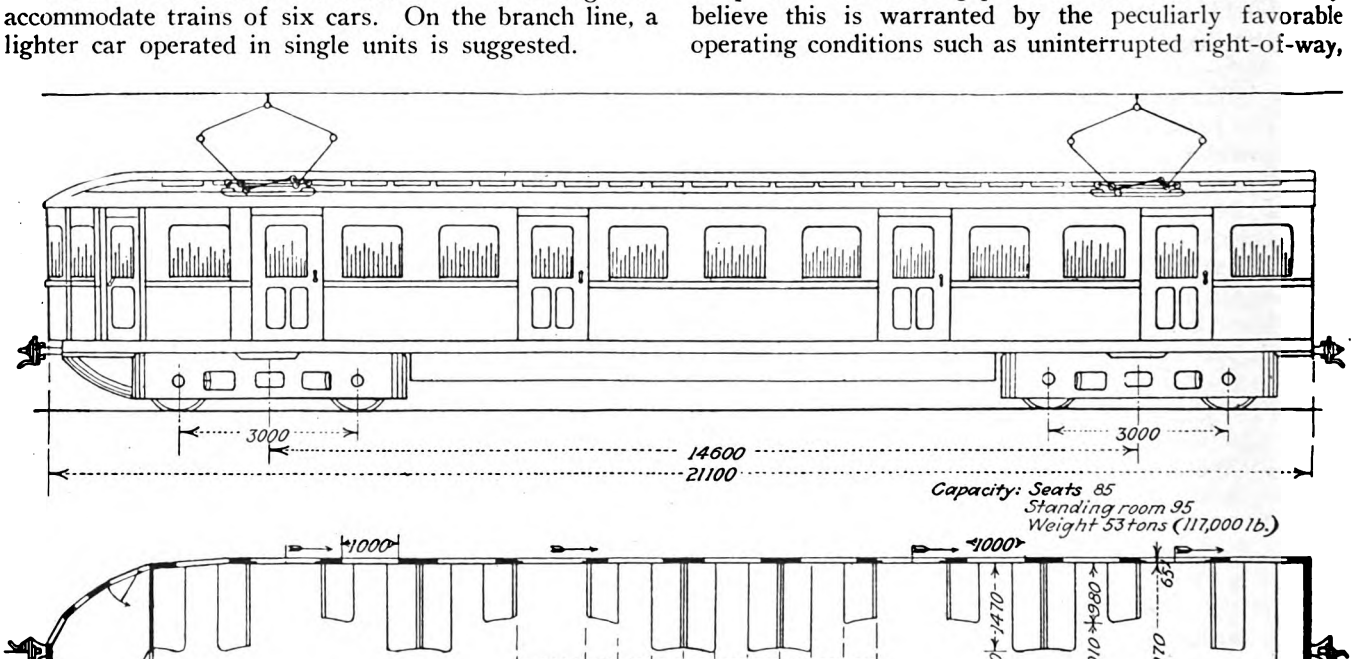
ESTIMATE OF INVESTMENT REQUIRED AND BUSINESS TO BE DONE BY PROPOSED COLOGNE-DORTMUND HIGH-SPEED RAILWAY DURING THIRD YEAR OF OPERATION

	Kemmann	Giese
Total number of fares per year	36,000,000	20,000,000
Average length of passenger trip	15.3 miles	15 miles
Number of passenger-miles	551,000,000	300,000,000
Utilization of seating capacity	33⅓ per cent	25 per cent
Number of car-miles	9,250,000	8,000,000
Capital to be invested	$85,000,000	$100,000,000
Average receipts per passenger-mile	1.8 cents	1.94 cents
Operating ratio	47.6 per cent	72.6 per cent
Profit	$1,675,000	.....
Loss	.....	$2,750,000

which, incidentally, about 60 per cent of the commuter traffic rides fourth class. As the average estimated time per passenger trip is not more than twenty minutes, a ratio of 85 seats to room for 95 standing passengers was assumed. Platforms at the stations will be arranged to accommodate trains of six cars. On the branch line, a lighter car operated in single units is suggested.

miles (177 km.) in 140 to 150 minutes, all stops included. On the proposed line the running time will be only 77 minutes between the two cities, the distance being reduced about 2½ miles (4 km.). The schedule speed during this trip, including the periods for acceleration and braking, but not including stops of one minute in each station, will average 71 miles (113.5 km.) per hour between Cologne and Duisburg and 51 miles (83.3 km.) per hour between Duisburg and Dortmund. To obtain these remarkably short running times, the train has to be kept at maximum speed, with motors running with reduced field, for as long as possible, and the coasting time has to be cut down to the utmost limits.

In the speed figures just quoted, Dr. Kemmann and his associate engineers have allowed only a small reserve in speed in the coasting period mentioned, because they believe this is warranted by the peculiarly favorable operating conditions such as uninterrupted right-of-way,



The proposed car is designed to reduce its air resistance

Power will be distributed at 25,000 volts to five substations equipped with mercury-arc rectifiers.

The automatic signal system is designed for a minimum headway of five minutes. It is expected that on the main line the headway will be 30 minutes, but between Duisburg and Dortmund a fifteen minute headway will obtain at certain times of the day. It is believed that if necessary a five minute headway can be maintained without delay even at the expected speed.

Speed-Time Curves

The upper-right chart on page 503 shows a group of speed-time curves of runs, based on the proposed maximum speed of 81 miles (130 km.) per hour. It is obvious from these that such speeds would not be economical in frequent stop service as the trains would have to cover at least 3.75 miles (6 km.) before the maximum speed is reached and, to provide adequate coasting the stops must be at least 15.6 miles apart.

The express trains on the existing steam railroads cover the distance between Cologne and Dortmund, 73

etc. This action is criticised by some other experts who argue that the few seconds which might be gained if the motors are run at full capacity until braking is begun is not sufficient to allow opportunity to make up for lost time.

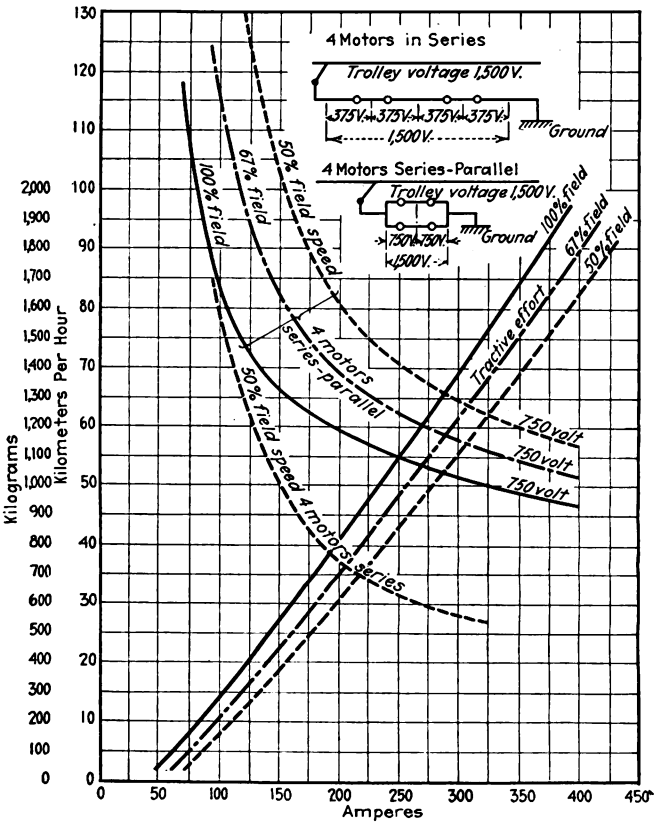
The rate of acceleration selected is 1.1 m.p.h. per second (0.5 meters per sec.^{2}). This corresponds to the input of 1,400 kw. for each two-car unit when starting. When running on level tangent track at constant speed with a 50 per cent field, each two-car unit will have a continuous input of about 750 kw.

The third chart on page 503 gives the consumption of energy by trains at different maximum speeds and distances between stops. The point A on this chart represents the conditions on the main line between Duisburg and Dortmund, B those on the branch line and C those on the Berlin subway. On the basis of this chart Dr. Kemmann claims that the watthours per ton-mile, even on the short distance section between Duisburg and Dortmund, will be less than on the branch line and that, in turn, less than on the Berlin subways.

Digitized by Google

The main line of the proposed railway runs approximately parallel to the main line of the state railroad system, with which it would be in direct competition. Nevertheless, its advocates believe, it has a distinct economic field.

In the first place, the capacity of the existing transportation facilities is now overloaded, complicated as they are because of the necessity of giving service to many scattered factories and mines. Besides this freight traffic, the existing steam railroad lines would still have to care for the through passenger express trains, a



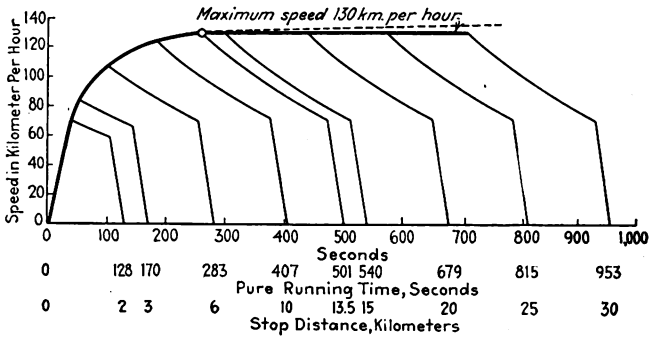
Characteristic curves of motor selected. The motors will be designed to develop 170 hp.

large number of which pass through this district. It would still also have to care for the local traffic, which is not being carried by the present interurban electric railways or buses.

The new line would be primarily for the high-speed interurban business between the nine cities mentioned. Dr. Kemmann estimates that in the third year of operation (1933), 60 per cent of the passengers carried will represent those who otherwise would have used the parallel steam railroad, electric railways or buses, and 40 per cent will be newly created business, resulting from a closer connection of the city centers. It is also believed that the hourly distribution of the traffic will be equalized better than on the existing railways, which chiefly serve commuters. Both terminals of the main line are in very large cities, so it is expected that the through traffic on the line will be a large and constant percentage of the business done.

There is considerable difference of opinion between Dr. Kemmann and Prof. Giese as to the financial results to be expected during the third year. The figures of each are given in the accompanying table.

Certain critics of the proposed line have claimed that the needed increased transportation facilities in this district might better be obtained by an expansion of the existing facilities. Dr. Kemmann's report, however, outlines the difficulty of such a development, especially the costly widening of right-of-way required in the cities, the complications at junctions with numerous branch lines and the difficulties of increasing the speeds of the steam operated trains, especially in the hilly districts around Essen. While the adoption of electric power for the local express tracks would improve conditions, the routes in use are not so well adapted to high speeds as on an independent system of the type consid-



Speed-time-distance diagram for different lengths of run

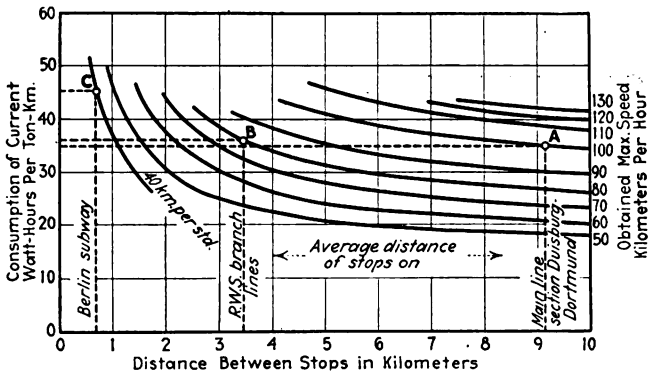


Chart showing energy consumption in relation to distances between stops and maximum speed

ered. Moreover, the cost of the necessary trackage rearrangement would be equal to that of wholly new construction.

As against these claims, it can be argued that the present economic conditions in Germany may make preferable a plan which permits the distribution of the expense over a longer period. The latest reports from Germany are that the directors of the state railway system have approved the expenditure of 300,000,000 marks during a period not yet fixed for improvements of the existing systems in the Ruhr. This decision was reached on the theory that even if the new road is built, the existing system must still handle the through business, the local commuters, and all freight traffic, for which new facilities are badly needed.

The latest contribution to the subject is a pamphlet recently issued by Dr. Kemmann. It contains the principal criticisms of the report which have been published in the German technical press, together with Dr. Kemmann's replies. The criticisms relate particularly to the feasibility of the short running times allowed in the report, to the volume of traffic to be expected and to the economic outcome of the entire high-speed plant as proposed.

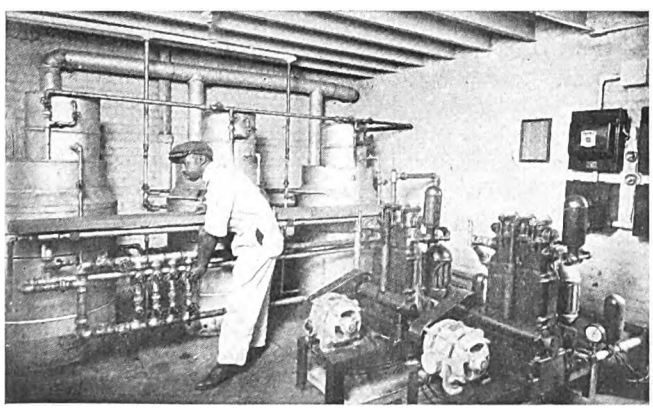
Seven bays are devoted to washing motor coaches

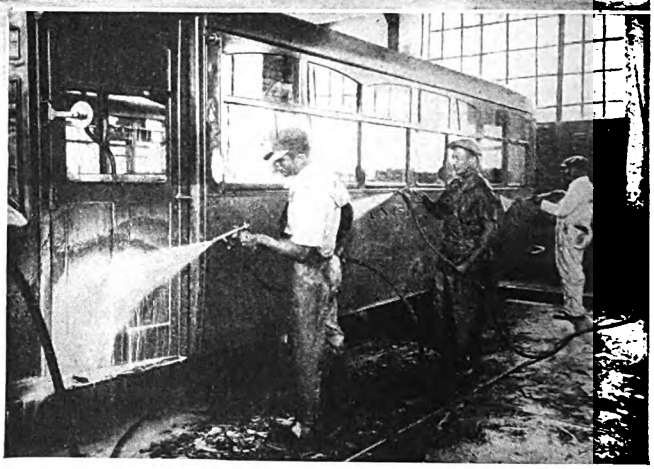
Bus Wash Rack

WASHING of buses is facilitated by a new wash rack just completed in the garage for the motor coach division of the Los Angeles Railway, Los Angeles, Cal. It is built of steel and brick, 37 ft. 1 in. wide by 123 ft. 6 in. long. There are seven bays for washing motor coaches and automobiles, one-half bay for cleaning parts, an equipment room and a locker room above this for the car washers. The locker room contains a full-length steel locker for each car washer. It also has benches for the workmen and a lavatory with hot and cold water.

The equipment room, which is on the ground floor, contains two high-pressure U. S. compressor pumps, hot water heaters, and solution tanks. The hot water heaters are controlled thermostatically. Five lines run into the intake manifold of each pump. They are (1) cold water, (2) hot water, (3) soap, (4) Oakite and (5) distillate. The valves and piping are arranged so that any one of these liquids or any combination of them may be turned into the intake manifold of either pump. The head car washer decides the liquid or mixture of liquids that is to go through each pump and turns the right combination into the pump manifold by adjusting the valves.



The equipment room contains high-pressure pumps, hot water heaters and solution tanks



Cleaning a bus in Los Angeles by means of the new high-pressure system

Each pump is capable of delivering continuously 4 gal. per minute at a pressure of 300 lb. to any four outlet nozzles of the high-pressure pumping system. Each pump is connected to a $1\frac{1}{2}$-in. high-pressure pipe line that runs the entire length of the wash rack. A $\frac{3}{4}$-in. line is tapped off each of the pump lines at intervals and runs to the four corners of each washing bay. The $\frac{3}{4}$-in. lines from each of the two pumps are joined to a common high-pressure hose outlet. Each line is arranged with a globe valve and a check valve. The globe valve regulates the flow of liquid and the check valve is intended to prevent the entrance of liquid from the other pump line.

With this arrangement a washer may use the liquid of either high-pressure line or any combination of liquids contained in the two lines. There is a remote-control system with a push button located at each high-pressure hose outlet, so that from his station a washer may cut off the pump. However, these buttons are arranged in parallel so that all stations must have their circuits open before the pump stops operating.

Each bay is arranged with high-pressure air hose for blowing off the water after the bus has been washed. The room for cleaning parts has two high-pressure hose outlets and high-pressure air outlets similar to those in the washing bay. City water outlets are in all washing bays and in the room for cleaning parts. One of the washing bays is arranged with a pit, so that the chassis and underneath parts of motor coaches and automobiles may be washed more readily.

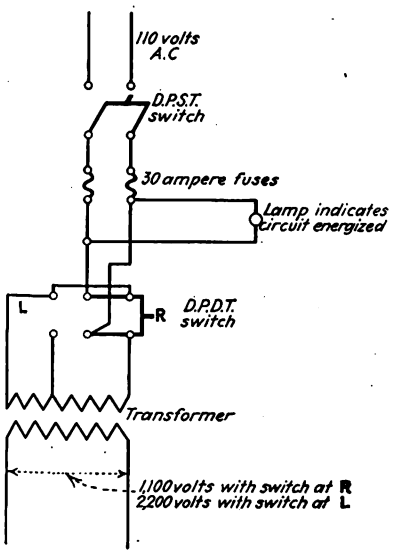
Maintenance Methods and Devices

Simple, High-Potential Testing Outfit

By R. S. Beers
Railway Engineering Department General Electric Company, Schenectady, N. Y.

MOST of us visualize a high-potential testing outfit as an elaborate and expensive piece of apparatus. Actually, any repair shop can have one at a low cost by purchasing a standard 1½-kw. lighting transformer that has a primary winding for 2,200 volts and a secondary winding with taps for both 110 and 220 volts. By connecting this secondary to the usual 110-volt a.c. lighting circuit, a potential of either 1,100 or 2,200 volts may be obtained. The former is recommended for testing overhauled or repaired motors, armatures, fields, etc., while the 2,200 volts should be used for rewound armatures and any other essentially new parts.



Connections for high potential test

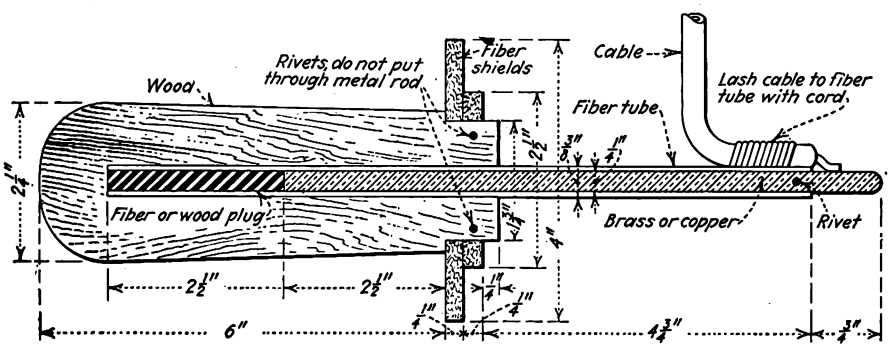
The other parts for the complete outfit are two 110-volt knife switches, fuses and high-tension leads which can most easily be made of automobile ignition cable. The high-tension leads should be in uncut lengths without breaks in the rubber covering.

There are two divergent methods of testing a piece of apparatus with the high potential. One is to terminate the high-tension cable in a bare wire or hook and always be sure the leads are dead when they are attached to the apparatus. For safety it is customary to surround the device being tested with a simple barrier such as a cord or white tape. The other method is to attach insulated handles to the ends of the high-tension leads and touch these while alive to the apparatus. A barrier around the apparatus under test is not ordinarily used, as the tester is near by and gives sufficient indication of danger.

An insulated handle that is easy to make and that has been used with success is shown in the accompanying illustration. The insulating properties of the wood from which these handles are made can be greatly increased by drying the wood out in the armature oven and then soaking in linseed oil for a day or so. This will fill the pores of the wood with oil and prevent moisture from entering.

The sketch shows the metal core about 2½ in. shorter than the fiber tube, the idea being to give ample creepage distance from the live metal along the surface of the fiber tube.

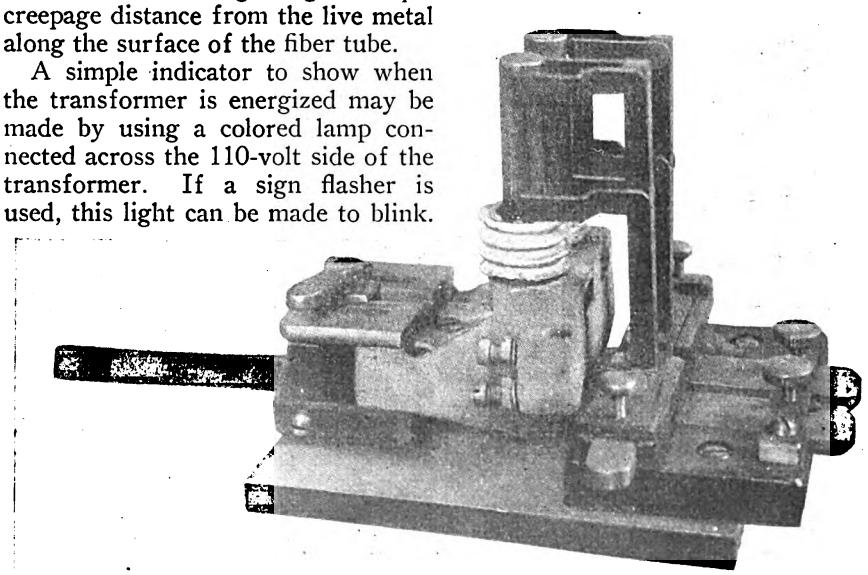
A simple indicator to show when the transformer is energized may be made by using a colored lamp connected across the 110-volt side of the transformer. If a sign flasher is used, this light can be made to blink.



Handle for high potential testing

To Check Alignment of Brush-Holder Parts

MANY of the troubles with railway motors can be traced to improper location of the brush-holder in the motor frame. To make certain that all parts of the brush-holder itself are in proper alignment before installation the Third Avenue Railway, New York City, uses in its 65th Street shop, the special fixture illustrated. It is shown with a Westinghouse type 310 brush-holder in position. The brush-holder itself is held firmly at the carbon box end by a clamp which has a metal block that fits inside the carbon box. This insures that the brush-holder frame is lined up carefully with respect to the finished inside of the carbon box. The upright studs are checked for alignment by a gage on the opposite end of the fixture. The two upright



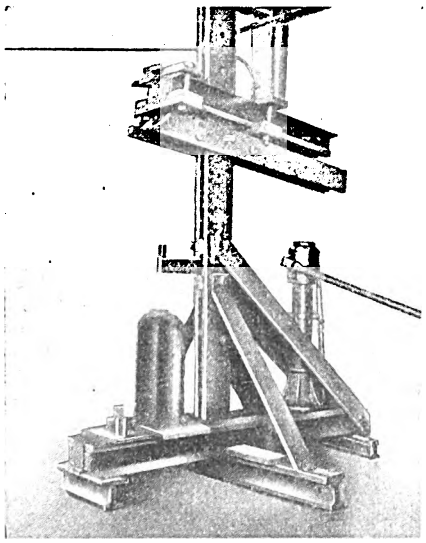
Fixture for checking brush-holders for alignment of various parts

Digitized by Google

arms are arranged so that they will slide sidewise or back and forth and when in correct position they are clamped by setscrews. With this arrangement the upright studs can be checked quickly and accurate alignment with respect to the finished inside of the carbon box is assured.

Hydraulic Press

IN THE shop of the Binghamton Railway, Binghamton, N. Y., work accumulated due to the absence of a suitable press. This became quite serious at times and finally it was found necessary to design and construct a hydraulic press. The press



Simple hydraulic press

constructed is shown in the accompanying cut.

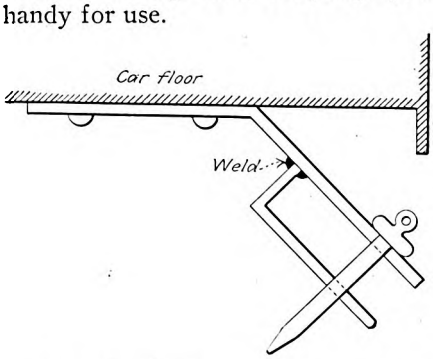
The foundation consists of three pieces of 80-lb. tee rails resting upon the floor. The base of the press is made of two pieces of the same rail with the space between filled with metal. They are tied together with ¾-in. bolts and welded. The post is made of two pieces of 1 in. x 6 in. steel spaced 1 in. apart by fillers, bolted to each other and to the base rails. This post is drilled with seven 1½-in. holes at the top to permit raising or lowering the rams to take care of various kinds of work.

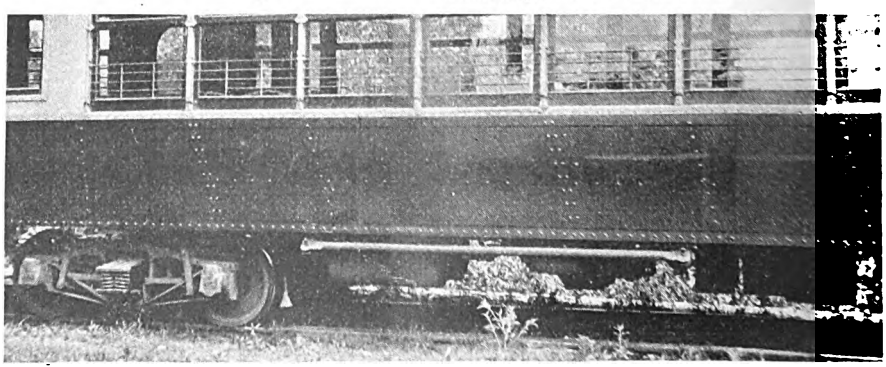
There are two press rams, one for light work and the other for heavy work. The light ram is made from 1-in. x 4-in. material whereas the heavy ram is made from 80-lb. tee rail. These rails are bolted together and filled in the same as are the base rails. Two heavy clamps give additional strength. When the heavy ram is to be used the light ram is removed, but the light ram can be used with the heavy ram in position. Additional rigidity of the post and ram is obtained by 1-in. x 4-in. braces fastened to the foundation and base rails. The leverage of the rams is two to one and the hydraulic power is obtained by a 15-ton hydraulic hand jack mounted on the base directly under the ram extension. The bed which is shown in the illustration resting upon the base under the ram is made of a piece of 3½-in. pipe welded to a 9½-in. x 16-in. x 1-in. plate. Four ribs ¾ in. thick are welded to this pipe and to the base. This press has afforded a means for increasing production.

Coupling Bar Holders

CONSIDERABLE trouble has been experienced by the Cincinnati Street Railway, Cincinnati, Ohio, in pushing disabled cars around sharp curves with the ordinary coupling bar. In an effort to solve this difficulty satisfactorily a bar has been developed with which a car may be moved around any curve on the property with ease.

This bar is 8 ft. 3 in. long and is made out of 2½-in. heavy pipe. A feature of the arrangement is the method employed for suspending the bar when not in use under the side of the car. The jaws of the hanger open downward and the bar, once inserted, is held securely in place with coupling pins. The bar is so long that it must be carried in the brackets and the position of the hanger jaws insures having two coupling pins handy for use.

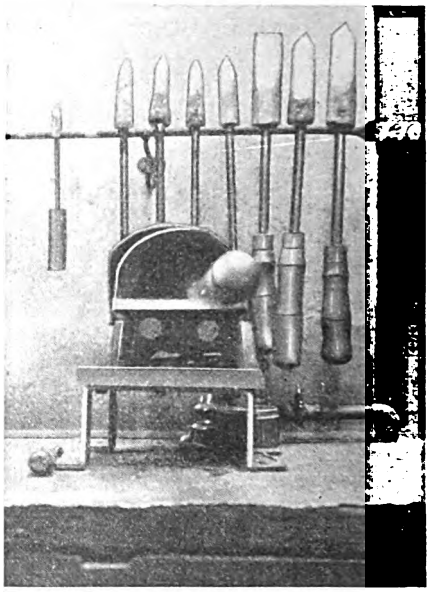




Arrangement of coupling bar holders under floor of street car

Rack for Soldering Irons

SYSTEMATIC arrangement and accessibility of tools in a shop usually reflects the quality of work being performed. Foreman armature winder Max Siebner of the New York



Rack used for soldering irons in the Woodside shops of the New York & Queens County Railway

& Queens County Railway, Jackson Heights, N. Y., believes that this is very important and has arranged all tools in his section of the Woodside shops in this manner. The accompanying cut shows one of the heating furnaces with its soldering iron rack. These irons are in clear view and a minimum of time is required to select the proper one for the job on hand. All irons must be in place on the rack when not in use. A careful check is made every night to see that all have been returned and are in place. The rack consists of a piece of ½-in. flat steel bar drilled on either end for mounting and notched to permit of suspending the various irons. It has improved the appearance of the shop and eliminated loss of time in looking for a certain iron.

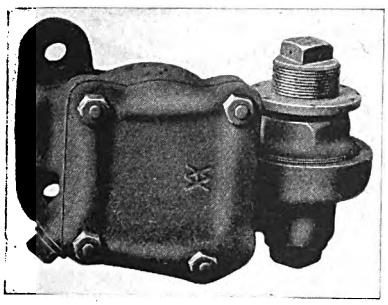
New Equipment Available

Feed Valve Adjustment Made Easier

IMPROVEMENTS have been incorporated in a feed valve, called the C-8, developed by the Westinghouse Traction Brake Company, Wilmerding, Pa., and now available for use with air-brake equipments.



Decreased maintenance is made possible by the use of this new feed valve

The new design facilitates maintenance of correct adjustment at low cost.

A larger ring-fitted supply piston, with definite size by-pass choke, replaces the loose fitting piston of former designs, assuring more positive and reliable performance. The piston stem guide is larger, which reduces wear and insures correct alignment of the piston, while the helical shaped periphery of the guide tends to keep the bush scraped free of dirt.

All wearing parts can be removed readily without special tools. Slip bushings are used throughout, while the slide valve bushing and piston bushing are in one piece.

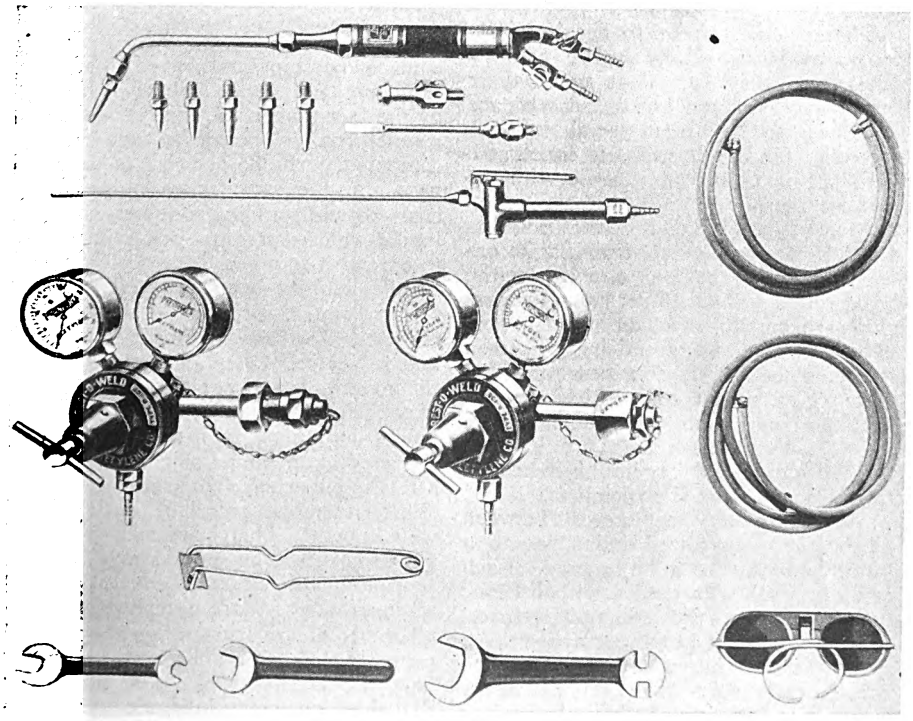
Three New Welding Outfits

MEETING the demand for low-price assemblies, three new welding outfits have been placed on the market by the Oxweld Acetylene Company, New York, N. Y. These outfits are made possible by the addition to the Prest-O-Weld line of two small two-gage regulators, and two special blowpipe tips, one for heating and brazing, and the other for soldering.

The type W-101-A outfit is for use where only an occasional welding job needs a large size blowpipe for straightening operations. For this purpose a No. 10 tip is included which is also suitable for reasonably heavy welding operations. A No. 6 tip is also provided for the usual type of welding job. A special heating tip and soldering tip which consume acetylene only, are designed for light brazing and for soldering.

The type W-102-A general purpose outfit, is for shops that wish to employ the oxy-acetylene process in all of its many applications, welding, decarbonizing, heating, soldering, brazing, lead burning and other repairs. Five welding tips and a decarbonizing blowpipe as well as the heating and soldering tips are included in this outfit.

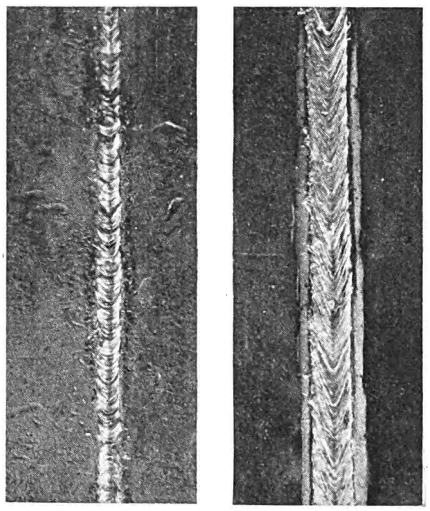
The type W-102-B welding outfit is recommended for welding light and medium castings. It is also suitable for sheet metal work and for light production welding such as is used in tanks, steel window frames and similar work. This outfit includes five welding tips.



One of three new welding outfits, the Type W-102-A for general purpose work

New Arc Welding Process Developed

DEVELOPMENT of a new arc-welding process termed by the manufacturers the "Electronic Tornado" is announced by the Lincoln Electric Company, Cleveland, Ohio. In it a specially induced magnetic field alters the ordinary characteristics and effects of the welding arc.



At left is shown a metallic arc weld; at right is one made by the "Electronic Tornado"

The company predicts its adoption for automatic welding in the fabrication of cars, tanks, pipe lines, box girders, etc., but it is not expected to find immediate use in hand-welding operations. The metal deposited in the weld by the ordinary electric arc process has characteristics like those of cast steel, while that deposited by the new process is said to have equal or better physical characteristics than the metal of the plates joined by welding, due to the purifying effects. The smooth finish obtained with the process is said to be due in part to the high speed of travel of the welding heads and in part to its inherent characteristics.

Association Activities

The Santa Claus Idea of Government*

By Henry Swift Ives
Vice-President Casualty Information Clearing House, Chicago

GOVERNMENT ownership is an attempt to transform the state into a benevolent Santa Claus doing everything for everybody at no cost to anybody. Presumably, the old feudal doctrine that the government should support the people has long since been discarded in favor of the theory of democracy that the people should support the government. The continuing agitation for government ownership and control of industry, however, belies that assumption.

There is, of course, a very potent lure in this Santa Claus idea of government, and that is why it has survived through so many centuries. Gift-government always has been popular among certain classes. Getting something for nothing never loses its appeal. Pilfering politicians thrive on such schemes, professional uplifters count on them to provide sustenance not only for their hobbies but for themselves, and socialists advocate them deliberately as a curb to prosperity, for prosperity spells the doom of socialism. Those who are subsidized seldom complain of the subsidy or investigate its source.

THERE is nothing particularly new in the idea of transmuting profits into gratuities through the alchemy of socialism, but the headway it has made in a country dedicated to liberty and resting on the sound foundation of private enterprise is rather surprising.

Has No Place in Democracy

It seems illogical, however, and almost tragic, that in a country which has prospered and grown great because of its espousal of democracy in its most virile form, the greatest threat against continuing prosperity is the rejuvenation of the long outlawed theory of government of which Santa Claus is the patron saint. The political Christmas tree, indeed, is now being trimmed and festooned with such gewgaws and baubles as railroads, insurance companies, electric light and power plants, coal mines, gas plants, street railways, grain elevators, oil wells and the like awaiting the glad day when the red-clad Kris Kringle will appear and pass them about among the faithful. He promises a golden age of luxury, idleness and wastefulness in which government deficits will be substituted for private profits and in which politics instead of business and work will become the national dividend producer.

There is nothing particularly new in the idea of transmuting profits into gratuities through the alchemy of socialism, but the headway it has made in a country dedicated to liberty and resting on the sound foundation of private enterprise is rather surprising. Government ownership and the imperious regulation and control of industrial processes by the politically minded take away the very fundamental rights of man which the American commonwealth was designed to foster and protect, and their inevitable consequence is despotism. It is about time that property owners and business men take stock of this situation and appraise the growing tendency towards confiscatory legislation more fully.

Ardent Capitalists Become Socialists

There would appear to be altogether too many business men in this country who are ardent capitalists when their own business is concerned, but who are apt to be just as ardent socialists when the other fellow's business is concerned. This class has had more to do with the headway made by the socialization movement than have all of the socialists and ordinary mine-run of pink agitators combined. One has only to examine the background of any government ownership scheme to discover the support given to it by substantial business men not engaged in the business affected. When government competition, regulation and control, however, touches them these same business men are loud in their protests and cry to high heaven to save them from the socialists.

The community of interest between all of the jeopardized industries to a large degree seems to be ignored. Each is fighting its own battles with little or no thought of the common menace. Often those most in danger are arrayed against each other and do not seem to care what becomes of the others "in the same boat," provided they themselves can keep a few feet ahead of the socialist sheriff with his writ of ejectment. This unfortunate division should be speedily remedied if an ultimate surrender to socialism is to be avoided.

The business man and property owner who secretly feels that he may gain some privilege or make a saving if somebody else is repressed by the strong arm of the state is an economic illiterate.

Insurance Companies and Utilities Have Common Interest

A large number of the leading stock casualty insurance companies of this country are face to face with this government ownership problem. In sixteen states workmen's compensation insurance is now being written in so-called state funds in competition with or to the exclusion of private companies. Despite the fact that this type of government ownership has proved a striking economic and social failure—evidenced by the fact that in the nine states where competition is permitted the private companies write 85 per cent of the business and the state funds only 15 per cent, notwithstanding a substantial saving in rates—attempts are being made to extend it to other lines, such as automobile liability insurance and the like.

IT ought to be an axiomatic political principle that no single industry or business can be lifted out of the mass of privately conducted enterprise, endowed with the attributes of sovereignty, subsidized by taxation and operated by a political bureaucracy without every other privately conducted business feeling the baneful and depressing effects of such a procedure.

Two states, Wisconsin and Massachusetts, also have life insurance funds, and in several states and municipalities the government ownership idea has been expanded to include funds for insuring public buildings against fire and, for the bonding of public officials. The disastrous experience of several of the Western states with hail insurance is well known. This brief survey of the situation in the business which I represent ought to lead to the conclusion that all insurance men are bitterly opposed to all kinds of government ownership because of their own afflictions. But that isn't necessarily true. I do not doubt that there are many insurance men who, at some time or other, have advocated state or municipal ownership for elec-

Abstract of address delivered at the joint convention of the Illinois Gas Association, the Illinois State Electric Association and the Illinois Electric Railway Association, at Springfield, Ill., March 14, 1928.

Digitized by Google

tric light and power plants, street railways and gas companies. I do doubt, however, if there is an active insurance man who ever has advocated government ownership of insurance.

In the same way I do not doubt that there are public utility executives and owners who, at some time or other, may have advocated and supported state insurance. I doubt, however, if there is a public utility executive or owner who ever has advocated government ownership of his particular business.

To both of these groups I wish to say that they ought to be just as much opposed to government ownership of any other industrial enterprise as they are opposed to government ownership of the enterprise in which they are engaged. It ought to be an axiomatic political principle that no single industry or business can be lifted out of the mass of privately conducted enterprise, endowed with the attributes of sovereignty, subsidized by taxation and operated by a political bureaucracy without every other privately conducted business feeling the baneful and depressing effects of such a procedure.

As long as this condition of chaotic political and economic thinking continues among the avowed supporters of democratic institutions—and these constitute more than 90 per cent of our population—the socialization movement, with its gift-government decoy for the unsophisticated always in the foreground, will continue to make progress.

There are many pitfalls which must be avoided if legitimate private enterprise is to be preserved in this country, and if individual initiative is to remain unfettered. The chief of these are the gradually growing American tendency to look upon capital with suspicion, to denounce large profits as immoral if earned by others than the denouncer, to yield to the delusion that wealth which is confiscated will continue to be created, to believe that the public can add to its possessions by taking property from individuals, to hold that compulsory equality of condition is more to be desired than unrestricted equality of opportunity, and to think that the leveling process can be accomplished by subsidizing mediocrity at the expense of genius. All of these are fundamental economic distortions.

Progress Dependent on Private Enterprise

After all, no material benefit has ever reached mankind except through the agency of private enterprise. To deny its potency is a confession that democracy is a failure. To shackle it with the chains of state slavery is equivalent to affirming that men can conduct governments better than they can conduct their own business affairs, a statement which history has denied from the dawn of recorded time until the dawn of today. In my opinion, the leading industrial enterprises of this generation—"big business," if you please so to designate them—are being conducted with a higher degree of fairness and justice to those engaged in them, with a more sympathetic regard for human aspirations and ambitions, with a keener sense of their responsibility to the people and to the nation, and with a more searching appreciation of the more lofty ideals of service, than any similar or comparable government enterprises on the face of the earth. I say that industry can run itself and is today running itself better than any government is being run. There is no "if" about it. The only effect of radical state interference is to supplant order with confusion. Industry today is for the most part two jumps ahead of the requirements of the people; most governmental organizations are two jumps behind.

THE business man and property owner who secretly feels that he may gain some privilege or make a saving if somebody else is repressed by the strong arm of the state is an economic illiterate.

Railway Engineering Association Holds Meeting in Chicago

ATTENDANCE at the convention of the American Railway Engineering Association, held on March 6-8 in Chicago, was larger than at any previous meeting. The registration, through March 8 was 968 members and 348 guests, or a combined total of 1,316. Last year the total was 1,251, and in 1926 it was 1,030. An exhibit was held, as usual, in the Coliseum building. There was a concurrent exhibit of signal apparatus, and the American Railway Association, signal section, held a two-day meeting on March 5-6.

At the railway signaling meeting, the recommended code on colors and forms for traffic signals for highway vehicles, as approved by the American Engineering Standards Committee on Nov. 15, 1927, was submitted by the committee on highway crossing protection. Later, highway crossing signals were again considered in the report of the committee on grade crossings of the A.R.E.A., when a standard highway crossing sign, carrying the words "Railroad Crossing" was recommended by the committee.

Brief abstracts of some other reports presented at the convention of the A.R.E.A., selected as of especial interest to electric railway operators, follow:

Ties

Among the subjects investigated during the year were anti-splitting devices for wooden ties, of which a number were tested at the Altoona laboratory of the Pennsylvania Railroad. The tests were made on 14-in. tie sections in which a $\frac{1}{4}$-in. slot was cut from one end of the block to within 3 in. of the other end. The anti-splitting irons were then pressed into the ends of the block so that they extended across the slot, and a wedge was driven into the slot. The conclusions, in brief, were: (1) An anti-splitting device should be straight where it crosses the split or check, rather than curved; (2) it should cross the split at right angles; (3) "S"-irons with a small perpendicular lug at the end have more holding power than the standard "S"-irons; (4) the holding power of a device with a right-angle bend supported by an end lug is slightly in excess of the standard "S"-iron with end lug.

Another subject studied was the holding power and thrust resistance of spikes in various kinds of wooden ties. Five thousand tests on this subject were made in the test department of the Santa Fe Railroad. More damage to the wood fiber was found when no holes were bored, or where the holes were too small. The recommendations were: (1) that holes for cut spikes in hard wood be $\frac{1}{16}$ in. smaller than the diameter of the spike; (2) that holes for cut spikes in soft wood be $\frac{1}{8}$ in. smaller than the diameter of the spike. Tests so far indicated that the chisel edge of the spike should be slightly less than the diameter of the hole.

Electricity

The report of this committee also comprised the report of the electrical section of the American Railway Association. Reference will be made to the longest sections of the report. One of these was a preliminary draft of specifications for catenary construction, though the committee points out that these specifications are subject to further revision, particularly such parts as relate to loading, unit pressures, and clearances. Further consideration of these features, it says, should be deferred until sub-committee No. 5, jointly with the N.E.L.A., concludes the preparation of wire crossing specifications satisfactory to the railroads. Another extended section in the report related to standardization of insulators, on which the sub-committee has been working with the American Engineering Standards Committee and the Bureau of Standards, for the purpose of reducing the number of varieties of one-piece porcelain insulators. Another extended section related to specifications for track and third-rail bonds. Formulas and charts giving the resistances of different types of bonds are given, with recommended methods of installation, testing, etc. For manganese track rails, the committee reports that the manufacturers advise against the use of heat-applied bonds and recommend mechanically applied bonds. On this point, the

Digitized by Google

committee studied the possibility of field drilling of bond holes in such rails, and found it could be done with a machine that will give a heavy rigid feed and low speed. Another extended report related to the design of indoor and outdoor substations. Other subjects were treated, but less extensively, than those mentioned.

ECONOMICS OF RAILWAY OPERATION

The most extended division of this report was on the effect of motor truck and bus lines on branch or feeder steam railroad lines. It was shown that as compared with ten or twelve years ago, steam railroads have been losing their short-haul passenger traffic to the buses. The number of passengers carried, passenger-miles run, passenger revenue and revenue per passenger-mile have all decreased on Class I railroads, as compared with 1920 or 1921. The reasons for public preference for travel by motor coach are given as lower fares, frequency of service, and "store-door" principle of passenger service. The committee believes that the railroads should give serious consideration to the use of highway motor coaches and rail motor cars, when their use as a substitute for steam service will result in larger net income or reduction in operating loss. The committee believes that recent decisions of state courts are favorable to the right of the existing rail carrier to furnishing such highway transportation as is needed.

TRACK

The most extended section in this report related to track construction in paved streets, where the committee presented for adoption and recommended practice a series of plans of ironbound manganese center frogs for 7-in. and 9-in. girder rails. The committee has under consideration plans for grooved tongue switch and mate for industrial track and connected tongue switch for main line use, as well as plans for ironbound manganese insert crossing, all for presentation in a report at a later date. A short section in the report referred to methods of reducing rail wear on curves with particular reference to oiling the rail or wheel flanges. The statement was made that quite a number of railroads are oiling rail and flanges both by hand and with devices made for this purpose and that desirable economies can be effected thereby. Wear on the high rail of the curve is greatly reduced, the life of ties is lengthened due to less regaging, less tread wear occurs on the low rail, curve resistance is lessened, and there is reduced wear on flanges. It is essential that the proper oil be used. The viscosity of the oil is important as it must be sticky enough to adhere to the flanges for application to the rail ahead and must function through a considerable temperature range. It is also essential that the oil be continuously applied, either to the wheels of every train using the track or to the rail ahead of every train, as less frequent applications of oil are not satisfactory.

Purchasing Agents Select Kansas City for Next Convention

MAY 28-31 has been selected as the time for the thirteenth international convention and exhibit of the National Association of Purchasing Agents. It will be held in the American Royal Building, Kansas City, Mo.

The convention program this year is being prepared to cover purchasing of commodities. There are also functional groups, such as the public utility group, composed of purchasers for the utilities. In this division purchase policy, association under particular connections with vendors, contacts with engineers in their own departments, standardization of particular problems, and similar topics will be covered.

Weekly Engineering Index Service

WEEKLY publication of an engineering index service is announced by the American Society of Mechanical Engineers. This is an extension of the old *Engineering Index*. By this service valuable material in 1,700 publications received by the United Engineering Societies Library is reviewed by a staff of editors qualified by practical field experience. Each article is then described in a carefully prepared note, and these notes are classified under one of the thirteen subject headings in which the different phases of the engineering interest are listed. They are then printed on index cards, convenient for filing, and sent each week to subscribers.

The classification "Railroads and Railways" is subdivided as follows:

12. Railroads and Railways:
A. Accessories—Signals, train control devices, etc.
B. Construction — Right-of-way, tracks, ties, stations, yards, etc.
C. Locomotives — Design, construction, operating, etc.
D. Railroads — Operation, management, etc., of trunk and main-line railroads.
E. Railways — Operation, management, etc., of street, and interurban railroads, subways, elevated railways, etc.
F. Rolling Stock—Car building, lighting, heating, etc.
G. Shop and Shop Equipment—Repair shops, roundhouses, equipment, etc.
M. Miscellaneous—Other subjects relating to railroads not otherwise classified.

For information concerning this service, together with sample index cards, address Major Carlos de Zafra, director, the Engineering Index Service, 29 West 39th Street, New York, N. Y.

City Planners To Meet in Texas

FORT WORTH and Dallas, Tex., will be hosts to the twentieth meeting of the National Conference on City Planning, which will be held in those cities May 7-10. The session of May 7 will be held at Fort Worth, after which the party will take buses to Dallas, where the meetings will be held.

Among other things a number of papers on street traffic planning and other topics of interest to transportation men are included. Those intending to attend are urged to communicate with Flavel Shurtless, secretary of the National Conference on City Planning, 130 East 22nd Street, New York City.

New York Alumni to Discuss Transportation

"SOME Interesting Steps in Transportation, Past, Present and Future," will be discussed by the New York Alumni Association of Tau Beta Pi, co-operating with the New York sections of the Founder Engineering Societies, at a meeting to be held in the main auditorium of the Engineering Societies Building, 29 West 39th Street, New York City, Thursday, March 29, at 8:15 p.m.

The speakers will be Daniel Willard, president Baltimore & Ohio Railroad; Major-General John F. O'Ryan, president Colonial Air Transport Company, Inc., and Colonial Western Airways, Inc.; Edward Hungerford, director Baltimore & Ohio Centenary, who will present a film, "The Fair of the Iron Horse," depicting the main events of the B. & O. centenary; and Lieutenant-Commander Charles E. Rosendahl, U.S.N., commanding officer of the airship *Los Angeles*, who will describe with motion pictures the landing of the *Los Angeles* on the deck of the U.S.S. *Saratoga*, and also tell about his recent trip to Panama.

Detroit Selected by Central Accountants

MEMBERS of the Central Electric Railway Accountants Association have decided to hold the next meeting in Detroit on July 27 and 28, according to an announcement from Secretary L. E. Earlywine.

World Engineering Congress at Tokio in 1929

PRELIMINARY announcement has been made through the United States Department of State of a World Engineering Congress to be held in Tokio, Japan, for two weeks toward the end of October, 1929. The congress will be held under the auspices of the Kogakkai (Engineering Society of Japan), of which Baron K. Furuichi is president. An American committee has been organized, with Hon. Herbert Hoover, Secretary of Commerce, as honorary chairman, Elmer A. Sperry, active chairman, and Maurice Holland secretary. The committee members are engineers who are nationally prominent.

The congress proposes to discuss various engineering subjects in anticipation eventually to initiate and promote international co-operation in the study of engineering science and problems in all its branches and to cultivate a feeling of brotherhood among engineers of the world.

Joint Interests of Utilities Emphasized at Springfield Meeting

Major speeches at joint sessions of Illinois Electric, Gas and Electric Railway Associations last week in Springfield, Ill., show that interests common to all utilities are increasing

NEED for a greater measure of co-operation between all utilities in furthering their common interests and promoting better service to their customers, the evils inherent in government ownership of business, the opportunity offered the public service company to assume an active, helpful part in community affairs as a good citizen, and an explanation of the construction and functioning of terminable permits constitute the outstanding features of the joint sessions of the Illinois Electric, Gas, and Electric Railway Associations which assembled in Springfield, Illinois, March 14, for a two-day convention. Approximately 800 delegates listened to messages from such authorities in their respective fields as R. P. Stevens, president of the American Electric Railway Association, Oscar H. Fogg, president of the American Gas Association, Henry Swift Ives, vice-president of the Casualty Information Clearing House, Chicago; Charles N. Wheeler, assistant to the president Illinois Power & Light Corporation, and E. R. Dillavou, assistant professor of business law and economics, University of Illinois. A report of the first day's sessions appeared in this paper, issue of March 17, page 478.

Thursday morning's joint session of the three associations was featured by the address of Professor E. R. Dillavou of the University of Illinois on the subject of the terminable permit. Pointing out that there was nothing novel or complicated about a terminable permit, Professor Dillavou defined one as a franchise which continues indefinitely unless the utility is purchased by the municipality, or unless the permit is cancelled because of misconduct on the part of the company. Continuing, he said, "Such a permit seems to remedy the evils of the short term franchise and at the same time protects the public interest, particularly since public utility operation is subject to regulation by a state commission. The investor, having faith in the behavior of the management, and realizing that his money will be repaid it the city sees fit to terminate the permit, is ready to supply funds from time to time as the progress of the business demands."

Commenting on the unwillingness of municipalities to surrender control over the local utilities and where possible continue to impose onerous conditions on them in favor of the municipality, Professor Dillavou outlined the four possible solutions of this problem which have been suggested by the laws of terminable permit states. He detailed that "the laws of Louisiana, which limit the use of such permits to the city of New Orleans, allow the municipality to insert any conditions which may be agreed upon at the time the permit is issued. Oklahoma provides that all new franchises must be for a definite term, but they may be surrendered at the option of the utility for terminable permits which embody the terms of the surrendered franchise. Massachusetts has a law which makes it possible for many of the utilities to have all duties commuted into an annual money payment. Wisconsin is illustrative of a group, the law of which reads that the permit shall be "held under all the terms and limitations of this act.'" Professor Dillavou added that in this latter instance the courts have construed the law to mean that each permit is to be like every other permit, the consequence being that all burdensome provisions are eliminated and no new ones may be added.

Fast Schedules Result of Training

In his paper on the advantages of fast schedules, presented at the afternoon electric railway session, E. J. McIlraith, staff engineer Chicago Surface Lines, urged that a company need not wait to secure new equipment, or to widen the car doors, or to change the motors, or in fact undertake any other major and expensive alteration in order to improve operating conditions. "Usually," according to Mr. McIlraith, "remarkable improvement in speed may be obtained with no other change than training and supervision of the operating force. This means training of the entire organization from the manager down, so as to have each one working actively to discover ways and means of eliminating waste of time, and carelessness in the operation." An abstract of Mr. McIlraith's paper will appear in an early issue.

The subject of noise reduction and car heating was treated in a paper presented by H. H. Adams, superintendent of shops and equipment, Chicago Surface Lines. Concluding a summary of improvements in car equipment in which the substitution of aluminum alloys for heavier metals was discussed, Mr. Adams opined that while these improvements have all had their individual effects, collectively they have exerted an equally important influence on the problem of noise reduction. "Reduction of unsprung weight, gears that run in an oil bath, the elimination of the usual brake rigging and insulation from vibration," Mr. Adams added, "are all important factors in securing quiet operation."

F. L. Reardon, assistant treasurer, East St. Louis & Suburban Railway, in outlining certain short cuts in accounting practices with special reference to motor coach accounting, described in some detail the mechanical handling of fares, the savings which had accrued from the use of ticket issuing cash registers, and the methods employed in supplying itemized pay cards to the trainmen, and bus employees.

R. F. Palmblade, division manager Illinois Power & Light Corporation, Peoria, was elected president of the Illinois Electric Railways Association for the ensuing year.

COMING MEETINGS OF *Electric Railway and Allied Associations*

March 30—Executive Committee American Electric Railway Association, 292 Madison Avenue, New York, N. Y.

April 6 — Metropolitan Section, A.E.R.A., 39 W. 39th Street, New York, N. Y.

April 25-27 — American Welding Society, annual meeting, 33 West 39th Street, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City, Mo.

May 2-5 — Southwestern Public Service Association, Dallas, Texas.

May 6-12—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.

May 9-10—Central Electric Railway Master Mechanics' Association, Erie, Pa.

June 6-8—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.

June 20-27 — American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.

June 21-22 — American Railway Association, Motor Transport Division, Atlantic City, N. J.

June 28-29—Central Electric Railway Association, Cedar Point, Ohio.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

July 25-27—Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.

July 27-28—Central Electric Railway Accountants' Association, Detroit, Mich.

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

News of the Industry

Relief Measure Voted Down in St. Paul

For the third time the voters of St. Paul, Minn., on March 13, turned down an enabling act amendment to authorize the Council to grant the St. Paul City Railway relief from certain costs which would have brought the return on the company valuation nearer to the 7½ per cent figure fixed by the Minnesota Railroad and Warehouse Commission as reasonable. It is expected the railway will now press a hearing before the commission on its application for an increased fare over its present 8-cent cash rate.

At two previous elections the proposed amendment was not put strongly before the voters, but the rejection on March 13 was in the face of a determined agitation by citizens to prevent a higher rate of fare in St. Paul than in Minneapolis. The relief intended to be afforded covered paving between tracks, cleaning, sprinkling and snow removal, etc. The saving to the company was estimated at $200,000 a year. On the other hand, it was estimated by the committee that an increase of 1 cent in the fare will cost the patrons of the cars $638,000 a year.

The net return at present to the St. Paul City Railway is estimated at 4.75 per cent as against 6.1 per cent in Minneapolis with the same rate of fare.

To pass the amendment needed 60 per cent of the vote cast at the election. The final figures were 28,077 to 29,836.

Franchise Suggestions Sought from Jacksonville Company

After lengthy discussion as to the factors that should enter into a franchise for the Jacksonville Traction Company, Jacksonville, Fla., the City Council voted unanimously to invite Peter O. Knight, Tampa, general counsel for the Stone & Webster interests in Florida, to prepare drafts of a franchise that would be acceptable by the company for comparison with the proposed franchise drawn by the local citizens' committee. Mr. Knight maintained that several of the provisions of the franchise draft that has been advanced for acceptance were restrictive and illegal. He said all that the Jacksonville Traction Company wants is "the right to live, a fair valuation set and a fair return on the investment."

Mr. Knight stated that Jacksonville alone presented opposition to his terminable permit bill in the last legislature and he distributed copies of a letter explaining the measure to every councilman. The letter states that the bill aims to eliminate the 30-year period of limitations for the granting of franchises by municipalities and would give the municipalities the right to acquire the property of a utility at the termination of a franchise.

The simplicity of the franchise under which the Tampa Electric Company is operating was stressed by Mr. Knight. It allows the company to operate for 99 years and exempts the concern from payment of corporation or franchise tax on equipment. This agreement has proved satisfactory to the people of Tampa, he said.

Paving Bill Lost in New York

Admitting that he could not muster the votes in his senate public-service committee to report his bill to relieve electric railways in New York State of a substantial portion of their present paving obligation, Senator Warren T. Thayer, father of the so-called compromise proposal, indicated on March 18 that he had abandoned all hope for the legislation. The Thayer bill was the result of conferences between representatives of the cities of the state and spokesmen for the organized railway interests.

The companion bill by Assemblyman D. Mallory Stephens of Putnam County now lies in rules committee of the lower house, where it bids fair to remain.

Appreciation of Toronto Service

THERE can be no doubt that D. W. Harvey, general manager of the Toronto Transportation Commission, and those associated with him have given to Toronto one of the finest street car services in the world. . . . Most of the complaints today arise from overcrowding in cars during rush hours. The remedy for this lies more with employers of labor than with the Transportation Commission. If office hours were "staggered," as has been suggested, much of the congestion on the street cars would be eliminated. It needs to be remembered by those who complain that the "rush-hour" problem is not peculiar to Toronto. It has taxed the best brains of transportation experts in every city, and has never yet been adequately solved. That the system under Mr. Harvey's management is giving an infinitely superior service to that in the majority of other cities there can be no doubt. With one or two difficulties ironed out, it will rank with the best in the world.—*Toronto Globe.*

Old Matters in Toledo Must Be Cleared Up

Mayor W. T. Jackson of Toledo, Ohio, recently insisted that all "unfinished matters" in connection with the Community Traction Company situation be cleared up under the Milner ordinance before there is talk of a new plan of operation. Company officials have agreed to this.

The power rate is one matter that has never been agreed upon definitely due largely to the fact that it is a contract between the Community Traction Company, and the Toledo Edison Company, identical in ownership and control to all practical purposes. Court action was tried at one time but the courts held that the Public Utilities Commission of Ohio alone had jurisdiction and no conclusion has ever been reached before that body. Whatever settlement is reached on power will be retroactive to July, 1924.

Another matter to be cleared up is the paving obligation of $187,500 with interest which was acknowledged due the city when the ordinance was adopted and accepted.

The Mayor has indicated that with these two matters arranged some new plan may be worked out which will give the company substantially what it desires—regulation of independent bus operation so that it may co-ordinate public transit in Toledo and put the financial structure of the company on a sound basis. Company officials contend that no change can be made in the valuation agreed upon at the time the Milner ordinance was adopted.

City representatives believe that the management should bring in new capital to bolster up the property and restore the value back of securities outstanding. A plan of this kind was tentatively agreed upon in the basis of agreement reached last summer before the so-called Dotson ordinance was drawn. That effort has now been laid aside apparently because it did not meet the ideas of the board of control.

Framing Wage Demands in Scranton

Employees of the Scranton Railway, Scranton, Pa., voted recently to ask for an increase of approximately 5 cents an hour and modification of several clauses in the present working agreement. The present one-year agreement expires on March 31. Last April the men were granted an increase of 1 cent an hour in all departments. This provided for a scale in cents per hour as follows: first three months, 57; next nine months, 62; after one year, 65, with an 8-cent differential for one-man operation.

Suit in Madison Settled

The suit in the Superior Court against the officers of the Madison Railways, Madison, Wis., has been settled by the payment of a fine. This suit arose out of an item of $73,000 which F. W. Montgomery, president, loaned to the company and subsequently forgave in 1921. In 1924 the board of directors by a resolution, immediately typewritten in the minute book of the company where it was open to inspection by the auditors of the Railroad Commission, offered to repay this amount as and when Mr. Montgomery might ask for it. This resolution was not regarded as creating an obligation of the company in the sense that it should be entered on the account books. Payments were made in 1925 and 1926, and these payments were duly entered on the account books of the company and reported to the Railroad Commission. An official statement says:

There was no attempt at concealment of the action of the board of directors, and no attempt to mislead anybody. Everything was open and aboveboard. The failure to report the item was at most a technical violation, and even that is subject to a difference of opinion.

The litigation in the Superior Court was, however, affecting the credit of the company, and the associates of F. W. Montgomery on the board of directors, and other friends, felt that the preferred stockholders and other investors in the securities of the company might suffer damage and loss unless this litigation was settled at once. For this reason alone the suits were settled and the fine paid.

During all of the time that the present management has had control of the Madison Railways it has been honestly and efficiently conducted. The credit of street railways has not been good for many years, and F. W. Montgomery has had to produce most of the money needed by the company. He has carried the burden. The city has received better railway service than any other city of its size in the United States. We shall continue to render this service in the knowledge that we have done no intentional wrong.

Short Extension of Eastern District Subway

The Transit Commission has informed the New York Rapid Transit Corporation (B.-M.T.) by letter that it had determined upon an extension of the Fourteenth Street-Eastern District Subway from its present terminus in Manhattan to a point between Eighth and Ninth Avenues, Manhattan, where a connection may be made for exchange of passengers with the existing Seventh Avenue subway, and with the Eighth Avenue subway now being constructed.

The extension will constitute a two-track underground railroad, beginning at a point in West Fourteenth Street, Manhattan, between Sixth and Seventh Avenues, where a connection can be made with the Fourteenth Street-Eastern line now in operation, and extending thence westerly under and along West Fourteenth Street to a point therein between Eighth and Ninth Avenues, including a station, to be centered approximately at Eighth Avenue. The extension is a very short one, not more than several blocks, but it would be of inestimable benefit in providing access to the transit lines on the west side.

W. S. Menden, president, in a letter to the commission on June 23, 1926, indicated that the railroad would acquiesce in the extension.

Homer Loring Helps Employees

Homer Loring, chairman of the board of the Boston & Maine Railroad, accepted no compensation from the Boston & Maine Railroad during the four years in which he directed the work of the road's rehabilitation. In accepting his resignation recently the board of directors voted him $100,000, which Mr. Loring has accepted only in order to establish a fund, "to be administered by trustees for the general good of all employees of the Boston & Maine."

Mr. Loring is best known to electric railway men as the former chairman of the trustees of the Eastern Massachusetts Street Railway. As a restorer and re-organizer of faltering enterprises Mr. Loring has had many conspicuous successes. He brought the Des Moines, Fort Dodge & Southern Railroad back to solvency and did some notable work in the revival of the Saginaw Traction Company in Michigan.

Trial of Higher Fare on Ohio Line

The right to charge a 10-cent fare between Dover and New Philadelphia beginning April 11 has been granted the Northern Ohio Power & Light Company. This rate of fare authorized by the City Council of Dover, Ohio, is to continue until the expiration of the company's franchise between the two towns Nov. 9, 1928. The change is made to enable the company to determine whether the increase would justify the company's continuing service between the two towns after that date. Heretofore the fare has been 5 cents between the cities. The company formerly had two lines operating between Dover and New Philadelphia. One of the lines was abandoned several months ago and bus service installed.

Wage Conferences in St. Louis

Conferences are being held by the Amalgamated Association at St. Louis, Mo., on the wage demands of the 4,500 union employees of the St. Louis Public Service Company. The union has asked for a sixteen-months contract and an increase of 5 cents an hour for the 3,500 motormen and conductors and increases of from 5 to 10 cents an hour for shopmen, mechanics and maintenance-of-way workers.

Would Sell Three Tokens in Omaha

The Omaha & Council Bluffs Street Railway, Omaha, Neb., has asked the Nebraska Railway Commission for authority to sell three tokens for 20 cents. The present requirement is that no smaller number than six tokens may be sold, and the commission fixed the rate at 40 cents. This is the equivalent of three tokens for 20 cents. However, the commission's finding, made two years ago, stated that the company needed every cent of revenue possible, and that to offer three tokens for 20 cents would result in a large decrease in the cash fares. Patrons are understood to have suggested that more persons would ride if they could invest only 20 cents at a time.

Increase on Warren & Jamestown

The Public Service Commission on March 19 authorized the Warren & Jamestown Street Railway, operating between Jamestown and Warren, Pa., to file a new schedule effective on one day's notice, increasing its mileage rate in New York from 2½ to 3 cents a mile and providing for fourteen zones, instead of eleven, with a fare rate of 5 cents in each zone. Seven of the fourteen zones are in New York State and the remaining seven in Pennsylvania. A single ticket-book rate of 56 coupons for $2.50 good for use by a purchaser and the members of his family without time limit and certain special one-way tickets and school commutation ticket rates have been authorized.

Present fares are based on a rate of 2½ cents a mile. The company asked the right to establish a basic rate of 3 cents. There are now eleven 5-cent fare zones covering the 22-mile distance between Jamestown and Warren which it asked permission to increase to fourteen.

Evidence submitted before the commission showed a decline in operating revenues during the past six years. Commissioner Pooley in a memorandum says the revenues of the company have steadily declined since the construction of the Jamestown-Warren highway. There were 753,505 passengers carried in 1920 and 419,987 in 1927. The revenue from passengers dropped from $150,701 in 1920 to $87,112 in 1927, or approximately 40 per cent. Freight revenues declined from $23,693 in 1920 to $4,529 in 1927.

The evidence showed that under the proposed new rates, and based on no further decline in traffic, there will be approximately a 20 per cent increase in passenger revenue. The commission further found that under the new rates and provided the company carried the same number of passengers in 1928 that it did in 1927, there would be an estimated increased operating income of $25,146, or a return of about 5 per cent on about $500,000 invested in giving service.

Senate Fails to Reappoint J. J. Esch

John J. Esch of Wisconsin, who had served on the Interstate Commerce Commission for six years prior to his renomination by President Coolidge last December, lost his fight for confirmation on March 16 when the Senate, after five hours of debate behind closed doors, rejected the appointment by 39 to 29.

The opposition was led by Senators from the Southern coal states. It was based almost entirely on the commissioner's change of attitude in the long pending contest between the mines of Pennsylvania and Ohio and those of West Virginia, Kentucky, Tennessee and Virginia, for the lake cargo trade.

The commission recently rejected a petition of Southern railroads for a reduction of 20 cents a ton in lake cargo coal transportation charges.

After the executive session Senator Neely, Democrat, West Virginia, said the vote "is a very emphatic warning that the Senate will not tolerate the packing of these important commissions by President Coolidge in favor of Pennsylvania or any other section or in favor of any particular interests of the country."

In a minority report from the Interstate Commerce Committee Senator Fess declared that from the standpoint of ability and experience Mr. Esch was "eminently fitted for the position and from the basis of honesty and integrity he is equal to the best in public life."

The minority report called attention that in between his two votes Mr. Esch, like all other members of the commission, had the benefit of "extended further hearings, a mass of further evidence which embraced some 2,000 pages, and two days of oral argument before the full commission."

Fare Hearing in New York Postponed

Because of the illness of Samuel Untermyer, special consuel for the New York Transit Commission, the sitting of the federal statutory court, scheduled for March 22 to hear further argument on the application of the Interborough Rapid Transit Company for a 7-cent fare was postponed on March 21 to March 29. The city's argument will then be presented by former Controller Charles L. Craig. George L. Ransom, special counsel for the Interborough, will make a reply argument.

Both Mr. Untermyer and Mr. Craig have declared that there is no conflict between them regarding the policy to be pursued in combating the Interborough's increased fare suit. It was pointed out that Mr. Untermyer had upheld from the outset the validity of the 5-cent fare contract between the city and the Interborough and that Mr. Craig was merely concentrating upon that phase of the entire case. The intricate questions of valuation and fair return upon capital invested, it was indicated, would be handled by Mr. Untermyer.

Franchise Talk in Kansas City, Kan.

Tentative plans of the City Commission of Kansas City, Kan., for the creation of a board of control to have jurisdiction over all transportation have virtually been abandoned following discouraging investigations of the cost of engaging technical experts as advisors.

It was suggested at the recent meeting of the City Commission that the body wait until the Wyandotte Railway requests a franchise as a solution to the problem of satisfying riders. The franchise of the predecessor company expired in 1922.

Interchanging System Between Illinois and Indiana

The Illinois Traction System is considering plans for a hook-up of its lines with the Terre Haute, Indianapolis & Eastern interurban lines between Danville, Ill., and Crawfordsville, Ind., utilizing either electric lines or buses. While the connecting link is intended primarily for convenience of shippers the line will be available to passenger traffic and give Illinois and Indiana an interchanging freight and passenger system.

Safety Rewarded at Little Rock

Twenty-five of the 110 operators regularly employed in the railway service of the Arkansas Power & Light Company at Little Rock, Ark., completed 1927 without a chargeable accident. This was announced at a recent safety meeting at which cash prizes were distributed to the successful competitors in the accident prevention campaign. Thirty-three men participated in the prize money.

The first team of eleven operators received $150. The second received $100, and the third $50. Seven teams failed to place.

The system of prizes, which was used last year as an experiment, is not being followed this year. In 1927 the men were grouped into teams in the accident prevention work, and the team worked as a unit. The purpose of this was to stimulate co-operation and emulation in accident prevention records. For this year the plan specified an advisory council consisting of various department heads.

Car on Exhibition in Macon

Residents of Macon, Ga., were invited in a newspaper advertisement to inspect the first of twelve new cars for the Macon Railway & Light Company on March 4 and meet a representative on duty to explain the safety devices.

Right of Hartford Under Tucker Grant Upheld

Chief Justice George W. Wheeler in the Supreme Court at Hartford, Conn., has handed down a decision against the Connecticut Company and upheld the city of Hartford and its right to collect 2 per cent of the gross fares paid to the railway within the city limits, as established by the Tucker Grant in 1894 through an agreement between the Connecticut Company and the city. This was for the privilege of electrifying and extending its railway lines in Hartford.

The Connecticut Company paid the tax from 1894 until 1922. It is not expected the company will appeal to the United States Supreme Court as no constitutional question is involved.

In the lower court last year Judge Jennings held the tax of 2 per cent was illegal. The Supreme Court in answer to this says:

> The payment provided for was not a charge levied by government upon the Connecticut Company's property for governmental purposes, but its payment of an obligation created by its voluntary action. The provision for payment of a percentage of the gross receipts does not fall within any known definition of a tax; it is neither proportional nor compulsory in character, but voluntary and individual, and its very attribute is antagonistic to the normal attributes of a tax.

The tax originated in 1893 when the Connecticut Company's predecessors sought to electrify and extend the Hartford lines. In 1894 the Tucker grant extended the right to the company with the understanding 2 per cent of the gross fares would be paid into the city treasury yearly. The railway agreed to the plan.

The Supreme Court in reviewing the case found that the city had the right to make such an agreement under its charter, and that the Connecticut Company could not by its long payment of the tax, challenge the validity of that agreement. The court also said the Connecticut Company could not have extended its lines without the consent of the Common Council at that time. The agreement then was made so that it could. The court said:

> The payment provided for was not a charge levied by government upon the company's property for government purposes, but the payment of an obligation created by its voluntary action.

Power Contracts to Boston Edison

Charles L. Edgar, president of the Edison Company, Boston, Mass., says that since the close of the fiscal year, contracts have been entered into with the Boston & Maine Railroad for its entire electric service and steam heating requirements for a long term of years, and for about 75 per cent of the electricity needed for the Boston, Revere Beach & Lynn Railroad, now being equipped for electric operation under plans outlined previously in these pages.

$10,000 in Prizes Offered for Traffic Solutions

With the view of determining the best means of solving the constantly growing traffic problem, *Nation's Traffic*, a monthly publication issued in St. Louis and devoted to street and highway traffic, is conducting a contest in which $10,000 is offered for ideas on the subject.

How to divert traffic into its most useful channels as well as how to administer properly the various functions of traffic control are among the purposes of the nation-wide quest for ideas. Fifteen cash awards are offered. First prize will be $2,500 and second $1,500. The next three will be awards of $1,000 each, with the sixth prize of $750 and the other nine ranging in amounts from $100 to $500.

The subjects are as follows: Text for uniform traffic ordinance, plan for regulating movement of traffic with signals and signs, plan for the solution of municipal parking problems, typical city plan to better traffic conditions, curriculum for adult education, plan for handling traffic violators, plan for regulation of pedestrians, curriculum for juvenile education, plan for reducing railroad crossing hazards, plan for traffic police organization, street lighting plan to aid traffic, plan for motor vehicle registration and identification, and plan for handling tourists.

There is to be a bonus of $100 for the neatest and most carefully prepared manuscript and another of the same amount for the most helpful suggestion or idea.

Another Boston "L" Program of Legislation

The death-knell of Governor Fuller's program for the extension of public control of the Boston Elevated Railway has been sounded on Beacon Hill. All possibility of the return of the road to private operation also seems to have vanished. There apparently remains now only the public ownership legislation, or a policy of letting the entire problem go over for another year.

In this connection the defection of Charles C. Warren of Arlington, up to this time foremost exponent of extending public control to the camp of those advocating public ownership, is regarded as significant. He first tried unsuccessfully to have a resolve recommended which would provide for the appointment of a special legislative committee by the governor, consisting of the president of the Senate and two Senators and the speaker of the House and four representatives, to prepare a public ownership bill.

Senator Warren then declared that after four years of constant effort to provide for an extension of public control he was convinced that no such bill could ever be passed which would be accepted by the stockholders. He said he opposed a return of the road to private ownership as the State would be giving up its option right of the 1918 public control act, which was of tremendous value to the district and to the state.

After considerable discussion a motion was made that the two committees, acting jointly, vote to report the public ownership bill.

Southern Ohio Company Granted Franchise

A fifteen-year franchise has been granted the Southern Ohio Public Service Company, Zanesville, Ohio, through the village of Bexley, Ohio. The company is permitted to abandon its Mound Street tracks through Columbus.

Provisions of the franchise include a 10-cent fare into Columbus from Bexley. The company is to use the same tracks as the Columbus Railway, Power & Light Company as far as Drexel Avenue, where it will continue to Pleasant Ridge Avenue and from there use its own tracks. Bexley is just outside the eastern boundary of Columbus.

Franchise Sought for Improvements in East St. Louis

The East St. Louis Railway is seeking a franchise to take over part of the tracks of the East St. Louis & Suburban Railway so that it may be able to cooperate in the construction of a subway to carry State Street under the tracks of the Terminal Railroad belt line at 21st Street in East St. Louis, Ill. The tracks of the East St. Louis Railway now end on State Street near Nineteenth Street. The franchise from that point eastward is held by the East St. Louis & Suburban Company.

If the bill, presented to the East St. Louis City Council, is passed it must be submitted to the people for ratification at the general city elections to be held on April 3. Convenience and safety to patrons are the considerations in this project.

The East St. Louis City Council is also considering a proposed franchise for the East St. Louis, Columbia & Waterloo Railroad to build new tracks in order to enter East St. Louis by a circuitous route instead of coming direct down Broadway on the tracks divisions of the East St. Louis Railway used by the Broadway and Alta Site Company. If passed this bill will also go to a vote of the people on April 3.

A Radio Treat by Railway Men

THE Cleveland Railway chorus and the Pittsburgh Railways' band will broadcast over KDKA Saturday night, March 31, at 10 o'clock p.m. There are 150 in the chorus and 50 men in the band. The arrangements were made by the Westinghouse Electric & Manufacturing Company.

Transit Legislation for New York City Defeated

As the special correspondent of the New York *World* at Albany expressed the matter in a dispatch to that paper dated March 22, the 151st session of the New York State Legislature performed that day what many people consider the most notable act of its career. It adjourned sine die at 5:56. In a session in which many bills went down there was defeat for all New York City transit legislation, except two bills sponsored by Assemblyman Moran, under which it is hoped to add somewhat to the speed of subway construction by making more prompt payment for property which may be condemned.

The manner in which some of these measures was handled had all the aspects of a political gesture. Thus Minority Leader Maurice Bloch made a motion on March 22 to discharge the rules committee from consideration of the transit bill to enable the city of New York to acquire and unite into one system all rapid transit lines in the greater city. The motion was defeated. This bill, presumably prepared by Samuel Untermyer, was not introduced until a very late date, almost on the eve of adjournment. It has never been supported by any statement from Mayor Walker of New York asking for its passage. In the Senate the bill was amended on March 19 to take care of a few technical errors which could have been corrected by the committee on revision.

The bill provided for a 5-cent fare so long as the city of New York wished to make up by appropriation any operating deficit that might ensue from management by a board which would be practically the city government of New York. In reality the measure would have allowed the city of New York to go into the rapid transit business.

Employees Charged With Neglect in Key System Accident

Two Key System Transit Company employees, Edward Dyson, chief engineer, and Harry E. Hill, both of the ferryboat Peralta, have been cited for neglect by steamboat inspectors who conducted an inquiry into the accident of Feb. 17 when the bow of the craft suddenly dipped and spilled 30 passengers into San Francisco Bay. Five were drowned. The two accused men face trial on March 28 before the steamboat inspection board. No criminal action is implied in the citation, but the two men will lose their licenses if found guilty.

The specific charge is that the two officers failed to notify Capt. W. H. Melsome of the Peralta that the forward ballast tank was filled at the time of the accident. Both men told inquisitors at the hearing that the tank was not filled. They deny the negligence charges.

The company's suggestion that the accident was caused by an uncharted declivity in the bottom of the bay has been discounted by soundings, United States investigators declare.

Recent Bus Developments

Buses Proposed for Use in Alameda

William J. Locke, City Attorney of Alameda, Cal., has announced that the Key System has notified Alameda that it has no intention of putting tracks through the tube or repaving its right-of-way along Webster Street. The company also, according to Mr. Locke, will apply within the next few days to the Railroad Commission to abandon its railway franchises in Alameda. Alameda county officials said recently that it is understood the Key System intends to substitute bus lines for its Alameda railway.

At a straw vote held early in February the citizens of Alameda registered their desire in favor of the railway system. A representative of the railway said the company has not filed an application with the state commission and that officials are not ready to make a statement.

Federal Court Has Jurisdiction in Muncie Case

A mandate from the circuit court of appeals at Chicago has been handed to the clerk of the federal court in Indianapolis reversing the decision of Judge Robert C. Baltzell in a suit of the Equitable Trust Company of New York, which sought to enjoin Sumner Denny and others from operating bus lines in Muncie, Ind. Judge Baltzell, who first heard the case, decided the federal court had no jurisdiction.

The complaint set out that the trust company held a mortgage as security for $5,000,000 in bonds issued to the Union Traction Company of Indiana in 1899. This mortgage, the plaintiff said, established the right of the trust company to jurisdiction over railway company franchises for bus operation in Muncie. The suit alleged that the defendants in establishing a competitive line in Muncie failed to obtain a certificate from the Indiana Public Service Commission. According to the circuit court decision the Indianapolis federal court has the right to hear the case.

Detroit-Pittsburgh Bus Permit Sought

Application has been made to the Ohio Public Utilities Commission for permission to establish the first interstate bus line from Detroit, through Toledo and Akron, to Pittsburgh by the Northern Interstate Transit Company, a subsidiary of the Northern Ohio Power & Light Company. Hearing on the petition has been set for April 5. The new bus line as proposed would make three trips daily each way between Detroit and Pittsburgh and would offer fare at rates below railroad transportation between those points. The proposed running time between Detroit and Pittsburgh is eleven hours and the proposed route extends from Detroit through Toledo, Elmore, Fremont, Norwalk, Medina, Akron, Alliance, Salem and East Liverpool to Pittsburgh. It is planned to use six coaches each carrying 24 passengers. Permission has been secured in Michigan to get out of Detroit to Toledo. Permission has also been secured for entrance into Pittsburgh. All that remains is authority from the Ohio commission and apparently there is no objection to this.

Extension of Bus Line in Los Angeles

The Los Angeles Railway has been authorized by the California Railroad Commission to extend its Melrose Avenue bus line in Los Angeles County from the intersection of Melrose and Western Avenues to the highway known as La Cienega Boulevard.

Bus Service Increased Following Ohio Abandonment

The Ohio Public Utilities Commission has granted the Northern Ohio Power & Light Company permission to discontinue interurban passenger service between Canton and Akron and to abandon its tracks between Canton and North Canton. Freight service between North Canton and Akron and passenger service between Akron and Springfield Lake will be continued. Bus service between Akron and Canton supplied by the Cleveland-Akron-Canton Bus Company, a subsidiary of Northern Ohio Power & Light Company, which has been operating for several year, will be increased. The commission's permit is to take effect not later than May 1, 1928. The line was built a little more than a quarter of a century ago. During all that period the company has maintained hourly schedules between the two cities.

Freight from Canton will be routed over the Stark Electric to Alliance which it will be switched to the Northern Ohio tracks and taken into Akron via Ravenna. Passengers will be transported from Canton to Akron by bus.

To handle the increased business, the Stark Electric plans to close its substation at Louisville, between Alliance and Canton, and have two substations one just east of Canton and one just west of Alliance. Traffic between Canton and Louisville, a distance of 5 miles, will require twice the number of interurban passenger cars. Extra track is being laid to accommodate the additional carriers.

Opposition to South Bend Feeder Bus Project

The recent application of the Chicago, South Bend & Northern Indiana Railway for a permit to operate feeder bus service in west South Bend, mentioned in the ELECTRIC RAILWAY JOURNAL previously, was opposed in a petition filed with the Indiana Public Service Commission by the South Bend Motor Bus Company. In the intervening petition the commission was asked to dismiss a petition filed by R. R. Smith, receiver for the railroad, on the ground that the commission has no legal authority to nullify an agreement with the South Bend board of public works, which allows the South Bend Motor Bus Company to operate in this section of the city.

Buses Withdrawn from Woodward Avenue, Detroit

Motor coach service on Woodward Avenue, Detroit, was ordered abandoned by the Detroit Street Railway Commission at a meeting in Mayor John Lodge's office on March 7. This action was taken as a result of the failure to make money and the monthly increasing deficit from its operation.

Del A. Smith, general manager of the system, stated that he would immediately place additional street cars in service to take care of the traffic previously handled by the buses. The number of cars operating to all points on Woodward Avenue will be increased. More cars are to run to the carhouse at the Ford factory, to the Palmer Park run and to the Fair Grounds run, all on the Woodward line.

Woodward Avenue is one of the main thoroughfares over which jitneys are operating in competition with the municipal transportation system. The buses released from this service will enable the department to extend its lines in other sections of the city.

Substitution in Indiana

On petition of William A. Carson, receiver for the Evansville & Ohio Valley Railway, operating electric railway lines from Evansville, Ind., to Henderson, Ky., Mt. Vernon and Grandview, Ind., Judge Elmer Q. Lockyear, of the Vanderburgh County Probate Court at Evansville, on March 16 ordered the suspension of service between Evansville and Henderson and the substitution of bus service by the company. The receiver filed a petition, setting out that suspension of the railway service between Evansville and Henderson was to the best interests of the company and the creditors because the company was losing money daily on the Henderson line.

The court granted the petition and authorized the receiver to borrow $21,000 for the purchase of three buses.

Mr. Carson said the bus route would be through Howell, down the Henderson public highway on the Indiana

Digitized by Google

side of the Ohio River to the ferry at the Louisville & Nashville Railroad bridge and across the river. Fares and schedules will be the same as on the railway lines.

The Henderson line of the Evansville & Ohio Valley Railway at present uses a transfer boat on the Ohio River 6 miles above Evansville to take its cars across the Ohio River.

Some time ago the Evansville & Ohio Valley Railway petitioned the Indiana Public Service Commission to permit it to use buses on the Evansville-Mt. Vernon line of the company and this change is expected to be made in the near future.

Priority Rights Questioned in Los Angeles

A petition for re-hearing of the commission's recent order granting the Pickwick Stages System a permit to operate its service between Los Angeles and Venice was filed by the Pacific Electric Railway Los Angeles, Cal., with the California Railroad Commission on March 13. The Pacific Electric protests the finding of the commission that it is not financially so well able to maintain the bus service as is the Pickwick Company, denies that Pickwick is better qualified by experience to operate the line, and contests the priority of the application upon which the permit was granted.

The United Stages, Inc., filed the original application in the matter and subsequently withdrew in favor of the Pickwick Stages. The withdrawal is cited by the Pacific Electric as a reason why its application has priority over that of Pickwick.

Bus Authorization in Massachusetts

The Massachusetts Public Utilities Commission has authorized the Point Shirley Street Railway to operate a bus line in the city of Winthrop, Mass. As planned, the line will run between the Winthrop Beach Station and Point Shirley. The commission has also authorized the railway to acquire, own and operate buses for the transportation of passengers.

Needed Bus Line in St. Louis Under Consideration

The St. Louis Public Service Company is making a survey to determine whether a bus line should be established between Jefferson barracks and Koch Hospital, the St. Louis, Mo., tuberculosis sanitorium south of the barracks. Arthur Stoehr, secretary of the St. Louis bond issue supervisory committee, pointed out to the railway officials that the tuberculosis sanitorium had hundreds of visitors weekly and that the only conveyance was a private bus which was furnishing unsatisfactory service.

Financial *and* Corporate

New Board for West Chester Street Railway

At the annual meeting of the West Chester Street Railway, West Chester, Pa., the following were elected directors for the ensuing year: Eric H. Biddle, John T. Collins, Jr., Franklin P. Jones, Lawrence J. Morris, Edmond W. Palmer, J. V. Pennegar and O. Howard Wolfe.

O. Howard Wolfe, cashier of the Philadelphia Girard National Bank, was elected president and Eric H. Biddle, formerly secretary and treasurer of the company, was elected vice-president and general manager. T. O. Roberts was elected assistant secretary and treasurer.

The West Chester Street Railway is undergoing a financial re-organization, a plan and agreement for the readjustment of the securities of the company having been issued by a security holders protective committee. Up to the present time a large part of all classes of the company's securities has been deposited under the plan and agreement.

$4,400,000 Kansas City Public Service Issue Offered

Improvements to the properties of the Kansas City Public Service Company, Kansas City, Mo., will be partially financed with a portion of the proceeds of $4,400,000 first mortgage 6 per cent bonds offered on March 21 by Halsey, Stuart & Company, Chase Securities Corporation and Newman, Saunders & Company. The bonds were priced at 95 and interest, yielding more than 6.40 per cent. They are dated July 1, 1926, and are due July 1, 1951.

It is explained that of these bonds, $2,534,800 are new bonds, and the proceeds therefrom will be used for capital additions and improvements to the company's property. The balance of the bonds being offered have been previously issued and do not increase the company's funded debt or its interest charges.

The company, with a wholly owned subsidiary, owns and operates the entire railway system in Kansas City and Independence, Mo., and Kansas City, Kans., and a motor bus system in Kansas City, Mo.

Debt in Seattle Diminished

Seattle, Wash., now owes on its municipal railway purchase debt to the Puget Sound Power & Light Company $436,296, not including interest. The debt was diminished $172,966 on March 13 when City Comptroller Harry W. Carroll paid that amount as first installment, with interest included. The remainder will be paid in four equal installments, annually. The payment was made in railway department warrants drawn on a fund that had been enlarged by loans of $550,000 from the light department. Part of the loan was used some time ago to enable the railway to pay operating costs while it accrued funds sufficient to meet the bonded purchase debt installment.

The railway was assessed $401,017 for 1919 by the county assessor but litigation costs and accrued interest have increased the total the railway must pay by nearly $300,000. There was pending a long time in federal court a suit in which the city contested a contract with the Puget Sound company stipulating that the city was to pay three-fourths of the 1919 tax. The company won.

Liberalizing Savings Bank Investments in New York

Without opposition the Assembly of New York has passed and sent to the Governor two of the bills permitting wider latitude in savings banks investments. The first bill permits savings banks to purchase equipment bonds of railroads and the second legalizes investment in the bonds of electric, gas and telephone companies. The provision for investment in utility bonds and telephone issues under stipulated restrictions is made in two subdivisions added to section 239 of chapter 369 of the laws of 1914. Most important provisions in the law follow:

The company must be duly incorporated under laws of the United States for business of supplying electrical energy or gas, and at least 75 per cent of the gross operating revenues of such company must be derived from such business, not more than 15 per cent of such revenues being derived from any other one business; the company must operate under the duly established public service commission or other regulatory body; the company must have the necessary franchises for operation in territory from which 75 per cent of its gross income is derived.

The outstanding full paid capital stock shall be equal to at least two-thirds of the total debt secured by mortgage lien on any part or all of its property; such corporation must have been in successful operation for at least eight fiscal years and must have a satisfactory record for payment of debt service; for a period of five fiscal years earnings must have averaged not less than twice annual interest charges on funded debt; applicable to the period such bonds must be part of an issue of not less than $1,000,000 and must be secured by either a first or a refunding mortgage secured by property owned and operated by the issuing corporation.

Not more than 10 per cent of the assets of any savings bank shall be invested in electric and gas bonds, and not more than 2 per cent of such assets shall be invested in bonds of any one such corporation.

The bill to amend the law on invest-

Digitized by Google

ments in bonds and obligations of railroad corporations recognizes the importance of earnings on capital stock, apart from whether such earnings have been paid out in dividends. In the old law it was provided investment might be made in bonds of railroads which, with other requirements, met the obligation that "at no time within five years next preceding the date of any such investment such railroad corporation shall have failed regularly and punctually to have paid in dividends to its stockholders during each of said five years an amount at least equal to 4 per cent upon all its outstanding capital stock."

The new law contains this provision, with the alternative that the road shall have earned net income of at least 4 per cent during each year of the five. Net income is defined to mean net income as set forth by the accounting regulations of the Interstate Commerce Commission.

Another departure is adding to the legal list bonds issued or assumed by a terminal depot or tunnel corporation, provided they meet the requirements applied to other railroad bonds, and provided the bonds are guaranteed by endorsement, principal and interest, by one or more railroads meeting the provisions of the savings bank law.

Bonds secured by pledge of other railroad bonds as collateral under a trust agreement become legal provided the pledged bonds are themselves legal for such investment; do not mature earlier than the bonds so secured; are not less in par value than the amount of the bonds they secure, and that no substitution or withdrawal of collateral may be permitted.

Equipment trust obligations, maximum amount of which do not exceed 80 per cent of cost of rolling stock purchased, provided the latter is owned by or leased to a road, any of whose bonds are legal, or to a company controlled through majority stock ownership, or a subsidiary whose controlling company guarantees the equipment bonds, provided its own bonds are legal.

Increase in Revenue and Riding

Chicago Surface Lines report increase in gross and residue receipts in 1927. Total rides, including transfers, were 1,585,441,127, while revenue passengers totaled 882,458,647

THE Chicago Surface Lines, operating under temporary municipal permits during the fiscal year Feb. 1, 1927, to Jan. 31, 1928, made further progress in its record of service, traffic and earnings. Gross earnings were $61,624,752, an increase of $451,151 compared with the previous year. This total was the highest in the history of the companies. Operating expenses, including taxes and renewals, were $48,231,496, an increase of $360,006. Residue receipts were $13,393,256, an increase of $91,145. The city of Chicago's share of divisible receipts was $2,500,225 and purchase price of the properties as of Feb. 1, 1928, was $163,917,765. These facts were contained in the fourteenth annual report of the president of the board of operation.

Increase in traffic, which had been maintained for 24 consecutive months, was interrupted in June when there was a decrease, and like conditions prevailed during four later months of the year. Notwithstanding this, the total rides for the year reached 1,585,441,127, an increase of 10,471,225, while the revenue passengers totaled 882,458,647, an increase of 6,208,984 over the previous year. Service was increased during the year to the extent of 3,200,000 passenger car and bus miles. The largest day's business of the year and the second greatest in the history of the companies both in earnings and traffic was Saturday, Dec. 17, when passenger receipts were $199,099, revenue passengers 2,901,195 and total rides 5,090,097. Revenue passengers on an average weekday numbered 2,548,443, which set a new high mark. Average Saturday passengers during the year numbered 2,660,278, and for an average Sunday or holiday, 1,625,365.

The first Chicago Surface Lines bus route was started on Aug. 11, on Diversey Avenue from Crawford Avenue to Laramie Avenue. A new type twin-motor bus seating 40 passengers and equipped with pneumatic tires and air brakes was adopted for this purpose. Public approval was promptly evidenced by requests from various sections of the city for extension of this type of bus service.

The properties have been operated practically on a day-to-day city permit since Jan. 31, 1927, when the franchises expired. The first permit after that date was for six months to July 31, the next four months to Nov. 30, and after that date for one month at a time.

Accompanying this recital of the affairs of the company are some comparisons of the extent of the Surface Lines' system at the end of the first year of unified operation (Jan. 31, 1915) and at the close of the fourteenth year (Jan. 31, 1928).

Items	1915	1928	Per Cent Increase
Gross earnings	$31,966,049	$61,624,752	92.78
Operating expenses	19,889,276	48,231,496	142.50
Taxes	1,439,279	2,900,000	101.49
Operating wages paid	10,560,039	30,280,959	186.75
Total wages paid	12,379,615	32,989,360	166.48
Revenue passengers carried	627,731,550	882,458,647	40.58
Total rides	1,115,312,129	1,585,441,127	42.15
Average fare per revenue passenger	4.99 cents	6.90 cents	38.28
Average fare per ride	2.81 cents	2.84 cents	36.65

A total of $113,741,583 has been paid for public benefits by the companies since the adoption of the 1907 ordinances, divided as follows: For cleaning right of way, including sprinkling and removal of snow and ice, $11,166,425; street paving, $16,671,621; maintenance paving, $6,578,339; general taxes, $35,839,359 (year 1927 estimated); track and overhead removal and replacement on account of sewer installation, etc., $1,890,744; city's 55 per cent proportion of net earnings, $41,595,095.

A new world's record in service was made during the 1927 Christmas shopping season when every car and bus owned by the company was operated in peak load periods on Wednesday, Thursday and Friday, Dec. 21, 22 and 23. This is the second time 100 per cent operation has been attained on a large street car system and the previous record was made also by the Chicago Surface Lines on Dec. 20, 1926.

This use of all equipment in the Christmas peak saved the investment necessary for 200 additional cars, the number usually being overhauled. The cost for each car and car storage would average about $20,000, making a total saved in capital investment of approximately $4,000,000.

The report refers to the supplemental arbitration agreement entered into Dec. 12, under which an award was made on Jan. 21, signed by two new arbitrators following the agreement for arbitration signed July 18, 1927, under which no award was made because of the inability of the two arbitrators to select a third man.

This award covers the period from June 1, 1927, to May 31, 1930. It provides for life insurance effective Feb. 1, 1928, in the amount of $1,000 and $20 a week for sick and accident insurance —also a 1 cent per hour increase in wages starting June 1, 1928, and an additional 1 cent June 1, 1929. It also provides for the payment of $35 to all members of Division 241 in service Feb. 1, 1928, who were in service prior to June 1, 1927, and $12 to those in service Feb. 1, 1928, who went into service between June 1, 1927, and Nov. 1, 1927. The award was approved by the Hon. James H. Wilkerson, Judge, United States District Court, in accordance with the terms of the agreement under which the award was made. The board of operation authorized extension of the life insurance and sick and accident benefits to all other employees, effective Feb. 1, 1928.

Team work on the part of employees directed by the department of accident prevention was largely responsible for a reduction of 12.5 per cent in number of reported accidents. Fatal accidents were reduced more than 14 per cent.

The best record during any fiscal year since 1921 was made in number of car riders and car-miles per accident.

The second annual accident preven-

Digitized by Google

tion contest among the various divisions of trainmen closed on Jan. 31, with Lincoln Avenue depot the winner.

Car mileage per pull-in due to equipment failures reached a new high average of 25,884, an increase of about 80 per cent. Compared with the showing for the fiscal year 1924, this is an increase of 424 per cent.

In the past year, 1,624 cars, or 45 per cent of the 3,639 cars owned, were overhauled and painted.

Each motor car on the system traveled an average of 37,593 miles during the year—establishing a new record for passenger equipment.

In spite of an increase of more than 3,100,000 passenger car miles during the year, there was a decrease of more than 8,300,000 kw.-hr. in power used. There was also a reduction of about $28,000 in cost of energy output.

The bus operation installed in August, 1927, as an extension of the railway facilities on Diversey Avenue, both with respect to character of service and type of buses employed, has given great satisfaction to the public. By an order entered Jan. 26, 1928, the Illinois Commerce Commission authorized and directed extension of this service east to Milwaukee Avenue and west to Narragansett Avenue, and by the same order authorized and directed bus service as an extension of the Belmont Avenue line between Central and Narragansett

EARNINGS, EXPENSES AND DIVISION OF RESIDUE RECEIPTS OF CHICAGO SURFACE LINES FOR YEAR ENDED JAN. 31, 1928, COMPARED WITH PREVIOUS YEAR

Total of balances at Feb. 1, 1928	$10,160,649	$5,783,489	$397,207	$16,341,347

Under orders of the Public Utilities Commission of Illinois and of its successor, the Illinois Commerce Commission, $8,337,705 has been expended since July, 1920, out of the "Special Renewal and Equipment Fund" for new equipment and for track extensions and reconstruction.

Although the property acquired by these expenditures is functioning as part of the operating plant, it does not appear in the Capital Accounts of the companies inasmuch as the Commission orders provide that such expenditures shall not be carried to capital account "unless and until the sum or sums thus expended have been paid into the renewal and depreciation fund."

The balance, $16,341,347, in "Reserve for Renewals" and "Special Reserve for Renewals and Equipment" is a cash balance and is on deposit in various banks.

CAPITAL EXPENDITURES BY CHICAGO SURFACE LINES FOR THE FISCAL YEAR ENDED JAN. 31, 1928.

Avenues. The Chicago Motor Coach Company is seeking to have the commission set aside this order.

Newspaper advertisements, frequent articles in the news columns and in trade papers and magazines, liberal use of car cards and public meetings at which talks have been made and motion pictures shown were the principal mediums of publicity.

The three motion pictures that were previously produced have proved so popular that it was decided to prepare another. "Safe Highways," a two-reel picture on the subject of safety, was completed the latter part of January. Through the speakers' bureau, consisting of employees of the company, 258 organizations with audiences totaling 59,800 were reached during the year. A route and sightseeing guide was distributed to 500,000 persons during the year and a new guide was issued Jan. 1.

Building Up a Sales Force

Every uniformed employee was impressed with the fact that his own interests were identical with those of his employers in securing and retaining the good will of his daily customers. More than usual care was exercised in the selection and training of new employees.

In conclusion President Henry A. Blair said:

Notwithstanding the handicaps of expired franchises and operation under temporary municipal permits, the Chicago Surface Lines continued with all the vigor and enterprise of an efficient industrial organization, to give the people of this city the highest type of street car service. Although borrowing power was curtailed by the franchise situation, more track, new and rebuilt, was constructed by this system than by any other street railway in the country. Service was increased materially and a beginning was made in the establishment of feeder bus routes with buses of improved design.

Increase in Riding Significant

Perhaps the most significant fact, however, is the continued and consistent increase in riding. In a year when decrease in business was the rule in street railway operation, this system showed a substantial gain over the previous fiscal period. This has been true of every year for the past six years.

The Chicago Surface Lines alone of the street railways in the eight American cities with a population exceeding 700,000 had a greater number of revenue rides in 1927 than in 1923.

Undoubtedly so outstanding an example of successful operation is not a mere chance occurrence. It is due to the consistent policy of improvement in service, effective maintenance of property and the constant effort to encourage riding by fitting transportation to the needs of the community to as great a degree as legal and financial restrictions would permit.

It is to be hoped that these restrictions may be removed in the near future by the enactment of enabling legislation by the State and agreement between the city and the companies on a plan adequate for present and future needs of Chicago, including unification of the elevated and surface properties with subways and feeder bus lines organized under a terminable permit from the city affording the necessary basis for ample financing.

Hearing on Accounting for Railroads Adjourns

The hearing before Commissioner Eastman and Examiner Bunten of the Interstate Commerce Commission on a system of depreciation accounting for steam railroads proposed by the commission in docket No. 15,100, was temporarily adjourned on March 15 after a brief session, to March 19, when testimony on a proposed system of depreciation accounting for telephone companies was to be taken up.

It is expected that in the case of the electric railways similar consideration will be shown at the conclusion of the steam railroad inquiry.

Santa Barbara Property Offered to City

The Santa Barbara & Suburban Railway, Santa Barbara, Cal., a subsidiary of the Southern California Edison Company, is willing to give its property to the city of Santa Barbara, if the city is willing to take it according to F. B. Lewis, assistant general manager of the Edison company. He made this announcement during the course of a hearing before a State Railroad Commission examiner on the abandonment of a bus line on March 9. Earle Ovington, real-estate operator, had appeared to protest against the discontinuing of the bus service, on which excessive losses were claimed.

Mr. Lewis explained that the railway property could be turned over to the city subject only to the assumption by it of certain mortgage obligations now outstanding.

The system in Santa Barbara consists of about 9 miles of railway line and 5 of bus routes.

Indianapolis and Cincinnati Bond Case Complicated

Hearings were conducted recently in the Federal Court in Indianapolis, Ind., on the application of Fred H. Kelley, a stockholder of Mattoon, Ill., for appointment of a receiver for the Indianapolis & Cincinnati Car Trust Equipment Company, on the ground that no dividends or principal maturity payments had been made since November, 1926.

The trust equipment company was formed in 1923 to finance the construction of ten substations along the lines of the Indianapolis & Cincinnati Traction Company, now in receivership.

Proceeds of the bond sales were used to build the ten substations required when the railway adopted direct current and for the purchase of twelve new cars.

The case recalls recent action by bondholders' committees which approved the sale of the railway to Charles T. DeHore, Toledo, and others. The total par value of bonds which were acquired by the DeHore group was $2,600,000.

In buying the railway bonds, however, the DeHore group stood to come into possession only of the tracks, poles, right-of-way and station equipment, since all rolling stock, substations and

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

†This index is changed to a base of "1926 = 100." That notation replaces the former basis of "1913 = 100." Inasmuch as the bureau has not calculated the index on this new base any further back than January, 1923, no figures are shown in this tabulation for the high and low points since the war. It is planned to compute the index on the new basis as far back as January, 1913. Until such time as the bureau makes public these figures for the earlier years this information will be lacking.

copper wire were obtained on conditional sales contract by the railway from the trust equipment company.

Soon after the bond sale had been approved, Mr. DeHore and his associates started negotiations for control of the Indianapolis & Cincinnati Car Trust Equipment Company. They are said to have been successful in buying the $140,000 of Series B stock and 25 per cent of the $600,000 Series A, or only about $190,000 of the total of $740,000 stock outstanding. Recently it has been reported an organized group of stockholders of the Car Trust Equipment Company had resisted the offer made by the DeHore faction, and that in consequence a situation had been created which threatened practical dismantelment of the line of the Indianapolis & Cincinnati Traction Company.

Stockholders at Washington Approve Merger Idea

Stockholders of the Capital Traction Company, Washington, D. C., at a special meeting on March 15 ratified the transit merger agreement by a margin of approximately 8,000 votes. The day before the Washington Railway & Electric Company stockholders took similar action. Chairman Childress of the Public Utilities Commission declared he was going to do everything possible to bring about a merger now. He said:

We must strike while the iron is hot. Any postponements of the merger for an indefinite period perhaps would jeopardize efforts to bring about the long-desired unification of the transit lines, which would indicate that the commission has no intention of holding any public hearings.

Move in Foreclosure Proceedings Against Long Island Line

A further step to conserve the interests of bondholders of the New York & Long Island Traction Company, which ceased operation at midnight on April 5, 1926, was taken recently when judgment was entered in the Nassau county clerk's office in Hempstead for $1,163,449, in foreclosure proceedings by the Union Trust Company as trustee of the mortgage which guaranteed the bonds. The railway has been in receivership since Dec. 21, 1923.

Abandonment of Interurban Lines in Lincoln Sought

Abandonment of its trackage from 21st and Y Streets to the downtown business district terminal at Fourteenth and O Streets is planned by the Omaha, Lincoln & Beatrice Railway, Lincoln, Neb. The City Council and the State Railway Commission are being asked to approve the removal of the tracks and the stopping of service.

President Harvey Musser of Akron takes the position that the company cannot afford the assessment for paving that will be placed upon it by reason of the authorization of a new district which includes a considerable portion of its trackage. Considerable of its interurban traffic has been diverted to the railway company's buses.

Baltimore to Reclassify Unissued Stock—February Gross Gains

Stockholders of the United Railways & Electric Company, Baltimore, Md., at their annual meeting to be held on April 11, will be asked to approve of an amendment to the charter of the company to empower the board of directors to classify or reclassify any unissued stock of the company in the form of preferred stocks, and to issue and sell convertible securities. The initial step in this direction was taken by the board at its monthly meeting on March 20, a resolution recommending such action having been adopted. President C. D. Emmons said:

The company, in order to avoid the annoyance and expense of a special meeting, has included in the notice for the annual meeting a resolution giving power to the company, through its directors, to file an amendment to the company's charter authorizing the issue and sale, subject to the approval of the Public Service Commission of Maryland, of any part of the present authorized but unissued common stock in the form of preferred stocks, and to issue and sell convertible securities.

This authorization has no immediate significance from the standpoint of financing the company, as the company's position does not at present justify the use of such securities, but it was thought well to give the company the power, through its directors, to take either or both of these steps, if later they seem to be advantageous.

The total amount of the authorized capital stock of the c mpany is $35,000,000 par value, div. led into 700,000 shares of the par value of $50 each, all of which are common stock. Of the authorized stock 409,224 shares are outstanding.

Earnings from Jan. 1 to Feb. 29 (60 days), 1928, compared with 1927 (59 days), were as follows:

	1928	Increase
Passenger rev.	$2,617,513	x$22,670
Other revenue	33,595	x2,211
Totals	$2,651,108	x$24,882
Oper. expenses	$1,676,907	$46,600
Depreciation	132,555	x1,244
Totals	$1,809,462	$45,355
Net oper. rev.	$841,645	x$70,238
Taxes	258,237	x14,313
Oper. income	$583,408	x$55,924
Non-op. income	21,933	398
Gross income	$605,342	x$55,526

Remainder	$130,470	x$62,582
Interest on income bonds	93,333	.....
Net income	$ 17,136	x$62,582

xDecrease.

Net income by months was:

	1928	1927	Increase
January	$18,366	$72,128	x$53,761
February	18,769	27,590	x8,820
	$37,136	$99,718	x$62,582

xDecrease.

Fares were changed at midnight, Feb. 12, 1928, from 8-7½ cents for adults and 4 cents for children to 9-8¾ cents for adults and 5 cents for children. There was no change in commutation or school ticket rates. For the month of February revenues and expenses are for 29 days in 1928, as compared with 28 days in 1927. Expenses for 1928 are at increased wage over 1927—2 per cent effective Jan. 1 and additional 2 per cent effective Feb. 12.

Protest Voiced Against California Tax System

Before an open forum meeting held recently by the California Tax Commission, attorneys for the electric railways in southern California protested against the present system of state taxation. The present state tax was declared to be a serious burden which increases yearly. It was declared that no electric railway in California is making an equitable return on its investment.

A substantial reduction in the present gross receipts tax of 5½ per cent was advocated by W. D. Hill, representing the Electric Railways Association. He suggested that relief should come from stringent paving requirements imposed on the railways, and expressed the belief that municipally owned public utilities should be taxed in proportion to assessments levied on privately owned utilities. In his opinion no state electric railway was making in excess of 5 per cent of its investment and most of them were making only 1 per cent.

Council Approves Increase in Philadelphia Capital

Increase of the capital stock of the Philadelphia Rapid Transit Company, Philadelphia, Pa., from $60,000,000 to $65,000,000 has been approved by the transportation committee of the City Council.

Of the $5,000,000 increase, $1,500,000 will be used for relocating the Market Street subway-elevated tracks under City Hall and for necessary changes in the underground stations. Another $1,500,000 is to be used in the construction of a garage for 500 motor cars, company buses and taxicabs beside the Fern Rock terminal yards of the Broad Street subway. The balance of $2,000,000 will be used in acquiring real estate for another garage in Locust Street, on the site of the old Hollingsworth school, at the rear of the Academy of Music.

In reply to a question about provision in the ordinance that any of the money not spent on the projects named could be used for other capital purposes Coleman J. Joyce, counsel for the company said:

That is right, but we do not expect to change the purposes enumerated in this ordinance. These figures are estimated, and sometimes such figures are under or over final costs. In case there is an underestimate, we must have a free hand to meet the costs out of the capital.

Digitized by Google

Personal Items

A. A. Mitten Succeeds T. E. Mitten as Chairman

At the annual meeting of the stockholders of the Philadelphia Rapid Transit Company, held on March 21, the following directors were elected to serve for a period of one year: A. A. Mitten, W. K. Myers, J. A. Queeney, R. T. Senter, R. F. Tyson, L. W. Hackett, J. McCartney and J. C. Haungs.

Mayor Harry A. Mackey, by virtue of his office, also serves as a director. E. T. Trigg and J. S. McCullogh are the other directors representing the city under the 1907 city-company agreement. T. E. Mitten resigned as chairman of the board so that the employees might have three representatives instead of two.

The employee representatives on the board are L. W. Hackett and J. McCartney, president and vice-president of the Employees' Co-operative Association, and J. C. Haungs, chairman of the general committee for employees under the Mitten plan. Mr. Hackett is a general repairman in the rolling stock and building department, Mr. McCartney is a driver in the bus department and Mr. Haungs is a paper cutter in the printing department. The board of directors thus consists of five men who are directly concerned in the management of the property, three who are representatives of the employees and three who represent the city.

The meeting of the new board of directors was held directly following the stockholders' meeting. A. A. Mitten was elected chairman of the board of directors and W. K. Myers vice-chairman. Mr. Myers becomes chairman of the executive committee, the membership of which also includes A. A. Mitten, J. A. Queeney and R. T. Senter.

The board of directors elected the following officers of P.R.T.: President, R. T. Senter; general counsel, E. A. Ballard; vice-president, R. F. Tyson; comptroller, W. M. Campbell; secretary of board, A. N. Hinkel; auditor, R. C. Williams; treasurer, G. W. Davis; secretary, F. B. Ellis.

G. D. Rushing Promoted at Shreveport

G. D. Rushing, formerly master mechanic of the Shreveport Railways, Shreveport, La., has been promoted to the post of superintendent of power and equipment. Mr. Rushing entered the service of the company in 1903, when it was known as the Shreveport Traction Company, as a motorman and conductor. He continued in this work for about a year and a half, meanwhile directing his energies to work in the shop. He acquired a good deal of practical experience and as a result was made master mechanic in 1907. This position he held until he was made superintendent of power and equipment.

Mr. Rushing was born in 1878 in Wood County, Tex. He lived on a farm until he was sixteen years of age when he became a clerk in a store. Here he remained for two years. Then he returned to school for a few years.

R. F. Palmblade President of Illinois Association

R. F. Palmblade was elected president of the Illinois Electric Railway Association at the convention held in Springfield, Ill., March 14-15. The new president entered the utility business in 1910 as foreman in the construction department of the Illinois Traction System. From the latter part of that year until 1912 he served as draftsman in the engineering department. During the next four years his headquarters were in Peoria, as operating engineer with the Peoria Railway. From this work he went to Jefferson City, Mo., serving in the capacity of general superintendent of the Jefferson City Light, Heat & Power Company and the Jefferson City Bridge & Transit Company. This work covered a period of three years from 1917 to 1920. Then he returned to the Peoria property taking on the duties of general superintendent until 1924. Since that time he has been manager of the Peoria Division of the Illinois Power & Light Corporation.

R. F. Palmblade

M. O. Benedict has succeeded G. D. Rushing with the title of active master mechanic of the Shreveport Railways, Shreveport, La. He began his career in the electric railway industry in 1906 and located in Shreveport in 1920, becoming chief electrician for the Shreveport Railways. This position he has held until his recent appointment. Mr. Benedict was born in New Madrid County, Mo., in 1889. He was educated in the public schools.

Messrs. Cooke, Bosserman and Ross Promoted in Pittsburgh

M. W. Cooke has succeeded A. J. Fink as superintendent of traffic and schedules of the Pittsburgh Railways, Pittsburgh, Pa. As was mentioned in the Electric Railway Journal, issue of March 10, Mr. Fink is now transportation engineer of the St. Louis Public Service Company, St. Louis, Mo.

Mr. Cooke entered the employ of the Philadelphia Company (the holding company of the Pittsburgh Railways) in 1911 as superintendent of the telephone department. In July, 1924, he was made superintendent of the overhead lines department of the railways, and in December of the same year was appointed chief of the current control department. He remained in this capacity until September, 1926, when he assumed charge of power and inclines. He was serving as superintendent of power and inclines at the time of his recent appointment.

Mr. Cooke was educated at Baltimore City College and John Hopkins University.

Assisting him in his new work is Traffic Engineer P. R. Bosserman, who has been associated with Mr. Cooke since 1925. Mr. Bosserman started with the railway company in 1915 in the substation department, but in 1925 was appointed by Mr. Cooke supervisor of maintenance and construction in the overhead lines department. In 1927 he was promoted to the office of superintendent of substations and inclines. This latter position he held until his recent appointment as traffic engineer.

The vacancy caused by the resignation of Mr. Cooke as superintendent of power and inclines has been filled by John L. Ross, until recently, engineer of power and inclines. Mr. Ross, a graduate of Carnegie Tech in electrical engineering, has been with the Pittsburgh Railways since 1917, when he entered the services of the company in the load dispatcher's office. He was later made chief load dispatcher, and then inspecting engineer of the technical division until his appointment as power and incline engineer in 1926.

H. M. Gould Editorial Consultant

Harold M. Gould, formerly electrical engineer and assistant general manager of the Department of Street Railways at Detroit, Mich., and previously student engineer in all departments of the metropolitan street railways in New York, has been added to the staff of *Nation's Traffic* as engineer adviser. The magazine, published monthly in St. Louis, is devoted to solving street and highway traffic problems.

Mr. Gould was graduated from the Sheffield Scientific School, Yale University, in 1907. Subsequently he served two years in the electrical department of the Long Island Railroad, and later joined the Metropolitan Street Railway in New York. He was with the city engineering department of

Digitized by Google

Bridgeport for eight years following, and thence went to New Haven to join the electrical department of the Connecticut Company. He left this company to become electrical engineer and assistant general manager of the Department of Street Railways in Detroit.

For the last two years Mr. Gould has been transportation engineer with Dodge Brothers, Inc., meanwhile acting as consulting engineer with the Detroit Police Department. In this capacity he recently completed a comprehensive survey of traffic in Detroit in which he recommended measures to be taken to remedy that city's traffic ills.

OSCAR A. BENNETT has assumed the position of assistant comptroller of the Puget Sound Power & Light Company, Seattle, Wash. Mr. Bennett for the past four years has been assistant treasurer of the Blackstone Valley Gas & Electric Company. John W. Kelly has succeeded him. Mr. Kelly had been assistant treasurer of the Baton Rouge Electric Company, Baton Rouge, La.

H. V. Wenger on Indiana Commission

Earl L. Carter has resigned as chief engineer of the Indiana Public Service Commission effective on April 1, to enter private consulting work. In his position as engineer for the commission, one of his principal duties was to fix valuations of utilities for rate-making purposes. He entered the service of the commission in 1917 as assistant engineer and succeeded Harry O. Garman as chief six years ago. He was graduated from Purdue University in 1914.

Harry V. Wenger, former member of the engineering staff of the commission, has been selected as Mr. Carter's successor. Mr. Wenger took a position with the commission in 1917. He served on the commission engineering staff more than three years. He left in 1923 after having been elected chief engineer of the Railroad Commission of South Dakota. Later he returned to Indianapolis and has been in private engineering work since that time.

The Story of Sam Greenland

Another railway official regarded as good diet for popular consumption is Sam Greenland, who was featured in the Sunday, Jan. 22, issue of the St. Louis *Globe Democrat*. All JOURNAL readers know by this time the work-loving, 48-year old general manager of the St. Louis Public Service Company, and residents of his city look to him to supply them with the best car service. The writer of this article says that long before he became an expert in the operation of electric railways he was a tool dresser in the oil fields, a lumberman, a clerk by day, a bill collector at night and a telephone lineman. How he happened into the railway business and what he made of it are now history, recorded from time to time in these pages.

Thomas H. David

Messrs. David and Tretton Advanced in Indianapolis

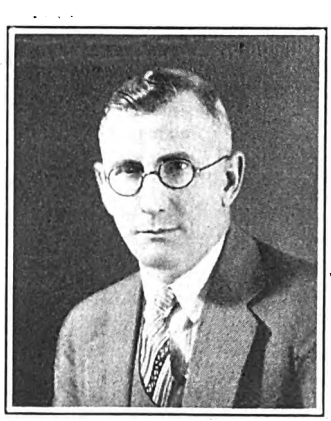
Promotion of two veteran employees of the Indianapolis Street Railway, Indianapolis, Ind., was announced recently by Robert I. Todd, president. They are Thomas H. David and James P. Tretton.

Mr. David, principal assistant engineer, has been promoted to chief engineer. He succeeds T. B. McMath, who has retired from active service because of ill health but retains the position of consulting engineer. Mr. David has had a long career in railroad work. After he was graduated from Purdue University in 1901, he spent the next six years on steam railroads in bridge, maintenance and construction work, being identified with some of the early elevation work in Indianapolis. In 1905 he received the advanced degree of civil engineer from Purdue University. Since 1907 he has been assistant and principal assistant engineer.

During the construction of the joint interurban terminal freight houses in Indianapolis in 1923 Mr. David was supervising engineer. These are believed to be the largest interurban freight facilities of their kind in the world, costing approximately $900,000. The houses have 43,160 sq.ft. of floor space under cover and 3 miles of tracks on the property which cover an area of approximately 12 acres.

Mr. David was born in Indianapolis Aug. 18, 1876. He is a member of the American Society of Civil Engineers.

The appointment of James P. Tretton, superintendent, to the position of general superintendent, comes as a well-merited acknowledgment of his 30 years continuous employment in the various departments of the Indianapolis Street Railway. He entered the company's service in 1898. It may be said that the electric railway business was Mr. Tretton's "first love" as he began his career after leaving school, at the age of fifteen years, his first position being in the truck department of the company's shops. Later he was promoted to the storeroom at the shop. In 1904 he was appointed paymaster. Three years later he was placed in charge of arranging schedules for the operation of the different lines. In 1907 he was advanced to the position of assistant superintendent and in 1919 he was made superintendent. On Jan. 1, 1928, he was advanced to the post of general superintendent.



James P. Tretton

J. A. BROMLEY, general manager and engineer of York Corporation Tramways, York, England, has been appointed general manager of Durban Corporation Tramways, South Africa. Before going to York Mr. Bromley held prominent tramway positions at Leeds and afterwards at Keighley.

Obituary

CHARLES P. HOWARD, president of James L. Howard & Company, Inc., Hartford, Conn., manufacturers of railway car supplies, died March 6 at his home in that city. Mr. Howard was educated in the Hartford schools and later matriculated at the Massachusetts Institute of Technology. After graduation as a mechanical engineer he became associated with the Howard company where he spent his business life. He was 74 years old.

DARLING L. WILSON, an employee of the Dallas traction lines for the past 41 years, and the Dallas Railway & Terminal Company since its organization, died recently in that city. Mr. Wilson was the author of a history in which he traced the development of railway traffic in Dallas from the days of the first mule car up to the present time.

W. N. OLDHAM, the oldest trainman in the employ of the Portland Electric Power Company, Portland, Ore., died Feb. 15, after 40 years of service. He was operator of the first horse car on the east side, and when cars were electrified he was placed on the Woodstock line. Since that time he had worked on various lines, with no major accident while in service. Mr. Oldham was 77 years old and worked up to June of last year.

STANLEY SHAFFER, 67 years old, prominent member of the Cincinnati Bar, died recently. He was associated with the builders of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad from its inception, a connection which continued until his death.

Manufactures *and the* Markets

How Price Cutting Works

A Close-Up Picture of the Tension that Exists Between the Seller and the Purchaser in the Utility Industries

By Earl Whitehorne
Commercial Editor "Electrical World"

In the Feb. 18 issue of Electric Railway Journal Mr. Whitehorne *outlined the evils that result from the present "buyer's market" for utility equipment. In this article he cites some of the purchasing and selling practices that are not in accord with sound business principles.*—Editor.

IT IS perfectly natural and practical and proper for the purchasing agent to buy as cheaply as he can. And it is no less right for the manufacturer who sells the goods to get as profitable a price as possible. But in the evolution of business certain principles have developed and certain responsibilities. The trickery that once was the life and sparkle of horse trading, is now frowned upon. Fair dealing has become the accepted standard in commerce. The seller is supposed to give honest value and the buyer is expected to pay an honest price. Why, then, is there so much talk right now of trouble between large buyers and sellers? What has gone wrong in the market place that there is bitter talk of price cutting by manufacturers and profiteering by purchasers?

Tricks of the Purchaser

Study it a bit and you find an interesting thing. There are some manufacturers who have the courage to establish prices and maintain them. Their price is their price and they refuse to dicker. But there are some who lack the courage or the strength. And just so there are some purchasing agents who do not haggle. They ask for bids from suppliers whose product is acceptable and the low man gets the business. But their are others who seem to consider their function one of dollar squeezing; and the length to which this gentle art is carried is astonishing.

The number and variety of tactics employed by these purchasers are without end, but there stand out certain typical situations:

1. Where the purchasing agent gets the high bidder to cut on the indefinite promise of a large block of business next year.
2. Where the buyer lies, giving a bidder the false intimation as to his competitor's price, or representing the competing price on motors alone, for instance, as the complete price for motors and control or citing a price on equipment that is not comparable, or ringing some other subtle change on the truth that deceives and tempts the bidder to cut.
3. Where the large buyer demands special discounts for large volume, claiming that this volume carries the manufacturer's overhead, and thus forces the big manufacturers' price down to where the small manufacturer cannot compete.
4. Where very large buyers of electrical equipment that is used as part of a manufactured product threaten to make their own equipment unless the price is cut.
5. Where large utility holding companies argue that one of the savings possible through holding company operation should show up as savings in purchasings, and demand discounts greater than those given to operating companies, which eliminate the small manufacturer and force the large manufacturer's price below the margin that provides for the further development of bigger and better apparatus.
6. Where purchasing agents apparently do not know how to buy because they have no facts to check bids with and no methods of evaluating bids and therefore resort to haggling.

What the Seller Does

That's what they are saying about the purchasing agent—not all, of course—but many. But what is the matter with the manufacturer? you'll say. Why does he fall for such methods? There is the rub. The manufacturer right now finds himself in a buyer's market. He has permitted himself to become involved in a mad scramble for orders that has enmeshed him until for every story reflecting upon the purchasing agent there are fourteen about manufacturer and his salesmen. As one man put it—"You can take a pure young man and make him a purchasing agent today and before Sunday the manufacturer's salesmen will have taught him all the dirty tricks in the business."

The utility purchasing agents say that the manufacturers are themselves the greatest culprits and are responsible for price buying. They say that first bids today are made for trading purposes only. Therefore, they say, they too must use trading methods because those are the methods that the manufacturers have developed and seem to understand. The purchasing agents say that they are willing to pay fair prices but that the manufacturers haven't the courage to put fair prices on their products and then stick to them.

The small manufacturer also charges that although the large manufacturers state that they desire competition and see no virtue in monopoly, yet they chafe under the competition of the small manufacturer and cut prices to get business, relying on price cutting and not on better quality, better delivery or better salesmanship to maintain their position. It is alleged that the spread of prices established by these larger manufacturers is unreasonably wide and is not justified by the savings effected in making and selling the larger quantity to the large buyer. In this competition between the manufacturers also, certain typical conditions stand out—

Tricks of the Manufacturer

1. The large manufacturer uses the lump sum bid as a lever to lower prices on individual products to compete with the small producer who specializes in that line. It is said that at times this is so manipulated that it has the effect of a straight price cut.
2. Allowances are made on old equipment taken back that range all the way from a reasonable scrap allowance to the full original price. This is pure price cutting when the allowance is more than the seller may reasonably expect to realize from the second-hand value.
3. Some manufacturers are making extravagant contributions in preliminary engineering expense for detailed working data that is out of all reason and constitutes a price consideration because it puts an undue extra burden on the profit.
4. Financial affiliations between some manufacturers and the utility companies are used to bringing pressure from on high to throw the order.
5. Reciprocity arrangements are drawn into competitive bids to an extent that overshadows the actual comparative values involved and works an injustice upon bidders who are invited to compete with the assumption that it is to be a fair and open contest.
6. And then there are the everyday conditions of price cutting where the manufacturer loses his nerve and pares his price for no other purpose than to get the order and camouflages it with all manner of alibis and explanations, such as a mistake in figuring, or new information or an unpectedly favorably purchase of materials or some other cock-and-bull story.

The Moral Aspect

There are many time-honored practices that some day will give way to the onward march of principle and be changed. There are many things that men used to do that have been stopped and are not countenanced today. After all, it gets down to a very simple consideration of plain honesty. If a purchasing agent lies or otherwise deceives a bidder into cutting his price, he is not dealing honestly. He is not fair. And if a manufacturer offers a bid that is not fair, either because the goods are not worth the money, or because he has padded the price for trading purposes, he is not dealing honestly.

Everybody will agree that it is considered wrong to slip your hand into a man's coat pocket and extract his wallet while his attention is distracted. No purchasing agent will do this to a salesman. No manufacturer will do it to a buyer. Well, the only difference is that dickering with bids and cutting prices has not yet lost its social standing. Today it involves no conspicuous degree of moral turpitude. But gradually the day will come when between intelligent business men price cutting will be taboo.

Digitized by Google

It is a matter of simple inescapable truth that destructive commercial warfare between competitors or between buyers and sellers eventually demoralizes markets, wrecks the economic health of the industry, and ultimately paralyzes the service upon which the public is dependent. And that is the reason why we find modern business bulwarked about with codes and standards and principles, with a highly developed system of self imposed controls that have evolved out of experience because without co-operation and mutual good will there is no safety for investment, no stability upon which to base projects and plans.

TWO OBJECTIVES

The greatest single problem in this whole situation to my mind is the difficulty of shaking men loose from the purely negative idea that because these unintelligent buying practices are general and have existed for long, they can't be changed. But that is just foolishness. Every buyer wants to get his money's worth. Every seller wants to get a fair price. No more, no less is satisfactory. What can be done, therefore, to put an end to the haggling and the price cutting? Fundamentally it seems to me there are two things to be done:

One — By the purchaser — Industry needs more intelligent buying. It needs purchasing agents who know the values of the equipment they buy, and make of their function something more than an adroit matching of prices. It needs recognition that what is bought must be paid for and that bids which embrace elements of engineering, and of service as well as the delivered product, cannot be compared by a mere tallying of the total cost figures.

And Two—By the manufacturer— Industry needs more sincerity in selling. It needs manufacturers who consider that a bid is a word given—an honest offer of service to a friend—and not just a gesture in a sparring match. In other words, a bid from a responsible concern to a reputable customer should be a firm bid, the pledge of the house, signed with its good name. And such a bid is the equivalent of an open bid because there is no trick in it. It is not subject to a revision, any more than the written word of that manufacturer is subject to question, because his honor is involved.

All this will not happen at once—not this week. I know it. But industry can work toward it—can fight for it. And the logical approach to it is for the seller to refuse longer to cut his price because the buyer tells him to. Let him at least begin to protect himself by making sure that the other bids that he is asked to beat are comparable and that the purchasing agent is not lying. If he is asked to refigure after the bids are in let him at least demand that all the bids be opened to inspection. And also, it is time the manufacturer knew a little more about the reasons why he loses orders, through regularly organized post mortem studies of the bids on his closed business.

Wheeler and Childress Railway Planned

Construction of an electric interurban railway between Wheeler and Childress, Tex., approximately 80 miles, is planned by the group of large oil companies which are operating in the Panhandle District. Electric power for the proposed line will be furnished by the West Texas Utilities Company which already has a power transmission line along the entire route of the proposed railway. Although it is intended that the electric railway shall handle passenger traffic, its chief purpose will be to give the oil fields of these companies an additional transportation outlet. The road will pass through Shamrock, Wellington and serve other smaller towns.

First of Twelve New Macon Cars Shipped

The first of the twelve new units for the Macon Light & Railway Company built by the Perley A. Thomas Car Company were shipped on Feb. 22. The second one was scheduled for shipment the last of that week. Delivery of the remainder is at the rate of two cars per week until completion of the order.

The cars are of the one-man double-end double-truck type, all steel design. They have an over-all length of 41 ft. 8 in. and a seating capacity for 40 passengers. Green and cream is the color scheme of the exterior, and the interior trim is of cherry. Specifications were printed in ELECTRIC RAILWAY JOURNAL issue of Oct 15.

Madagascar to Electrify

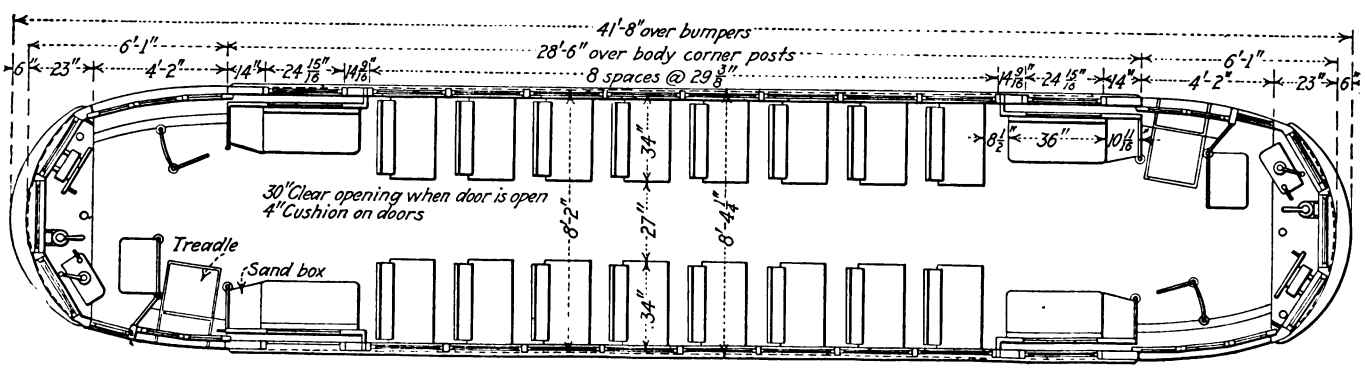
The government of the French colony of Madagascar has approved a project for the partial electrification of the Tananarive-East Coast main line railway to make use of the potent waterfalls located on the Mangoro River. The project is estimated to cost 20,000,000 francs, not including electric locomotives. It will take six years to complete. The work will probably not be undertaken before late in 1928.

Employment Activity on Increase

Employment and activity in the manufacturing industries of the United States have been on the increase since November, 1927, it is indicated by the January, 1928, returns from about 2,000 manufacturing plants reporting monthly to the National Industrial Conference Board, New York. These plants are located throughout the various sections of the country, are of both large and small size and represent 25 different divisions of manufacturing. Inasmuch as midwinter is a quiet period in many industries, seasonal influences should show further improvement in February and March employment when the data for these months become available, in the view of the board.

January figures show more than 1 per cent increase over the number employed last November which, according to the conference board's reports, was the lowest ebb of employment for the year 1927 and the lowest since the last quarter in 1924. However, not only has the number of employed increased, but the total number of hours worked in these plants shows an even greater increase, totalling 3½ per cent more than in November, 1927. This, the conference board points out, indicates not only more employees at work but an increased number of working hours per employee, and thus an increase in activity exceeding that indicated by the additional number of men engaged. Average weekly earnings per worker during January showed proportionate increase.

The decline in employment in the manufacturing industry during the year 1927, which came to a halt in December, amounted to only 3½ per cent for the entire year from January, 1927, to January, 1928. There was a decrease in manufacturing employment in



Floor plan of new Macon cars

Digitized by Google

January, 1928, as compared with January, 1926, when industrial activity was near the peak of the 1921-1927 period. The total number of hours worked, in January, 1928, was 8½ per cent lower than in January, 1926, and 4 per cent lower than in January, 1927.

Steel for Subway Work

Bids will be taken March 30 on 7,700 tons of structural steel for a subway section near Prospect Park, Brooklyn. The state of North Carolina is in the market for 3,000 tons for state highway bridges near Wilmington.

American Bridge Company has taken 500 tons of bridge work for New York State, and an inquiry is in the market for 500 tons additional. Erie Railroad is inquiring for 250 tons for a pier on the Hudson River in Jersey City.

ROLLING STOCK

WINNIPEG ELECTRIC COMPANY, Winnipeg, Canada, has received recently three Twin Coaches of the mechanical-drive, street car type, made by Twin Coach Corporation.

SAN DIEGO ELECTRIC RAILWAY, San Diego, Calif., has received its third street car type Twin Coach made by Twin Coach Corporation, Kent, Ohio.

HAZLETON AUTOBUS COMPANY, Hazleton, Pa., a subsidiary of the Lehigh Traction Company, has received from Mack Trucks, Inc., New York, N. Y., one Mack six-cylinder 29-passenger city-type bus.

WICHITA FALLS TRACTION COMPANY, Wichita Falls, Tex., operating the Wichita Falls Bus Company, has placed in service two Mack four-cylinder 25-passenger city-type buses.

MONTREAL TRAMWAYS, Montreal, Canada, has ordered 50 new cars costing about $1,000,000, from the Canadian Car & Foundry Company.

ILLINOIS POWER & LIGHT CORPORATION, Chicago, Ill., has accepted delivery on one Mack six-cylinder 29-passenger parlor-car bus.

CHICAGO, SOUTH SHORE & SOUTH BEND RAILROAD, Michigan City, Ind., has received two 80-ton electric locomotives built by the Baldwin Locomotive works and the Westinghouse Electric & Manufacturing Company. The new engines, of 1,200 hp., are 39 ft. 4 in. long, and cost about $56,000 each.

CITY OF OSLO, Norway, has placed an order for four more A.C.F. 198 in. wheelbase chassis. The fleet at Oslo now consists of 43 A.C.F. buses.

SHOPS AND BUILDINGS

CINCINNATI STREET RAILWAY, Cincinnati, Ohio, has put into service the Colerain Avenue substation, first of the nineteen stations to be completed in the new automatic power distribution system now under construction. Power from this station will go to cars on five routes. All five stations are scheduled to go into service in July.

BRITISH COLUMBIA ELECTRIC RAILWAY, Vancouver, B. C., is reported to be planning to erect two substations at an estimated cost of $70,000.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

	March 20, 1928
Metals—New York	
Copper, electrolytic, cents per lb.	13.8125
Copper wire, cents per lb.	16.125
Lead, cents per lb.	6.00
Zinc, cents per lb.	6.00
Tin, Straits, cents per lb.	52.25
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	.....
Somerset mine run, Boston, net tons	.....
Pittsburgh mine run, Pittsburgh, net tons.	.....
Franklin, Ill., screenings, Chicago, net tons	1.825
Central, Ill., screenings, Chicago, net tons	1.675

Turpentine (bbl. lots), N. Y., per gal.	$0.655

TRACK AND LINE

LOS ANGELES RAILWAY, Los Angeles, Cal., has under way a widening and grading program on Vermont Avenue between San Marino and Washington Streets. Grading will also be done on Mesa Drive from Vernon to 61st Street.

KANSAS CITY PUBLIC SERVICE COMPANY, Kansas City, Mo., has submitted its 1928 program for track improvement to the Kansas City park board and the director of public works. The program includes the reconstruction of the double tracks on Broadway between West Linwood Boulevard and Westport Road, the relaying of the double tracks on Prospect Avenue between 43rd and 47th Streets and a single track on Prospect Avenue between 48th and 75th Streets. Other double tracks to be relaid are on Twelfth Street between McGee Street and Euclid Avenue, Main Street between Pershing Road and 27th Street, McGee Street from Twelfth to Fifteenth Streets, Walnut Street between Twelfth and Thirteenth Streets and Jackson Avenue between Twelfth and Fifteenth Streets.

TRADE NOTES

E. D. GIBBS, who has served as advertising director of The National Cash Register Company, Dayton, Ohio, at three different periods, has resigned his position to engage in business for himself in New York City. He will serve a limited number of clients on work in connection with sales promotion, sales contests and advertising. His temporary New York address after March 15 will be 66 West 55th Street.

IDEAL COMMUTATOR DRESSER COMPANY, Sycamore, Ill., has opened a New England office at 182 Purchase Street, Boston, Mass., and has appointed the following new sales representatives: C. B. Keck, 1565 Ryalmount Road, Cleveland Heights, Ohio; F. D. Lawrence Electric Company, Cincinnati, Ohio; O. T. Hall, 432 North Calvert Street, Baltimore, Md.; G. A. Brewer, New Haven, Conn.; and DeMoss-Fox & Company, Detroit, Mich.

ARMCO CULVERT MANUFACTURERS ASSOCIATION, Middletown, Ohio, has appointed as its municipal engineer Harry E. Cotton, formerly assistant city engineer at Omaha, Neb. His engineering experience is now at the service of all municipalities in the United States and Canada for assistance in the solution of problems involving drainage, subdrainage and flood control.

HENDRICK MANUFACTURING COMPANY, Carbondale, Pa., manufacturer of "Mitco" interlocked steel grating, stair treads and armorgrids, announces the opening of a Chicago district office, 223 Railway Exchange Building, Chicago, in charge of Lon Sloan.

GERARD SWOPE, president of the General Electric Company, has returned to this country after a trip abroad. He says England is definitely on the road to economic and industrial recovery and progress is everywhere evident.

ASBESTOS BRAKE LINING ASSOCIATION and the National Battery Manufacturers Association announce the removal of their offices to the Hale Building, 7 East 44 Street, New York, N. Y.

ADVERTISING LITERATURE

SILENT HOIST, WINCH & CRANE COMPANY, Brooklyn, N. Y., has issued a new bulletin, No. 27, on winches. The winches illustrated are suitable for either portable or stationary use and as car pullers.

SHERMAN CORPORATION, Boston, Mass., has published a report of a survey of industry, entitled, "What Is Happening to Business?" The report includes causes to which increase or decrease in net profits is attributed, and excerpts from interviews with representative business executives.

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, has issued a new bulletin descriptive of the "Linc-Weld" motor.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued bulletin GE A-828 describing the electrification of the Butte, Anaconda & Pacific Railway. Other bulletins issued are: GE A-872 on drum-type controllers for railway service; GE A-951 on Mazda C short-circuiting lamp and socket; GE A-137A on synchronous motors, types T.S. & Q.S.; GE A-914 on CR9441-LS 424A limit switch; GE A-797 on the repair of railway commutators; GE A-921 on better lubrication of railway motors; GE A-467A on automatic starters for slip ring motors; and GE A-808A on totally enclosed fan-cooled motors.

Terminable Permits of Advantage Both to Investors and Consumers

MORE rapid adoption of the terminable permit, in place of the fixed term franchise has not come, according to Prof. E. R. Dillavou in this paper for March 24, because of two important things: First, the type of law to be enacted and, second, the kind of regulation best adapted to its use. When these two questions are settled he feels the way will be open for its more general adoption. Since the life of the utility becomes indefinite, the terms of the agreement become doubly important. But if it is now possible to draw up franchise laws that are satisfactory and will stand the test of the courts, there is no reason why they cannot be drawn for the terminable permit equally well.

As to the question of regulation, there is a great difference of opinion. Rates and service must be adjusted from time to time so that the utility can provide adequately for the community's wants, earn a fair return on the capital invested, and attract new capital as well as lay aside a sum sufficient to permit the utility to perpetuate itself.

Any fair-thinking body of men should be able to regulate in this manner. Naturally, local regulation is preferable, particularly with respect to service, since those intrusted with the duty are able to determine more closely the needs of the public. The ever-present difficulty, however, is that local politicians will not permit regulation to be so fair as when the supervisory power is removed outside their jurisdiction. Keep men of this type out of office and local regulation is easy.

The advantages of the terminable permit are so great that sight of them should not be lost for an instant. The plan has been adopted to a greater or lesser extent in nine states, and it can well be extended to all the states. As Professor Dillavou points out, the benefits are certain—neither the investors nor the consumers should be deprived of the advantages which are derived from the use of terminable permits.

From the City of the Unusual

STARTLING in what it may portend is another move made by Mitten Management, Inc. It has to do with a working arrangement entered into by Mr. Mitten with the Amalgamated Association. In the quiet and calm of Atlantic City the Mittens and the Mahons, as the official statement puts it—meaning T. E. Mitten and A. A. Mitten and W. D. Mahon and O. L. Mahon, father and son respectively, through the good offices of W. Jett Lauck, former member of the War Labor Board, were brought to see the planet Mars in the same way through the same end of the telescope.

It is a significant move. Of that there is no doubt. On that account the official statement covering the agreement is published in full elsewhere in this issue. Naturally, things immediate and things futuristic have been read into the document by the commentators. It was only to be expected that there should be some speculation. It may be that the real significance of the agreement now reached is contained between the lines rather than in them, but so far as Philadelphia and Buffalo are concerned, conditions there are to remain as at present, in order that the standard of economic excellence of these companies be the criterion by which union performance in co-operation with Mitten Management on other properties is to be measured.

As for the future, it is specifically stated in the memorandum that when co-operation between the Amalgamated and Mitten Management has developed to a point where the results are equal to those obtained on the Philadelphia and Buffalo properties, the matter of union-management agreements on these properties may be discussed and be made the basis of further agreement. The memorandum has been referred to as "one of the most extraordinary developments in the long history of the labor movement." That statement may, of course, turn out to be no exaggeration. In any event, the move just made is one that will again turn the attention of the industry to Philadelphia, the city of the unusual in railway operation and publicity.

Will the Trackless Trolley Regain Favor?

WHETHER or not there is an opportunity for the resurrection of the trackless trolley in this country, is a transportation question that justifies serious consideration. During the past several years this vehicle has not made much headway and after arousing some interest its popularity has actually waned. This in itself, however, is far from convincing evidence that the trolley-operated trackless vehicle does not have a place of considerable importance in the scheme of local transportation.

An analysis of the inherent characteristics of the trolley bus reveals no basic limitation. On the other hand there are indications which point strongly in the direction of a revived interest in its possibilities. Rapid strides have been made in the design of chassis for highway transportation vehicles since the early trackless trolleys were tried in this country. There has been likewise, rapid progress in the design of electric motors and control for highway vehicles. Although these latter developments have come about because of the attention given gas-electric drive for buses, they make available new equipment adaptable for the trackless trolley which opens up entirely new design possibilities for the latter vehicle in comparison with what was available at the time of early attempts.

There are two important factors, other than design, to be considered in determining the possibilities of the

Digitized by Google

trackless trolley. The first is whether or not the substitution of electric motors for gasoline engines is a sufficient advantage to overcome the limited flexibility and the overhead construction required for the trolley bus. The second factor is that when attempts were made to install the trackless trolley in this country, a demand arose for the operating companies to provide paving; whereas, the elimination of the trolley wire and the use of straight automotive equipment obviated this requirement.

There is no justification for this public discrimination from the standpoint of fundamental transportation economics, but the question of paving did become a large element in eliminating the trolley bus. It is obvious that the choice between gas power and trolley power thus became a question of pure expediency. During the past several years the public mind has gradually been acquiring a more liberal viewpoint regarding paving, and it is probable that this issue, which so effectually blocked the trackless trolley in some locations, can now be surmounted.

In the field in which gas buses have been adopted as "street cars on rubber tires"—not for the development of a distinct and preferential class of service but as an expediency to give low priced transportation where track reconstruction requirements or traffic sparsity constituted economic limitations to street cars, the trackless trolley seems to offer distinct advantages in its own favor. It has the flexibility to draw up at the curb and to pass other vehicles on the street. Properly designed, it can be made easy riding. On pneumatic tires it may be made the quietest vehicle on the street. But by far its greatest advantage, within a given range of traffic density, lies in its operating economy. There is no track to maintain. There are substantial operating economies to be derived from cheaper power and simplified construction which more than offset the cost of overhead line investment.

For these several reasons, the operation of the eight new trolley buses built for the Manila Electric Company, Manila, P. I., and described in an article in the March 10 issue of ELECTRIC RAILWAY JOURNAL, will be watched with interest. They were designed especially for this class of service and their operating figures should be a guide as to the further possibilities of this type of vehicle in the United States.

Chicago's Need—Enabling Legislation

PUBLIC assurances, given through the annual statements of the Chicago Surface Lines and the Chicago City Railway by Messrs. Blair and Busby, and the earlier report of the Chicago Rapid Transit Company, should serve as a fitting prologue to the resumption of transit negotiations scheduled for early April.

In the Surface Lines report it appears that much has been accomplished during 1927. President Blair refers to the continued and consistent increase in riding. He looks to the future enactment of enabling legislation by the state, and for the formulation of a plan between the city and the companies adequate for the needs of Chicago. It is indeed gratifying, as the annual report of the Surface Lines indicates, that despite the expiration of the Surface Lines franchise more than a year ago, despite the impossibility of borrowing capital for the making of much-needed extensions and improvements the Chicago management during 1927 constructed more track than any other street railway in the country. So far as the elevated lines are concerned, the Rapid Transit Company, although indicating in its report that the fare was insufficient to produce a fair return upon the value of the property, did report fairly constant traffic figures for the past six years and an increase in car-mileage in 1927 over the year preceding.

But the transportation situation in Chicago cannot rest on its 1927 laurels any more than any other institution can sell itself on its past achievements. The matters now of paramount importance lie in the future. What extensions, consolidations, unifications or other steps toward improved transportation service can be expected? What subway proposals and elevated problems can be worked out which will satisfy complaining factions? Are most of the proposed bills to go by the board while time, money and opportunity are wasted? In Mr. Insull's trite but true remark made at the annual meeting of the Commonwealth Edison Company is the answer—a settlement can be made only "by close co-operation among the city authorities, the citizens, the railway companies and the various agencies which create public opinion." It is to be hoped that this year's annual statements will do much to assure the people of Chicago of the efficiency with which their transportation systems are being managed. In this respect they are documents of tangible evidence that should carry weight with every thinking citizen who inspects them.

Congress Indicts Itself in the Esch Case

REJECTION by the Senate of the nomination of Commissioner Esch for reappointment to the Interstate Commerce Commission cries to heaven. Press and public rightly had hoped up to the last minute that wise counsel might prevail on the floor of the Senate at least, even if it did not do so in the committee on interstate commerce. But on March 17 the Senate voted 39 to 29, after five hours of debate, to sustain the unfavorable report made by the committee on March 5.

Sad, indeed, is the commentary to which the rejection applies. There is no question about the ability of the man. There is no question about his fitness for office. There is no question about his sincerity and conscientiousness. He has been on the commission since March, 1921. Previously he served 22 years in the House of Representatives, and during his membership was co-author of the Esch-Cummings transportation act. Last December he was nominated for reappointment by President Coolidge. In what did he offend? It has been hinted that Mr. Esch changed a point of view out of desire to win reappointment. This charge against him is based on the fact that he changed his vote in the Lake cargo case, whereby the railroads serving the Pennsylvania mines were permitted to reduce rates to lake ports, thus increasing the difference in favor of the Pennsylvania fields as against the mines in West Virginia, Virginia, Kentucky and Tennessee.

Therein lay his offense. In consequence his nomination was opposed particularly by the Senators from the Southern coal states. The issue involved really transcends that of personalities. The rejection of Mr. Esch instances the length to which an opposition is prepared to go that is selfish in its outlook. The adverse vote in his case is a thrust at the whole idea of regulation.

Congress has its own troubles. It is not qualified to deal with questions that properly come before the Interstate Commerce Commission. By attempting to do so

Digitized by Google

by pressure as in the case of Mr. Esch it breaks down confidence in the commission as a government agency that should be free from any possible taint of bias, political or otherwise. The commission was created by Congress mainly to regulate rates because experience and reason showed that a small body of men especially qualified and devoting all their time to the matter could be expected to function competently. That the commission has done. True, it may make mistakes. Mr. Esch may have been wrong in his changed stand on the coal freight case. But his courage in changing his vote after a review of additional evidence is to be commended in principle rather than condemned. The judicial character of the commission's work demands that it be as inviolate from pressure from any source as is the United States Supreme Court. But that apparently is not so. By its handling of the Esch case, Congress has indeed visited upon itself a terrible indictment.

Horse-Trading Methods Have No Place in Modern Business

MANUFACTURERS and purchasers are equally responsible for unsound practices in the buying and selling of industrial products. Purchasers are tempted to beat down price levels. Manufacturers are accused of cutting prices in their eagerness to obtain orders in the scramble of competition. The result is that a large portion of the business thus transacted is in utter disregard of sound business and economic principles. Some of the more flagrant practices encountered in the utility industries were outlined in an article by Earl Whitehorne on page 524 of last week's issue of ELECTRIC RAILWAY JOURNAL.

As Mr. Whitehorne points out, the time must come when the purchasing agent will no longer be valued for his penny-squeezing ability, but for his skill and intelligence in selecting material on the basis of its quality and performance. Likewise, manufacturers have the responsibility of developing greater sincerity in selling. Their bids must be final, for only such bids protect both the buyer and the seller by banishing the unseen menace of deceit. Any other purchasing or selling standard is unsound. It stifles healthy competition and encourages horse-trading methods in the conduct of business. Under the modern business code both parties should profit from a buying and selling transaction. If a manufacturer is forced or tricked into taking an order at a loss, it is the industry which ultimately pays the difference with interest—if the manufacturer is to stay in business. A bid is the written word of the manufacturer and it should not be subject to revision. But when a manufacturer loses an order under such conditions it is good for the industry in general that he know a little more about the reasons why he loses than at present. There seems to be no single good reason for the air of secrecy which is sometimes thrown around the business of buying and selling equipment or supplies.

True, not all manufacturers dicker after their price is once given. There are some who have the courage of their convictions and hold fast to the price which they know is right. There are also some purchasers who do not haggle. They pick the products that are acceptable and the low bidder gets the order. On the other hand the number who disregard modern ethics of business is appalling and their tactics would take volumes to explain. It is not good for industry that such conditions exist and it is not safe for industry that they continue. Is it not time for American business to put an end to blind bartering and wit matching as factors in the buying and selling of industrial products?

An Enticing Annual Report

CONSIDERED as a statement of stewardship under service-at-cost the report of President Draper of the Cincinnati Street Railway for the year ended Dec. 31, 1927, is a very interesting document. It shows that there was an increase of 7,224,704 revenue passengers in 1927 over 1926. Expressed in other terms, this is an increase of 7.5 per cent. This, however, is only one of the many things of interest in the report. It appears that the present rate of fare of 8⅓ cents for tickets and 10 cents cash is almost exactly the right figure to provide for all the requirements for the proper operation of the company. This, of course, is a happy thing for the company and for the public which it serves. The public has a right to know about the affairs of the company and it does know under what Mr. Draper has set down. It knows the bad along with the good. It knows, for instance, that the loss on the buses was $152,426, but it also knows that this loss is being cut down and that further improvement is promised.

Mr. Draper has explained that it is the policy of the company to put the track in condition before ordering new cars. But more than that. He goes on record to the effect that the expenditure of additional money on obsolete equipment should be abandoned in favor of the purchase of new rolling stock. He says unequivocally that as yet it would appear that mass transportation, particularly in large cities, can best be handled by the familiar form of street cars improved and developed to meet special needs, but he says "there has now been developed a new motor coach unit of greater carrying capacity which must be reckoned with and which may cause street railway operators to change their opinion as to the availability of the motor coach for use in city transportation." Thus there is presented the opinion of the head of the property about the value of the new electric railway equipment balanced against the view that he holds about the bus.

So the significant references might be expanded. One other, however, does deserve consideration. To say the least it is unusual. It takes into account public recognition on the president's part of the work of the newspapermen who have been so thoroughly interested in the efforts to improve the system, and it expresses a full measure of gratitude to the employees for their many acts of co-operation in selling the service and to all citizens generally who have helped by their praise and advice and criticism—and even by their complaints.

Never is the report fulsome. It might be advanced that all these and many more are things often spread before the public in similar documents. That is true, but it is the way the things have been made known that counts. The report would probably not be appraised 100 per cent from the standpoint of accounting. But it is a human document. Consciously or unconsciously the report reflects a journalist's keen interpretation of news values. It is, of course, too much to say that it is to be regretted that more newspapermen are not presidents of railways, but it is not too much to say that it would be better if more journalists had a hand in the preparation of annual reports.

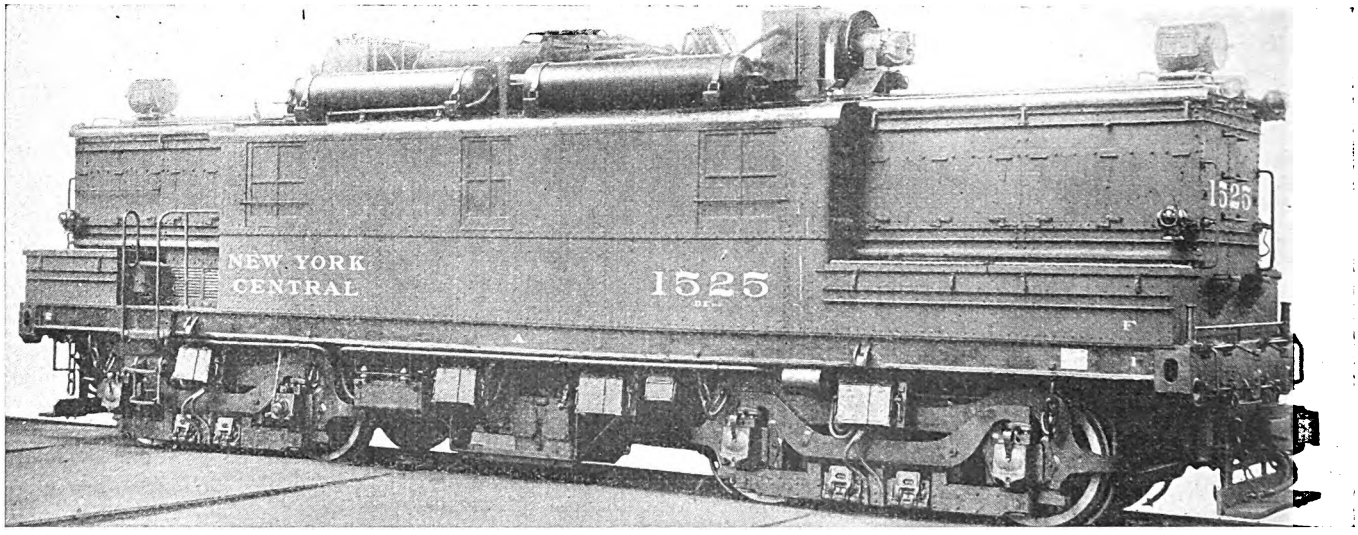
Combination Switching Locomotive

Meets Unusual Requirements

Locomotive of New York Central uses either a battery charged by an oil engine-generator, or external power from overhead or third rail



Combination switching locomotive designed for different characters of service in New York City yards

TESTS were conducted recently by the New York Central Railroad of a new battery-oil-electric locomotive, designed for switching service in the New York City terminals and yards. It is primarily intended for use in the freight yards on the west side which are not electrified and where part of the time the locomotives are required to operate through city streets. Switching service requires that a locomotive respond quickly to applications of power, which in turn means that a relatively large amount of power must be available for short periods, even though the average energy requirement over an eight-hour shift is small. In order to secure this fast action from this locomotive it is equipped with a storage battery of relatively large capacity which can easily supply the high momentary currents required for switching service.

Since the locomotive will be used mainly in yards not electrified, the engine generator set, consisting of a 300-hp. oil engine connected direct to a 200-kw. generator is arranged for charging the battery. This engine is capable of supplying ample power to keep the battery fully charged for all switching service. The generator is so designed that if it is run at the same time power is being supplied to the traction motors it will divide the load with the storage battery under periods of heavy output without overloading the engine, and will return automatically to charging the battery as soon as the load has decreased. The voltage at light load is so proportioned that there is no danger of overcharging the battery.

As the generator capacity is more than enough to supply the average energy requirement of the locomotive over an eight-hour shift, it will not have to be run all the time. This is especially advantageous in connection with work in the lower west side. At places where switching locomotives have to go inside of buildings the locomotive can be operated from the battery alone.

It should be noted that the engine is run at constant speed under the control of the governor, and this permits the maximum fuel economy to be obtained.

The storage battery consists of 218 cells, the maximum number so far used for locomotive service. This number is made possible by grounding the mid-point.

As the locomotive will be called on at times to operate over tracks which are electrified, third-rail shoes are provided and also an overhead collector. This permits the engine and battery to be disconnected from the traction motors when running in electrified districts. As the west side electrification is extended this feature will become more and more important. The third-rail shoes are of the folding type to permit operation in city streets.

The mechanical portion was built and the locomotive equipped by the American Locomotive Company at its Schenectady plant. The storage battery was supplied by the Electric Storage Battery Company and all other electrical equipment by the General Electric Company. The oil engine was furnished by the Ingersoll-Rand Company.

The locomotive was designed by the New York Central Railroad's electrical engineering department working with the General Electric Company, the Electric Storage Battery Company and the Ingersoll-Rand Company.

Locomotive is Swivel Truck Type

The locomotive is of the swivel truck type. The cab has three sections, the batteries being carried in the end sections and the oil engine in the central section.

Digitized by Google

The running gear consists of two four-wheel swivel equalized trucks. The truck frames are of the Commonwealth cast steel type with transoms and pedestals cast integral. These are carried on semi-elliptic springs to the equalizers which in turn are carried on the journal boxes through quiver springs. The transom is a hollow box casting which serves as a duct for the motor ventilation. Truck center plates are carried on the transom and the air for ventilation is conducted through the center of these plates into the transom and from there distributed to the two motors carried on the truck. Wheels are solid rolled steel with 44-in. diameter. The axle diameters are 8 in. at the motor bearings, and 9 in. at the gear fit, with 8x14-in. collarless journals.

The cab platform is a Commonwealth steel casting. The cab itself is of structural material riveted to the platform. The storage batteries are arranged in three tiers convenient of access from the outside. The central section of the cab has in addition to the power plant and the control apparatus, two small operating compartments for the enginemen. Good vision along the track is obtained from the engineer's seat as the battery section does not project sufficiently to interfere.

Doors give access to each operating compartment from the outside and to the power plant compartment from the operating compartments. There is a hatch in the roof of the central compartment directly above the oil engine to permit its removal.

Electrical Equipment Designed for Both Internal and External Power

The locomotive is equipped with four GE-286, 600-volt d.c. single-geared commutating pole traction motors. Each motor is geared to the driving axle through a 72-tooth gear and seventeen-tooth pinion. These motors and the gear ratio are the same as used on the New York Central Class Q electric switching locomotives. The continuous rating of the motor is 330 hp. at 600 volts and the one hour rating 415 hp. at 600 volts. At this rating of the motors the locomotive will develop a tractive effort of 34,000 lb. It will develop a tractive effort of 60,000 lb. with 900 amperes per motor. The operating characteristics of the locomotive and the tractive efforts available at various speed are shown in the accompanying group of curves.

WEIGHTS, DIMENSIONS AND BATTERY CHARACTERISTICS OF THE LOCOMOTIVE

Weights

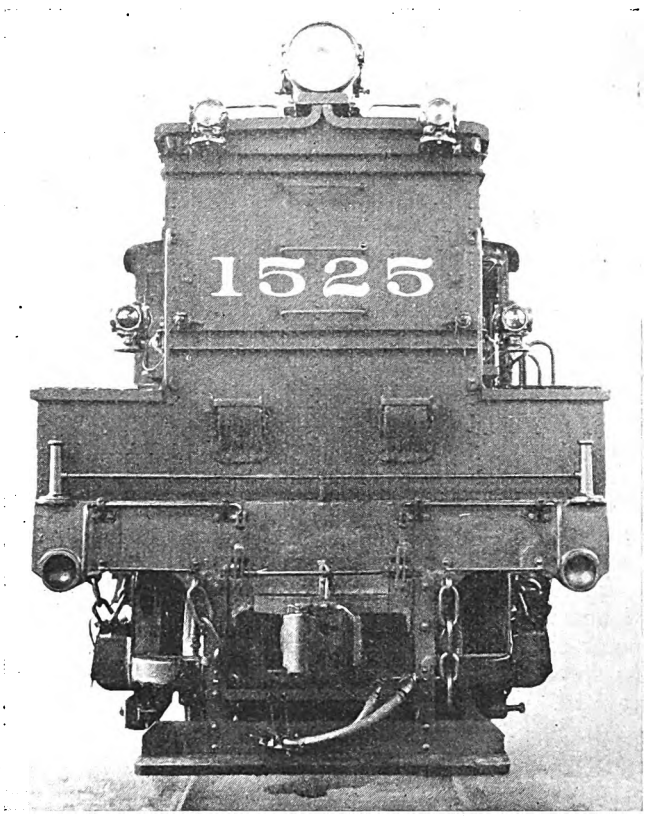
Locomotive complete	257,000 lb.
Mechanical equipment	110,000 lb.
Battery	34,300 lb.
Motors	36,400 lb.
Engine and generator	28,800 lb.
Radiators and fans	2,700 lb.
Control	18,800 lb.
Air compressor and brakes	4,800 lb.
Miscellaneous	21,200 lb.

Dimensions

Length over coupler pulling faces	46 ft. 8 in.
Wheelbase	34 ft. 1 in.
Rigid wheelbase	8 ft. 3 in.
Height	14 ft. 8 in.
Width	10 ft. 2 in.
Tractive effort one-hour rating of motors	34,000 lb.
Speed at one-hour rating	18 m.p.h. on external power 8 m.p.h. on internal power
Maximum speed	40 m.p.h.

Battery Characteristics

Ampere-hour capacity at six-hour rate	680
Average volts at six-hour rate	432
Kilowatt-hour capacity at six-hour rate	294
Maximum discharge rate in amperes	3,000
Maximum kilowatt discharge rate	180
Approximate weight of battery, pounds	34,300



The battery sections are narrow enough to permit an unobstructed view by the engineer

Two motor blower sets furnish air for ventilation of the traction motors. Air for the air brakes is supplied by one CP-26-C4 compressor having a displacement of 120 cu.ft. of air per minute when running at 600 volts.

The control is type PCL, non-automatic with individual electro-pneumatic contactors. It is arranged for operation from either end of the locomotive. It is also arranged to permit the following methods of operation:

1. Internal power: (a) From storage battery alone. (b) from storage battery and engine-generator together.
2. External power: (a) From third rail. (b) From overhead.

The control is arranged to connect the traction motors automatically to internal power should the external power fail at any time (which may be due to running off the end of the third rail) and to restore the connection automatically to external power when the controller is shut off after external power is again available. Indicating lights show whether operation is from internal or external power.

Resistance steps are used for accelerating the locomotive both with internal and external power. The controller steps and motor groupings are as follows:

Ten resistance steps, motors connected four in series.

One running position, motors connected four in series.

Six resistance steps, motors connected two in parallel. Two such groups in series.

One running position, motors connected two in parallel. Two such groups in series.

Seven resistance steps, motors connected four in parallel.

One running position, motors connected four in parallel.

The locomotive is protected against short circuits by a type JR high-speed circuit breaker. The individual mo-

Digitized by Google

tors are protected against overloads by overload relays which trip out the high-speed circuit breaker.

Storage Battery Has 680 Amp.-Hr. Capacity

The storage battery consists of 218 cells of MVA-41 Exide-ironclad battery. The ampere-hour capacity of the battery is 680 and the kilowatt-hour capacity 294 at the six-hour rate of discharge. All cells are connected in series for connection to the generator and traction motors but the mid-point is grounded to reduce the maximum potential to ground.

The control, lights, etc., are connected between each terminal of the battery and ground and arranged to equalize so far as possible any unbalanced loads on the two halves of the battery. The control is always connected to the battery even when running on third rail.

The locomotive has a complete metering equipment to assist in studying its utility for service and determining what, if any, modifications should be made in the equipment for future locomotives of this type. Ammeters and voltmeters at each operating position indicate the current of one traction motor and the voltage on the traction motor circuits. A speed recorder indicates and records the speed in miles per hour and registers the total miles traveled.

An ampere-hour meter indicates the state of charge of the battery. The zero point of the scale indicates full charge and the pointer moves forward or backward to indicate the ampere hours drawn from or supplied to the battery. An integrating ampere-hour meter connected in the battery circuit has two sets of dials, one of which indicates the total ampere-hours of discharge and the other the total ampere-hours of charge. One integrating watt-hour meter indicates the total energy passing through the traction motor circuits while another indicates the total energy delivered from the engine-generator set.

Oil Engine Is Constant-Speed Type; Has Direct Fuel Injection

A 300-hp. oil engine direct connected to a generator is provided for charging the battery. The generator is built with a drooping characteristic to match the voltage characteristics of the battery and to furnish power to the traction motors in parallel with the battery under various conditions without overloading the engine, or overcharging the battery. The engine generator set is started by running the generator as a motor from the battery.

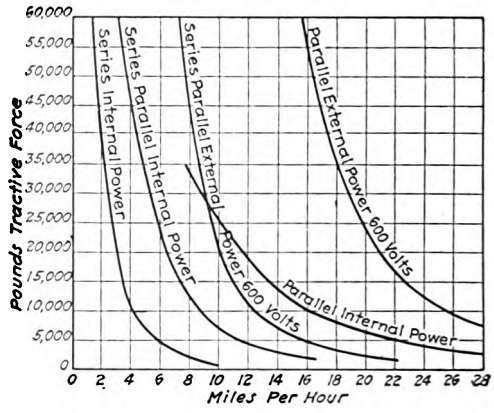
The engine is of the vertical, six-cylinder, four-cycle, single-acting, constant-speed type having direct fuel oil injection. The cylinders have 10 in. diameter and 12-in. stroke. Cylinders, cylinder heads, and combustion chambers are completely water jacketed.

Fuel oil is injected by two opposed spray nozzles in each combustion chamber, to which oil is delivered under pressure by an injection pump driven from the main shaft. No compressed air is used for fuel injection. Ignition is produced by the heat of compression only. One fuel injection pump serves all cylinders. The fuel oil distribution is obtained by a distributor timed to admit oil to the spray nozzles of each cylinder in their proper firing order. The storage tanks have a capacity of 200 gal. of fuel oil and are sufficient to operate the engine at full load for about ten hours.

The lubricating system is entirely enclosed and of the forced feed type. Lubricating oil is pumped to the moving parts of the engine by a gear-driven pump in the crankcase. Oil in contact with the cylinder walls is passed through a filter and returned to the crank case oil reservoir.

A closed cooling water system is used on the engine. The water is circulated by a centrifugal pump driven from the crankshaft. Radiators for cooling the engine circulating water are on the roof. These radiators are made in two sections, each ventilated by a motor-driven fan.

The engine is the same type as that used on a large number of oil-electric locomotives, with the exception that on this locomotive it is run at constant speed under the control of the governor.



Tractive efforts at various speeds, operating from internal or external power

The accompanying table gives the approximate weights and dimensions of the completed locomotive.

Combating the Would-Be Good Samaritan

NEARLY every electric railway company is losing considerable revenue because automobile owners insist on picking up not only their friends for short trips, but also total strangers who could just as well ride to their destinations on a near-by car line. The loss of this patronage, in the aggregate, is a considerable amount. One of the companies which has attempted to combat this evil is that at Little Rock, Ark., and the means followed by the Arkansas Power & Light Company have an interest for others who are trying to reduce losses of this character.

One method used is to carry occasionally in its advertising space in the daily papers accounts of injuries or losses suffered by automobile owners who followed this practice. Such an advertisement the early part of this year cited the case of a St. Louis professor who was atttacked by two young men he had picked up and carried in his car, as well as of a suit brought in a local court against the automobile owner by such a free passenger for $500 damages for an alleged sprained wrist he claimed to have sustained while riding in the Good Samaritan's automobile. Still another case was mentioned where a local man had to pay $5,000 damages to an automobile guest who claimed to have been injured in an accident while taking a social ride in his host's car.

In the advertising which has been carried on this subject the company has made no definite appeal to the public to discontinue the practice on the ground that the street railway is being deprived of just revenue. It is the belief of the company that the public is not particularly interested in this phase of the problem.

Fast Schedules Bring Car Riders

By E. J. McIlraith
Staff Engineer Chicago Surface Lines,
Chicago, Ill.

The author, speaking before the meeting of the Illinois Electric Railway Association this month, showed clearly that fast schedules are within the ability of almost any electric railway, and without expenditures or complications

RARELY is attention paid to schedules and schedule-making. The title of this paper really calls for a discussion of fast schedules, or, in fact, consideration of speed, and not of the job of scheduling. We must assume in the beginning that schedules as written can be maintained on the street. A schedule that is not reasonably observed or that cannot be operated is, of course, undesirable. So we really are considering the advantages of fast operation or of quick transportation.

What is fast operation of street cars? Nearly all citizens today are automobile drivers. Those few who do not own automobiles or drive them, ride in them often enough so that practically everyone thinks in terms of automobile speeds, and it is speeds of the open road they remember. The word speed always seems to mean something over the legal speed limit. It is from 35 m.p.h. up, that represents the popular idea of speed today, and movement of less than 20 m.p.h. is a drag.

STREET cars need not apologize for being on the street, and operators should develop a recognition that each street car is as important as from 40 to 60 individual automobiles. Trainmen should be encouraged to operate safely at higher speeds. . . . Trainmen should be ready to avoid accidents but should not let automobiles assume superior rights.

Comparative Car and Auto Speeds

People are not accustomed to thinking of trips about town being made at an average speed of 15 m.p.h. from start to final stop, but if you ask a driver how fast he makes a given trip in town his likely answer would be "about 25 m.p.h." The average top speed while moving is what stands out in a driver's mind. So it sounds rather a contrast to mention average speed of a street car which in most systems would be an average of about 10 m.p.h. from terminal to terminal. The Chicago Surface Lines feels it has reason to be proud of its average speed between terminals, including time used at all intermediate stops, which is 11.2 m.p.h., and is higher than the speed of any other city system of which we know.

While such speeds sound low to the average citizen, who thinks in terms of his running speed not including slow-downs or stops, it is really unusual in driving in large cities for automobiles to average more than 15 m.p.h. between origin and destination. As congestion grows automobile speeds suffer seriously. Not much further increase for the street car can be expected. A vehicle making seven stops per mile, each of seven seconds' duration, cannot average as much as 15 m.p.h. even if on a private right-of-way. No matter how large motors are used the limitations of starting and stopping keep the average speed below 15 m.p.h. Of course with smaller motors a lower speed results. Increasing the number of stops per mile has an enormous influence, and increasing the length of stop is also a serious source of delay. The sense of greater speed is given to the passengers because between stops the street car may run as fast as 30 or 35 m.p.h.

Operation as fast as possible is an absolute necessity to get business in these days of impatience and of speeding automobiles. Saving in time without recklessness is the thing we must drive at. The customers must be rushed through the trip without being made conscious of any danger, but rather with a feeling of comfort and security. The street railway must establish in the minds of the people it wishes to serve the opinion that its service is regular and dependable and moves with the best possible speed and evident efficiency.

The train crew, whether one-man or two-man, must give the impression of prompt, efficient, alert attention to the job of moving the car safely and speedily over the street. This does not mean giving the passenger a sense of impatience and haste. The careful, efficient trainman who makes it most convenient for passengers to get on or off, who accelerates his car as rapidly as possible but smoothly, who brings the car to rest rapidly but skillfully, inspires confidence, and the passenger can be at the door ready to get off the moment the door opens instead of remaining clinging to something for safety.

It is not reckless haste that develops maximum speed, but competent, careful attention on the ways of eliminating waste of fractions of a second. Cars need not accelerate or brake at rates uncomfortable to passengers.

The big loss at present in braking efficiency is due to the slowness of getting braking under way. Many cars require two seconds for the braking pressure to build up in the cylinders and the brakes to get in contact with the wheels. In two seconds a car at 25 m.p.h. will move 75 feet.

Automobile brakes begin to function almost instantly, and no distance is lost between the time a man decides to brake and the time brakes are applied. Then, since automobile passengers are seated, the rate of braking can be more rapid than could be tolerated in a street car.

Digitized by Google

Further, the friction between rubber tires and pavement is better than the friction between the steel wheels and steel rails.

Improvement in braking will not come from increasing the rate of braking, but must come from reducing the wastage of time in getting the brakes applied. The present braking mechanism is not well suited to modern car operation.

The acceleration of cars can probably best be speeded up by automatic control. Of course, this is expensive, adds to maintenance costs and increases the chance of trouble. Thorough training of motormen will serve the same purpose. Motors of sufficient size are needed, but even with the best equipment the speed of a car will not be satisfactory unless the crew is alert, active and competent in saving moments of needless delay.

Few managements are today pressing the trainmen and the supervisory force to get this actual speed-up of the lines. The usual city crew gives the impression of leisure and indifference. There has been altogether too little attention paid to getting higher speed because most managements have accepted the idea that accident prevention demands slow speed and timidity. In many cities the motormen are actually afraid to move with certainty and as if they had a right to use the street. They are taught to hold back until all other traffic has gotten out of the way. Street cars need not apologize for being on the street, and operators should develop a recognition that each street car is as important as from 40 to 60 individual automobiles. Trainmen should be encouraged to operate safely at higher speeds. True accident prevention should build better operating principles into the minds of the trainmen, but not at the sacrifice of all their rights to move. Trainmen should be ready to avoid accidents, but should not let the automobiles assume superior rights. Analysis of accident causes does not show that fast operation properly handled creates accidents.

USUALLY remarkably good improvement in speed may be obtained with no other change than training of the entire organization from the manager down so as to have each one working actively to discover ways and means of eliminating waste of time and carelessness.

The training of the motorman and of the conductor, and the use of care to get them working in sympathy with a sound, well-planned viewpoint is a major portion of the problem of obtaining higher speed and lower accident costs.

If in the city that has the most intense use of streets, an average of 11.2 m.p.h. can be maintained for street cars, then in the smaller cities higher average speed should be possible because of relief from traffic interference and because of a smaller number of stops per mile. When speed is increased either the same number of cars will give a closer headway, or a smaller number of cars will maintain the same headway.

Increasing the speed by reducing wastes of time will certainly produce more business. It is the increased speed without the sacrifice of personal comfort for the passenger that is largely responsible for the growing business of the Chicago Surface Lines. In most large cities the street railway business is not growing. Perhaps a major part of the reason is because too little attention is given to increasing the rate of speed. Some cities are using more and more trains with longer headways. Perhaps the slower operation of trains and the longer headway has something to do with the decrease in the number of passengers obtained.

Many little things can become serious in producing low speed of operation. Here are a few that are within the control of the company without cost for changes in equipment:

Motorman accelerates slowly or brakes slowly.
Motorman stops car in the wrong place.
Doors opened slowly after the car has come to a complete rest.
Car equipped with interlocked door control.
Motorman coasts too much.
Brakes slack or braking equipment slow to operate.
Stops too close together.
Overhead wiring poorly set and requires slow speed to keep trolley wheel on the wire.
Car crew permitted to buy lunch, to stop for drink of water, to get transfers or change, or to visit carhouse at other points than terminals.
Track special work including curves in such condition as to require slow operation.
Switches operate hard.
Crew required to operate slowly over special work of all kinds when slow speed should only be necessary past facing switch points.
Low joints or broken rails.
Defective circuit breaker or circuit breaker set for too low current.
Improper setting of traffic lights or careless control by traffic officer.
Lack of safety zones at loading points.
Slow loading at heavy transfer points.

Of course many other small operating factors must be constantly watched, and should be continually improved upon.

A company need not wait to get new equipment, or to widen the doors, or to change the motors, or to make any other major and expensive change in order to improve its operating conditions. Usually remarkably good improvement in speed may be obtained with no other change than training and supervision of the operating force. This means training of the entire organization from the manager down so as to have each one working actively to discover ways and means of eliminating wastes of time and carelessness.

Most visitors to Chicago are looking for some big item that is responsible for the higher speed. They seem disappointed when informed that it is produced merely because of careful attention to the details. This attention to details is a measure of effectiveness of the management. If speed could be purchased by buying something which when installed would produce this speed all properties would probably have it.

All railways can be improved. We cannot ever expect to reach perfection; we can drive towards it, and should approach as nearly to it as can be accomplished with the resources under our control. Financial and political limitations are severe on all properties. Managements are not always able to accomplish what they most earnestly wish, but this does not justify failure to do the best possible with the given circumstances.

We should never be content that we have reached the ultimate limit of accomplishment, but we can often be content that we are making the most sincere effort towards that accomplishment.

The track yards at Paris are equipped with traveling cranes and other modern machinery

European Track Construction

in Paved Streets

Points of resemblance and points of difference as compared with American construction are given. Extensive use is made of alloy steels in special track work. Paris methods are given in detail

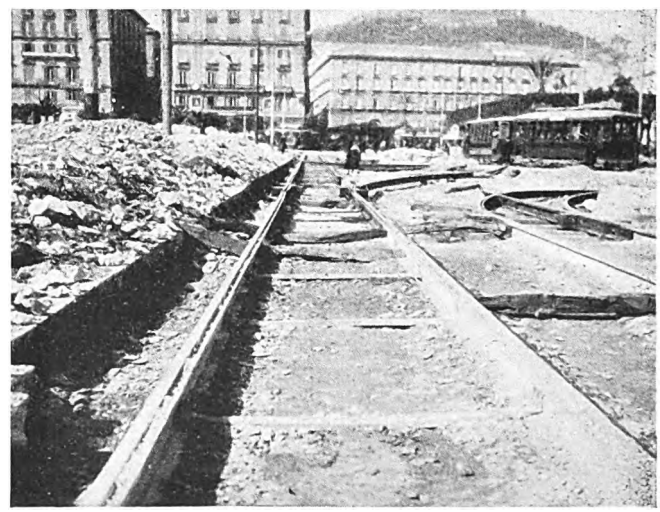
By Henry W. Blake
Senior Editor *Electric Railway Journal*

IN MANY ways European electric railway track construction is similar to that in America. Some track in paved streets is laid on wooden ties, and some is laid on metal ties or chairs embedded in concrete. The single-web girder rail, in distinction to the duplex rail with two webs, is now standard in Europe as in America. In straight track the usual rail length is 18 m., practically the same length as our 60-ft. rail. Rails as long as 24 m. (79 ft.) have been laid, but their use has not been continued owing to the inconvenience of handling them on the streets.

The three standard rail heights recommended at the International Electric Railway Convention in Paris in 1924 were 7.1, 6.3, and 5.7 in. (180, 160 and 145 mm.). These rails are illustrated on page 536, but have not yet been formally adopted by the Association. As will be noted, the width of the base equals the height in each case.

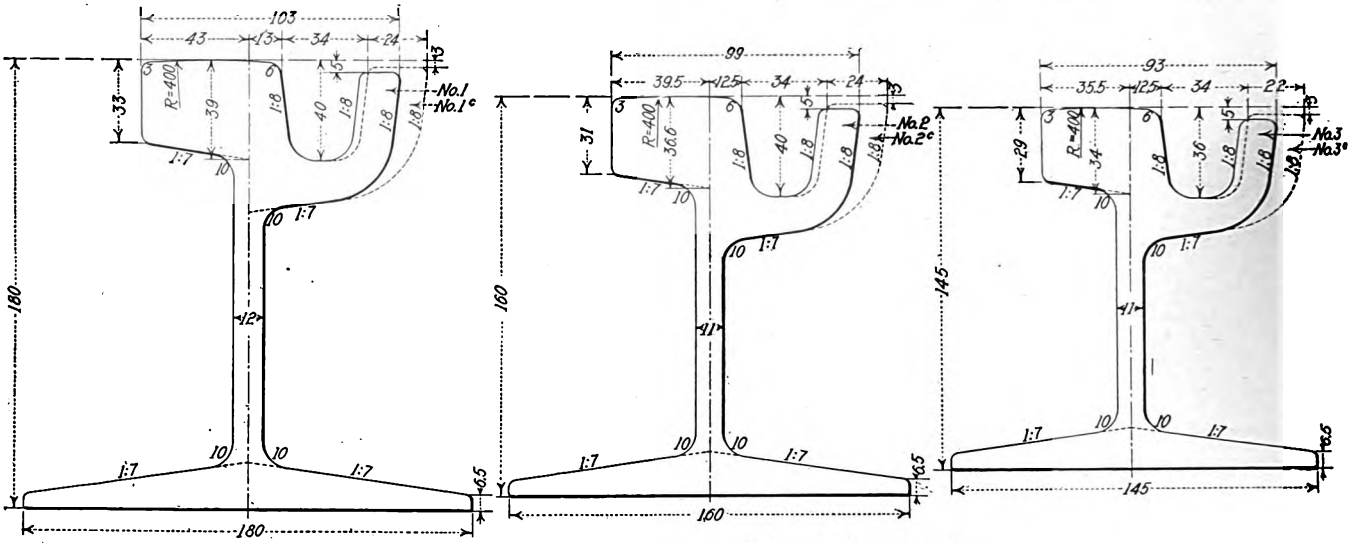
Manganese steel rail is generally used in special track work, although a number of the companies are experimenting with other alloy steels, such as chrome steel and nickel steel. Electrically operated track switches are used extensively.

The gage situation in Europe is practically the same as in the United States, though perhaps there is rather a larger proportion of narrow gage track. The two gages most generally used are 1,435 to 1,445 mm., which are practically the same as our 4 ft. 8½ in. standard gage, or a 1 meter (39½ in.). The latest tabulation available on gage is a report presented at the 1926 convention of



Track construction in downtown Naples. The timbers shown are simply to protect the fresh concrete and will be taken away after that has set

Digitized by Google



Sections of standard rails recommended at Paris convention

the International Street Railway Association. It showed that of 31 companies, mostly city lines, replying to a questionnaire, sixteen had standard gage, twelve a meter gage and three odd gages. A more extensive statement was given in a report at the 1910 convention of the same association. Although this report is now some eighteen years old, gages naturally are not changed often, so that it may be assumed that practically the same condition prevails today. At that meeting, 105 railway companies, mostly street railways, reported on gage as follows:

TABLE I—TRACK GAGES USED BY 103 EUROPEAN STREET RAILWAYS

Number of Roads	Gage of Track MM.	Gage of Track In.	Number of Roads	Gage of Track MM.	Gage of Track In.
1	891	35.0	31	1,435	56.5
1	915	36.0	7	1,440	56.7
48	1,000	39.4	4	1,445	56.9
1	1,050	41.3	1	1,450	57.1
3	1,100	43.3	1	1,453	57.2
1	1,345	53.0	2	1,458	57.4
1	1,416	55.7	2	1,524	60.0
1	1,430	56.3			

The two lines using the 1,524 mm. gage (5 ft.) were those in Moscow and St. Petersburg (now Leningrad).

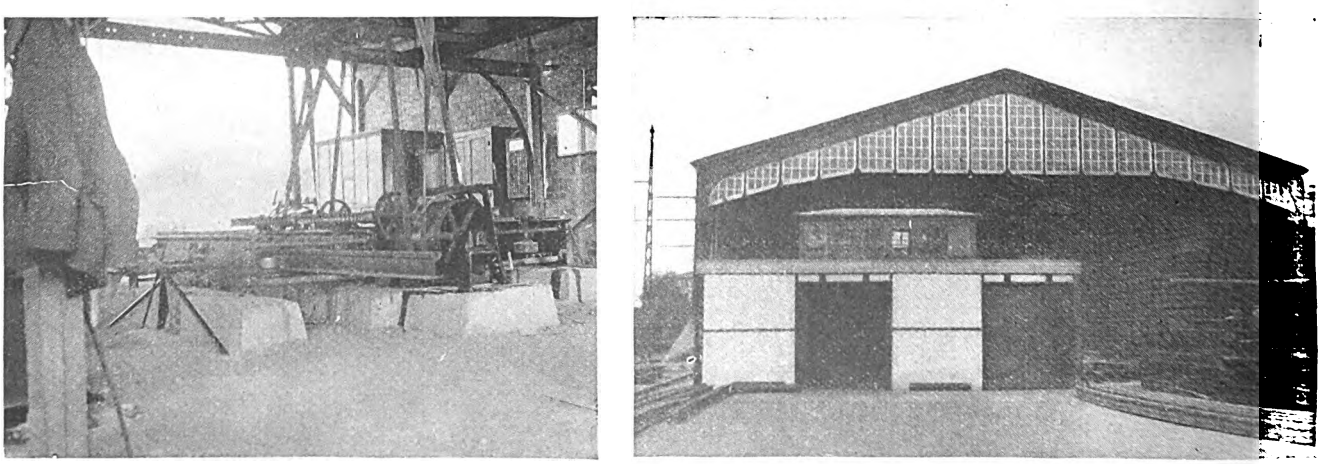
Points of Difference Almost as Many

Having considered the points of resemblance between European and American electric railway track construction let us consider the points of difference. They are almost as many as the points of resemblance just referred to.

In the first place, the track construction in paved streets in the larger cities in Europe, at least in those visited by the writer during a recent trip, seemed on the whole to be more substantially built than that usual on similar properties in this country. This was especially noticeable in view of the much smaller and lighter cars operated.

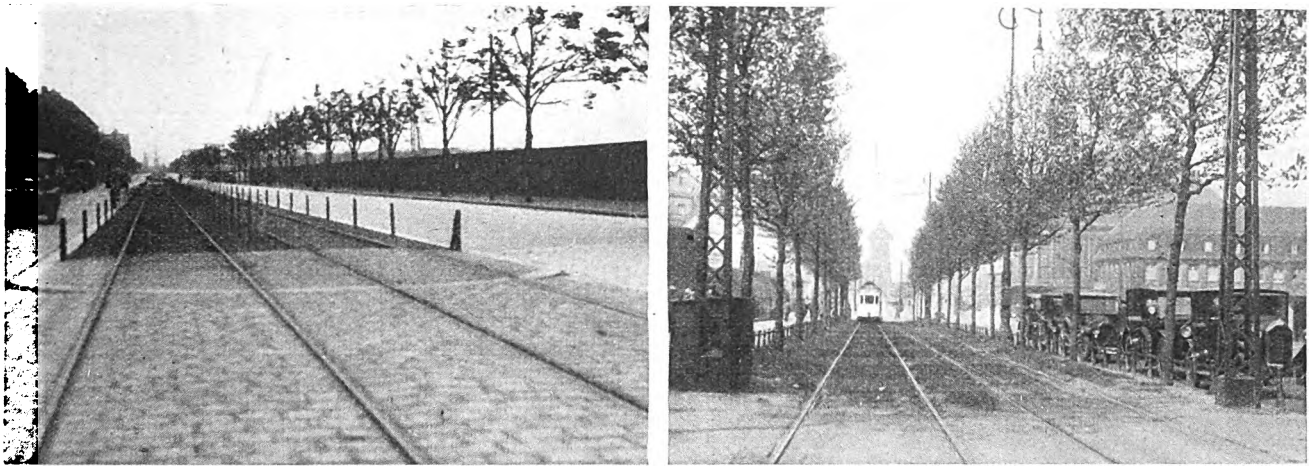
Where wood ties are used, there is a tendency to employ the most durable kind. Oak is not uncommon, and wooden ties, when installed, are usually treated with a preservative. Some track is laid on steel ties and some on chairs embedded in concrete, with the rails kept to gage by tie rods. In the newer sections the installation of tracks on reservations in the center of the street is not uncommon. There is considerable construction of this kind in Berlin and Paris.

Thermit joints are used more extensively in straight track than is electric welding. Of the 36 companies that replied to a questionnaire on the subject of rail joints at the 1924 convention of the International Street Railway Association all but one were using thermit, although it was not standard on all of those so reporting. Bolted joints are also used quite extensively.



Rail-bending machines form part of the usual equipment of a track yard in Europe. The view at the left shows the rail bender at the Paris yards—The right-hand view shows the shelter housing the rail bender in the track yards of the Hamburg Street Railway. This shelter is directly in front of the company's large track storage house

Digitized by Google

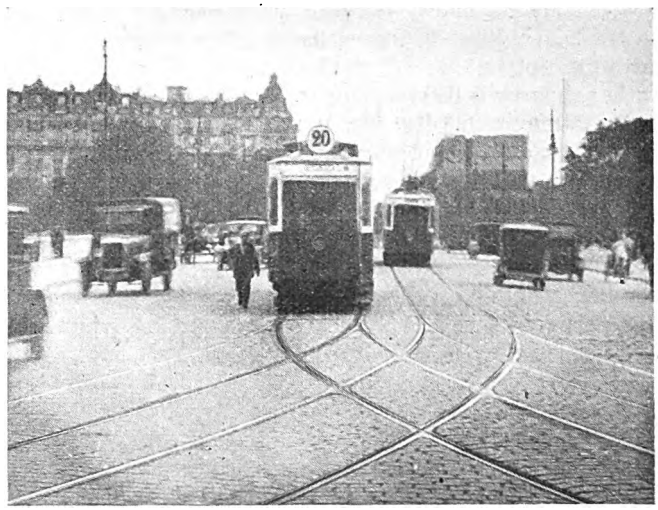


Track is often laid on reservations. The view at the left is from Berlin; that at the right from Dortmund

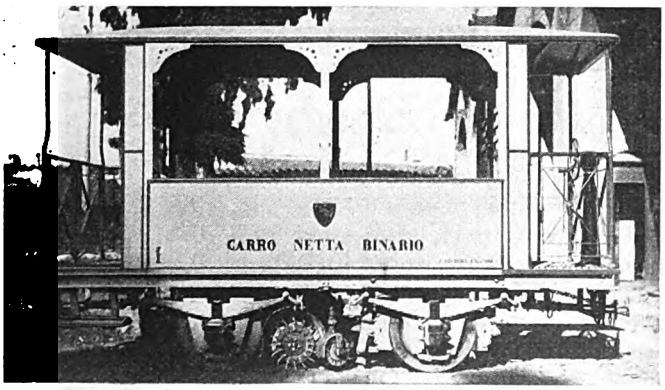
The groove in the rail is narrower than is customary in the United States, as will be seen from the sections reproduced. In fact, the groove in the rail is so narrow that it is not self-cleaning through the action of the car wheels, like most of the American grooved sections. Instead it has to be kept clean by track men who remove the dirt by an especially shaped shovel which they push before them, or by a digger which is carried on a car. Some companies have cars especially equipped for the purpose of keeping the head of the rail clean. Such a car, used on the Rome Municipal Tramways, is illustrated. It not only scrapes the dirt out of the groove in the rail and brushes it aside but it flushes the head of the rail with water from a reservoir carried on the car.

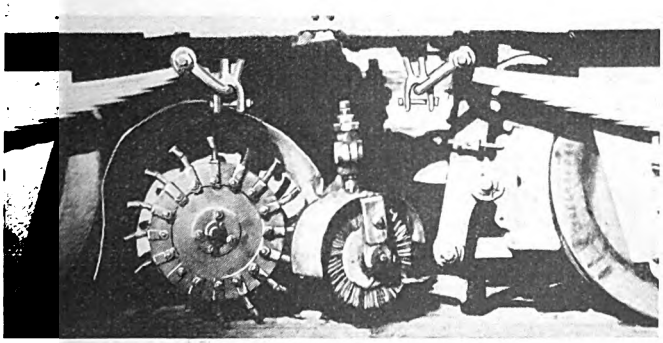
The continued use of a narrow groove on European tramways seems to be largely the fault of the city authorities. When narrow-tired horse-drawn vehicles were used, such a narrow groove may have been necessary to some extent. With automobiles now so general, there seems to be no reason against the use of a flaring groove.

Alloy rail for places of great wear is used more generally than here, as on curves of short radius. More attention is given to the drainage of track, particularly of the track groove. It is almost universal to use groove

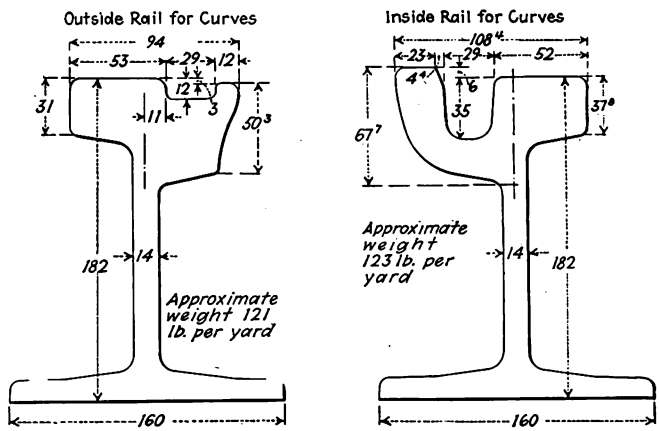


Paris is noted for its excellent special trackwork construction in paved streets





A work car cleans out the track groove and brushes the dirt away on the Rome Municipal Tramways. It also flushes the track. The upper view shows the complete car, the lower view shows the digging tool and rotary brush on a large scale

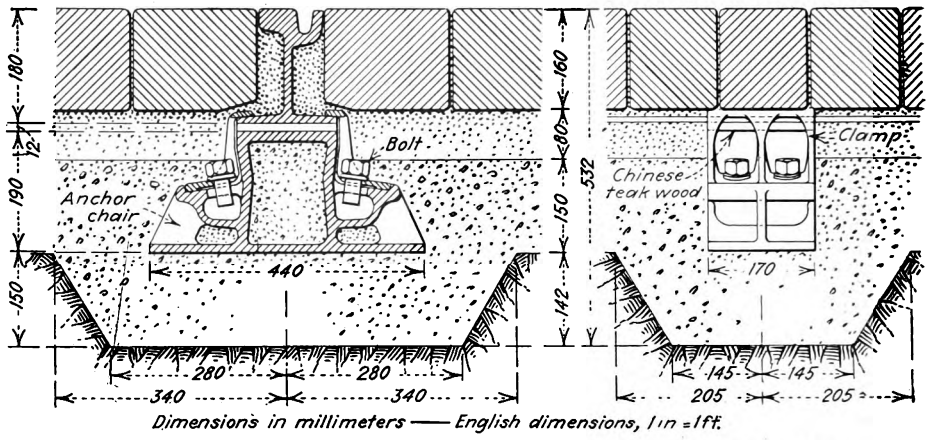


The outside rails on Paris curves up to 90 ft. radius use a shallow groove

Digitized by Google

drainage. The maintenance of track as a whole is better in Europe than in America. This is a noticeable factor in reducing the noise of car operation.

At least as much attention is given in Europe to the use of track machinery in the construction and rehabilitation of track. Thus, a great many of the larger electric railway companies have power rail-bending machines, which are built in a variety of patterns in Germany and England. With the English bending machine used in Rome, two men can bend a rail in fifteen minutes. Rails can be bent on this machine to a radius of 40½ ft. The use of rail machinery is not always extended, however, to track grinding. Corrugation is often removed by the reciprocating action of a block operated by two men rather than by a rotary grinder.



Section of standard track construction in Paris. The rails are held in chairs embedded in concrete

An attempt to give details of the varieties of street railway track in Europe would require as much space as a similar article on track construction in this country. Instead an account will be given of the methods of track construction on the Paris overhead trolley lines. Within the center of the city these lines use the underground conduit system with the rails on yokes. The accompanying particulars relate to the construction on which the overhead trolley is employed.

Track Construction in Paris

The standard rail of the Paris surface lines is 7.1 in. (180 mm.) high, weighs 104 lb. to the yard (52 kg. to the meter) and rests on cast iron chairs embedded in concrete. These chairs weigh 54½ lb. (24.8 kg.) each and are spaced 51.2 in. (1.3 m.) apart except at the joints where they are closer together. Between the base of the rail and the top of the chair is a flat piece of Chinese teakwood ½ in. (12 mm.) thick, to give resiliency to the track. The chair has a base $17\frac{3}{16}$ in. wide, or at right angles to the rail and $6\frac{9}{16}$ in. in the direction of the rail. Its shape is such that it is held firmly into the concrete to which it transmits its load. It holds the rail by two clamps with lock nuts on each side. No ties are used, but tie rods are installed midway between the chairs, or every 51.2 in. (1.3 m.) apart. Special trackwork is supported on chairs like straight track. These chairs are of the same height and similar in design to those used elsewhere but of a special shape to fit the base of the switch, mate or other part supported.

Manganese rail is used for the inside rail of all curves of less than 93 ft. (30 m.) radius. It is purchased in lengths of 5 m., 7 m., or 10 m. and is bent to shape in the company's track yards. A feature of curve construction in Paris is the use of a shallow groove for the outside rail of sharp radius curves. Its purpose is to allow the outside wheels of all cars to run on their flanges while passing around the curve so as to reduce grinding be-

These two views show the method of laying track in Paris. It is first aligned, then mounted on wooden blocks, then the concrete is poured

Digitized by Google

tween the wheel flange and rail groove. Otherwise, the grinding would be considerable as most Paris cars are mounted on four 31½-in. wheels with a wheelbase of 11 ft. 10 in. This long wheelbase was adopted to reduce car nosing.

Besides its use of curves, manganese rail is standard for practically all crossings, switches and other special trackwork, and the throats of all such frogs are flange bearing. This practice undoubtedly has contributed greatly to noise reduction.

Other alloy steels, such as chrome steel and nickel steel, are also being tested for this purpose. The experience at the time of the visit of the writer to the property last summer was that manganese steel was more satisfactory, except that the other alloy rails had the advantage that thermit welds could be made to them more easily.

It will be noticed from all the Paris rail sections published that the head of the rail is absolutely flat. The treads of the wheels are also flat so that they have a bearing surface over the entire head of the rail. This design was adopted partly for the purpose of reducing rail corrugation and partly to reduce car nosing, which is thought to be greater where coned wheels are used.

Several photo engravings accompanying this article show the method of building track in Paris. It is not constructed from the bottom up but from the top down. After the trench has been dug, the track is laid in place with the chairs and tie rods attached. The track is then aligned and raised to position on wooden blocks. The final operation is to pour the concrete and then to lay the paving.

The cost of this construction without crossings or other special trackwork is approximately 300,000 fr. per kilometer ($19,200 per mile) of single track.

Novel Color Advertising Featured

MUCH of the advertising literature of the Pittsburgh Railways, Pittsburgh, Pa., is unusual, particularly with respect to the use of color and also the advantages derived from seasonal subjects. The text matter of one campaign was confined mainly to accident prevention, the weekly pass sale and a series of sixteen traffic talks as issued by the Better Traffic Committee. The first talk, which was released coincident with the opening of the public schools, warned Pittsburgh citizens of the no-parking rules, at the same time reminding them of the city's narrow streets and that there are about 120,000 automobiles in the community, with parking space for only about 5,000 cars. This talk was followed by a humorously illustrated reminder of how business is retarded by too much parking. Some of the other talks, which were issued weekly, are reproduced on this page.

The colored autumn leaf poster used in previous years was also presented, with an element of timeliness by calling attention to an accident on Sept. 8 which resulted from the street and track having become dangerous due to their leafy coating. Another effective use of multi-

IT'S THE CAREFUL DRIVER WHO IS WRECK-LESS

Some examples of publicity with which the Pittsburgh Railways is striving to put across the message of safety and service

Digitized by Google

color may be seen in the accompanying illustration where a comical bird is employed to put across the economy resulting from the use of the weekly pass. Perhaps the most interesting of the color ads is one which is a reproduction of the old-time school slate, which not only

Types of posters in color used by the Pittsburgh Railways

stresses the Sunday pass selling argument but maintains humor and brings back memories to the older residents of the city.

A very effective poster in black and white gives a list of the number of accidents per carhouse in terms of car-miles operated, settlement and verdict, cost per hundred car-miles and accidents per 10,000 miles operated. The poster shows an auto caught by a street car and a telegraph pole on a dangerous curve. Referring again to the use of color, there was an interesting poster done in orange and red illustrated by a grotesque figure in black standing before a microphone. This was used to put over the radio show held at Duquesne Garden from Oct. 3 to 8. Another very effective poster showed a green cab and car drawn up side by side, the motorman and chauffeur grinning at each other. Underneath the text is as follows:

To Our Friends—the Motormen and Conductors: The traffic problem is our mutual one. The public safety on our streets and avenues is of constant and immediate concern to us all. By co-operation much can be done to solve this vital and important question. Green Cab is ready and willing to consider any way to help. We want to know how Green Cab men and the railway's men can work together for the public welfare. Suggestions from motormen and conductors on this matter will be welcomed by us.

This poster is signed, "Green Cab," below which is the slogan, "Let's all help the taxicab boys."

Although concerned with the distribution of larger posters, the Pittsburgh Railways has not neglected the little window pasters, some of which put over various problems in a few words; for instance:

Our present streets should be used for moving vehicles only. The parked car congests.

School opens this week. Please be careful of kiddies in the streets.

If every one would obey signals streets will be safer and all of us happier.

In addition to these forms of advertising the company still continues its policy of exhaustive publicity through the medium of the *Transit Guest,* the make-up of which is familiar to most of the readers of ELECTRIC RAILWAY JOURNAL.

Use of Maps Improves Service

STREET railway and interurban lines can add to their service to the public and increase the number of car riders, by a display of system maps in all cars and in terminals, according to an article in the Public Utilities Advertising Association *Bulletin* for February. Nearly all cities carry a transient population daily and house a portion of inhabitants who are familiar with not more than a fraction of the routes of their railway system. A better knowledge of the entire system, localities reached, points of general interest and educational institutions easy of access by trolley will increase car riders.

Wide adoption of one-man car operation has made it less convenient and desirable to interrupt the car operator. A complete map attached to the car window for ready reference will help patrons to answer many of their own questions by referring to the map. Such maps naturally should be designed to display street names clearly, designate car routes by number and bring out interesting points, of a nature to attract the public, in a graphic manner.

The use of car window maps is not altogether new. The Hudson Tunnel trains, joining New York City and New Jersey, carried maps for many years, attached to the center door of each car. Today each of the thousands of cars in the New York subways carries a map of the entire system. They have proved of widespread reference use.

In addition to car window maps, some companies distribute system maps in folded form and spread them widely in the thought that familiarity with the system is the first step in attracting traffic.

Manufacture Transportation That Will Sell

By E. G. Buckland
Vice-President and General Counsel
New York, New Haven & Hartford Railroad

Nations rise and fall as their transportation is good or bad. The only thing to do is to produce transportation of a kind that the people will buy at a price that will pay, said the author, speaking before the New England Street Railway Club at its Springfield meeting March 22

MANUFACTURING of transportation is no different than manufacturing of any other commodity necessary to the prosperity of a community. It may be that transportation is in a measure more essential to the prosperity of a community than any other one article which industry may make in that community. But the economics which govern it are identical. In the case of a street railway, it is the manufacture of passenger-miles that will sell. You cannot manufacture any commodity economically with obsolete, worn-out, extravagant machinery. Therefore, the only thing to do, where you find that more power is being used in moving a car than should be used, is to look to the bonding of your tracks, to look to the character of the construction of your tracks, to look to the weight of your cars, to see that your transmission lines are right, to see that your generating station is right. That is common sense, applied to any other industry, and it is common sense when applied to railroading.

Now, the New Haven Railroad happened to be very largely interested in street railways. And the job which was up to us to work out was to see if we could produce a kind of transportation that people would buy at a price at which we could sell it. There was nothing more complicated than that. There is, however, one thing which enters into that question of transportation which perhaps does not occur to the layman, but certainly is in the minds of most of you as representatives of street railways. And that is, the kind of transportation that people will buy.

Four Principal Means of Transportation

I think we can say without fear of successful contradiction, that of the four principal kinds of transportation, that by water has its place as perhaps the cheapest kind of transportation to perform. The cheapest method of transporting masses of property overland is by the standard steam railroad. Now we have motor trucks and we have all sorts of other kinds of vehicles operating on the highways. All told they do not carry 5 per cent of the traffic. I wish sometimes that they would be required to carry the same degree of low-class traffic that we have to, but they apparently can pick and choose, and therefore take only the best. But in the matter of tonnage they do not carry more than 5 per cent of the traffic. I think, therefore, we can say safely that water transportation between ports is the cheapest, but that overland transportation by rail is most economical and will prevail.

What is the place of the street railway? At the inception of our negotiations with the cities of Worcester and Springfield, Mayor O'Hara and Mayor Parker were good enough to appoint in each of their cities experts to study, along with our representatives, the characteristics of the street railway transportation carried on in these two communities. And it is curious how closely together those reports were in their recommendations. And it is also interesting that the reports were unanimous in both cities and in both places. They came to the conclusion that in cities of the character and size of Springfield and of Worcester, where large numbers of people had to be handled in peak hours in the densely traveled portions of the cities, there was no other means of transportation so economical of space and so satisfactory, as to speed and facility, as the street railway. When we come to operation between cities we get into a twilight zone. As the density of the traffic decreases the profitable or economic character of the street railway car likewise decreases. When, added to that, by reason of the magnificent highways which the state of Massachusetts has constructed, a means of speedy communication is afforded, we have found that we can do better by substituting passenger motor buses from the perimeter of the densely-settled portions of the community, operating express from the center of the city to that perimeter and locally beyond that.

Now, that is simply a common sense co-ordination of traffic, which we believe will work and which has the advantage, I believe, of giving to people the kind of transportation which they wish to use. And it is difficult to sell to a man a thing which he does not want.

While I am on that subject, the question has been frequently asked: If you agree that the street railway has its place, as you have stated, that the passenger motor bus has its place, that the railroad and the steamboat have their places as stated, why not the motor truck? Why should you stop arbitrarily and not carry property over the highway, just as you do carry passengers over the highway?

The answer is that we are stopped by artificial statutory enactment in the interstate commerce act. Sections 2 and 3 of this act forbid unjust or unreasonable discrimination between persons or places, and the Interstate

Digitized by Google

Commerce Commission has several times decided that a carrier subject to that act has no right to make a different rate in a locality, or to two persons in that locality engaged in the same kind of business. I am measuring my language here pretty carefully. The railroad has no right to make a different rate to one man than to another located in the same community, and doing the same kind of business.

If the railroad were to engage in the motor truck business, it would speedily find itself in this position, of continuing to give free delivery on a siding to an industry which had for a long time been established on that railroad siding, and charging an industry located a mile or so off the railroad for that transportation. And so long as it was engaged in motor trucking, there is nothing that the railroad could do to escape the imputation and the prohibition of unjust and unreasonable prejudice in charging the man located off its line for the motor truck haul.

Now, gentlemen, a few years ago we made an intensive study of the cost of trucking to and from our stations, and yards along our line, and we found that the amount which was paid was equal to the entire revenue which the company received for the carrying of the freight. If we were compelled to absorb motor truck charges we would probably go broke in 60 days. And that is the whole reason why you do not find the degree of willingness on the part of common carriers to engage in motor trucking that you find to engage in the carriage of passengers.

I am tempted at this point, because my subject is a pretty broad one—"The Co-ordination of Transportation in New England"—to say a few words to you who represent the producers of transportation, with respect to the character of the business in which you are engaged. I do not know whether you have ever really realized the importance of transportation in civilization. The great Francis Bacon once wrote this sentence: "There be but three things which make a country great and prosperous; a fertile soil, busy workshops, and easy conveyances for men and things from one place to another."

Whether he wrote Shakespeare or not, he uttered a great truth in that statement. There has never been a nation in the history of civilization that has risen to power that did not carry with it adequate means of transportation. I think we are entitled to accept the origin of transportation in Mesopotamia and in Egypt, which was the caravan route between the Red Sea, the Arabian Sea, and the Mediterranean. It is characteristic that this transportation followed the lines of transportation to Phoenicia, which controlled the Mediterranean. It was the envy of Israelites by reason of the magnificence of its commerce, that had spread to Carthage, which was a Phoenician outlying point, and remained in control of Carthage until Rome, in the three Punic Wars, wrested the control, and of the million population of Carthage only a few thousand were left. It was the outstanding characteristic of the Roman Empire, stretching from Jerusalem to the walls of Antioch, with a great stream of transportation which made it possible for the Roman citizen to go the entire length of the Roman Empire with the products of the Roman territory. Later, Venice came to the fore, when she controlled the transportation of the seas, and traded with Constantinople, Greece, Syria and Egypt. Her prosperity increased and far surpassed that of the first Venice. Until she lost her transportation power the Roman Empire had prospered. Spain succeeded, and if she had been as willing to colonize as she was to conquer might have maintained her prestige today. But she ran against England, who was destined to colonize in conquering, and the Armada destroyed Spain's power because it took from her the means of transportation and gave it to the British Empire, which has maintained it ever since.

Are you interested in the solution of traffic problems?

Then read the

DETROIT TRAFFIC SURVEY

digest, the first section of which will appear in next week's issue.

Here in the United States we have grown up with transportation. The thirteen original states, the real fringe along the Atlantic seaboard, measured the extent to which the sailing ship, and the rowboat, and the ox wagon went, and it so happened that almost at the beginning of these United States of ours occurred the beginning of new methods of transportation. We became a nation in 1787. Within twenty years the steamboat was invented; within twenty more years the steam locomotive was invented; within 25 more years the telegraph was invented; in twenty more years the telephone was invented; all means of conveying persons and property in commerce, and the transmission of intelligence in commerce.

We, here in the United States, have grown hand in hand with the development in our transportation; in the intermingling of people, in the exchange of ideas, in the exchange of property, all of which are essentials to the progress of a nation. If you do not believe it in modern times, just compare two countries, the United States and Russia. They are not very different in area; Russia is somewhat larger. They are not very different in the breadth of latitude which they occupy. We have 262,000 miles of railroad; Russia has 25,000 miles of railroad. Can anyone doubt that if 100 years ago, when Peter the Great was teaching the greatness to which Russia was destined, he had educated his people and built 260,000 miles of railroads, ramifying through that great empire, that Russia today would have a great asset for national prosperity, instead of being a blot upon the nations of the world?

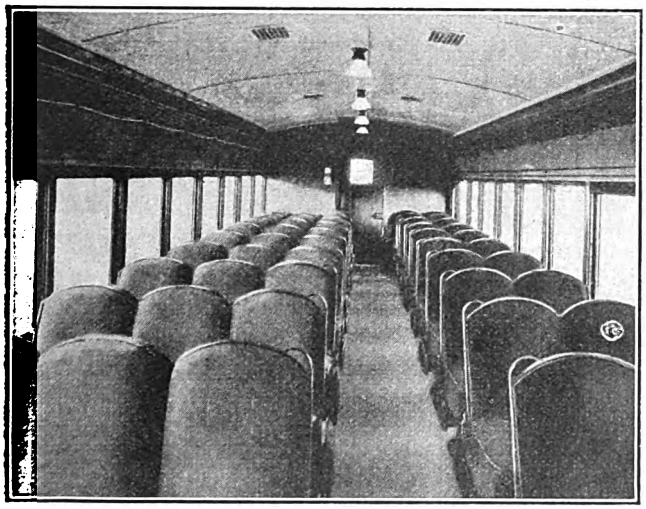
So you who are engaged in this great industry of transportation need never apologize for it. It is one on which I believe the prosperity of the world depends, and I am in good company when I predict that the peace of the world may depend on it; for it was only the day before yesterday when that splendid Lone Eagle, who winged his way alone from New York to Paris, and afterward as the Ambassador of Good Will to the countries about the Caribbean, said that the differences which existed between those countries existed because it took days and weeks to go through the jungles and over the mountains, but that by air that distance could be traversed in two or three or four hours, and these people be brought into contact, each with the other, so that these

Digitized by Google

jungles of doubt and mountains of ignorance might be levelled, and be brought to a common understanding.

It is that which gives us as transportation men the vision which Tennyson gave us so many years ago in Locksley Hall, when he spoke of the time when "the war drum throbb'd no longer, and the battle flags were furl'd in the Parliament of Man, and the Federation of the World."

Winnipeg Company Uses Gas-Electric Car



The interior of the gas-electric car is roomy and comfortable

RAPIDLY increasing traffic on the Winnipeg River Railway due to pulp, wood and mining activity in central Manitoba made necessary recently the installation of a Mack model AS gas-electric car by the Winnipeg Electric Company.

The car is 52 ft. long, 10 ft. wide and over 12 ft. high. It weighs 30 tons and carries 59 passengers. The car is of aluminum construction throughout, contains a parlor car section, smoking compartment, express room and the usual conveniences found on standard main-line trains. It has a rating of 120 hp. From the viewpoints of comfort and utility, the car has proved highly satisfactory. Well-cushioned spring seats absorb all road shocks.

Witness Blank Tells of Bonus

ACCIDENT PREVENTION BONUS

The conductor and motorman of this car are paid a bonus for safe operation, which they lose if involved in a preventable accident.

The management and employees take pride in an exceptional record for safe operation—and solicit your co-operation.

Your name and address on this card will assist the company in giving fair treatment to all concerned.

Name .....

Residence .....

Telephone Number .....

City .....

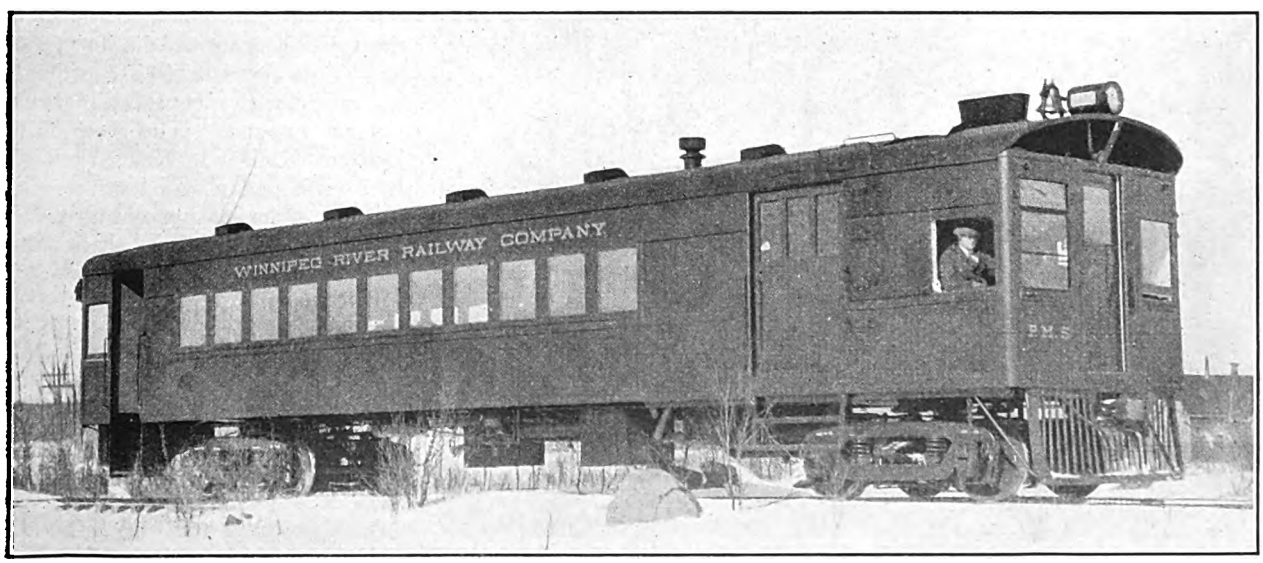
DATE ..... **THANK YOU**

Brooklyn witness card tells of bonus plan

SINCE the introduction of the bonus system for excellence of accident records, conductors and motormen of the Brooklyn City Railroad, Brooklyn, N. Y., have been turning in the names of more witnesses than they did previously. In order to assist them still more, a new form of witness card has been made out which tells the witness of the participation of motormen and conductors in the bonus for safe operation. It is believed that with the use of this card, the accident records will continue to improve.

More Light for Chicago Readers

ELECTRIC lamps with clear glass which have been standard in the cars of the Chicago Surface Lines, Chicago, Ill., rated at 23 watts, are being replaced by 36-watt lamps, with inside frosting. This change was determined upon after an extensive investigation. These new lights will provide 40 per cent more illumination, making it much easier for passengers to read newspapers. Additional energy required for these lights will amount to about $25,000 a year.



This gas-electric car is handling passenger traffic on an outlying line of the Winnipeg Electric Company's system

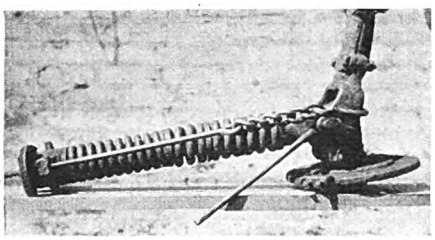
Maintenance Methods and Devices

Emergency Trolley Tension Rod



This trolley base tension rod is a time saver when the regular rod breaks

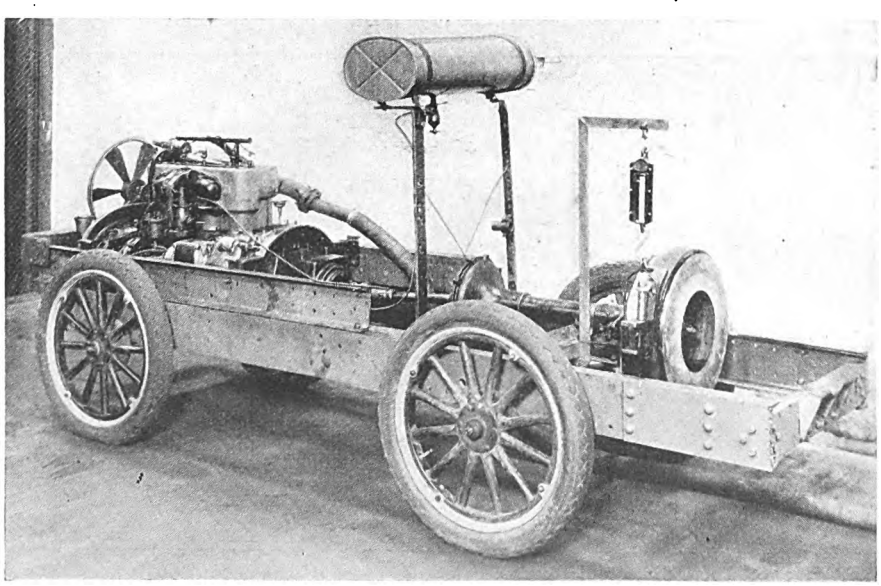
PROPER trolley pole pressure is easily obtained in the event of a broken rod with the trolley base tension rod shown in the illustration. It was developed by one of the trouble men of the Cincinnati Street Railway, Cincinnati, Ohio. This rod may be attached to the trolley base without driving out the pin that holds the end of the broken rod in place. As a result this tension rod has been found a very effective time saver for emergency jobs of the nature described.

Portable Dynamometer Set for "Running-In" Motors

IT IS BELIEVED by the bus maintenance department of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., that the bearings of automotive engines which have had their periodic or emergency overhauling completed, are best run in with a portable prony brake dynamometer.

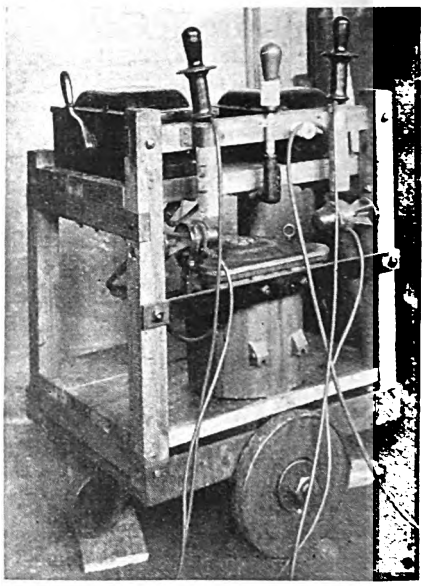
The truck assembly of dynamometer equipment shown in the accompanying illustration was made in the company's shop to answer this purpose. It consists essentially of a deep channel side frame bolted together with end pieces of almost equal depth to form a rigid chassis. This is mounted on ordinary light-weight automotive type axles, with wheels proportionately of light construction and taking 30x3½-in. tires. An additional steel frame is mounted at one end of the chassis with cross members so spaced as to permit the mounting of either four or six-cylinder motors as used with the bus equipment.

It has been found that proper "running-in" of motor bearings is not insured simply by operating such a motor at an idling speed over a period of twelve to eighteen hours. The prony brake is used, therefore, to load the engine progressively over a period of twelve hours until during the last one to one and one-half hours or so, it is carrying as nearly normal full load as can be approximated. The first two hours of the "running-in" process is at no load, the next eight hours a load of about 33 per cent of normal full load is held, and the finish is with the engine operating at its rated horsepower.



This portable prony brake dynamometer was made in the Milwaukee Electric Railway & Light Company's own shops to solve the problem of properly "running-in" bus motors

High Tension Test Outfit

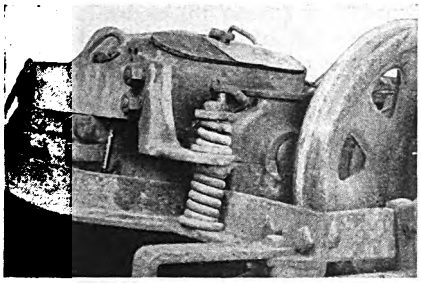


SINCE publication of the article by R. S. Beers on a simple high-potential testing outfit in the JOURNAL for March 24, page 505, a photograph of the actual device has been received. This is reproduced herewith. The basis of the outfit is a standard 110/2,200-volt lighting transformer. The auxiliary equipment and the testing leads are also shown.

Wood Commutator Cover with Added Features

FAILURE to latch properly often caused the malleable iron commutator covers furnished originally with the GE-80 motors to be lost in service. This necessitated a continual replacement with a resultant high maintenance expense. The New York & Harlem Railroad, New York City, has developed a wood cover with a locking screw to prevent this. It is made of oak, oval in shape and is 19½ in. long, 9 in. wide and 1 in. thick. One-half of the thickness of the wood is cut away for a distance of 1 5/16 in. from the edge. This leaves an oval boss 16⅞ in. long by 6⅜ in. wide. The boss fits into the commutator hole of the motor frame and prevents shifting of the cover. A ⅛x4-in. steel plate installed across the entire width of the cover at the middle acts as a reinforcement as well as a footing for the holding screw. The holding

Digitized by Google



Wooden commutator cover takes place of lost ones

screw support is a malleable casting and is bolted to the top half of the motor shell. This casting projects over the plate for about 3 in., and the end is drilled and tapped with ½-in. machine threads.

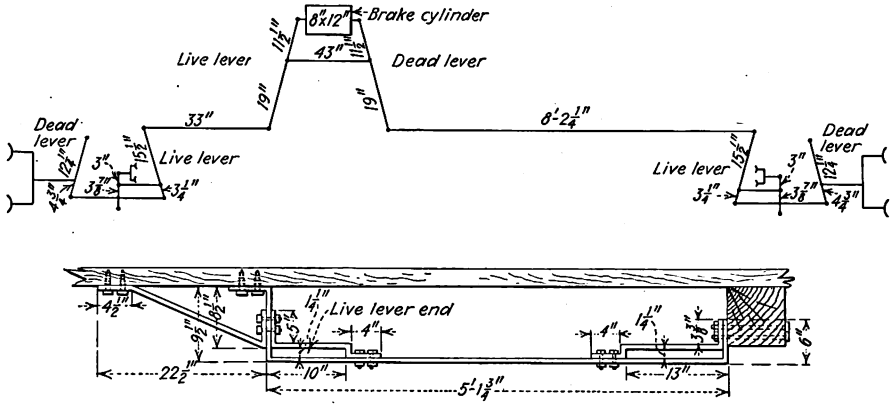
The holding screw is made from ½-in. round bar. It is bent at a right angle with a short end of 2½ in. and a long side of 4½ in. The short end is threaded for installation in the support and the long side is used as the handle. This cover is light, and since the locking handle is within easy reach of the workman no difficulty has been experienced in keeping it on at all times.

Portable Vacuum Cleaner for Car Seats

PLUSH and cane seats in the cars of the Atlantic City & Shore Railroad, Atlantic City, N. J., are cleaned at regular intervals by means of an Electro-Lux vacuum cleaner. This is a small portable equipment operating on 110 volts alternating current. Convenient outlets at this voltage are located at intervals through the car shops. The process takes about 4½ hours per car, including removal of dust and dirt from the floor around the seat supports, and from the arm rests and window sills, as well as from the seats themselves. A thorough cleaning is given to each car once every two weeks.

Safety Stop for Brake Cylinder Levers

SAFETY and continuity of service being considered of importance on the New York & Queens County Railway, Woodside, N. Y., nothing is overlooked that will tend to improve these factors. To guard against a total loss of the braking power if one of the pull rods breaks led to the design of a stop which would assure one-half of the braking effort. This was accomplished in the following manner: A flat bar ½ in. x 3 in. x 66¾ in. is installed in such a position that it supports the ends of the brake cylinder live and dead lever in a horizontal position. One end of this carrier is fastened to a cross sill by ½-in. through bolts and the other end is secured to the center sill by ½-in. lagscrews. A piece of ½-in. x 3-in. iron is bolted to the carrier over each lever so that it forms a slot 10 in. long for the live lever and 13 in. long for the dead lever. These slots allow free movement of the levers under normal operating conditions, and with a broken pull rod act as a stop for the loose lever. This permits the proper functioning of the complete braking equipment fastened to the other lever.



Arrangement of safety stops for brake levers

Twenty Things to Avoid in Maintaining Cable Leads

1. *Cutting of wire strands when removing cable insulation.*
2. *Making a terminal connection with ends of strands twisted.*
3. *Removal of too little insulation so that only one setscrew takes hold of the cable.*
4. *Terminal and connector setscrews not locked with jam nuts and lock washers.*
5. *Soldering of cable ends by inexperienced men.*
6. *Poor cleaning of conductors preparatory to soldering.*
7. *Solder that is too cold.*
8. *Soldering acid that is too weak..*
9. *Rough soldered joints with poor insulation.*
10. *Solder spattered over face of commutator and necks at armature connections.*
11. *Acid flux spilled on armature windings.*
12. *Poor insulation of field coil terminals after making cable connections.*
13. *Iron setscrews dropped in motor frame and left there.*
14. *Poorly supported leads anchored inside motor frame.*
15. *Cable for motor leads and wiring around frame that is too stiff.*
16. *Reversed field coils from wrong cable connections.*
17. *Motor leads brought out of frame by non-uniform methods.*
18. *Insecure cleating to hold leads to motor frame and car body.*
19. *Leads arranged so they will rub on motor or car parts.*
20. *Knuckle joint connectors placed in the swinging loop.*

New Equipment Available

Light-Weight Calculator

LESS than 7 lb. is the weight of a calculating machine announced by the Burroughs Adding Machine Company, Detroit, Mich. While small and compact it is equipped with full-size keys, a standard keyboard, visible adding dials and operates the same as the larger models. The machine is but 6½ in. wide and 11¼ in. long. It has an accumulating capacity

Small compact computing machine

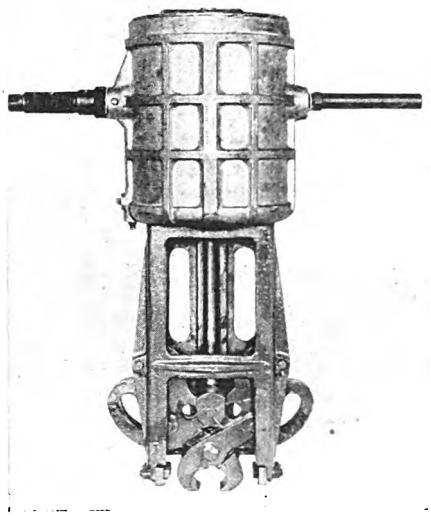
of 9,999.99 for addition and multiplication. Subtraction and division are facilitated by the proper complementary figures on all keytops.

The mechanism of the new calculator is adjusted to high-speed work. It was brought out primarily to meet the requirements of railways and public utilities for a low-priced machine for revenue accounting work, and for checking invoices and computing payrolls.

Air-Operated Spike Puller

SPIKE pulling is facilitated by a tool developed for the purpose by Ingersoll-Rand, New York, N. Y. It is claimed that with it one man can pull eight to ten spikes per minute. The machine is light, so that it can be moved quickly by hand from tie to tie. It is said to consume on the average only 3 cu.ft. of air per spike.

To pull a spike the throttle is turned to admit air on top of the plunger. As the plunger moves down a link arrangement opens the jaws on the lower end. The machine is then set with the jaws around the spike and the foot-rest on the lower flange of the rail. Air is admitted by rotating the throttle and the plunger rises. The pull from the

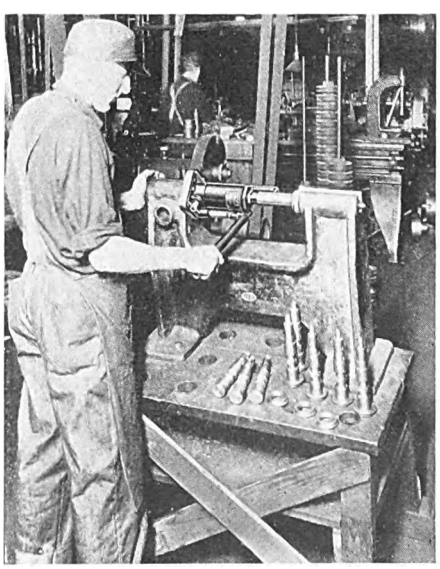


Air-operated spike puller

plunger moves the links to close the jaws under the head of the spike and clamp it firmly. As soon as the jaws clamp a strong upward pull draws out the spike.

Hydraulic Jack Used for Pressing In Bushings

HEREWITH is shown a Blackhawk hydraulic jack of 7-ton capacity installed so as to act as a horizontal press. All hydraulic jacks of the Blackhawk Manufacturing Company, Milwaukee, Wis., operate horizontally providing the pump side is down. To help speed up production a spring is fastened to the base of the jack and to the side of the ram. When the release valve is



Method of using hydraulic jack as a horizontal press

opened this spring pulls the head of the jack off the finished job, and allows removal of the piece and the placing of a new shaft and collar.

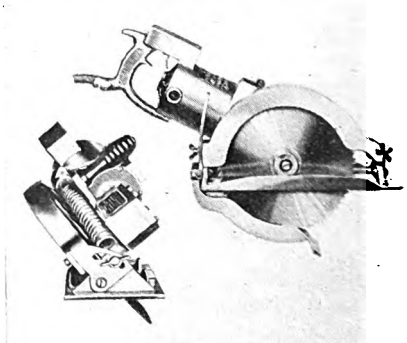
Manganese Steel Drilled Successfully

IT HAS always been considered impracticable to drill or machine high manganese steel. With the advent of a new cobalt steel, however, the Morse Twist Drill & Machine Company, New Bedford, Mass., announces that it has been able successfully to drill railroad frogs with a chemical content of 1.08 carbon, 10.04 manganese, and with a Brinell hardness of 207-217, using a drill of special structure to withstand extreme torque and point pressure.

On one grind nine holes each 1½ in. deep were drilled through the railroad frog. The company announces that it is now prepared to make drills for this work upon specification.

Portable Electric Hand Saw

BEVEL sawing, at any angle up to 60 deg., in addition to vertical sawing is announced as a feature of a new hand saw produced by the Wodack Electric Tool Corporation, Chicago, Ill. The new type B portable electric hand saw has a tilting



New type portable electric hand saw

base which can be set and locked at any angle within the 60 deg. range, by means of a slide and locknut.

Another new feature is that of the width gage for vertical sawing, which can be set for any dimension up to 6 in. With it various widths of strips can be sawed without the necessity of marking.

Like other Wodack saws the type B has a built-in General Electric universal motor which operates on both alternating and direct current. Each saw is furnished complete with a one 11 in. and one 9 in. blade.

Association Activities

Utilities Problems Discussed at Baltimore Meeting

Beneficial results to be accomplished formed the theme of the principal speakers at the sixth annual convention of the Maryland Utilities Association held in Baltimore, Md., last week

WITH ADDRESSES by nationally known experts in their particular fields, the Maryland Utilities Association held its sixth annual convention at the Emerson Hotel, Baltimore, Md., Friday, March 23, 1928. In order to promote liberal discussion of the various problems, the morning session was divided into four groups, electric, transportation, gas and water. In the transportation group Dean J. Locke, staff engineer United Railways & Electric Company of Baltimore, told of traffic conditions and various schemes of traffic control used in Chicago, Cleveland, Detroit, Pittsburgh and Baltimore. An abstract of his paper is published elsewhere in this issue.

In the discussion following Mr. Locke's paper, C. D. Gaither, police commissioner of Baltimore, told of some of the problems that were confronting the police department and of various remedies that were being tried to solve them. Carl W. Stocks, editor *Bus Transportation,* spoke briefly of the desirability for uniformity in traffic regulation, and Clarence W. Squier, associate editor ELECTRIC RAILWAY JOURNAL, spoke of the reduction in accidents that could be expected from improved traffic control and the advantages of safety zones and wide left turns in speeding up the movement of traffic in city streets.

The electric group discussed various committee reports and listened to a paper by Earl Whitehorne, commercial editor of *Electrical World,* on developing domestic loads. The gas group heard about care and maintenance of the gas meter by A. M. Wolfe, assistant manager Maryland Meter Works, and the water group had a general discussion on their problems.

The afternoon joint session was taken up largely by three addresses by prominent officials of the American Electric Railway Association, the American Gas Association and the National Electric Light Association. In comparing electric railways with other public utilities, L. S. Storrs, managing director American Electric Railway Association, commented on the size of the electric railway industry and by various comparisons showed its real importance and that, in fact, it must be considered as one of the greatest factors affecting the growth and prosperity of any community. Without transportation, he said, development would lag badly. An abstract of Mr. Storrs' address is given below.

Major Alexander Forward, managing director American Gas Association, prophesied the ultimate elimination of smoke and spoke of some of the things that he believes could be expected in the future for gas producers. He gave some statistics to show the trend toward consolidation of industry. Interstate power was discussed by Major H. S. Bennion, director of engineering National Electric Light Association.

In the business session of the association, the following officers were elected: President, H. T. Connolly, general manager Washington, Baltimore & Annapolis Railroad, Baltimore, Md.; vice-president, H. A. Brooks, Potomac Electric Power Company, Washington, D. C.; treasurer, R. E. Town, Potomac Edison Company, Hagerstown, Md.; secretary, David Kinnear, United Railways & Electric Company of Baltimore. The directors chosen were Adrian Hughes, Jr., L. G. Smith, C. H. Leatham, Frank Meyers, Frank Mitchell, and G. W. Woolford.

The evening session included a banquet and addresses by Albert C. Ritchie, Governor of Maryland, and William F. Broening, Mayor of Baltimore.

Electric Railways Are Not Looking for Charity*

By LUCIUS S. STORRS
Managing Director American Electric Railway Association

IN RECENT years the electric railway branch of the public utility business has been regarded almost as a "poor relation." With $5,500,000,000 invested in it, with 300,000 men on its payrolls, and with its service to nearly 16,000,000,000 of passengers per annum, it still is a great enterprise. But lately the growth of the power and light business has been so spectacular, and the troubles of the electric railways due to the competition of the private automobile and the unregulated bus have been so prominently before the public, that the vitally necessary service which the electric railways are rendering to the public, and which they will continue to render, has been somewhat obscured.

But the electric railways are not "poor relations." They are by no means clamoring for charity. They *are* asking for better understanding, for better appreciation of the fact that they are rendering a service that cannot, by any stretch of imagination, be dispensed with; they *are* seeking the full co-operation of the public in the rendering of that service.

Electric railways *do* render an essential, absolutely necessary service. The reason why electric railway service is irreplaceable is that it is the most economical means of transporting the masses of the people. Nothing yet has been devised that is so efficient and inexpensive in carrying large numbers of people from their homes to the factories, to the shopping centers, to the theaters and other places where people must gather in large bodies.

The principal field for the electric railway is in the medium and large-size cities. It is inconceivable that a city like Baltimore could continue to be an attractive, prosperous metropolitan city without such excellent service as the local street railway gives the public.

Too often the question of rate of fare occupies the public mind, when the real problem is quality of service. Where can you buy for 5 cents anything that you could have bought for that sum ten or fifteen years ago, except possibly a postage stamp? Yet the 5-cent fare has been a political fetish in some of our large cities, notably in New York, where the inadequate revenues of the electric railways have prevented the development of the kind of service which the people really want, but which their political overseers have prevented them from getting.

It is gradually sinking into the public mind that something cannot be gotten from a street railway company for nothing any more than something can be taken from a grocery store without payment. You may force your public utility to continue to give you service at less than a fair rate of return, but

**Abstract of an address delivered before the Maryland Utilities Association, Baltimore, Md., March 23, 1928.*

Digitized by Google

rest assured that that company cannot continue forever to give service under such a handicap and remain a sound business organization. Sooner or later the day of reckoning comes, and then you have receiverships, with the lopping off of non-paying lines, destruction of values, disruption of the business of the community and greater expense and inconvenience to the public.

Fares Should Give a Reasonable Rate of Return

If I had any plea to make, more than another, it would be for recognition of the right of the electric railways to earn a rate of return that would permit them to render the public the high quality of service which the public wants. The granting of that plea would insure the continuance of this necessary service with ever-increasing improvement. It would insure as ready a flow of capital into the electric railway industry—publicly regulated and controlled—as flows into private business enterprises, many of them by no means essential and all of them free from public regulation.

Granting of that plea would put quality and adequacy of service over everything else. It would make the rate of fare a matter of secondary importance, which it rightfully should be.

The first essential of any public service is *adequacy,* and as the service is publicly controlled it is within the power of the regulatory authorities to insist that it shall be adequate. But a company not earning its operating expenses, or at best a mere pittance above them, is in no position to give the public the kind of service it most earnestly wants to give and which the public desires and ought to have.

In some parts of the country, notably in Ohio, the service-at-cost franchise has solved the problem of adequacy of service and reasonable rate of return. This kind of franchise provides that a specified rate of return on the value of the property shall be counted as part of the cost of providing the service. The rate of fare fluctuates according to the condition of the operating surplus of the company. You probably are familiar with the franchises in Cincinnati and Cleveland, in which those large cities recognize a fair return on the value of the properties as a proper element of the cost of service.

I am not here advocating any particular kind of franchise, I cite these instances merely in support of my statement that the public is coming to recognize more fully the importance of permitting its street railway companies to charge rates of fare that will assure the investors a reasonable return on their money invested in the public service. The same result may be obtained under any franchise, provided the regulatory bodies, the public and the companies have mutual understanding of their obligations to each other, mutual confidence and respect and a common ideal—the provision and support of a truly adequate public transportation service.

Traffic and Traffic Control in Various Large Cities*

By Dean J. Locke,
Staff Engineer United Railways & Electric Company of Baltimore

OUR highway systems, designed for the most part many years ago to meet the then existing traffic conditions, are inadequate today. It is the purpose of this paper to describe briefly the traffic in a number of cities visited and make a comparison with Baltimore.

The visitor to Chicago is quickly impressed with the absence of congestion in street and pedestrian traffic within the downtown Loop district. Most of the streets are either 38 or 48 ft. between the curbs. Blocks are laid out in a rectangular pattern, and average 400 ft. north and south, and 320 ft. east and west.

The co-ordinated traffic light system now in use in the Loop district of Chicago has three objects in view: (1) to release traffic officers for better use in the promotion of safety and reduction of ordinance violations; (2) to speed up traffic, and (3) to increase the capacity of the streets. The system was a success from the start. It nearly doubled the speed of street cars and motor vehicles through the controlled district and increased the street capacity by from 25 to 50 per cent. Regulations on parking that became effective two years later, further materially increased street capacities. Records of the Police Department indicate a reduction of 23 per cent in the number of personal injuries from automobile accidents as a result of the signal control.

At the entrance of the controlled area the signals are set to admit traffic part of the time, and part of the time to permit traffic on the cross streets. This breaks the lines of vehicles into groups or platoons separated by an interval of time. As each group moves along the street toward the succeeding street intersection, the signals at that intersection are made to give an indication in their favor just as they arrive. The interval between the changes in lights at successive intersections is timed to permit steady movement under average conditions. The travel on cross streets flows in the interval between these groups and in a similar manner.

When the system was planned the data indicated that a 90-second cycle would be necessary. In practice traffic movements have been so facilitated that for normal weekdays six different lengths of cycle are now employed during the different periods of the day, ranging between 50 and 70 seconds. On Saturdays seven different cycle lengths are employed, as the traffic at times is materially different from that on other weekdays.

Shortly after the signals were placed in operation, parking within 50 ft. of the downtown signal lights was prohibited to promote better vision at the street intersection, to facilitate the loading of street cars and to minimize delays at congested street corners. At each stopping place at the near side of each intersection a car safety zone has been established. Free wheel vehicles are required to use the lane between the curb and the loading zone.

All left turns are prohibited at all intersections within the Loop except at the boundaries of the section.

On Jan. 10, 1928, parking in the Chicago Loop section was prohibited by ordinance during business hours. This "No Parking" ordinance affects an area of approximately 1 mile square. Within the past few days opponents of the plan have succeeded in securing an amendment to the ordinance permitting ten-minute parking of passenger automobiles within the Loop district.

With the parking ban as first instituted vehicles move with a saving in time of more than 20 per cent during the evening rush hours and of more than 30 per cent during the middle of the day. Pedestrians move more freely with a greater sense of security. Street car schedules are much more regular and save 15 per cent of passenger time. Cabs, buses, private and commercial cars operate as before, and passenger vehicles can stop to receive and discharge passengers as they always have done. All of these benefits have been obtained without limiting the use of the street to traffic in any way. It simply means that vehicles cannot block the streets by using them for storage.

Cleveland's Natural Advantages

Cleveland has about 225 traffic lights installed at the present time. The great majority of these are at isolated corners in outlying sections and work independently although controlled by the master timers of the groups to be described. There are, however, three groups of signals, working on the co-ordinated control plan, which handle traffic on heavy arteries in a most efficient manner.

The first group is that on Euclid Avenue between Public Square and Eighteenth Street, where, in the shopping district for a distance of about 4,000 ft. nine signals have been installed with control centered in a tower at Ninth Street, the busiest intersection.

The second group is that on Carnegie Avenue between 30th Street and Sterns Road, where 21 signals provide co-ordinated control of free-wheel vehicles for a distance of more than 3 miles. Carnegie Avenue is a main artery of travel. Traffic consists almost entirely of passenger cars and buses; slow-moving trucks are diverted to parallel streets. Cross traffic at the different in-

Essential Features to Successful Solution of Traffic Problems

1. Without genuine co-operation and unselfish contributions by the various interests involved, including the city administrators, the police, business organizations, transportation companies and the general public, the present-day traffic problems cannot be solved as they should be.

2. The immediate problem, apart from that of city planning, is concerned with means of securing the maximum efficiency in the use of existing streets and other traffic facilities.

3. Traffic control devices have passed the experimental stage, but they should be installed only after very careful engineering investigation and study into all the facts and conditions surrounding their use and when a definite need for them has been established. There is real danger that the widespread installation of signals at isolated intersections will result in great delay to traffic which will not be compensated for by added safety.

4. Automatic traffic control devices, when installed under proper conditions and operated properly, increase materially the capacity of streets, the speeds of vehicle operation and the safety of individuals using the streets.

5. Parking is the principal and least justifiable cause of street congestion. It is the crux of the traffic problem in most cities, including Baltimore. Parked cars cut our street widths in two, strangle business and delay all who use the streets, while only a few car owners are benefited.

6. Materially greater provision should be made for off-street storage of motor cars in the business district.

7. Where free wheel vehicles and street cars are in conflict, separate lanes of travel should be provided to permit the fluid movement of traffic. To this end, car stops generally throughout the business district should be provided with clearly defined safety or loading zones. Where street widths are too narrow to permit of clear free-wheel vehicle lanes opposite such zones, curbs should be recessed, where physically possible.

8. Boulevard stops, when carefully located, are a material aid to the relief of traffic congestion and to the promotion of safety.

tersections varies from a volume approximately equal to that on Carnegie Avenue, to a very small amount. The width of Carnegie Avenue permits four lanes of traffic. In the morning rush hour three lanes are occupied by inbound traffic and one by outbound, while in the evening rush hour three lanes are occupied by outbound traffic and one by inbound. The system is so adjusted with a cycle of 84 seconds that traffic at a speed of 25 m.p.h. can move in both directions without interruption. Motorists may now cover the controlled section in an average time of ten minutes, where formerly with manually operated semaphore control, 21 minutes were required.

The third installation is on Euclid Avenue in East Cleveland, where for a distance of more than 3 miles, sixteen intersections are co-ordinate-controlled from City Hall. There the roadway is 68 ft. in width. The 61-second cycle permits of an average vehicle speed through the section of about 24 m.p.h. and an average car speed of about 12 m.p.h., including stops. Elevated car loading platforms are used at each car stop.

The streets adjacent to the boundaries of the Loop district in Detroit are rectangular in pattern with widths of about 60 ft. between building lines. In the center, however, streets are in radial and circular pattern, with Grand Circus Park as a center. Some of the radial streets, including Woodward Avenue, are as much as 120 ft. wide. The street plan makes the control of traffic difficult.

Traffic on the principal streets is controlled by some 125 automatic signals, mounted in a variety of ways, hence somewhat confusing to users of the streets.

Practical Benefits in Doubt

The signals operate on a fixed 56-second cycle split equally between green and red. They are controlled from one timing mechanism. The light aspects are staggered to provide progressive movement of vehicles at about 20 m.p.h. With this arrangement the aspects down any one street at any given time are individually or in groups alternately green and red. While this plan when installed penalized traffic on the main thoroughfares while giving an unduly long interval to minor cross streets, it was supposed to speed up both motor and street car traffic some 60 per cent and to reduce the accidents very materially. There has, however, been some controversy as to its practical benefits and I understand that it is proposed to rearrange the signal timing mechanism to provide for co-ordinated control, as in Chicago and Cleveland. A trial installation of this type has been in successful operation for some time on Cass Avenue between Temple and Antoinette Streets.

Pittsburgh's Tough Problem

Undoubtedly Pittsburgh has one of the toughest traffic problems to solve of any large city in the United States. The business center, termed "the Triangle," lies in the fork of two rivers, and is surrounded by hills and precipices. The blocks are irregular and narrow. Practically two-thirds of the blocks are under 300 ft. in length. About half of them accommodate but two lanes of traffic. Most of the three-lane streets, comprising 40 per cent of the blocks, are one-way streets and have been such for a number of years.

At the present time traffic control in the Triangle is by officers using semaphore signals. Congestion is so great that vehicular speeds are very low and street capacities are decidedly limited. That these conditions are not worse is due in considerable measure to a no-parking ordinance which prohibits parking on a vast majority of the downtown streets either for 24 hours a day or between 8 a.m. and 6 p.m.

A solution of Pittsburgh's traffic problem is in sight, however, as the result of the untiring efforts of the Mayor's better traffic committee, which, appointed early in 1925, has made a comprehensive study of the problem and recently has submitted a report recommending: (1) The immediate installation of a "flexible co-ordinated" electric traffic control system in the central business district; (2) that steps be taken to bring about obedience to signals by pedestrian traffic as well as by the vehicular traffic; (3) that immediate consideration be given to the elimination of many of the left-hand turns; (4) that immediate consideration be given to the prohibition of horse-drawn traffic from certain major streets during the peak hours, with the setting up of certain suitable by-pass streets for this type of traffic.

It is proposed to install electric signals at some 100 downtown intersections at a cost of several hundred thousand dollars. These signals would be master-controlled at some convenient centralized point and would provide a means of increasing street capacities and the safety of movement. The studies made indicate a possible time saving for both motor vehicles and street cars in traversing the proposed signalized area of from 30 to 40 per cent.

Here in Baltimore we have a serious traffic problem. Within the central business district 66 per cent of the roadways are less than 40 ft. in width and 50 per cent of the blocks are less than 300 ft. long.

Digitized by Google

At all but a few intersections downtown traffic control is by officers using semaphores or lights. No parking is permitted between 7:30 and 9:30 a.m. and between 4:30 and 6 p.m. on a limited number of streets, while two-hour parking is permitted generally between 9:30 a.m. and 4:30 p.m.

Outside the business district traffic is controlled at some 135 intersections by automatic lights, most of which are controlled individually. The exceptions are small groups on North Avenue, Mount Royal Avenue, the Fallsway and St. Paul Street, which are synchronously operated, and a group of twelve lights on Cathedral Street, which recently have been connected with a more modern co-ordinated type of control. The Cathedral Street group permits continuous flow of automobile traffic for a distance of 4,200 ft. at 22 m.p.h. The length of cycle is 63 seconds. Plans have been made for the use of co-ordinated control on North Avenue, a heavy crosstown street on Lincoln Highway, and on St. Paul Street, a heavy radial artery. Co-ordinated electric signal traffic control is also planned for some sixteen intersections on Baltimore and Howard Streets in the central business district. Boulevard stops are little used. Street car stopping places on the railway system as a whole average ten per mile during rush hours with the rush-hour stop plan, and twelve per mile during non-rush hours.

The features most essential to the successful solution of our traffic problems are given on page 549.

Modern Equipment Interests New Englanders

IMPROVING electric railway service through the use of up-to-date equipment was the principal subject of discussion at a meeting of the New England Street Railway Club held at Springfield, Mass., March 12. At the afternoon session W. L. Harwood, engineer of power and equipment of the Springfield Street Railway and the Worcester Consolidated Street Railway, told about the results achieved with the Springfield experimental car. An abstract of Mr. Harwood's paper appears elsewhere in this issue. He illustrated his talk with lantern slides showing details of the equipment. The advantages of the treadle door over the older type of door operating mechanism were outlined by J. H. Vander Veer, sales engineer National Pneumatic Company. His talk was accompanied by motion pictures showing operations of treadle doors on electric railway cars in many cities.

Commenting on the necessity for giving up-to-date service, Lucius S. Storrs, managing director, American Electric Railway Association, pointed out that the number of people who ride on the electric railways during the course of a year is greater than the number of postage stamps sold in the United States. Improvements being made to the local transportation systems in many cities, he said, are indisputable evidence that the public transportation industry is on the road to recovery. Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, mentioned the recent developments in car design as one of the most significant things in the field of local transportation today. W. C. Slade, vice-president, United Electric Railways of Providence, said that electric railways have been marking time during recent years because they have been undecided whether to buy more cars or to buy buses. Developments in car design fostered by the Springfield and Worcester companies will mean much, he said, to the future of the industry.

Improvements to the Springfield and Worcester Street Railway system were not made for idealist reasons, according to E. G. Buckland, vice-president New York, New Haven & Hartford Railroad. Mr. Buckland's remarks are given elsewhere in this issue.

More than 500 men, a record-breaking number for the New England Street Railway Club, attended the banquet in the evening. Howard F. Fitch, vice-president of the club, presided at the banquet and made brief remarks welcoming the men to the dinner and convention. He deviated from the regular program to introduce Clark V. Wood, president of the Springfield and Worcester railways, and the man in charge of arrangements for the record-breaking meeting. Mr. Wood welcomed the huge crowd and thanked everyone, from the officials to the track repair crews, for their presence and their interest.

Mayor Fordis C. Parker, of Springfield, welcomed the members of the club to the city. He spoke with gratitude of the efforts of the Springfield Street Railway to maintain the highest grade of service. He said that the expenditure of more than $800,000 by the company last year was evidence of the attempts being made to render the best possible service. He thanked Mr. Wood for his endeavors and experiments that had given the city a type of street car that is being copied in other communities.

The city of Worcester was represented by Mayor M. S. O'Hara, who congratulated the officials of the New York, New Haven & Hartford Railroad for their courage in buying a railway that was on its "last legs" and putting it on a sound basis again. He told how the old cars had been painted and repaired, and the service improved more than 100 per cent. He said that it was a satisfaction to have responsible persons running the buses in the city. He was proud of the fact, he said, that powerful interests would spend money on the railway property to provide better service for the residents.

Capt. Ralph Earle, president Worcester Polytechnic Institute, gave an interesting talk on the duties and accomplishments of the United States navy during peace times. Robert Burlen, of Boston, concluded with what he termed "A Message" to the effect that humor is necessary to play the game of life.

Energy Consumption Low on Springfield Experimental Car*

BY W. L. HARWOOD

Engineer of Power and Equipment Springfield Street Railway, Springfield, Mass.

SEVERAL years of thought and experimenting by the Springfield Street Railway have resulted in the Springfield experimental car.

It would be too long a story to tell of the development of the various pieces of equipment which finally went into the completed car, but after some delays and some interesting experiences, the car was finally completed shortly before midnight, April 13, 1927, and on Thursday, April 14, at 10:30 a.m., made a scheduled exhibition run with some 40 prominent persons. The run was successful beyond expectations. Between that time and May 13 this car made many demonstration runs for the benefit of men connected with the industry from many parts of the country. On May 13, 1927, it was put into regular service on one of the heaviest city lines and has to date made some 12,000 miles.

We have been operating the experimental car on one of our heaviest city lines, the State Street Line. This line operates on State Street with a maximum grade of 6.5 per cent, with some 1,300 ft. averaging over 5 per cent. The line loops through Dwight Street and returns via Main Street. The round trip is 7.1 miles and the actual running time varies from 48 minutes during the lighter periods of the day to 58 minutes during the rush hours, making the schedule speed from 7.3 m.p.h. to 8.9 m.p.h. Some tests taken last May showed 5.8 equivalent stops per mile at times of non-congestion and 13.5 stops per mile during congested periods. The car has made some 12,000 miles in this service, having been out of service for about a month, in order to go to Cleveland, and has carried some 75,000 revenue passengers (transfer passengers

**Abstract of a paper read at a meeting of the New England Street Railway Club, held at Springfield, Mass., March 22.*

Digitized by Google

not included). During this service, the car has performed very satisfactorily and has developed no major defects. When first put into service, the press named it "The Noiseless Car," due to its quiet operation. There are no gear or brake noises, the only noise being the trolley wheel on the wire and flange noise of the wheels on the rail. The low unsprung weight, combined with the long springs and rubber shock-insulators, allows the car to pass over special work with a rather pleasant click, quite different from the noise made by the conventional car. Tests made by the A.E.R.A. committee on noise reduction also show it to be more quiet in operation than our other cars.

The light weight and roller bearings allow the car to accelerate very smoothly and rapidly. Under test, rates as high as 2.2 m.p.h.p.s. have been noted, and in actual service rates average around 1.5 m.p.h.p.s.

Braking rates as high as 4.35 m.p.h.p.s. have been noted, and in revenue service the braking rates run around 2 m.p.h.p.s. While these are high braking rates, the effect on the passengers is not uncomfortable, as the rate is uniform without objectionable changing or jerky operation. This is partly due to the special material of which the brakeshoe is made, having a fairly constant coefficient of friction with varying loads, and there is no seizing action as the car comes to rest. In emergency, full brake chamber pressure can be obtained in less than $\frac{3}{5}$ second, and in service, in something less than $1\frac{1}{5}$ second which, combined with the rapid rate of retardation, makes possible stops in the shortest distance.

To get an accurate comparison of the power required by the experimental car as compared with a modern light-weight car, we equipped both the experimental car (No. 554) and one of our 50 new light-weight double-truck safety cars (No. 565), with watt-hour meters. Both cars are operated regularly on the State Street line. The results are as follows:

	Kilowatt-Hours per Car-Mile
For the month of December, 1927, the total amount of energy required, including heat, lights, air compressor, etc., for No. 554 was	3.19
And for No. 565 was	3.65
For the month of January, 1928, the energy used by No. 554 was	3.27
And by No. 565 was	3.88

That is, in December, 1927, the light-weight double-truck safety car No. 565 used 14.4 per cent more energy than the experimental car, and in January, 1928, 18.7 per cent more energy.

A special energy test of 8.7 miles, with one car following the other, making the same stops as traffic required, and measuring energy for motors only, showed an energy consumption as follows:

Car No. 554, kilowatt-hours per car-mile	1.61
Car No. 565, kilowatt-hours per car-mile	2.18
Car No. 554, kilowatt-hours per ton-mile	0.127
Car No. 565, kilowatt-hours per ton-mile	0.119

In this test the light-weight double-truck safety car No. 565 took 35.4 per cent more energy than the experimental car.

Another test of 9.5 miles over another route at rather higher speed, with fewer stops, showed the following:

Car No. 554, kilowatt-hours per car-mile	1.58
Car No. 565, kilowatt-hours per car-mile	2.11
Car No. 554, kilowatt-hours per ton-mile	0.125
Car No. 565, kilowatt-hours per ton-mile	0.116

In this case the light-weight double-truck safety car used 33.5 per cent more energy than the experimental car.

The weight of car No. 565 is 36,500 lb. against 25,300 lb. for experimental car No. 554—car No. 565 is 44 per cent heavier.

There have been no worn-out parts or replacements in the 12,000 miles of service. A thorough inspection made recently showed no wear in the bearings and the worm gear and work shaft were in perfect condition. It is too early to predict what the life of bearings and drive will be, but there is every indication of long life. Brakelinings show wear of only $\frac{1}{8}$ in. for 10,000 miles of service, which would indicate that we will obtain about 20,000 miles per set in our heavy city service. Based on 12,000 miles of operation, there is every indication of low maintenance.

New Business Can Be Developed With Advertising and Publicity*

By E. E. Soules

Manager Department of Publicity Illinois Traction System, Peoria, Ill.

FROM an industry that was largely non-advertising ten years ago there is today being spent better than $6,000,000 each year for city and interurban transportation advertising. How and why the industry has brought advertising into its operating program is of interest; what have been the results and what results may be expected is the present-day concern.

The modern railway manager uses advertising continually to keep his public informed about the affairs of his company. He has learned that it does not pay to wait until there is trouble and then rush into print and expect the public to join in the mourning. He knows that the public is not interested in the troubles of the advertiser, and that they would rather hear of success than failure; but he also believes that the public is notably fair, and that if it can be made to see that the community is directly affected by the failure or success of the transportation system it may be depended upon for support.

Ask a progressive city railway operator for concrete figures on the result of his advertising. If reports for comparative periods show increased riding he will state that in his judgment advertising, plus good service, and perhaps plus changed conditions, have all had a part in the improved reports. If reports do not show increased riding or earnings he will tell you that without advertising the story would have been worse.

Recent years have produced but few examples of increased riding on city properties. An outstanding exception with which we are all more or less familiar is the city of Chicago, where the surface and elevated lines have shown consistent increases. It is significant that both of the operating companies in Chicago have within recent years established advertising departments that have effectively used the display columns of the newspapers. It is not contended, even by the advertising man, that advertising alone has been responsible for the upward turn in Chicago. Increasing difficulties for the motorist who now finds street congestion almost unsolvable has also tended to put passengers back on the rail cars; while speeding up of schedules and re-routing of basic lines is keeping passengers on the cars. But advertising and publicity have played an important part by first telling the story of things to be done and things accomplished, then selling the public on the advisibility of doing the things planned, and finally selling them again on the use of new and improved services.

Abstract of a paper presented before the Illinois Electric Railways Association, Springfield, Ill., March 14-15, 1928.

Newspaper the Basic Medium

There is such a variety of operating conditions that no standardization of advertising methods has been developed by city railways. Following well-proved advertising practises the newspaper is the basic advertising medium. On the average about 65 per cent of transportation advertising appropriations is expended in the columns of the daily and weekly newspaper. The street railway and bus operator has a decided advantage in having a medium of advertising without cost in the car card space in his own cars and buses, and dashboard space on the outside of his cars, but its real value is not appreciated by many operators. In recent years city transportation advertisers have come to more generous use of outdoor advertising, principally in the form of painted bulletins. The radio, the motion picture and other novelty forms of advertising are included in the plans of a few companies.

High-pressure sales methods are not entirely lacking in city transportation advertising. In recent months we find a representative company in the mid-west city offering reduced bus fares on certain "express" lines during off-peak hours of the day. In another instance we find free rides advertised for the day on which a new bus route is opened. We find other companies co-operating with retail stores on special shopping days by offering free rides during certain hours.

The advertising activities of electric interurban railways, which at first were secondary to the publicity work, have

Digitized by Google

steadily grown. Companies were to a great extent impelled to adopt active selling and advertising policies by the keen competition offered in the transportation field, by the growth in popularity of the private automobile, the interurban type of motor bus and the increased hard road mileage. Because the interurban railways have been employing strenuous merchandise and advertising tactics over a longer period of time, there are available more examples of developing new business in this field than in that of the city operating company.

There are sufficient examples of developing new business with advertising in the interurban field to convince the doubtful operator that advertising, when coupled with sound merchandising principles and a saleable service, does produce results. Here again the first attribute to success in terms of increased business is a service that permits the electric carrier to compete on a service basis with other carriers. In every instance where the company has been able to secure and hold new customers it will be found that the quality of the service has warranted the merchandising and advertising that is used to sell it.

Selling Improved Service

In the passenger field many improvements designed for the special comfort of passengers, such as standard parlor, sleeping and dining cars, luxurious modernized coaches, faster schedules and smoother roadway, have been made by the electric railways. In the freight field there has been intensive solicitation for local freight and express, and many of the larger companies have redesigned and rebuilt motive power and equipment to place them in position to handle through freight in car lots with interchange of equipment and rates with other carriers. Advertising and publicity has had much to do with acquainting the traveling and shipping public with these developments.

Today we find electric railways not only using the pages of local publications for their freight traffic advertising story, but also the columns of traffic magazines with national circulation. In these pages the shipper of freight in San Francisco, in New York, in New Orleans is told that certain electric railways solicit freight shipments in carload lots to and from any point in the United States. The Illinois Traction System was the first electric railway to place its advertising regularly in a traffic magazine of national circulation. It began to tell this story only after it was capable of giving a valuable freight service to the national shipper, and now finds it profitable to maintain representatives in most of the larger cities for the solicitation of through freight business.

Taking an illustration from the remarkable story of the Chicago, South Shore & South Bend Railroad, we find an electric railway which through rehabilitation of its physical properties and reorganization and modernizing of its traffic and sales policies, almost doubled its gross revenues in less than two years. Advertising played an important part in this noteworthy transportation achievement, as it has also done in the rejuvenation of the Chicago, Aurora & Elgin Railroad.

There was a time when "doorbell ringing" was considered an undignified type of solicitation, but the advertiser of today appreciates the value of personal solicitation and the modern electric railway is making good use of this form of approach. The employee sales campaigns of some of the most progressive railway organizations have proved their worth as business producers for both the passenger and freight departments. The Chicago, North Shore & Milwaukee Railroad was a pioneer in this method, and it has also been used to good advantage by the East St. Louis & Suburban Railway in introducing new motor bus routes.

Many electric railways are acting as ticket agents for athletic events and theatrical attractions, reserving seats and selling combination tickets that include transportation and seat accommodations.

The direct mail medium of advertising is given an important place in the advertising plan of the modern electric railway. Lists of memberships of lodges, civic clubs, social organizations, school classes and various kinds of societies are usually available and the personalized letter announcing a special service or innovation is an effective and dignified method of approach, providing it is not repeated too frequently.

Outdoor advertising is a valuable medium in territories where population is dense and circulation is heavy. This has been demonstrated to the satisfaction of companies like the Chicago, North Shore & Milwaukee Railroad, the Chicago Rapid Transit Company, the Chicago, South Shore and South Bend Railroad and the Chicago, Aurora & Elgin, which have the advantage of telling their story to a tremendous outdoor circulation through the use of painted bulletins and lithographed posters.

Exhibits at expositions, public speaking activities, use of the radio, motion picture and other novelty advertising will be found in the advertising plans of many companies and are used with various degrees of success. Results from this form of media, however, are not easily checked and they are of value principally for general publicity purposes.

COMING MEETINGS OF *Electric Railway and Allied Associations*

April 6 — Metropolitan Section, A.E.R.A., 33 W. 39th Street, New York, N. Y.

April 25-27 — American Welding Society, annual meeting, 33 West 39th Street, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City, Mo.

May 2-5 — Southwestern Public Service Association, Dallas, Texas.

May 6-12—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, biennial meeting, Rome, Italy.

May 9-10—Central Electric Railway Master Mechanics' Association, Erie, Pa.

June 6-8—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.

June 20-27 — American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.

June 21-22 — American Railway Association, Motor Transport Division, Atlantic City, N. J.

June 28-29—Central Electric Railway Association, Cedar Point, Ohio.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

July 25-27—Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.

July 27-28—Central Electric Railway Accountants' Association, Detroit, Mich.

Aug. 16-17 — Wisconsin Utilities Ass'n, Transportation Section, Sheboygan, Wis.

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

American Association News

Entertainment

PLAN early and well, was the motive of C. S. MacCalla, chairman of the entertainment committee, in calling the meeting held on March 26 at association headquarters in New York. Last year's results were discussed and plans were developed for the coming convention to be held during September in Cleveland.

With the addition of a theater seating 5,000 and a smaller ballroom now being completed on the auditorium property it was planned to have all social events on the "pier," as the verbiage goes after so many years at Atlantic City.

The meeting was headed by C. S. MacCalla, chairman, and attended by J. C. McQuiston of East Pittsburgh, vice-chairman; Ralph Emerson, Cleveland; Joe Stewart, Jr., Cincinnati; S. I. Cotsworth, Philadelphia, and John A. Dewhurst, L. S. Storrs, J. W. Welsh and A. A. Hale, all of New York.

News of the Industry

Short Railroad in Michigan Does Trick

An interurban railway line boasting of only 8 miles has reversed the usual order of things by threatening to run a bus line out of business. It is the United Suburban Railway "the shortest railroad with the longest list of stockholders in the United States" that has turned the trick. Started in July, 1927, with 700 stockholders, the line runs from Grand Rapids, Mich., southwest to the village of Jenison, Mich. A bus line has covered the same route for the past few years but offered its equipment and franchise to the railroad this month for $57,000. The stockholders see little value in purchasing the line.

In 1926 the Grand Rapids, Holland & Chicago Railroad succumbed to the competition of the bus lines. With the passing of this road the residents of the territory between Grand Rapids and Jenison had no means of transportation. The bus line service did not satisfy and finally the commuters decided to own their own service.

Five cars were ordered from New York City and on July 17, 1927, using the defunct road, the first trips were made. Later it was found necessary to lease an additional car from the Grand Rapids Railroad, and early this year two more new cars were ordered from the East.

At the first annual meeting of the stockholders the books showed a profit of $2,950 for seven months of operation. Each succeeding month has shown an improvement. December, with its heavy holiday traffic, was expected to top the list, but its high mark was exceeded by January, which in turn was surpassed by February.

Hope is held out that the initial cash dividend would be paid next year. However, the 700 stockholders who reside along the right-of-way feel that they are receiving substantial dividends through increased property values since the resumption of operations.

Toronto Men Want New Agreement

Features of a new agreement shortly to be submitted by the employees of the Toronto Transportation Commission, Toronto, Ont., are a clause to give all employees two weeks' annual vacation with pay, and an increased schedule of wages for the maintenance department. With the exception of a proposed increase to maintenance men and the request for two weeks' vacation with pay, the new agreement differs little from the present, which expires March 31. The employees take the position that since they are in the employ of the city they are as much entitled to a vacation without any penalty as are other city employees.

The agreement will be for two years. It will probably not be dealt with before General Manager Harvey's return from England.

Talk of Lackawanna Electrification Revived

Representatives of 23 North Jersey civic organizations on March 27 told J. M. Davis, president of the Delaware, Lackawanna & Western Railroad, that they would use their influence to increase commutation fares if his company would electrify its lines to commuting communities. The project of electrifying these lines has been talked of for twenty years, but this was the first time that spokesmen for the public involved have come forward to aid the project. Mr. Davis said he would give the suggestions that have been made serious consideration.

It is proposed to operate trains electrically on 75 miles of road. These would include the lines from Hoboken to Montclair, Dover and Bernardsville. The cost would be about $13,000,000 if the railroad bought power from outside interests or $17,000,000 if it constructed its own generating plant.

Mr. Mitten and Amalgamated Negotiate

Conditions in Philadelphia and Buffalo to remain as at present so far as organization activities are concerned. Two-thirds secret vote will fix policy on any new lines

ANNOUNCEMENT was made on March 28 that Mitten Management, Inc., had reached an agreement with the Amalgamated Association for union labor co-operation where Mitten Management in the future may acquire or operate any transportation system, providing two-thirds of the employees of the system by secret vote agree.

Mitten Management, Inc., of which Thomas E. Mitten is the head, manages the operation of the Philadelphia Rapid Transit Company system and the operation of the International Railway system at Buffalo, but these companies are not affected by the agreement.

The agreement was reached after a series of conferences in Atlantic City among Thomas E. Mitten and his son, Dr. A. A. Mitten, chairman of the boards of the Philadelphia Rapid Transit Company and the International Railway, and W. D. Mahon, president of the Amalgamated Association; his son, O. L. Mahon; L. D. Bland, treasurer, and P. J. Shea, vice-president of the Amalgamated. The conference was arranged by W. Jett Lauck, a labor economist and former secretary of the War Labor Board.

The full memorandum of the union-management agreement, dated March 25, follows:

Mitten Management reiterates its desire to deal with organized labor whenever and wherever any union organization will undertake to co-operate for increased economic efficiency and where two-thirds of the employees, by secret ballot, may so elect.

Mahon and associates, speaking for the Amalgamated Association of Street and Electric Railway Employees of America, being also desirous of co-operating in economic accomplishment and of aiding their membership to a 50-50 participation in the rewards rightfully paid to men and management, in addition to the present wages paid, have now come to an understanding with Mitten Management, Inc., by which the following procedure will hereafter govern both parties:

The P. R. T. Co-operative Plan of 1926 shall be made effective with the union covering such system, or departments of a system, as the union may designate, after two-thirds of such employees shall have so determined by secret ballot, it being fully understood that the right to organize is a fundamental right of labor which should not and cannot be permanently abridged or denied, but it is now understood and agreed that the activities of the Amalgamated in this respect shall be restricted to properties that are to be acquired or operated by Mitten Management in the future.

So far as Philadelphia and Buffalo are concerned, conditions there are to remain as at present in so far as organization activities are concerned, it being desirable that the situation on these properties shall remain as at present in order that the standard of economic excellence of these companies now being operated by Mitten Management be the standard by which union performance in co-operating with Mitten Management on other properties shall be measured. When co-operation between the Amalgamated and Mitten Management has developed to a point where the results are equal to those obtained on these properties, the matter of union-management agreements on these properties may be discussed and be made the basis of further agreement.

Working agreements including standards of work and compensation to be matter of local arrangement and ratification. Collective consideration to be upon the basis of group representation through branch, departmental and general committees, with recourse to arbitration in case of failure of agreement. Before arbitration shall be re-

Digitized by Google

sorted to, however, the matter under discussion shall be submitted to two representatives of the International Association and two representatives of Mitten Management for review and attempted settlement. Failing agreement one arbitrator for employee and one arbitrator for employer shall be chosen, these to select a third. If these two arbitrators are unable to agree upon the third arbitrator then the Public Service Commission shall act as the third arbitrator.

Contract shall run during delivery of co-operative effectiveness, which is understood to mean that degree of assistance in securing the result on the property in question as secured by Mitten Management on the properties operated by them at this date. Non-performance by either party to be settled through arbitration. Contract may be terminated by vote—secret ballot—of two-thirds of the employees represented by the organization. Operating company and union each to supply, at their own cost, their representatives on the 50-50 collective consideration committees, also each its own secretary. Operating company and union to share equally in the office and operating expenses as mutually decided. Operating company to, where two-thirds of the employees so vote, collect by check-off system and pay to organization such amounts as the organization may from time to time decide. All the employees of the departments involved to be so assessed. Funeral, disability, old age and all other benefits to be undertaken by the union, for which operating company will pay union $1 per month per man.

In addition to the usual results of collective consideration, it is the further object of this arrangement to secure for all interested parties the advantages of collective effort and accomplishment. To the owners this will mean a fair return on their property; to the public an adequate and efficient system of transportation; and to employees, in addition to wages sufficient for the necessities of life, comfort and savings, an opportunity to participate in increased earnings made possible by their increased effort and productive efficiencies. Mitten Management and Amalgamated Association are agreed that the same 50-50 participation shall be effective between "management and union" as now exists between "management and men," and the sense of this agreement is that both shall supply the same degree of co-operation and both similarly shall participate in the results secured therefrom.

It is explained that T. E. Mitten and W. D. Mahon have been seeking industrial peace for more than 30 years. Each has always had great respect and admiration for the other. Yet more than half the time each has been obliged to fight the other by the force of the powers to which Mr. Mahon owned his leadership as president of the Amalgamated and Mr. Mitten his position representing capital.

Twenty years ago Mr. Mitten endeavored to secure co-operation as between capital and labor, but "neither the force let by Mr. Mahon nor the capital represented by Mr. Mitten could be brought each to trust the other at Chicago, and Mr. Mitten came East in 1911 to try his 50-50 plan as between labor and capital in Philadelphia where it was fully intended by Mr. Mitten and Mr. Mahon that the union and company would co-operate."

The P. R. T. co-operative plan of 1911 was signed and all looked well, but insurgents in the forces of organized labor caused it to fail in polling the agreed two-thirds vote. Then came sniping by labor at Mr. Mitten, who for the past fifteen years "has been forced to fight off organized labor and against conservative capital to protect his 50-50 plan, which is now generally admitted to have proved beneficial alike to employees, owners and public." In conclusion an official statement said:

"All's well that ends well" and "everything happens for the best" are old and trite sayings. These have proved true here. Capital has now capitulated, and had Mr. Mitten and had Mr. Mahon worked together from 1911 forward as planned, their very association would have encouraged radical labor and reactionary capital to such opposition as would have made impossible the wonderful results secured by Mr. Mitten and the men of Philadelphia and Buffalo. These two cities, independently operated, can be now used as a measuring stick for results to be obtained wherever Mitten Management and organized labor can be combined.

This resolution, dealing with the Mitten-Mahon agreement, was adopted by the employee committee men of P. R. T., on March 27.

Whereas Mitten Management has made a formal agreement with the Amalgamated Association covering future relations; and

Whereas the basis of this agreement is the policy of men and management co-operation and fair dealing which has since 1911 guided the activities of men and management on P.R.T. system; and

Whereas this agreement in no way affects the present relationship between P.R.T. employees and Mitten Management under the co-operative plan, but on the contrary makes the men of P.R.T. system, with independent operation, the pattern of co-operative efficiency by which future Union-Management accomplishment will be measured: Therefore be it

Resolved, that the joint convention of employee and employer committees of the Philadelphia Rapid Transit Company obligate themselves jointly to maintain such a continuing degree of excellence in co-operative efficiency as will well justify the confidence thus expressed in us. And be it further

Resolved, that we indorse this agreement and extend to Mitten Management our congratulations on this accomplishment which, after many years of misunderstanding, indicates the acceptance by organized labor in the street railway industry of the fundamental principles of the Mitten plan.

Uniform Franchise Expiration Sought

An application has been filed with the City Council by the Spokane, Coeur d'Alene & Palouse Railway, Spokane, Wash., the Great Northern subsidiary owning and operating the former Inland electric railway system, asking that its franchise on Main Avenue, between Washington and Wall, be extended until 1930 in keeping with the expiration dates of other franchises held on that street. The company is not operating electric cars over this part of its line, but has leased the trackage to the Spokane United Railways. It has three franchises on Main Avenue, and wants a common date of expiration for all of them.

Progress on Merriam-Shawnee Line

Officials of the old Hocker Line, christened the Kansas City, Merriam & Shawnee Railroad, are planning to rush its opening. Work of putting back that part which was torn up after the line was sold last winter is expected to start immediately.

The new line has been granted a charter and has applied to the Public Service Commission to operate from Eighth Avenue and Southwest Boulevard in Kansas City, Kan., through Merriam and Shawnee to Rose Hill. The reorganized company may be able to resume service about Easter.

Fare Increase in Los Angeles Denied

Holding the 5-cent fare of the Los Angeles Railway, Los Angeles, Cal., to be "not unreasonable" the California State Railroad Commission in a decision made public on March 26 unanimously denied the company's application for an increase from the present 5-cent fare to a 7-cent fare or four rides for 25 cents. Application for the increase was made to the commission on Nov. 17, 1926. A valuation of the properties made by the commission was declared to amount to $42,000,000. This was used as a rate base. The figure includes undepreciated cost of properties with land at present values; also an allowance of $750,000 for materials and supplies on hand and of $250,000 for work in progress.

In its decision the commission declared the net earnings for 1927 to be $2,070,261 or 4.9 per cent on the rate base of $42,000,000. The commission held that this return had been earned in spite of the fact that the company had made no effort to take advantage of possible economies pointed out by the commission at previous hearings on the question.

Commissioner Carr in a separate but concurring opinion declared that this was the second time that the Los Angeles Railway Corporation had applied to the commission for permission to depart from the 5-cent fare and enter upon what he termed "the unchartered sea of multi-coin fares," this referring to the proposal to issue tokens at the rate of four rides for 25 cents. He pointed out that on May 31, 1921, the commission issued an order permitting the company to charge a 6-cent fare with ten tokens or tickets for 50 cents, under certain conditions which the company did not accept. He added that during the period 1921-1927 under the 5-cent fare, the company realized average net earnings of 6.6 per cent. The fluctuations, the commissioner continued, indicate the danger of attempting to arrive at a satisfactory conclusion as to rates based upon the experience of as short a period as one or two years. He said he believed there was no convincing evidence that the present cycle of low earnings was permanent.

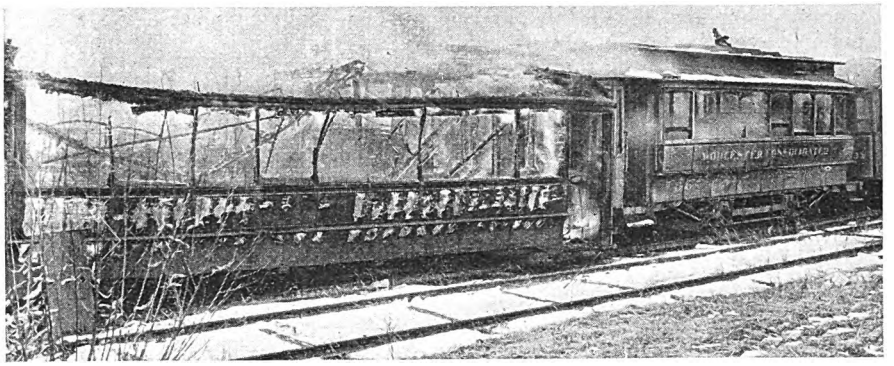
Graveyard Fires in Worcester and Springfield

Under the plan of the New York, New Haven & Hartford Railroad for the thorough rehabilitation of the railway properties in both Worcester and Springfield, Mass., a group of 130 cars was burned recently in Worcester. This group is part of 189 cars burned during the last two weeks. The grand total of cars in Worcester sold for scrap and to be burned is 375. In addition 128 obsolete cars formerly operated in Springfield are to be fed to the flames.

As has been noted before in the ELECTRIC RAILWAY JOURNAL, the program of burning old equipment is part of the process of putting the Springfield and the Worcester properties in first-class operating condition by the purchase of new cars, reconstruction of track, building of a new carhouse and garage in Worcester and the elimination of all facilities that cannot be rehabilitated and put into efficient operating condition.

The final chapter that made possible the program now being carried out at Worcester and Springfield was written early in January, 1927, when the Public Utilities Commission of Massachusetts approved the acquisition of stock of the New England Investment & Security Company by the New York, New Haven & Hartford Railroad. The commission at that time approved the acquisition of $300,000 of first mortgage bonds of the Springfield Street Railway, authorized the issue of shares of preferred stock of the New England Investment & Security Company and authorized the acquisition of outstanding shares of the common stock of the New England Company.

Almost immediately thereafter the New Haven Railroad entered upon the program of rehabilitation calling for the expenditure of many millions of dollars on these properties that is now fast being brought to completion. Included in that program has been the realignment of the systems in both cities with the lopping off of many railway branches operated in territory sparsely settled and the substitution of bus lines for them with subsequent co-ordination of both railway and bus lines on a scale perhaps never before attempted in cities situated similarly to the two very thriving industrial communities of Massachusetts served respectively by the Worcester Consolidated Street Railway and the Springfield Street Railway.



A hook-up with the past unloosed

Would Appeal Frankfort Ordinances

An appeal from two city ordinances at Frankfort, Ind., was taken on Feb. 23 by the Terre Haute, Indianapolis & Eastern Traction Company in petitions filed with the Indiana Public Service Commission, protesting against the speed limit of 4 m.p.h., that has been fixed by the City Council in Frankfort and other regulations pertaining to track repairs. The railway was recently ordered to pave between its tracks and because of failure to do this, the Council, it is said, passed the speed regulation as a retaliatory measure.

Interborough Not to Appeal Decision in Labor Suit

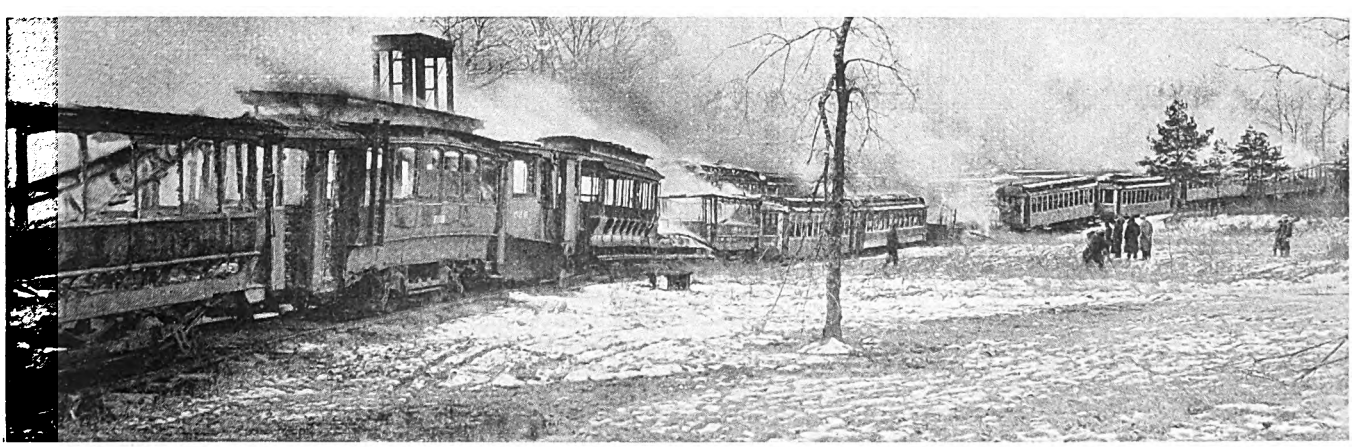
James L. Quackenbush, general counsel for the Interborough Rapid Transit Company, New York, on March 23 notified Nathan D. Perlman, counsel for the Amalgamated and other labor bodies, by letter that he had decided not to appeal from the decision of Supreme Court Justice Wasservogel denying the company the restraining orders sought. The Interborough has dismissed most of its employees who joined the union and the labor organizations failed to carry out strike threats.

Terminable Permit Bills Signed by New York Governor

Governor Smith, of New York, has approved the two Thayer bills, the one amending the transportation corporations law, to provide for terminable permits for stage, omnibus and motor vehicle lines, as chapter 717 of the laws of 1928, and the other amending the railroad law, to accomplish the same purpose for street surface railroads, as chapter 733 of the laws of 1928. The bills provide that every city, town or village, in addition to other powers now conferred on them by law, shall have power to grant to street railways and to bus corporations a terminable permit to occupy and use its streets.

Every such municipality shall have power to enter into an agreement for the purchase of and to acquire by purchase all or any part of the property, plant and equipment of such a corporation actually used and useful for the convenience of the public, operating under terminable permit, and upon purchase thereof to operate, or to contract with any person, firm or corporation for the operation thereof. Power is also granted to the municipality to amend any existing license, grant, franchise or permit, or any of the conditions thereof, whether granted by municipal authority or directly or indirectly by the state or otherwise, or any consent of local authorities, or any of the terms, provisions or conditions thereof, relating to construction or operation.

Every terminable permit and every amendment to any existing license, grant, franchise, permit or consent in-



One horseman fire visits Worcester

Digitized by Google

corporating therein the terms of a terminable permit, shall contain an irrevocable option for the purchase by the city, town or village, either directly or through its nominee or nominees, of all or any part of the property of the transportation corporation.

All terminable permits and amendments thereto are to be subject to the approval of the Public Service Commission or the Transit Commission.

It has been hinted that the immediate effect of the bill will be to further a proposal to reorganize the surface transportation of Brooklyn in order to overcome the city's objection to inclusion of surface railway lines in a comprehensive unification plan.

Wage Hearing in Fort Wayne

A hearing was held in the Allen County Courthouse, Fort Wayne, Ind., on Feb. 27 before Commissioner Harvey Harmon at which operators and officials of the Indiana Service Corporation presented their arguments on the employees' petition for an increase in wages. The men, who had asked the Public Service Commission for a hearing, contended that the wage scale at present was inadequate and the company stated that business conditions and a general falling off of electric railway revenues made it impossible at the present time to grant the requested increase. Following the taking of testimony from the men and the company the commissioner said that a later date would be set for oral arguments before the full commission.

Crash on Long Island Injures More than a Score

A twelve-car train of the Long Island Railroad left the rails in the Sunnyside Yards in Long Island City on March 28 at 8:15 a.m., bringing serious injury to four, lesser hurts to 30 more, and ripped up 600 ft. of roadway, bringing commuters to their offices late and demoralizing traffic on the road throughout the day. Four investigations are under way as to the cause of the wreck. The derailed train was made up of sections coming from Speonk and from Long Beach combined at Jamaica.

New York City to Try to Recover Subways

The Board of Estimate of New York voted on March 29 to sue the Interborough Rapid Transit Company for the return of the city-owned subways as the city's answer to the Interborough's attempt to raise the fare to 7 cents. The counter suit was not started, however, because a federal court decision which former Comptroller Charles L. Craig, the city's new special counsel, is awaiting was put off until April 2, at which time a hearing before the Federal Statutory Court, scheduled for March 29, will also be held.

$75 for Best Design in St. Louis

Miss Florence Boeffer, St. Louis, Mo., a student in the Fine Arts School of Washington University, submitted the design which will be used by the St. Louis Public Service Company to mark all its street cars and insignia. She won the first prize of $75 in the contest conducted by the company among the students of Washington University. Miss Roberta Shine won the second prize of

Prize winning design

$50, while the third prize of $25 went to Fred Dreher. More than sixty students participated and some submitted as many as fifteen designs.

The design is suitable for use on cars and motor buses, on badges of conductors, motormen and chauffeurs and on caps and uniform buttons as well as for stationery and other printed matter.

Still Dallying with Boston "L" Legislation

There are no clear-cut lines yet for the form that the Boston Elevated Railway legislation may take this year, although the matter has been before the Massachusetts Legislature almost daily since its opening. Opinion sways with the wind. From present indications it seems likely there will be no Elevated legislation, though Governor Fuller has stated more than once that he will keep the Legislature in session all summer, if necessary, to straighten out the Elevated situation.

It is quite clear that no public control bill can get through the house and no public ownership bill can get through the senate. Both branches are opposed to returning the road to the stockholders. On the other hand, the Committee on Metropolitan Affairs and Street Railways has voted, fifteen to fourteen, to report a bill for public ownership, but some of the members who voted with the majority are known to have done so merely to break the deadlock and are not in favor of public ownership.

Matthew C. Brush, president of the American International Corporation, New York, and former president of the Boston Elevated Railway, was in Boston during the week ended March 24 and delivered a bristling address before the Boston Chamber of Commerce, in the course of which he rejected as useless all the propositions that have been raised before the Legislature this year. Among other things he said:

You have an impossible situation over the Elevated Railway problem. You haven't suggested a solution up to 12:30 p.m. today. I have no suggestion to make. But I do advise you not to rush into a solution until you are dead sure you are right. A hurry-up job is worse than none at all.

The statement in the interview attributed to Mr. Brush to the effect that the road could be run profitably on a 6-cent fare has since been denied.

New Franchise Sought in Wichita, Kan.

The Wichita Transportation Company, controlling both street cars and buses in Wichita, Kan., has asked the city commission for a new franchise. In return, the corporation promised the highest efficiency possible in transportation and the directors pledged themselves to fight with the commission for a return of "home rule" over buses to Wichita.

Robert C. Foulston, attorney for the carriers, explained at the start that his board of directors had decided that it was best that control over both street cars and buses be vested in the city.

The terms of the franchise were then discussed. The new franchise would run for twenty years. The carrier would have the right to supplement and extend its lines by automotive equipment as it became necessary and the commission would have the right to demand such extensions as it deemed necessary. The City Commission, by right of the ordinance, could fix the bus and car fares, but should not deny the company the right to earn 8 per cent, with any excess over that amount to be applied to the reduction of fares.

At the start, both bus and car fares would be 8 cents for one fare, 15 cents for two, 35 cents for five and $1.50 for 24 fares, with the universal transfer system in force.

There would be co-ordination between cars and buses with competitive elements eliminated. The city would retain the right to purchase the transportation system any time that it desired, providing a fair price was paid for the properties. Mr. Foulston was unable to state the value of the system, but he gave the combined property account at about $3,000,000. As to the financial condition of the company now, it was said that there are $1,490,000 in first mortgage bonds, $300,000 in 7 per cent preferred stock and $500,000 of preferred stock in the Wichita Transportation Company, recently floated to buy the independents, build a garage and add new equipment. There was a floating indebtedness which he could not describe as to amount.

Mr. Foulston stated that only one year remains for Howard Wheeler, R. C. Clevenger, R. B. Campbell and associates to finance the local transportation system which they plan to take over from the Illinois Power & Light Corporation. The franchise is considered necessary if this financing is to be consummated. He said there will be 20,000 shares in the new system. A total of 4,000 shares will be held by the Illinois Power & Light Corporation and 16,000 will be in the hands of the local cap-

Digitized by Google

italists. They must refinance the 16,000 shares by next March 1 to get the properties.

Mayor A. J. Coombs has indicated that an early answer may be expected from the city.

Valuation Figures in Madison Vary

In connection with the valuation news about the Madison Railways contained in the article in the JOURNAL for Feb. 11, page 252, it should be explained that the Railroad Commission of Wisconsin, in a late hearing, valued the property on the basis of reproduction new at $1,559,089 and less depreciation at $1,268,096 whereas the expert engineers of the company in valuation proceedings valued the property in detail with each item clearly set forth at $2,188,501 and less depreciation at $1,960,216.

It is understood that the company considers the valuation placed upon its property by the Railroad Commission engineers very much less than any court of equity would approve. In the meantime it has accepted in good faith the ruling of the commission with reference to fares in the hope that the outcome will be mutually satisfactory to the company, the city, and the commission.

Another Move in Baltimore Fare Case

The People's Corporation at Baltimore, Md., has asked the courts to set aside the Public Service Commission's decision granting the United Railways a 9-cent cash fare with three tokens for a quarter and return to the old 8-cent rate with two tokens for 15 cents.

The appeal from the commission's February ruling was filed in Circuit Court No. 2 by Linwood L. Clark, counsel for the People's Corporation. The People's Corporation, according to Mr. Clark, is composed of numerous civic organizations having a combined membership of 300,000.

Counsel for the United already has carried to the same court its appeal for a straight 10-cent fare which the company asked in its petition to the commission last August.

Need of Increased Fare for St. Louis Stressed

Unless the fare increase sought by the St. Louis Public Service Company, St. Louis, Mo., is granted by the Missouri Public Service Commission it will be impossible to maintain the railway system on the present 80 per cent efficiency basis according to a brief of the company filed with the commission on March 9. The company seeks a straight 8-cent fare for adults, this rate to be based upon a property valuation of $75,000,000. This fare would net the company approximately $2,000,000 which is only 6 per cent on the valuation claimed. Refusal of the increase requested would, the brief says, "drive the company into a pecuniary decrepitude which would result in another receivership, and the property and equipment would fall into a condition of disrepair which could only be corrected after the lapse of many years and the expenditure of many millions."

The city in its brief contends the valuation of the company's properties should not exceed $53,000,000. This is only $1,000,000 greater than the tentative valuation fixed by the commission pending the completion of the rate case. It was the contention of the company that the reproduction value of its property would be $98,573,000. The rate case has been before the commission since June, 1926.

Grand Rapids Solicits Suggestions

Employees of the Grand Rapids Railroad, Grand Rapids, Mich., are asked through the columns of *The Token*, the official paper of the company, to submit their ideas on the betterment of service and working conditions for their own benefit and the benefit of patrons. The men are asked to drop suggestions in the suggestion box in the carhouse, shop or general office and not to let an idea slip away, go undeveloped or unknown where it might do the company and others much good. In the February issue of the paper awards are announced for such suggestions as coat hooks on cars for operators' overcoats, blanks for operators' use in caring for mistakes of passengers in farebox errors, and many others.

Wages in Memphis Unchanged

Wages on the Memphis Street Railway, Memphis, Tenn., shall remain unchanged the board of arbitration decided on March 23. Declaring the present scale a satisfactory one the board denied the union's demand for a 9½-cent increase and the company's demand for a 7½-cent decrease. For one-man car operators the men sought an increase in the differential from 5 cents to 20 cents. This finding becomes effective on April 1. A. B. Galloway, representative of the union, dissented from the majority report, signed by W. A. Ransom, chairman and neutral member, and Frank N. Fisher, company member.

Back of the proceedings just ended are many months of almost continuous negotiation by both union and employers for changes in the wage scales. In the spring of 1926 an arbitration board granted the men an increase in hourly wages of 2½ cents. That scale which is continued, provides 47.5 cents an hour for men who have worked with the railway for less than two years, 52.5 cents an hour after the second year, and a top wage of 57.5 cents an hour for three-year or more men.

T. H. Tutwiler, president and general manager of the railway, says the company will make a new contract "upon a reasonable and satisfactory basis."

Hearing on Chicago "L" Increase on April 28

Consideration by the Illinois Commerce Commission of the Chicago Rapid Transit Company's application for an increase in fares, which began in Chicago on March 15 with the presentation of evidence by the company, has been postponed until April 28. The company is asking to have the $1.25 weekly pass and the three-for-a-quarter ticket rate abolished, leaving only a straight 10-cent cash fare.

H. J. Dunbaugh, attorney for the Rapid Transit Lines, explained that the company is receiving a return of about 3½ per cent on its investment, while the commission itself has held that a return of 7½ per cent would be fair. The proposed increase will bring the company's return up to only 6 per cent.

Mr. Dunbaugh recalled that in 1919 the Illinois Commerce Commission found the value of the Rapid Transit Lines properties to be $86,250,000. However, since that time, he contended the value had increased nearly $10,000,000. Harley Johnson, general manager, testified that wage increases since 1922 had totaled $1,251,339.

In deferring the hearings until after the April primaries, David H. Jackson, chairman of the commission, has allowed the city more time in which to prepare its testimony.

Right-of-Way of Chicago & Southern Becomes Highway

The Will County board of supervisors has just concluded negotiations for the purchase of the right-of-way from the Kankakee County line north to Monee, a distance of 6½ miles, formerly used by the Chicago & Southern Traction Company. Paralleling this strip must come an additional 40 ft., being purchased from land owners. This will supply the 90 ft. necessary for the construction of the new super-highway by the state of Illinois between Kankakee and Chicago, the first stretch of 4 miles, extending from Kankakee to the north, being under construction by the state. The railway suspended 2 years ago.

Dispute Ends Amicably in Winnipeg

A dispute in Winnipeg, Man., Canada, over the dismissal of a conductor of the Winnipeg Electric Company has been settled without the threatened strike. Through the efforts of two members of the Conciliation Department and Hon. Peter Heenan, minister of labor, and A. W. McLimont, president of the company, negotiations were opened and the men's committee agreed to have the conductor reinstated in some capacity other than that of conductor. The company maintained that since it was misconduct on the part of an employee it was therefore a matter of discipline and required no board of conciliation. Conciliation proceedings were set up under the industrial disputes act by the Canadian Government.

No Date Set for Public Utility Hearings

The Federal Trade Commission states that the date for beginning public hearings in connection with inquiry into public utilities has not been definitely decided. Commissioner McCulloch, who authorized the statement, said every effort was being made to speed the day when the session will be started.

Commissioner McCulloch's interpretation of the Senate resolution is that while the Senate prescribed an investigation of a public nature, "it intended that we make preliminary inquiry and collect facts upon which to base our evidence for introduction at the hearings. Thus the whole inquiry falls naturally under two headings, general investigation and public hearings."

He added that he was anxious to begin the public hearings in the utilities investigation at the earliest possible moment, but that so far the commission had not reached the stage where it was ready to proceed.

The preliminary inquiry now in process has generally to do with business and financial facts on the one side and the question of alleged propaganda and influencing of elections on the other.

A. G. Mott Defends Zone Fare for Key System

Defending his 5-cent zone fare plan, which the Key System Transit Company, Oakland, Cal., is opposing, A. G. Mott, chief engineer of the California Railroad Commission, occupied the stand the entire day at the rate hearing before Commissioner Clyde Seavey on March 21 in San Francisco. Operation of street cars under his plan, Mr. Mott declared, would increase the company's annual revenue anywhere from $134,000 to $834,000. The engineer further asserted that a rate increase would result in a decrease in patronage that would bring about curtailment in service followed by a further patronage decrease. He estimated that a rate increase from 5 to 6 cents would bring a 20 per cent patronage loss, an increase to 7 cents a 40 per cent loss, and an increase to 10 cents a 73 per cent loss.

The cross-examination of Engineer Mott was resumed on March 24. This rate hearing has been going on intermittently for three months and is now nearing the end. Key System officials contend that operation of the Mott 5-cent zone plan would force the road into bankruptcy. The company wants a 10-cent fare with $1 weekly passes.

Illmo Limited in Operation

The Illinois Traction System has added two parlor-car trains to its fleet between St. Louis and Peoria. The new trains are known as the Illmo Limited. The trains are dispatched from St. Louis and Peoria, Ill., at 10 a.m. daily, making the run in five hours.

Recent Bus Developments

Detroit Operation Raises Storm

Purchase of additional vehicles must await special report. Inquiry into results of present operation

THE Detroit Street Railway Commission has ordered a complete survey of the department's bus system under supervision of William B. Mayo, chief engineer of the Ford Motor Company and consulting engineer of the department. Until this survey, which will study the department's methods of bus cost accounting, the commission decided to defer considering purchase of additional buses.

Commissioner Barlum called the meeting to order at which this decision was made. Commissioner John J. Gorman is reported to have then said:

I hope my criticism won't be taken as a reflection on the manager, but I haven't had a good reason presented to me why these additional buses should be purchased. Likewise I have heard no description of where they are to be used. I have made an investigation and I find that the department has a lot to learn about bus operation.

We should know costs. Our statement shows that it costs 24 cents a mile to operate buses, while, as a matter of fact, the cost is nearer 34 cents a mile. There are many things, such as cost of supervision, pro rata share of overhead on shop equipment and other similar items, that are not charged against bus operation. We have no definite figures.

Isn't this going too fast? As our finances are nothing to brag about, wouldn't it be wise to hire outside aid to investigate the department's bus situation? The Woodward Avenue line lost $80,000 a year. Out of 43 lines, only fifteen show a profit under the department's own figures. Obviously we need buses, but we should postpone buying more until we investigate.

"I'm told our shop methods are lax. We don't know definite costs. We are groping in the dark about the operating costs of the eleven or twelve different type buses. I haven't talked with any one in the department who has practical experience in operating buses.

General Manager Smith, of the department is said to have replied:

The double-deck buses, purchased eighteen months ago, I had nothing to do with. They are obsolete now and we can't forecast what type of bus is to come three years hence. I don't think we can defer enlarging our system. The new buses will be used on Chalmers and Livernois Avenues, the two fastest growing lines in Detroit. Our bus traffic has grown from a few thousand to upward of 37,000,000 passengers last year. You can bring in a staff of reputable engineers and if they don't tell you that the buses are operated economically, I'll resign. There has been a lot of misinformation and not enough real information handed around.

After Mayor Lodge intervened, Mr. Smith continued to answer questions of both commissioners with the statement that "bus costs might be a shade more than is shown in the auditor's figures," and Mr. Barlum retorted: "If we don't get costs of bus operation, we had better get new auditors." Mr. Smith also stated that cost figures on each type of bus are being segregated now.

The Mayor is quoted as follows:

Shortly after election, I studied the audits of Mr. Hauser and Price-Waterhouse and came to the conclusion that, if possible, I would have an entirely neutral firm take the two audits and reconcile them. Ralph Stone, of the Detroit Trust Company, consented to do this and his report will be ready about May 1. There was no use for me to do this and I wanted some one in whom the public had confidence. Until May, we won't be in any position to talk about accounting.

As to bus operation, I don't believe the D. S. R. general manager wants to do anything unnecessary and I am glad that Mr. Gorman has raised his questions. I should like to have the survey made for me and also for Mr. Smith. And Mr. Smith, I should like to have you consider carefully the question of turning the D. S. R. purchasing department over to the city purchasing department.

Sale of Louisville Franchise Set

Mayor Harrison of Louisville, Ky., affixed his signature to the bus franchise ordinance he sponsored and which had passed the Board of Aldermen on March 20. The ordinance was passed without a dissenting vote. John Chandler, attorney for the jitney bus operators, and George C. Burton, representing labor interests, opposed the measure. On March 22 the Board of Public Works announced that the bus franchise provided for in the new ordinance would be sold at public auction on April 2. The sale is regarded as a matter of form since the ordinance was drawn with a view to the acquisition of the franchise by the Louisville Railway.

Shore Line Operating Offices Removed to Hammond, Ind.

J. C. Johnson, general manager of the Shore Line Motor Coach Company, a subsidiary of the Chicago, South Shore & South Bend Railroad, and a large mechanical and operating personnel were removed recently from Michigan City and are now housed in the company's new garage and office building in Hammond, Ind. Removal of the company's headquarters from Michigan City to the more central point on the system was effected because of the sale last December of the Shore Line routes from Chicago to Detroit and from Benton Harbor north to Muskegon, Mich., to the Motor Transit Corporation of Chicago. The service between Chicago and Benton Harbor is still maintained, however. A small staff and office is still retained in Michigan City to handle the Benton Harbor division.

Operators in Cleveland Rewarded for Safety Records

Morse W. Rew, superintendent of the motor coach department of the Cleveland Railway, Cleveland, Ohio, at a dinner at the Winton Hotel in that city on March 16 made the first awards of this kind to 98 men who had operated three months without a chargeable accident. As chairman of the evening Mr. Rew introduced Judge Skeel, president of the Cleveland Safety Council, who talked to the coach drivers on the part that safety plays in safe driving. Earl J. Harrington, superintendent of accident prevention division, also talked briefly on the relationship of accident prevention to operation of coaches.

An outstanding fact was that eight of the drivers operated during the period of three months without any accident, either chargeable or non-chargeable. Should these men continue this record for one year, they will receive a certificate symbolic of their good operating record.

As a means of promoting safe operation a committee of coach drivers recommended to the management on Nov. 1, 1927, that awards be made to the coach drivers who operate without chargeable accidents. The recommendation was approved, and awards were arranged upon the following basis:

Bronze safety pins for those drivers who operate three months without chargeable accidents.

Silver safety pins for those drivers who operate six months without chargeable accidents.

Gold safety pins for those drivers who operate one year without chargeable accidents.

It was in accordance with this plan that the first awards were made on March 16.

Buses to St. Louis Zoo

The St. Louis Public Service Company, St. Louis, Mo., has been granted permission to operate buses on Sundays and holidays along Kingshighway from Manchester to Oakland Avenue. The buses will replace the one-man street cars heretofore used on this stretch during the Summer months when the Taylor Avenue division runs direct to Forest Park Highlands amusement park and the Zoo in Forest Park.

New Move in St. Paul Following Voters' Action

Voters at St. Paul, Minn., will have submitted to them for action at the election on May 1 a proposed charter amendment authorizing the city to engage in bus transportation. The draft of the amendment was voted unanimously for submission March 22 by members of the City Council. For passage the amendment must receive a favorable vote of 60 per cent of the ballots cast at the election. This action follows refusal of the voters at the last election to adopt an amendment allowing the City Council to vote expense relief suggested by the Minnesota Railroad & Warehouse Commission to enable the St. Paul City Railway to come nearer the 7½ per cent return on its valuation authorized by the commission. This included cost of paving between tracks where the streets are already paved. The company has before the commission application for an increased rate of fare, now 8 cents or six tokens for 40 cents.

New Interstate Bus Bill Introduced

Measure now before House represents legislation regarded as not too restrictive yet sufficiently protective

CONGRESSMAN PARKER, chairman of the House committee on interstate and foreign commerce, introduced on March 24 H.R. 12380 as a substitute for his bill H.R. 5640 and, with the consent of Mr. Denison, as a substitute for H.R. 19. This bill was introduced at the request of a legislative subcommittee of the bus division of the American Automobile Association which, under the instructions of the bus board and bus division legislative committee, has since Dec. 2, 1927, been negotiating with all the interests concerned in an attempt to get a bill satisfactory to everybody which would stand a good chance of passage at this session.

In the opinion of the bus board and legislative committee, H.R. 12380 represents more perfectly the viewpoint of the bus operators in the bus division than did the Denison bill, and, at the same time, it has the approval of the American Electric Railway Association, the American Association of Railway Executives, and, informally, pending an official meeting of its legislative committee, the approval of the National Association of Railroad and Utilities Commissioners. The bill also includes several recommendations which were made by the National Automobile Chamber of Commerce at meetings between representatives of that organization and the bus board in Washington on Nov. 11 and Dec. 2.

The chief changes in H.R. 12380 over Mr. Denison's bill are as follows:

1. The two classifications have been omitted and the term "motor carrier" redrafted to take care of this change.
2. The "grandfather" clause has been changed from March 3, 1925, to one year prior to the opening day of the legislative session at which the act is passed.
3. The provision for a suspension of rates during the time when hearings are being held on a protested rate has been omitted. The regulating agencies, under the terms of the act as now written, are without authority to suspend a rate pending the outcome of a controversey.
4. The different matters which under the old bill the board or commission was required to take into consideration before granting a certificate of convenience and necessity have been cut down to a statement that, among other pertinent matters, the board or commission shall give reasonable consideration to the public convenience of and necessity for the transportation proposed and to existing available transportation agencies and service.

These represent the major changes. The only other change to be noted is that the excess phraseology in the bill has been eliminated and where the Denison bill ran to 25 pages, H.R. 12380 runs to only 20 pages. In drafting the bill every effort was made to follow to the closest degree possible the recommendations which were made to the Interstate Commerce Commission at the time of the oral argument on the examiner's tentative report in docket No. 18,300, held at the commission's office on Feb. 10.

No definite information as to hearings on interstate legislation is forthcoming as yet except that whatever hearings are held will be on H.H. 12380 and will not involve anything directly or indirectly connected with motor truck transportation. In an informal statement made to representatives of the bus division on March 28, Mr. Parker said that he would do everything he possibly could to have the committee take early action and he thought that hearings might be held the first or second week in April. At least a week's notice of the date which the committee would set for hearings has been assured. An official statement says:

> The bill as it now stands is simple in form and covers all the fundamentals of regulation. Everybody participating in the conferences at which the bill was drafted was agreed that the bus should be given every opportunity to develop along sound, healthful lines and, except for those provisions necessary for the protection of a certificate, no attempt was made by anybody to insert anything which could be construed as being at all restrictive.

Governor Signs New Jersey Bus Bill

Governor Moore of New Jersey has approved Senator Wolber's bill, senate 204, authorizing the substitution of buses for trolley cars, and extending the Public Utility Commission's control over corporations operating both railways and buses as one system. Under the terms of the bill it is announced many improvements in the transportation system of the Public Service are planned. One of the immediate changes is in West Hudson and Bergen County, where the Hackensack-Newark railway line, is to be turned into a bus line from Hackensack to Rutherford, while from Rutherford the present railway line is to be continued. There is already a de luxe bus line from Hackensack to Newark.

Consolidation Rumors in Albany

An unconfirmed rumor is afloat in Albany, N. Y., that plans are being negotiated for a consolidation of all existing bus lines radiating out of Albany. It is said that a bus corporation operating in the northern and central portion of the state and a railroad controlled corporation are both seeking to promote such a consolidation.

Financial and Corporate

Canadian Park Property Passes to Electric Railway

The Canadian National Electric Railways has taken over the ownership of Eldorado Park served by the Toronto-Guelph line of the railway. Its former owners were a group of business men in Brampton and vicinity. The amount involved in the transfer has not been made known. It is stated that the park will be placed under the same management as the railway company's Lakeside Park at Port Dalhousie.

Eldorado Park has an area of 128 acres, and is looked upon as the choicest picnic property in the vicinity of Toronto. It is located upon the upper reaches of the Credit River, where nature has been generous in making that part of the country a delightful beauty spot. The most direct route to the park is over the railway's own line, but it is only a short distance from the Provincial highway running through Brampton.

The railway has under way a program of improvements to the park facilities, in order to bring it up to the same standard as the park at Port Dalhousie.

Mayor of Philadelphia Would Act to Condemn "Underliers"

Mayor Mackey of Philadelphia intends to start action on the McChord plan to untangle the city's transit problems by condemning Philadelphia Rapid Transit Company "underliers." Only a short time ago General Atterbury in a letter to the Mayor explained that elimination of the subsidiary companies would remove obstacles now in the way of developing the Pennsylvania Railroad terminal west of the Schuylkill.

Mr. Mackey says that he may ask the Public Service Commission to determine the value of the "underliers" in time to submit the question of their purchase to the voters in November. The McChord plan, he explains, calls for increasing the city's indebtedness to $136,000,000, but not for any increased charge against the city borrowing capacity.

St. Joseph and Benton Harbor in Sale Proposal

A proposal is under consideration by local business men to purchase and expand the railway in the twin cities of Benton Harbor and St. Joseph, Mich., now run by the Benton Harbor-St. Joseph Railway & Light Company. A committee of six has been named by the Benton Harbor Chamber of Commerce to analyze the proposal and report its recommendations.

The question came up recently when it was revealed that the American Gas & Electric Company, which owns the outstanding capital stock of the local company, contemplated the sale of the system. The American Gas & Electric Company is interested principally in gas and electric properties.

Receivership Case in Binghamton Still in Courts

Federal Judge Frank Cooper has received briefs in Albany on the motion entered by attorneys for the Chatham-Phenix National Bank & Trust Company, New York, in which permission was requested to foreclose and sell under a mortgage held against the Binghamton Railway, Binghamton, N. Y.

The Chatham-Phenix is trustee under the first mortgage of $500,000 by the railway. That company asks for extension of the present federal receivership of William H. Riley. It wants the proceeds of the receivership to be allocated so that $100,000 in interest overdue and accruing on the mortgage may be paid.

A brief has been filed in opposition on behalf of the Traders Trust Company, Binghamton, trustee under the general consolidated mortgage of 1901, under which the receivership now stands.

Another hearing is scheduled to be held on April 5 before Special Master Roy C. McHenry, who will report to Judge Cooper.

Cincinnati Street Railway Doing Well

More passengers being carried. Surplus of $172,765 from railway operation, but loss on coaches. Interesting comment by President Draper

OPERATION of the Cincinnati Street Railway, Cincinnati, Ohio, for the year resulted in an increase in the number of passengers carried and a slight increase in the actual surplus over all expenses, taxes and charges. The surplus would have been greater had it not been that a larger amount than had been anticipated or required to be accrued into the special depreciation reserve fund, was expended to take care of track reconstruction. Part of this was charged as an operating expense. Walter A. Draper, president of the company, said:

The test of the successful operation of the Cincinnati street railway under the service-at-cost plan is the amount of money that is paid into or withdrawn from the fare control fund. In the last two months of 1925, following the date when the new franchise went into effect there was paid into the fare control fund in the way of surplus earnings $6,775. In the year 1926 the amount was $14,064, while in the year 1927 the amount was $20,339. The initial amount paid into the fare control fund when the new operations started was $400,000, provided from the sale of securities, which has been increased to $441,177 by the amount added in the 26 months of operation.

These small additions in themselves indicate, under the service-at-cost plan, that the rate of fare is almost exactly the right figure to provide for all of the requirements for the proper operation of the property. A total deficiency in an equal sum for the period mentioned would indicate the same thing. The fare control fund is provided as a reservoir into which small surpluses and out of which small deficits shall be paid so as to avoid too frequent changes in the rate of fare. It will be recalled that if the surplus should increase the fare control fund to $600,000 fares would be reduced, and, likewise, if deficits should be paid out of the fare control fund so as to reduce it to $200,000 fares would have to be raised. The rate of return to stockholders is fixed under this plan. Instead of the piling up of a large surplus as a proof of sound financial condition, the fare control fund and possible increases or decreases in the rate of fare provide the stability and protection that a corporation must have in order to have good credit and realize successful operation.

Two Full Years Under New Operation

The Cincinnati Street Railway has completed two full years of operation under the new plan and at the rate of fare that went into effect on Nov. 1, 1925, of 8⅓ cents for tickets and 10 cents cash. It is possible therefore to present a statement showing the results of operation for the two years that are fairly comparable, being on the basis of the same corporate and financial structure and the same conditions of operation with two exceptions; first, the property of The Cincinnati & Hamilton Traction Company was operated under lease as part of the system to April 1, 1926, at which date it was purchased and made an integral part of the property; and second, the company began the operation of motor coaches in April, 1926, having no operations of that character prior to that date.

The results of operation of Cincinnati Street Railway including cars and coaches follow:

	1927	1926
Operating revenue	$8,700,257	$8,065,296
Operating expenses	6,332,429	5,846,221
Net operating revenue	$2,367,827	$2,219,074
Taxes	771,369	708,831
Operating income	$1,596,458	$1,510,242
Non-operating income	48,021	37,220
Gross income	$1,644,480	$1,547,463
Rental, interest, sinking fund and return on capital	1,624,140	1,533,399
Balance	$20,339	$14,064
Fare control found previous balance, including initial $400,000	420,837	406,733
Total in fare control fund.	$441,177	$420,797

A separation of this statement between cars and motor coaches would

STATEMENT OF PASSENGERS CARRIED BY CINCINNATI STREET RAILWAY

	1927	1926	1925	1924	1923	1922	1921
Revenue Passengers:							
Cars	94,006,310	89,493,159	90,629,875	100,839,343	108,625,599	107,528,666	106,527,759
Coaches	6,816,139	4,104,586	.....	.....	.....	.....	.....
Total revenue passengers	100,822,449	93,597,745	90,629,875	100,839,343	108,625,599	107,528,666	106,527,759
Transfer Passengers:							
Cars	30,221,784	29,480,811	30,832,130	32,706,502	34,066,858	34,765,044	34,904,917
Coaches	1,390,784	768,711	.....	.....	.....	.....	.....
Free Passengers:							
Cars	1,553,513	1,465,801	1,309,845	1,319,318	1,292,290	1,399,018	1,527,297
Total, all passengers	133,988,530	125,313,068	122,771,850	134,865,163	143,984,747	143,692,728	142,959,973

show that the operation of the former resulted in a considerable surplus while in the case of coaches a loss was sustained. The surplus from car operation was $172,765, and the loss from coaches was $152,426, the combined statement therefore showing a surplus of $20,339. Mr. Draper explains that as long as coaches are used to serve remote and thinly populated parts of the city they may be expected to show a loss, but it is encouraging that this loss has been reduced in the latter part of the year and promises further improvement.

One of the provisions of the franchise under which the company operates is that on Dec. 1 of each year there must be filed with the city an estimate of gross receipts and budget of operating expenses, taxes, fixed charges and return on capital for the ensuing calendar year. The estimate for the year 1927, which was filed on Dec. 1, 1926, was closely realized by the actual results, as the actual operating revenue for the 12 months was $8,700,257 or $37,000 over the estimate, while the surplus after paying all requirements for the year was $20,339 or $8,712 in excess of the estimate.

Included in revenue passengers carried are those riding on the Sunday pass, which has now been in use for more than a year. The number of Sunday passes sold during the year was 556,736, which were used for a total of 3,450,344 rides. The Sunday pass is sold for 25 cents and is good for as many rides as the times it is presented by the holder on cars of the system between the hours of 5 a.m. and midnight on the same day sold. No transfers are issued on the Sunday pass, hence each time it is presented for fare it is recorded as a ride.

$1,209,453 Spent on Track

In no department was there greater activity in 1927 than in the roadway department. The program of track reconstruction, as distinguished from ordinary maintenance and repairs, included 33 major locations and involved an expenditure of $1,209,453, of which $936,753, was chargeable to operating expense as renewals and replacements and $272,700 to additions and betterments as adding to the value of the property through the installation of heavier foundation and rails and steel ties in place of the previously constructed lighter track. This was almost twice the amount expended the previous year and much in excess of the amount anticipated to be done in any one year when operations were undertaken under the new franchise. This measure required the company to charge to a special depreciation reserve fund over a period of 50 months a total sum of $1,750,000 for track reconstruction. It was early seen, however, that it would be to the advantage of the city as well as the patrons of the system if the work were speeded up sufficiently to correspond more nearly with the program for street improvements by the city.

Expenditures on Obsolete Equipment Unwise

On the subject of cars Mr. Draper said:

It has been the policy of the company to put the track in good operating condition before proceeding with the purchase and operation of new cars. The point has now been reached where new cars can fit into the rehabilitation program and the company will shortly be prepared to place a contract for the construction of from 50 to 100 new cars, delivery of which is expected to be made during the summer. The present equipment operated by the company has been improved in many ways, but the expenditure of additional money on obsolete equipment should be abandoned in favor of the purchase of entirely new rolling stock.

Employees Play Their Part Well

More and more it is being realized by all of the employees of the company that we are all part of one big family and that our interests are mutual and our welfare interdependent. Probably nothing has served to emphasize this more than the starting of a company publication called the *Cincinnati Street Railway News* devoted to the interest and the welfare of this big group of railway people.

The courtesy shown by the company employees toward the car-riding public is increasingly commented upon and many responsive echoes from individuals are received in the shape of commendatory letters. Complaints there are, naturally, where 1,500 men come in daily contact with 400,000 people, but in every such case an effort is made either to make amends, to correct or to explain, and above all, to show the complainant that the company is desirous of learning of every incident that should have attention.

The statement of additions and betterments made to the Cincinnati property during 1927 follows:

Way and structures		$272,700
Real estate for loops		40,442
Winton shops, real estate and buildings		792,084
Sub-station real estate and buildings		141,955
Automotive equipment		35,758
Shop equipment (tools)		8,434
Remodeling cars into prepayment type		15,158
Miscellaneous		36,083
Total cars		$1,342,617
Motor coaches	$78,185	
Coach, shop and service equipment	12,266	
Total coaches		90,452
		$1,433,070

The building up of the capitalization of the company or capital value from the date when the present plan of operation went into effect is shown by the following table:

Capital Stock		
Outstanding Nov. 1, 1925	$22,761,950	
Issued to buy Cincinnati and Hamilton property	1,000,000	
Total		$23,761,950
5½ per cent gold bonds		7,000,000
Car trust notes		512,500
Additions and betterments to Dec. 31, 1927	$2,403,369	
Funded	2,181,950	
Unfunded additions and betterments provided by company funds		221,419
Total capital value Dec. 31, 1927		$31,495,869

On the subject of the bus Mr. Draper said in part:

The officers of your company are of the opinion that the motor coach is a type of transportation which fits in logically with rail operation. It is good sense for railway systems to utilize the motor coach where it can best serve different communities, and also to use it in experimentation to determine how it may best fit in. As yet it would appear that mass transportation, particularly in large cities, can best be handled by the familiar form of street cars improved and developed to meet the special needs. The field of the motor coach has heretofore been limited by the size of the units available. There has now been developed a new motor-coach unit of greater carrying capacity which must be reckoned with and which may cause street railway operators to change their opinion as to the availability of the motor coach for use in city transportation. It is wise, therefore, to consider all the possibilities of the motor coach in connection with any future extension that the company may be called upon to make by the growing community.

On the matter of the rapid transit line and other subjects the report says, in part:

The report of the Beeler organization, employed jointly by the city and the company to make a survey of the rapid transit line situation, has been completed. An analysis and study of the Beeler report is now being made in order that the company may be in a position to undertake intelligently the discussion of what had best be done with this important enterprise. The position of the company is that if the Rapid Transit Line can be operated as a part of the local transportation system with the reasonable certainty that the operating costs and taxes, together with all of the fixed charges and return on capital of the present system can be met, it is willing to undertake its operation on a basis that will insure this result as far as possible. A committee has been authorized by Council to sit with the Rapid Transit Commission in the discussion with the company of this important matter. Mutual interest of city and company in retaining the integrity and increasing the efficiency of the existing transportation system (which will have to continue to serve by far the greater majority of the people) should leave little room

Digitized by Google

for disagreement as to the principal terms and conditions of operation.

It has been the endeavor of the officials of the company to co-operate with the city administration in every way and, in return, fair treatment and unprejudiced consideration has been accorded by the Mayor and other members of Council, the City Manager, the Director of Public Utilities and all city officials with whom the company is brought in contact.

When the franchise under which the company is operating went into effect on Nov. 1, 1925, the annual return to stockholders was reduced from the former rate of 6 per cent to 5 per cent for a period of three years. The allowance to the company for dividend payments to its stockholders will consequently continue at the rate of 5 per cent until Nov. 1, 1928, when the amount of the allowance will return to that which will allow the payment of 6 per cent. Some stockholders have felt that this temporary reduction in the return on capital has been a hardship that they should not have been called upon to suffer. However, the purpose was to help to provide funds for putting the property in a better condition than that in which it was found as the result of the four years of negotiation. It is a wise thing for directors properly to maintain the property in their charge. While a larger return on capital than 6 per cent has been allowed to public utilities in many rate cases before courts and commission, it must be kept in mind by stockholders that to offset this limited return and the control exercised by the city there is provided in our case a fair and equitable means for insuring this return, which is as far as the municipality could go toward making the return safe and secure.

In a year of rehabilitation, development, experimentation and adaptation to new conditions, the officials of the company have worked steadily and enthusiastically to accomplish the task that was so clearly set before them. Likewise, the directors of the company have been patient and interested in hearing the many problems presented to them and thoughtful and considerate in advice as to how they should be solved. To directors and officials and also to the rank and file of employees my thanks and appreciation are cordially extended.

Although this may not be a proper place in which to do so, I desire to express appreciation to the newspaper men of Cincinnati who have been so thoroughly interested in our endeavors to improve the transportation system, and also express a full measure of gratitude to all citizens generally who have helped in greater or less degree by their praise and advice and criticism, and even their complaints, and most of all to the hundreds of thousands who have shown an increasing confidence in the ability of the company to serve them by their increased patronage of cars and motor coaches.

New Chairman in Baltimore

At a meeting of the stockholders of the Washington, Baltimore & Annapolis Electric Railroad, held in Baltimore on March 26, Herbert A. Wagner was elected chairman of the board. He succeeds George T. Bishop, Cleveland, who resigned from the board some time ago. Mr. Wagner is president of the Consolidated Gas, Electric Light & Power Company, Baltimore, which controls the electric railroad and its subsidiaries through a holding company.

Economy and Efficiency Help Boston Elevated

Operation of the Boston Elevated Railway, Boston, Mass., during the last eight years has been set forth for study in parallel columns giving a few vital operating statistics for the two years 1920 and 1927.

Thirty-one million more people used the "El" in 1927 than in 1920, and the average fare per revenue passenger decreased from 9.868 to 9.266 cents. It is also disclosed that 5,500,000 more miles and 1,500,000 more round trips were operated in 1927, and as a result the number of revenue passengers carried per mile decreased from 6.548 to 6.457.

Without the economies which have been effected, the wage increases awarded during the eight-year period would have placed a burden of $4,000,000 on the car riders. Fixed charges (taxes, rent of leased roads, dividends, subway and tunnel rents, interest on bonds and notes) have increased by $1,250,000 in this period.

Notwithstanding the wage and fixed charge burdens, the actual payroll was $459,107 less in 1927 than in 1920 and operating expenses as a whole were $636,789 less than in 1920.

If operating expenses in 1927 had taken the same percentage of passenger revenue as in 1920 there would have been a deficit in 1927 of $1,293,668 instead of a surplus of $222,000.

AN EIGHT-YEAR COMPARISON OF BOSTON ELEVATED RAILWAY

	1920	1927	Increase	Decrease
Revenue passengers, 5-cent fare	8,952,577	8,534,666	.....	417,911
Revenue passengers, 6-cent and 6½-cent fare	.....	58,890,542	58,890,542	.....
Revenue passengers, 10-cent fare	326,496,184	299,340,854	.....	27,155,330
Special car and bus passengers	77,800	172,846	95,046	.....
Total	335,526,561	366,938,908	31,412,347	.....
Average fare per revenue passenger, cents	9.868	9.266	.....	0.602
Wages—Amalgamated and Craft employees	$14,040,747	*$18,045,550	*$4,004,803	.....
Actual total wage cost	$17,216,445	$16,757,338	.....	$459,107
Average employees on payroll	9,628	8,607	.....	1,021
Gross revenue	$34,031,636	$35,193,410	$1,161,774	.....
Fixed charges (taxes, rent of leased roads, dividends, subway and tunnel rents, interest on bonds and notes) and miscellaneous items	$8,609,681	$9,838,261	$1,228,580	.....
Operating expenses	$25,769,122	$25,132,333	.....	$636,789
Ratio of operating expenses to gross revenue, in per cent	75.721	71.412	.....	4.309
Revenue-mileage	51,237,527	56,827,962	5,590,435	.....
Round trips operated	5,764,347	7,295,371	1,531,024	.....
Car defects per 10,000 car-miles	13.4	3.8	.....	9.6
Revenue passengers per mile	6.548	6.457	.....	0.091
20-minute delays in service	885	500	.....	385

*Based on hours and rates of 1920.

If operating expenses in 1927 had taken the same percentage of gross revenue as in 1920, they would have been greater by $1,516,484, and there would have been a deficit for the year of $1,293,668.

Nothing in Ottawa Situation to Cause Alarm

Shareholders of Ottawa Traction Company, Ottawa, Ontario, are in receipt of a circular letter, signed by President Thomas Ahearn, setting forth the reasons for the concellation of the quarterly dividend of 1 per cent, payable ordinarily on April 2 next. The letter reads as follows:

Your directors regret very much the necessity of informing you that the reserve fund of the Ottawa Electric Railway, which has been used for the purpose of dividends for the past four years, is exhausted and that it is, therefore, necessary to suspend payment of dividends until the earnings of the company prove sufficient to warrant a resumption of payment.

You are of course aware that the application of that company for increased fares is now before the Board of Railway Commissioners for Canada, and your directors have every confidence in the merits of the application.

Your directors feel very strongly that there is nothing in the present situation to occasion any feeling of alarm in the minds of the shareholders. They themselves and other large shareholders who have made a study of the situation feel quite satisfied that the position of the company is inherently sound and that the present difficulty is that the company has for some years been selling transportation at a price too low. Ottawa will always need the street cars, and the Ottawa Electric Railway will always be able to provide transportation at a rate which will justify people in using its system.

Local Ownership the Aim in Worcester

For the first time since the New York, New Haven & Hartford Railroad resumed control of the Worcester Consolidated Street Railway, Worcester, Mass., it has been revealed that the ultimate aim of the railroad officials is to have the road become the property of Worcester investors, once it has been thoroughly rehabilitated and put on a sound basis.

Edward G. Buckland, vice-president and general counsel, says it is now the hope of the New Haven to return to the city the management of its trolleys in order that the railroad can concentrate its attention on the steam road properties. Mr. Buckland is confident the Worcester line can be made to pay. He explains that the New Haven road is getting things into shape in the hope that in the not too distant future it can entertain offers for the property.

Since reassuming control of the Worcester line in 1926 the New Haven has spent more than $1,000,000 in a rehabilitation program. This covers only part of the work to be done. Mr. Buckland says the New Haven has no prospective customer in view for the purchase of the Worcester road. When the road is placed on a paying basis it

Digitized by Google

will be ready to entertain propositions and Mr. Buckland believes that if it is earning 6 per cent on the investment there will be no dearth of purchasers. He is quoted as follows:

We would prefer to sell to Worcester interests. It is our belief that an electric railway should be locally owned just as much as an electric light company or a gas company. However, we are not idealists. If an attractive offer was received from a large utility operating company we would consider it carefully.

Preferred Dividend Passed by Tri-City Company

The Tri-City Railway & Light Company, Davenport, Ia., has passed the preferred dividend due on April 1, this year. The last payment was 1½ per cent, made on Jan. 2.

Richard Schaddelee, president of the United Light & Power Company, and a director of the Tri-City Company, said recently:

Under present conditions the operation of the railway systems in the tri-cities is producing barely enough to pay the straight operations costs, plus the taxes, without earning a cent for depreciation.

The situation is growing steadily worse and we have racked our heads for a solution, without being able to find one.

First Dividend on St. Louis Public Service Preferred

The first quarterly dividend of the St. Louis Public Service Company, St. Louis, Mo., has been declared on the preferred stock of the company. It is payable on April 1 to stockholders of record of March 20. The company has outstanding a total of 70,620 shares of preferred stock, of which 16,212 shares were allotted to the city, 53,845 shares to former St. Louis Transit Company bondholders and 553 shares to various other creditors of the United Railways, which the St. Louis Public Service succeeded after foreclosure and sale.

Financial Condition of Southern Michigan Divulged

The Southern Michigan Railway, operating from South Bend, Ind., to Benton Harbor, Mich., which went into receivership in Grand Rapids on Feb. 10, owes corporation income taxes and interest totaling $25,411 in Indiana, according to a statement received from George L. Foote, Indiana collector of internal revenue. The company owns tracks from the northern city limits of South Bend to the state line and the worth of the property is estimated at $2,000,000. The Chicago, South Bend & Northern Indiana Railway, which owns the Southern Michigan stock, operates railway service to St. Mary's over the Southern Michigan line. It is serving as receiver pending the outcome of proceedings in the Michigan Federal Court. The Northern Indiana line itself is under R. R. Smith, general manager, as receiver.

Personal Items

Changes in Buffalo

T. E. Mitten resigns from International Board. Messrs Lesswing, Sherman and Koch represent employees

AT THE annual stockholders' meeting of the International Railway, Buffalo, N. Y., held March 27, T. E. Mitten resigned from the board, on which he has served since 1920. This enables the employees to have three representatives instead of two. The following directors were selected to serve for a period of one year: A. A. Mitten, chairman; J. A. Queeney, vice-chairman; C. J. Joyce, W. K. Myers, Nelson Robinson, B. J. Yungbluth, H. P. Lesswing, M. H. Sherman and R. W. Koch.

The employee representatives on the board are: H. P. Lesswing and M. H. Sherman, president and vice-president of the employees Co-operative Association; and R. W. Koch, chairman of the general committee of employees under the Mitten plan. The board of directors thus consists of nine men, three of whom directly represent the employees, who are substantial owners of International Railway system. W. K. Myers, who is financial vice-president of Mitten Management, Inc., succeeds H. G. Tulley, former president of the International Railway and now vice-president of Mitten Management in charge of industrial relations.

Mr. Mitten To Give More Time to Banking

The meeting of the new board of directors was held immediately following the annual stockholders' meeting. A. A. Mitten was elected to succeed his father as chairman of the board, and J. A. Queeney, vice-chairman. Mr. Queeney continues as chairman of the executive committee whose membership also includes A. A. Mitten, W. K. Myers and B. J. Yungbluth. The board of directors elected the following officers of I.R.C. B. J. Yungbluth, president and general manager; N. T. Brown, vice-president of transportation; C. A. Weber, secretary and treasurer; and C. A. Chavel, auditor.

The resignation of Mr. Mitten from the board of the International Railway follows closely his resignation from the board of the Philadelphia Rapid Transit Company, and is in line with his announced intention to relinquish active operation of the Mitten properties to the younger men whom he has trained to succeed him. In this way he can devote his entire time to Mitten Bank and the Mitten Bank Securities Corporation, through which he plans to advance still more widely the principle of democracy in industry.

Dr. A. A. Mitten is the only son of T. E. Mitten. He is well known in Buffalo, having lived for some time in Lockport and having graduated from the University of Buffalo. He has served for several years as vice-president of Mitten Management, Inc., which operates International Railway property, the Philadelphia Rapid Transit Company, the Yellow Cab Company of Philadelphia, the Yellow Cab Company of Atlantic City and associated enterprises. He is vice-president of Mitten Men and Management Bank and Trust Company and also a vice-president of the new Mitten Bank Securities Corporation. Dr. Mitten was educated as a physician and surgeon. His first connection with the electric railway industry was in 1915 when he became industrial surgeon in Milwaukee. When the United States entered the World War Dr. Mitten went to France as a captain of an ambulance company. When he returned to this country he became very much interested in the far-reaching demonstration of industrial democracy which his father was developing in Philadelphia.

Dr. Mitten's personality makes him eminently well qualified to establish and maintain the intimate contacts between men and management which are so essential to the Mitten plan for industrial democracy. He is as much at ease with a track employee as he is with one of the officials of the company and the interesting thing about it is that the track employee will be equally at ease with Dr. Mitten.

Mr. Lesswing has been continually in the employ of the International Railway since May 7, 1917. He is 28 years old and is employed as an electrician in the power department.

Mr. Sherman has spent 6 years in the service of the International Railway and is an operator working out of Broadway station.

Mr. Koch was employed on April 15, 1909 and is a substation operator in the electrical department. He is 37 years old.

Charles Fields and Otto Schultz Newly Assigned in New Jersey

Charles Fields has been appointed manager of the new Morris division of the Public Service Railway, Newark, N. J., and Otto G. Schultz has been assigned, reporting to Matthew R. Boylan vice-president in charge of operation, co-ordinated transport.

Mr. Fields started his career in the transportation business as conductor with the Brooklyn Rapid Transit Company in 1905. In 1907 he accepted a position as inspector with the New York & Queens County Railway, being subsequently promoted to chief inspector. In 1913 he became superintendent of the Binghamton Railway Company, Binghamton, N. Y. He left the employ of this company in 1917, to engage in special transportation work for Stone & Webster, and the J. G. White Management Company. In 1923 Mr. Fields was transferred to the

Digitized by Google

Morris County Traction Company as general superintendent.

Mr. Schultz has been associated with the Morris County Traction Company since December, 1909, and has held the position of manager and treasurer during that time.

Messrs. Gunn and Francis Advanced in San Francisco

Two more employees of the Market Street Railway, San Francisco, Cal., who began their railroad experience on the platforms of the cars in that city, have stepped into executive positions. They are Byron F. Gunn, who has become superintendent of the Geneva division, and A. E. Francis, who succeeds him in the post of superintendent of ferry terminals.

Mr. Gunn entered the service of the company Jan. 27, 1909, as a conductor at the Kentucky division. He was appointed starter at Third and Townsend Streets station Oct. 14, 1914. Here he distinguished himself for his handling of thousands of commuters and in dealing with emergency situations such as arise around terminals. From May 1, 1927, he has served as superintendent of ferry terminals.

Inspector A. E. Francis succeeds Mr. Gunn as superintendent of ferry terminals. Mr. Francis entered the service on Dec. 11, 1907. His appointment as inspector came on Nov. 22, 1910. He served as relief inspector, thus familiarizing himself with the entire system in San Francisco and meeting thousands of people.

H. J. MARTIN has been promoted to the position of safety inspector of the New York State Railways, covering all Rochester, N. Y., city lines, including the co-ordinated buses. Mr. Martin began his railway career twenty years ago in Manchester, England, where he operated both as a motorman and conductor. He served in Hamilton, Ont., going to Rochester as a conductor in 1921. Later he was made inspector on the Rochester lines. In addition to his other duties Inspector Martin teaches in the school of instruction, aids in the investigation of accidents and makes special investigations of safety suggestions.

W. F. BURDELL was elected assistant secretary and assistant treasurer at a recent meeting of the stockholders of the Scioto Valley Railway & Power Company, Columbus, Ohio.

F. S. SHEFFIELD, formerly chief instructor for the Eastern Texas Electric Company, Beaumont, Tex., has been appointed assistant superintendent of transportation. He will report to O. W. Gaines, who, in addition to his work of superintendent of transportation in Beaumont, has similar duties in Port Arthur. The property in the latter city was recently purchased by the Eastern Texas Electric Company as told in ELECTRIC RAILWAY JOURNAL.

FRANK MILHOLLAND, chairman of the North Dakota Railroad Commission, will resign from that position April 1 to become president and general manager of the Central West Public Service Company with headquarters in Omaha, Neb. The Central West Public Service Company properties serve 29 cities and towns in Iowa, Nebraska, Minnesota, South Dakota and North Dakota with electricity, telephones, gas and water.

Obituary

Edwin E. Downs

Edwin E. Downs, superintendent of railway revenues of the Winnipeg Electric Company, Winnipeg, Canada, died in Winnipeg on March 17. Mr. Downs was well known throughout the electric railway industry, which he had served for about 35 years.

His first business experience was in general contracting and telephone work. With the introduction of electricity for use on city and other railways he became connected with the construction department of the Thomson-Houston Company and had charge of installing electricity on the Second Avenue Passengers' Railway, Pittsburgh, Pa., the first railway in Pittsburgh to adopt electricity. Later he installed electricity on the Missouri Street Railway, St. Louis, Mo.; City Electric Railway, Little Rock, Ark.; Fort Clark Street Railway, Peoria, Ill., and the Fort Wayne & Belle Isle Railway, Detroit, Mich. In his work at Little Rock Mr. Downs was associated with Bion J. Arnold.

Subsequently Mr. Downs became manager of the railways in Kalamazoo and Battle Creek, Mich., for the General Electric Company.

Mr. Downs assisted in constructing an electric railway between Anderson and Marion, Ind., and in 1907 was engaged by George J. Kobush, St. Louis, Mo., as general manager of the Winnebago Traction Company, Oshkosh, Wis., with which company he remained for more than seven years. In October, 1904, Mr. Downs went to San Francisco in the interests of E. H. Rollins & Sons, Boston, Mass., as general manager of the Petaluma & Santa Rosa Railway. In March, 1908, he succeeded E. R. Kirk as general manager of the Sterling, Dixon & Eastern Electric Railway. Two years later he was appointed general manager of the Chicago & Milwaukee Electric Railway and later moved to Winnipeg to take the position with his old working comrade, President A. W. McLimont, as superintendent of railway revenues.

WILLIAM F. M. Goss, formerly dean of the College of Engineering at the University of Illinois and president of the Railway Car Manufacturers' Association for ten years, died on March 23 at the Waldorf-Astoria Hotel, New York. Dr. Goss is probably best known to the electrical industry for his work as a member and later as chief engineer of the Chicago Association of Commerce committee on smoke nuisance and the electrification of railroad terminals in Chicago. In the course of his academic career he organized the department of practical mechanics at Purdue University, with which institution he was connected for seventeen years, being dean of the engineering school for a large portion of that time. In 1907 he became dean of the College of Engineering of the University of Illinois, but ten years later he severed his connection with that faculty to take up the duties of president of the Railway Car Manufacturers' Association. Dr. Goss was active in association work, having been a past-president of the American Society of Mechanical Engineers, a fellow of the American Association for the Advancement of Science, a member of the Society for the Promotion of Engineering Education and of other engineering associations. Dr. Goss was a native of Massachusetts and a graduate of the Massachusetts Institute of Technology. He was 69 years old.

T. R. BRISTOL, assistant superintendent of equipment, Georgia Power Company, Atlanta, Ga., died March 9. Mr. Bristol served his apprenticeship as a young man with the Santa Fe System. Then he served the Westinghouse Traction Brake Company for a number of years. He saw service in France with the railway engineers and after the war he resumed his duties with the Westinghouse Traction Brake Company, being stationed in Atlanta as mechanical expert. Mr. Bristol became affiliated with the Georgia Power Company in September, 1921. He was well known throughout the Southeast, which was the territory he traveled for the Westinghouse Traction Brake Company and also through his activities in the Electric Railway Association of Equipment Men, Southern Properties. Mr. Bristol was in his 32nd year.

PETER J. METZDORF, assistant to the vice-president of the Twin City Rapid Transit Company, Minneapolis, Minn., died recently. After a term of service as supplies salesman, manager of outdoor amusement enterprises and pavilions in St. Paul and county treasurer, 21 years ago he first became a member of the staff of the Twin City Rapid Transit Company, as chief clerk. Later he looked after other enterprises of the Twin City Rapid Transit Company and managed other electric railway recreational projects.

PHILIP MATTER, a director of the Indiana Union Traction Company, Anderson, Ind., and one of the principal stockholders of the company, died recently at his home in Marion, Ind., following a few days' illness resulting from a fall. He settled in Indiana in Civil War days. His judgment was sought in many business transactions and his advice aided many Marion men to build and increase their fortunes. He is survived by three sons and three daughters. Mr. Matter was 85 years old.

Manufactures and the Markets

General Electric Annual Report

The net profit of the General Electric Company for 1927 amounted to $48,799,489, after interest, depreciation and taxes. This was equal after dividends on the special stock to $6.41 a share earned on 7,211,481 no par common shares. It compared with $46,672,499, or $6.14 a share, earned in 1926.

Orders received during the year amounted to $309,784,623, against $327,400,207 in 1926, a decrease of 5 per cent. Unfilled orders at the close of 1927 were $68,916,000, against $72,297,000 at the close of 1926, also a decrease of 5 per cent. Net sales billed during the year were $312,603,772, against $326,974,104 in 1926.

Inventories, after reserves, were $67,213,705 at the end of 1927, against $65,295,154 the year before. At the close of 1920 inventories amounted to $118,109,173 and shipments were $275,758,487, the ratio of inventories to shipments being 42.8 per cent. At the close of 1927 the ratio was 21.5 per cent, or a turnover nearly double that of 1920. An increase of 13 per cent in shipments billed was accomplished, while the capital locked up in inventories was reduced to $50,895,000.

Uruguay Asks Bids For Oil-Electric Units

Bids are now being sought by the Administración de los Ferrocarriles y Tranvías del Estado covering construction of two gas-electric generating units to be installed in two of the Unicars which were bought some time ago by the Uruguayan Government. Copies of the call for bids will be lent to interested firms upon request to the Department of Commerce, Bureau of Foreign and Domestic Commerce, Washington, D. C., referring to No. EE 1069. The closing date for bids is 11 a.m., June 1, 1928.

Business of Austin Company Very Active

Unusual building activity in the Cleveland territory is reported by the Austin Company, well known national builders, with headquarters in Cleveland. More than a dozen of the 100 building projects which this firm has under way from coast to coast are located in Greater Cleveland alone; among them is a large garage and service station, for the Cleveland Railway, costing about $200,000, with three stories and basement 100x125 ft. in size.

Austin's 1928 business is starting with a volume that bids fair to make the year even better than 1927, which was the most successful in the company's history.

The Austin Company is expanding its own facilities to meet this greatly increased demand. At its main office, corner Euclid and Noble Road, ground has been broken for a large two-story and basement addition to the office building. Greater facilities for the engineering department and general office use are being provided at a cost of more than $50,000.

At Bliss Mill, Austin's steel fabricating plant, in Euclid, Ohio, provision is being made now for the construction of an entire new woodworking shop to replace the cramped quarters at its present location on East 152nd Street, opposite the Jordan Motor Company plant. This move will result in the mobilization of all Austin service facilities at Bliss Mill, where the steel fabricating plant has been located for several years. Austin is the largest fabricator of structural building steel in the Cleveland territory.

Spanish Railway Improvements

Plans for the expenditure of 1,433,670,000 pesetas for improvements in the rail systems of Spain were approved at a recent meeting of the Supreme Railway Council. Of this amount 160,980,000 pesetas has been allotted for improvement of the electric service. A peseta is approximately 17.1 cents.

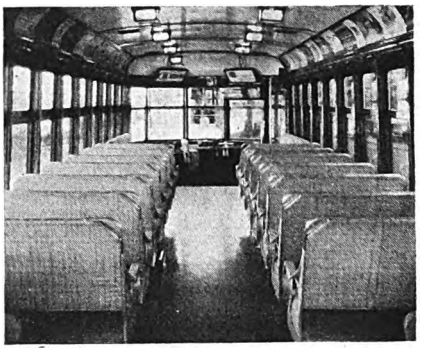
New Twin City Cars in Operation

The Twin City Rapid Transit Company, Minneapolis, Minn., has put in operation 25 new street cars. The cars are of the light-weight, noiseless type built in the Snelling shops of the company.

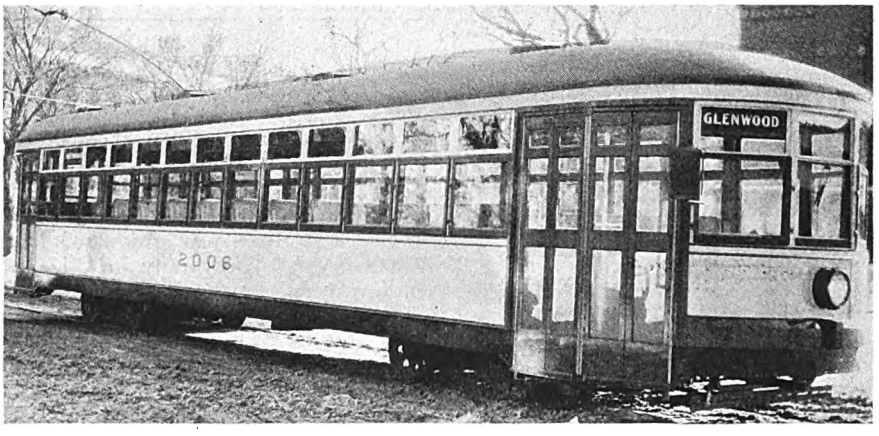
The car body is built on a steel and duralumin frame weighing 4,230 lb. In addition to this metal frame, the car has a complete frame of white oak. The ceiling, roof and sides of the car are plywood and the vestibule linings are plymetl. The floor is double and well insulated and the inside finish is mahogany with a white ceiling.

The trucks are each equipped with 56 coil and elliptic springs and a swinging spring plank giving a perfect graduation of the load and eliminating vibration.

With this car having a normal load, it is possible to reach a speed of 21 m.p.h. and to come to a stop within 600 ft. in 26 seconds.



The interiors of these cars are in mahogany finish with a white ceiling. They are well lighted and ventilated



One of the light-weight, noiseless type cars put in operation by the Twin City Rapid Transit Company

Name of railway	Twin City Rapid Transit Company
City and state	Minneapolis, Minn.
Number of units	25
Type of unit	one-man, two-man, double-end
Number of seats	50
Weights:	
Car body and equipment	17,983 lb.
Trucks	6,980 lb.
Total	24,963 lb.
Length over all	45 ft. 6 in.
Truck wheelbase	4 ft. 6 in.
Width over all	9 ft. 0 in.
Body	Semi steel
Doors	End
Air brakes	G. E. Concentric Clasp
Armature bearings	Roller
Axles	Tubular
Compressors	G. E.
Control	G. E.
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Johnson
Hand brakes	Peacock
Headlights	Ohio Brass
Interior trim	Wood-trim mahogany with aluminum metal trim
Journal bearings	Hyatt roller
Motors	G. E. No. 4
Roof material	Plywood
Seats	Rattan
Wheels, type	Steel, oil tempered, diameter 26 in.

Philadelphia Station Control Contracts to Be Let

The contract for station control and miscellaneous equipment is one of the most important awards on the Broad Street Subway yet to be let by the Department of City Transit, Philadelphia, Pa. It provides for furnishing and installing in the fourteen subway stations fencing, railings, gates, grills, handrails, baggage boards, signs, ticket booths, passimeters and turnstiles. Railings are to be constructed around the upper track levels, guard plates for emergency exit doors are to be placed in the sidewalk ventilator gratings, signs are to be placed along the tracks and in the emergency exits, and bent numbers are to be stenciled on the subway walls and columns. The specifications also provide that ticket booths shall be installed on mezzanine floors in express stations and on the platforms of local stations. There will be two types of ticket booths—the side control booth and the end control booth.

New Type Electric Locomotives for South Africa

Seventeen bids have been received in South Africa for an experimental type of electric locomotive for use on the Natal electrified system. This locomotive is to be three times as powerful as any of the units now employed on the South African Railway. Future orders for any number of locomotives up to 100 depend on the success of this experiment.

ROLLING STOCK

FITCHBURG & LEOMINSTER STREET RAILWAY, Fitchburg, Mass., has ordered five 21-passenger street car type Studebaker buses from the Studebaker Corporation of America, South Bend, Ind.

PUBLIC SERVICE CO-ORDINATED TRANSPORT, Newark, N. J., has received the first shipment of bus chasis on order of 331 gas-electric chassis recently placed with the Yellow Truck & Coach Manufacturing Company. Three chassis a day will be turned out up to April 15, and five a day thereafter, until the order is completed.

DETROIT MUNICIPAL RAILWAY, Detroit, Mich., will do nothing more about the purchase of additional buses, on which bids were recently received, until the results are made known of a survey of bus operation to be made by W. B. Mayor at the suggestion of the Street Railway Commission.

TRACK AND LINE

INTERNATIONAL RAILWAY, Buffalo, N. Y., is planning to co-operate with the city in repaving and rebuilding streets over which its local traction lines operate. One of the first major improvements planned by the railway is the rebuilding of part of its William Street line to handle the heavy traffic which will result with the opening of the new passenger terminal of the New York Central Railway late this year. Several other lines will be included in the reconstruction and improvement program.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Feb. 27, 1928
Copper, electrolytic, cents per lb.	13.90
Copper wire, cents per lb.	16.125
Lead, cents per lb.	6.00
Zinc, cents per lb.	6.0375
Tin, Straits, cents per lb.	52.875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	4.125
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	2.025
Franklin, Ill., screenings, Chicago, net tons	1.825
Central, Ill., screenings, Chicago, net tons.	1.675
Kansas screenings, Kansas City, net tons	2.375
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	15.30
Weatherproof wire base, N.Y., cents per lb.	16.5125

Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.2
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal.	$0.645

MONTREAL CITY COUNCIL, Montreal, Canada, has granted a contract to a local firm for the construction of the roadbed for the double tramways line across the top of Mount Royal. The project will involve an outlay of $287,415.

SHOPS AND BUILDINGS

WINNIPEG ELECTRIC COMPANY, Winnipeg, Manitoba, Canada, will soon erect a new terminal power station in Winnipeg, to cost approximately $750,000.

TRADE NOTES

L. W. BIRCH of the Ohio Brass Company, Mansfield, Ohio, has been made assistant manager of the railway sales division. He became a member of the staff of the Ohio Brass Company in December, 1921, and during recent years has specialized on the overhead distribution systems for electric railways. Mr. Birch was graduated from the Ohio State University in 1917 and after a brief service in the army, in which he became first lieutenant, joined the Carolina Power & Light Company and later the Pittsburgh Plate Glass Company.

WILLIAM H. WOODIN, chairman and president of American Locomotive and American Car & Foundry, has been elected a director of American Surety Company.

TRUSCON STEEL COMPANY, Youngstown, Ohio, has named C. I. Auten, vice-president in charge of sales in its standard building division. M. T. Clark is vice-president in charge of sales of the steel window division, with which he has been identified for the last nine years. C. D. Loveland, formerly manager of the Pittsburgh district of the Truscon organization, is made vice-president with headquarters at Newark, N. J. He will be in charge of Truscon distribution in that state.

FORD CHAIN HOISTS are now being distributed on the Pacific Coast by E. O. Johnstone, district sales manager for the American Chain Company, Inc., at 425 Second Street, San Francisco, Cal.

FRED A. WALES has been appointed to do sales promotion work for the bus coach work division of the Murray Corporation, according to an announcement by William Robert Wilson, chairman and president of the corporation. Mr. Wales was former sales manager of the body division of the Aluminum Company of America. He goes to the Murray Corporation equipped with an experience of twelve years in the aluminum and aluminum alloy industry. As an officer in the production division, U. S. Army Engineers, he was closely connected with the development of the Class B military truck, known as the Liberty truck.

HEYWOOD-WAKEFIELD COMPANY has appointed C. E. Preble, who has had charge of the engineering department at Wakefield, Mass., assistant to Bertram Berry in the railway sales department, New York, N. Y.

NATIONAL FLUE CLEANER COMPANY, Groveville, N. J., has recently appointed the following representatives: Chicago territory, Naylor-Hickey Corporation, 643 Washington Boulevard, Chicago, Ill.; New England territory, Furnace Improvement Company, 511 Westminster Avenue, Providence, R. I.

OXWELD ACETYLENE COMPANY, New York, N. Y., will in the future distribute exclusively the Carbic acetylene floodlight, generator and other Carbic equipment. The Carbic cake-form carbide will be distributed by the Union Carbide Sales Company, New York, N. Y.

WHITE COMPANY, Cleveland, Ohio, has appointed Jay Rathbun a vice-president of the eastern region, with headquarters at 17 Battery Place, New York. Mr. Rathbun has been a vice-president of The White Company in charge of the export department since 1926. He became associated with the company in 1911 as manager of sales for New York State, and in 1914 was appointed manager of export sales, with headquarters in New York.

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, has appointed Jacob F. Savela as welding service manager for the Detroit district under the direction of J. M. Robinson, district sales manager.

B. F. GOODRICH RUBBER COMPANY, New York, N. Y., accepted the resignation of Harry Hough. James D. Tew, first vice-president, was elected president to take Mr. Hough's place. Mr. Hough will retain his position as a member of the board of directors and will act in an advisory capacity. Also T. G. Graham, works manager, was elected first vice-president; and T. B. Tomkinson, comptroller, and V. I. Montenyohl, treasurer, were elected to fill existing vacancies on the board.

Telling the Intelligentsia About the Trolley

MENCKEN'S *Mercury* for April contains an article, "The Troubled Trolley," by Raymond S. Tompkins. It is a good article. The name under which it appeared was enticing, so reference was made to the back of the book where Mr. Mencken identifies his "contribs," as Franklin P. Adams and H. I. Phillips say. Sure enough, Raymond Tompkins is none other than the assistant to the president of the United Railways & Electric Company of Baltimore. Thus do their deeds find them out. Of course, Mr. Tompkins tried to approximate the Mencken manner. And in this he succeeded, so that some of his sallies may be forgiven. Since Mr. Tompkins is himself an electric railway booster his remarks about street car Messiahs may be taken with a grain of salt. Naturally he recognizes for what they are worth some of the nostrums to which recourse has been had, but he spreads the gospel of common sense. Into the article the favorable has been packed along with the unfavorable, with a tinge of history sufficient in the way it is presented to retain the reader interest. If to some readers it would seem he is at times inclined to play ducks with those within the industry, it must not be forgotten that he plays drakes as well with the public itself. The account may be read with profit, not forgetting that the author, despite his references to the ballyhooers within the industry, is optimistic about the prospects for the restoration of the electric railway as a transportation service to full vigor and efficiency. In fact, there shines incessantly through the persiflage which Mr. Tompkins called to his aid the fact that the public is by no means ready to count out the trolley, nor are its seconds in the industry ready to toss the sponge into the ring as an admission of defeat. They have too much courage for that. And Mr. Tompkins proves it, even though he does so in a roundabout way.

The Courts Must Now Settle the Question of a 7-Cent Fare in New York

WHETHER the New York State Legislature, in its amendment to the rapid transit act in 1912, exempted the contracts authorized thereby from the general provisions of the public service law, seems to be the crux of the Interborough Rapid Transit fare case. The contention of the company is that this was not done and that the general law applying to franchises authorized by the state holds with those of the Interborough subway. In the opinion of the company, this means that the fare charged on these lines must be adequate to produce a reasonable return on a fair value of the property used in the public service, not only that owned by the company but also that owned by the city.

The fare question is now before the courts, which is the place where it apparently must be settled. If the decision is in favor of a higher fare, the city should gain equally with the company. Not only would the city profit by receiving a return on a large investment not now earning interest, but its ability to borrow funds for further subways or other public improvements would be greatly increased. It would also gain because of the improvements which the company could make in its service. Necessary extensions of the present rapid transit system could also be financed.

Representatives of the city are opposing the company in its present application, but New York as a whole would profit quite as much as the company from a decision granting a higher fare.

Transportation That Will Sell

SUCCESS of any manufacturing business comes only when the products made will be absorbed by the ultimate consumers in volume and at a price sufficient to cover the cost and a reasonable profit. This is an economic truth that cannot be controverted. That in this respect a transportation system is no different from any manufacturing concern was brought out by E. G. Buckland, vice-president of the New York, New Haven & Hartford Railroad, in his address before the New England Street Railroad Club published in this paper last week.

Making transportation that people will buy is a complicated problem. Let there be no mistake about that. After many years of effort had not solved the problem, at least in the Massachusetts cities of Springfield and Worcester, a new method of approach was tried by the New Haven, following the restoration of the two systems to the railroad. First of all, it was necessary that the buying public should have faith in the product. This necessitated negotiations of a new kind with the public authorities. Mayors of the two cities were invited to study the problem through their representatives along with those of the railroad. The finding of these experts was that in cities of the size and character of these two, where large numbers of people had to be handled in peak hours in the densely traveled portions, no other means of transportation was so economical and so satisfactory as the street railway, properly supplemented with modern motor bus service.

With this fundamental settled the company proceeded to make an investment sufficient to produce the kind of transportation that the public wants—and that is the kind of transportation the people will buy. New cars, new track, new buses are combined with a new attitude on the part of the management and the employees, to give a brand of product with which the public has not been familiar, but which it appreciated.

Not that the New Haven was doing all this from an altruistic viewpoint. The New Haven has something to sell, apart from the local transportation in these cities. Can it be gainsaid that the vast improvement in the relations with the citizens locally will have a good effect on the general transportation situation, both freight and passenger, of the parent road? The New Haven has so

Digitized by Google

much at stake that even if it made no profit out of these local systems the good will created by the attention that has been paid to the public—its own customers—will pay handsomely in the improved outlook of the railroad itself.

It has taken a long time for the New Haven to appreciate all the possibilities in the situation. But it now has done so, and has pointed the way for other companies. There are many electric railway orphans under the control of light and power syndicates that are being carried along because they must be, and service is given half-heartedly because the franchise makes operation of some sort necessary. How much better it would be to adopt the policy of the New Haven, make the railway property stand on its own feet, and so make it return a profit, if not in cash, then in the good will it can create for the benefit of the larger system.

English Companies Admonished to Court Public Favor on Their Merits

"ABOLITION of the tramways" is a cry now very rarely heard in England, even the most rabid of the anti-tramways' party having been convinced—much against their will—that tramways are here to stay, simply because they are absolutely indispensable to provide the transportation requirements of the people. Thus, says the *Electric Railway & Tramway Journal* in a recent review of the prospects for 1928. The functions of the bus have come to be better and more sensibly defined, and its adoption and use have been hastened and co-ordinated in an eminently satisfactory manner. As the English commentator sees it these are all notable gains from the standpoint of efficient public services, and their settlement enables all tramway operators to plan their future with a measure of confidence which has not existed for many years past. The results of this more healthy and better feeling are making themselves apparent on all sides. All the large tramway undertakings, and many of the smaller ones, are adding freely to their rolling stock, or are re-conditioning their old cars, being convinced by the stern logic of facts that it is only by becoming thoroughly up-to-date in that respect that they can hope to live and thrive. It is recognized that passengers want, and will have, comfort if they are to be patrons of the tramcars, hence the movement in the direction of transverse seats and close attention to upholstery. The buses give these refinements, and the cars must do likewise if they are to compete successfully.

In England, as in the United States and Canada, efforts are being made to augment the speed of the cars, and something has been accomplished in that respect, but, as the review points out, much more needs to be done by cutting out redundant stops and by adopting more efficient methods of loading and unloading before speeds can be deemed to be satisfactory. Again, as in the United States, while the movements in the directions just indicated are highly satisfactory so far as they go, there are scores of other changes and improvements which could be—and it may even be said must be—made before the tramways can be said to be doing justice to themselves and demonstrating to the full the numerous and incontestable advantages that they possess as an efficient means of public transportation. The admonitions of ELECTRIC RAILWAY JOURNAL are reflected by the reiteration of its British contemporary to the effect that the English companies must show that their industry is dynamic and not static, that they are out to please the public, and that they court public favor on their merits and not on sufferance.

Changing Aspects of Transportation in New Jersey

MUCH progress has been made by the Public Service Corporation of New Jersey on its program for co-ordinating railway and bus operation. The work done during 1927, which is reflected in the annual report of the company, digested elsewhere in this issue, shows the extent to which the process has been carried. During the year there was an increase of 29,822,141 passengers over the number in 1926. This was due in part to the normal increase in traffic in the rapidly growing territories served and in part to the acquisition of bus lines from independent operators, the putting of new lines into service, the extension of routes and the starting of lines giving a higher grade of service at a higher rate of fare. In all, 627,153,013 passengers were carried, 266,079,948 of them by bus compared with none so carried in 1922 and only 1,952,059 by bus in 1923. Thus is the extent of the growth of the use of the bus by the company reflected in the official figures. This makes the company the third largest in the world operating as a single unit. It is surpassed as a bus carrier only by the systems in London and Paris.

In improving the railway and bus properties $5,973,531 was spent during 1927. This certainly is a big sum, but the Public Service is a big system and it is undergoing significant changes. On no other system in the country are the changing aspects of the industry better reflected than on this state-wide system, which includes city, suburban and interurban operations.

Hook Up to the Reader's Interests

MOST electric railway managements are now alive to the fact that the great advantage of newspaper advertising is reader interest. Unfortunately, not all of these same managements appreciate the fact that unless the messages take on the color of news they are not welcomed and are far from immediate in effect. Consequently, the very purpose for which the space was bought and paid for is defeated and in the medium which, all things being equal, should insure instantaneous attention. Opposed to this waste of words and money on the part of some railways, is the carefully poised newspaper copy of other companies which frequently effects a tie-up between the message in the advertisements and the vital interest of the community. It would appear that these companies are buying space wisely and winning customers effectively.

For example, the publication of the electric railway schedule to reach a local store on "dollar day" makes more of an appeal to the bargain hunter than statistics on railway mileage last year or last month. A picture of the comfortable seats in an interurban which runs direct to the playhouse showing Richard Barthelmess in the "Patent Leather Kid" accompanied by some teaser copy is a bigger inducement to "ride the trolley" than the economics of railway riding compared with that of competitive agencies. Similarly, an invitation to inspect new cars "today" is a more forceful selling argument than mere statements on safety, speed and economy of car riding. Not that the importance of these features in railway operation is to be minimized; but to attract the attention of the hurried newspaper reader who can afford only a very limited part of his day to the reading of news, the railway story should be tied to the reader's own interests.

An Often-Neglected Way to Reduce Costs

IN THESE days electric railway executives are exerting every effort to effect operating economies to offset decreasing revenues. Very few, however, really give consideration to the matter of fire insurance as a means of reducing their operating costs. In the matter of housekeeping alone, many thousands of dollars in insurance premiums could be saved annually without involving a large expenditure. Keeping premises clean and in order, the proper distribution of approved waste cans, fire extinguishers and sand pails, and the substitution of approved metal lockers for wooden lockers involve little expense, while the reduction in insurance rates thus effected is important.

The prevention of freezing liquids used in fire protection apparatus such as fire extinguishers, water pails and stand pipes, and the enforcement of "No Smoking" rules in car shops and carhouses, involve little, if any, expense; yet they have a direct bearing in reducing insurance rates.

The installation of properly approved sprinkler systems in carhouses and car shops probably offers the greatest saving in fire insurance premiums. In many instances, a sprinkler installation will pay for itself in from three to five years. In fact, today nearly every concern selling sprinkler systems will install complete equipment and accept in payment therefor the annual savings in insurance premiums.

As pointed out in an article in this issue by O. H. Bernd, the Des Moines City Railway, by the adoption of these principles and by carrying out a campaign among the workmen for better housekeeping, has been able to reduce its annual insurance costs $6,315, or 44.4 per cent. Even if it were found necessary to employ a man who would devote his entire time to this one thing, and to pay him the entire saving in premiums, it would be worth while on account of the greater feeling of security and reliability of service that will be obtained. Though the anticipated fire never may happen, still the removal of potential causes goes a long way toward insuring that it cannot under any conditions disrupt the service of the road and take away much-needed revenues.

Make It Easy for the Public to Ride

REGRETS often are expressed that street railway traffic gradually is being confined to necessity riding. Certainly there is a trend in that direction. Those who bemoan the trend most loudly, however, not infrequently are the very ones who are doing least to counteract it. For one thing, efforts to encourage the casual rider to use the street car have been sadly lacking in many American cities. Far too little has been done to tell him how to use the service.

At least in the medium-sized or large cities nearly every street car carries one or more signs of some sort to tell where it is going. The signs do not always give much information. Often they are too few, they are not prominently displayed, and the lettering is too small for legibility. Inadequate illumination is provided, and all too often the signs are old and dingy. Even the largest, most legible and best illuminated ones give only meager information as to where the car is going. Admittedly it is difficult to give a full description of the route on a sign. The deficiency has been met in some places by distributing maps of the system showing just where the various routes run. This practice is widely followed in Europe. In this country one seldom sees such a system map. Abroad it is common practice to place at prominent points in the street, signs giving the names or numbers of the car routes that pass a given locality.

All too often it is argued that signs are of use to the stranger only and that the resident of the city has virtually no use for them. It is true that they do not make much difference to the person who knows just where he wants to go and how to get there, and who already has decided to go by trolley or bus. But even the old resident, as soon as he gets off his beaten track is little better acquainted with the routing of the system than is the stranger in town. Many a person who would patronize the transportation system if he knew more about it actually uses some other vehicle, probably a taxicab. He is willing to spend a little more money rather than take the trouble to find out how he can get to his destination by street car. He is a potential rider and his patronage could be secured by a few simple efforts to sell him the service. If the non-necessity riding is to be sold, the company must do as progressive business houses do and give the purchaser a full description of the product that is for sale.

Careful Training Results in Safety

ONE is appalled to learn that during the last five years 115,000 persons have lost their lives accidentally, more than 3,000,000 have been injured and accidents are increasing about 2,000 annually. In isolated instances a week devoted to safety parades and speeches brings gratifying results, but to have more than a transient effect it is necessary to have a well-planned campaign that continues and an organization always on the alert to keep safety before the public.

In a recent United States Supreme Court decision is a constructive suggestion for future safety at grade crossings. A man, who was killed while crossing a railroad track, heard neither the train nor any other signal and took no further precaution. The court held that he did so at his own risk. To take every precaution necessary was his duty, according to the ruling, so that his own negligence caused his death. It was a "standard of conduct" the court was dealing with "and when the standard is clear it should be laid down once for all by the courts." Many avoidable accidents at crossings or in streets are directly attributable to the wanton neglect of "further precautions." Some well-informed authorities go still further and hold that there is no such thing as an unavoidable traffic accident.

In conducting an inquiry into an interurban accident some time ago a Public Service Commission made no drastic recommendations but did urge greater caution on the part of the general public and common carriers at all railroad crossings, insisting that all existing speed regulations and signals be obeyed and used.

Fortunately, accidents on interurbans and street railways are rare and not only, as some one tersely concluded on looking over the statistics, because an erring motorman "must answer to a stern boss," but also because an effort has been made to teach the motorman the ways of the motorist. In this way the human machine is developed to operate at the critical time when the careless pedestrian or motorist neglects his own safety.

In reporting the progress of its national highway safety campaign the American Road Builders Association stated that more than 200,000 persons pledged themselves to use courtesy and caution on the highways this year. Such a pledge implies mental alertness, sound reasoning and a "standard of conduct." Its slogan is short in preachment. May it be long in practice.

Detroit Survey

Develops Basic Traffic Data

An improved traffic signal system, reasonable parking restrictions, distribution of traffic, pedestrian regulation and more efficient utilization of transportation vehicles are proposed to give relief

PART ONE

Triple parking, preventing the use of three travel lanes, is a serious parking law violation. The two offenders in this case are jitneys

RECOGNITION of the need for reducing traffic hazards and the economic losses due to traffic congestion, and the possibility of making more efficient use of its streets, prompted the city of Detroit, Mich., through its Police Department, to conduct an extensive traffic survey which was recently completed under the direction of A. T. Waterfall, chairman of the Mayor's traffic committee and third deputy police commissioner. The actual work of the survey was handled by Harold M. Gould, engineer in charge. He was assisted by H. S. Simpson, traffic engineer for the Mayor's traffic committee, and an organization built up by these two engineers. The work was started in October, 1926, and the final report submitted in September, 1927.

An appropriation of $30,000 for conducting this work was made by the Detroit Common Council upon the recommendation of Mr. Waterfall. There have been many suggestions for the improvement of traffic in Detroit, most of them mere expressions of opinion and not supported by facts. Along with these came demands for street widening, paving, and numerous other items involving large expenditures. Extensive street improvement programs were suggested by some city officials, even though Detroit was fast approaching its bonding limits. This survey was therefore suggested as a means of studying the city's traffic problem as a whole, with a view toward the establishment of definite policies that would bring about relief. It was felt that Detroit, as the center of the automobile industry, should take the lead in the analysis and amelioration of the traffic congestion problem.

As a result of preliminary studies it was estimated that Detroit, in common with most large American cities, is less than 50 per cent efficient in the use of its streets, and that the annual economic loss due to traffic congestion and delays is more than $30,000,000. The report of the survey is divided into two parts, each separately submitted. The first part includes surveys of alley traffic, street parking, garage and parking lots and studies of economical vehicular speed and downtown business district traffic flow. The second part of the report includes studies of garage and parking lot

AN important purpose of the report was to collect and present basic facts regarding traffic conditions so that these data might be available for judging the effectiveness of various traffic relief measures proposed.

Digitized by Google

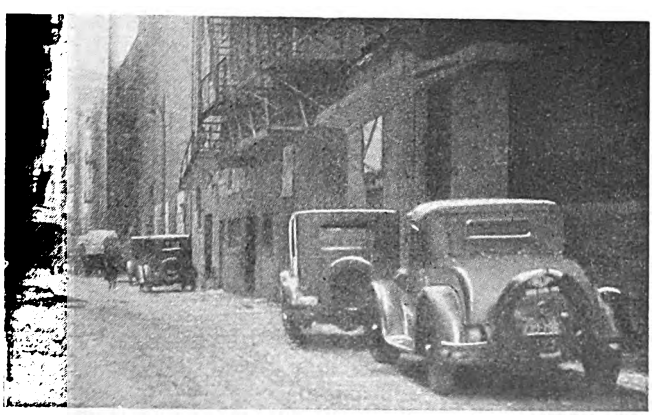
facilities outside of the downtown business district, night street storage of vehicles, freight and merchandise handling and transportation, cruising taxicabs and private automobiles, pedestrian control, school crossing protection, accident statistics and their use, travel habits of representative groups of the population, traffic direction and volume, trends of business and building development and a summary of suggestions made by individuals and organizations regarding improvement of the traffic situation. Numerous exhibits, charts, diagrams and tables were prepared from the data obtained. They proved valuable in showing the conditions as they actually exist and in dissipating popular fallacies regarding traffic matters.

Three General Relief Measures Proposed

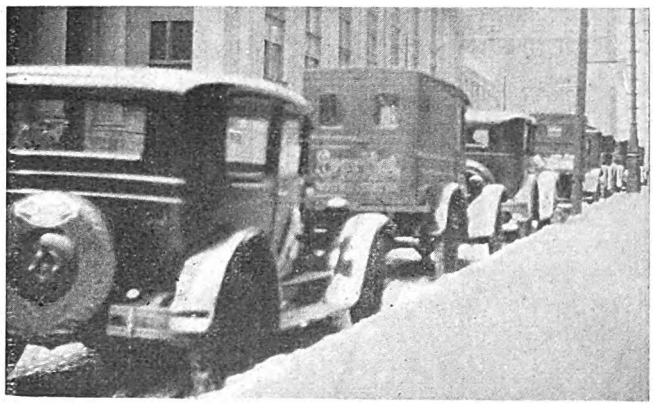
General measures for improving traffic movement, recommended by the report, group themselves under three headings: First, a traffic signal system that assists in producing a uniform fluid movement of vehicles and at the same time provides ample time allowance for pedestrians; second, regulations including reasonable parking restrictions, maximum use of travel lanes, distribution of traffic by the use of by-pass streets around congested centers, and pedestrian movement; third, a more efficient utilization of existing transportation agencies, including the motor car, bus and street car, through co-ordination and such measures as the express car experiment on Jefferson Avenue, operation of trucks at night, etc.

The report suggests further that merchants and truck operators make every effort to load and unload freight in alleys. It recommends the prohibition of alley parking of private automobiles and blocking of alleys by building construction. It suggests that numbers and names of business firms be provided at the alley entrances; that a strict observance of the parking provisions of the present ordinances be procured, especially during rush hours; that city departments, public utilities and other interests endeavor to arrange their field work so as to avoid partial blockade of travel lanes; that all vehicles be parked parallel to the curb, even in loading and unloading; that the present automatic signals on Cass Avenue be re-equipped as platoon-type operated signals for an extended test of this signal method, and that additional automatic signal installations be suspended until the above mentioned test has been completed.

A test of the combination express trolley car and local bus service, which is now under way on Jefferson Avenue, was recommended as a means of improving the



Private automobiles parked in alleys for long periods obstruct the movement of commercial vehicles



An example of the absolute disregard of "No Parking" signs by some motorists

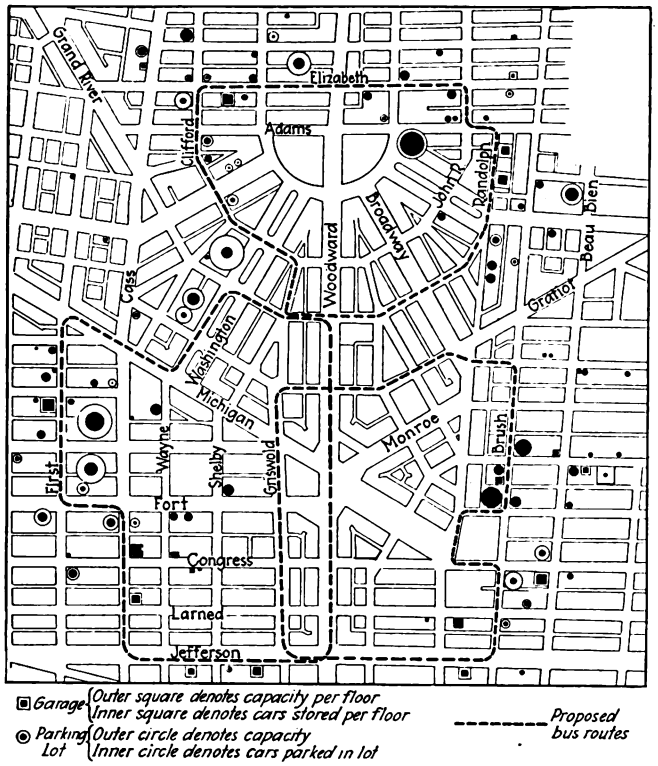
speed and convenience of public transportation service, at the same time reducing traffic congestion. Other specific suggestions included in the report are that unpaved alleys serving stores and business houses be paved; that consideration be given to night illumination of alleys as a means of increasing the use thereof, both for trucks in the business districts and motor cars in the residential districts; an attempt be made to increase the use of parking lots and other off-street parking spaces; that an ordinance be enacted prohibiting street parking of vehicles between the hours of 3 a.m. and 6 a.m. to reduce thefts and accidents; that merchants study the matter of night pick-up and delivery of freight and merchandise; that space be assigned for taxicab stands, and that automatic call boxes be installed to reduce the amount of taxicab cruising. The report recommends a test to regulate pedestrian movement, including marking sidewalks into three distinct lanes in an attempt to better pedestrian traffic flow. It suggests that automatic traffic signals be installed so that pedestrians can observe them easily, and that an accident analysis committee be formed to apply actively accident prevention remedies through detailed analyses of the monthly reports of the Accident Investigation Bureau. Other recommendations are brought out in the presentation of the detailed information within the report.

One thing upon which particular stress is laid is the necessity for a determination of policy as regards the installation of automatic traffic signals, that is, whether the ultimate result is to be the aggregate of signalled intersections or a gridiron of signalled routes; the former producing frequently interrupted traffic movement on any possible route, and the latter, if progressive signals are employed, aiding in the procurement of uniform and uninterrupted traffic movement on certain important arterial routes.

Many Unfavorable Conditions in Alleys

Although Detroit's alley system is adequate to permit segregation of passenger-carrying and freight-carrying vehicles in the business districts, the absence of street numbers and in most cases of firm names on alley entrances of business houses, has led to their improper use for storing private automobiles, and building construction materials instead of for the loading and unloading of freight-carrying vehicles to relieve street congestion. Some buildings abutting on alleys were found to have no alley access; and some business houses used the street for freight handling because their elevators were located

Digitized by Google



Detroit has adequate off-street parking facilities, but motorists do not use them extensively

The survey of available garages and parking lots in the Loop district showed 22 garages and 106 parking lots with capacities of 5,735 and 7,660, respectively. Unused spaces averaged 6,000 each day. Three bus routes were proposed to serve the garages, parking lots, stores and buildings.

adjacent to streets. As a remedy, the report suggests an ordinance providing for placing street numbers and the names of business firms occupying the premises at alley entrances, and that business firms whose premises abut on an alley provide adequate entrances as soon as possible; that sidewalk freight elevators be moved to the alley entrances wherever such an alley is available; that alleys be kept clear of rubbish and garbage; that the blocking of alleys by building construction materials be prohibited; that merchants and truck operators load and unload freight in alleys wherever facilities are available; that when trucks are stopped for any purpose in alleys, care should be taken to avoid blockading, and that parking of private automobiles in alleys be prohibited.

The report calls attention to the need for strict enforcement of parking restrictions in the congested business district. To determine the volume and characteristics of street parking a field survey was made in 48 selected sections of the city over a period of nine hours. The field men traversing the business section every 30 minutes recorded the license numbers of all parked automobiles, whether single or double parked, whether they were parked legally or illegally, and in addition noted the location of horse-drawn vehicles. This information showed that many of the permissive parking spaces in the downtown district were occupied for periods greatly in excess of the legal time limit; also, that many automobiles were parked where parking was prohibited altogether. The maximum demand for curb parking space occurred between 1:30 and 2 o'clock in the afternoon, at which time there were recorded 4,715 vehicles parked, whereas the permissive parking space numbered about 3,753. The influence of the one-hour parking limit was very pronounced in that out of a total of 32,450 parked vehicles recorded during the day, 25,185 were parked for one hour or less, leaving a balance of 12,265 vehicles which exceeded the one-hour limit.

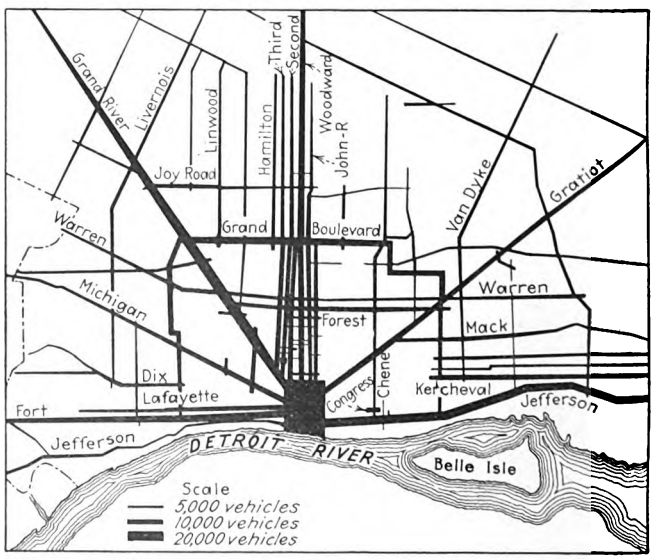
Of 195,078 persons who were tallied at 27 stores during three days in November, 1926, 36,272, or 19.1 per cent, came by private automobiles. Of this number 20,393 parked their autos in the street and 15,879 in garages or parking lots. The other modes of transportation used were the motor bus or jitney, which accounted for 24.2 per cent, and the street car, which accounted for 56.7 per cent. The survey proved conclusively that storage of vehicles on business streets is not justified.

Off-Street Parking Facilities Adequate But Not Used

A survey of the available garages and parking lots in the business district showed 22 garages and 106 parking lots, with capacities of 5,735 and 7,660 vehicles, respectively. The combined capacity totaled 13,395 cars. While the street parking survey showed 7,309 automobiles parked for periods in excess of one hour, the garage survey revealed that on the first day there were 5,524 spaces unused in garages and parking lots and on the second day 6,578. It is assumed that the average of 6,000 unused spaces in garages and parking lots would be ample to accommodate the 7,309 illegally curb parked vehicles whose average storing time was approximately three hours.

Strict compliance with the traffic ordinance, it was held, would not act as a deterrent to motorists driving into the downtown business district, but would simply have the effect of changing the storage habit of those who now store their automobiles in the street.

Closely allied with the vehicular movements and parking in the downtown business district is the matter of economical vehicular movement between this district and other districts, business or residential. A study of vehicular speeds and traffic flow between the districts is



Traffic flow for twelve-hour period on the major thoroughfares

Counts were taken every day for two weeks to secure average figures and checks made at four later periods. Vehicle tallies were made also in the Loop district and the data charted.

Digitized by Google

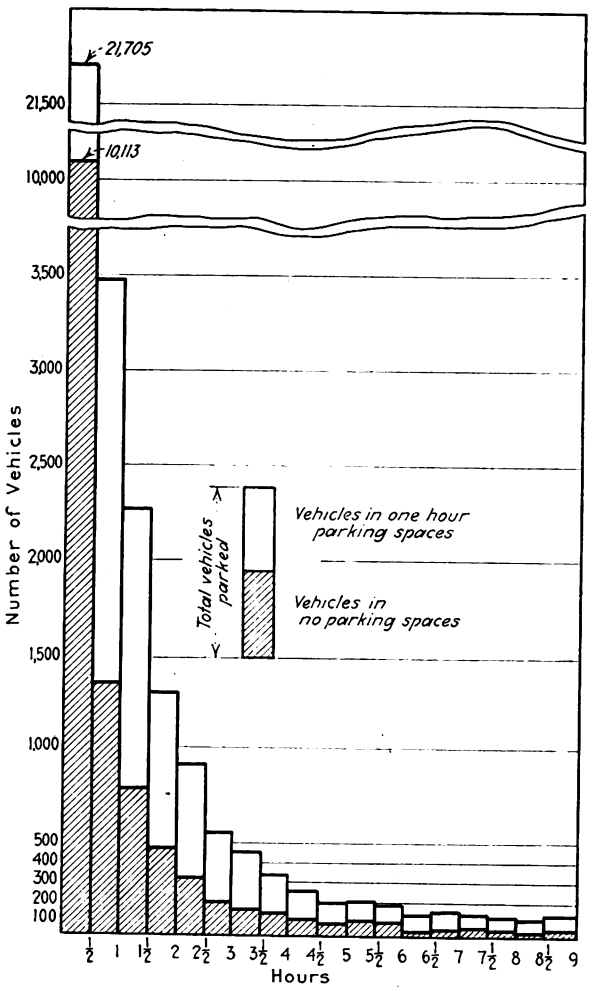
covered in the report. An inventory was taken of the automatic traffic signals installed both within and outside of the downtown district. The data show that there were 305 locations where signals were installed, 13 from which signals had been removed and 110 for which signals had been requested. It was recommended that a fixed policy be established with respect to all signal requests, and that a study be made of each section before a signal be installed for use.

A study of four different types of signal control, namely, the isolated traffic signal, synchronous, partial platoon and full platoon or progressive system, showed that the latter type was perhaps the most desirable. Time-lane diagrams were prepared for a portion of Cass Avenue, showing vehicular movements obtained with the use of the four different types of control. The charts show a decided advantage for the progressive type from a point of speed and street capacity. The report suggested that a thorough test be made of this type of control and if found as satisfactory as anticipated that other installations be made.

Rush-hour traffic should be given special preference by keeping open for moving vehicles the full width of the pavement in the direction of greatest traffic movement. Although this is provided for by ordinance in Detroit it is not satisfactorily observed. Another disturbing factor is the obstruction of traffic by slow-moving vehicles.

Street cars using the natural highest speed lane and operating on a local stop service become low speed vehicles, and in view of the ordinance requiring other vehicles to stop with them, have a very definite retarding action on all other vehicular movements, according to the report. A speed of between 15 and 25 m.p.h. is said to be the most efficient for the flow of vehicles along a thoroughfare. Tests made on several Detroit streets showed that the average speeds were considerably lower than they should have been.

It was suggested in the report that a plan of operating street cars express with supplementary buses to give local service be tried on some route in the city. This is being done on Jefferson Avenue as described in the Jan. 7, 1928, issue of ELECTRIC RAILWAY JOURNAL. Such a combined service was expected to expedite materially the flow of all types of vehicular traffic on any street where trolley cars are operated.



This chart shows the length of time vehicles park in the "No Parking" and "One-Hour Parking" spaces of the Loop district

TRAFFIC FLOW DATA IN LOOP DISTRICT OBTAINED

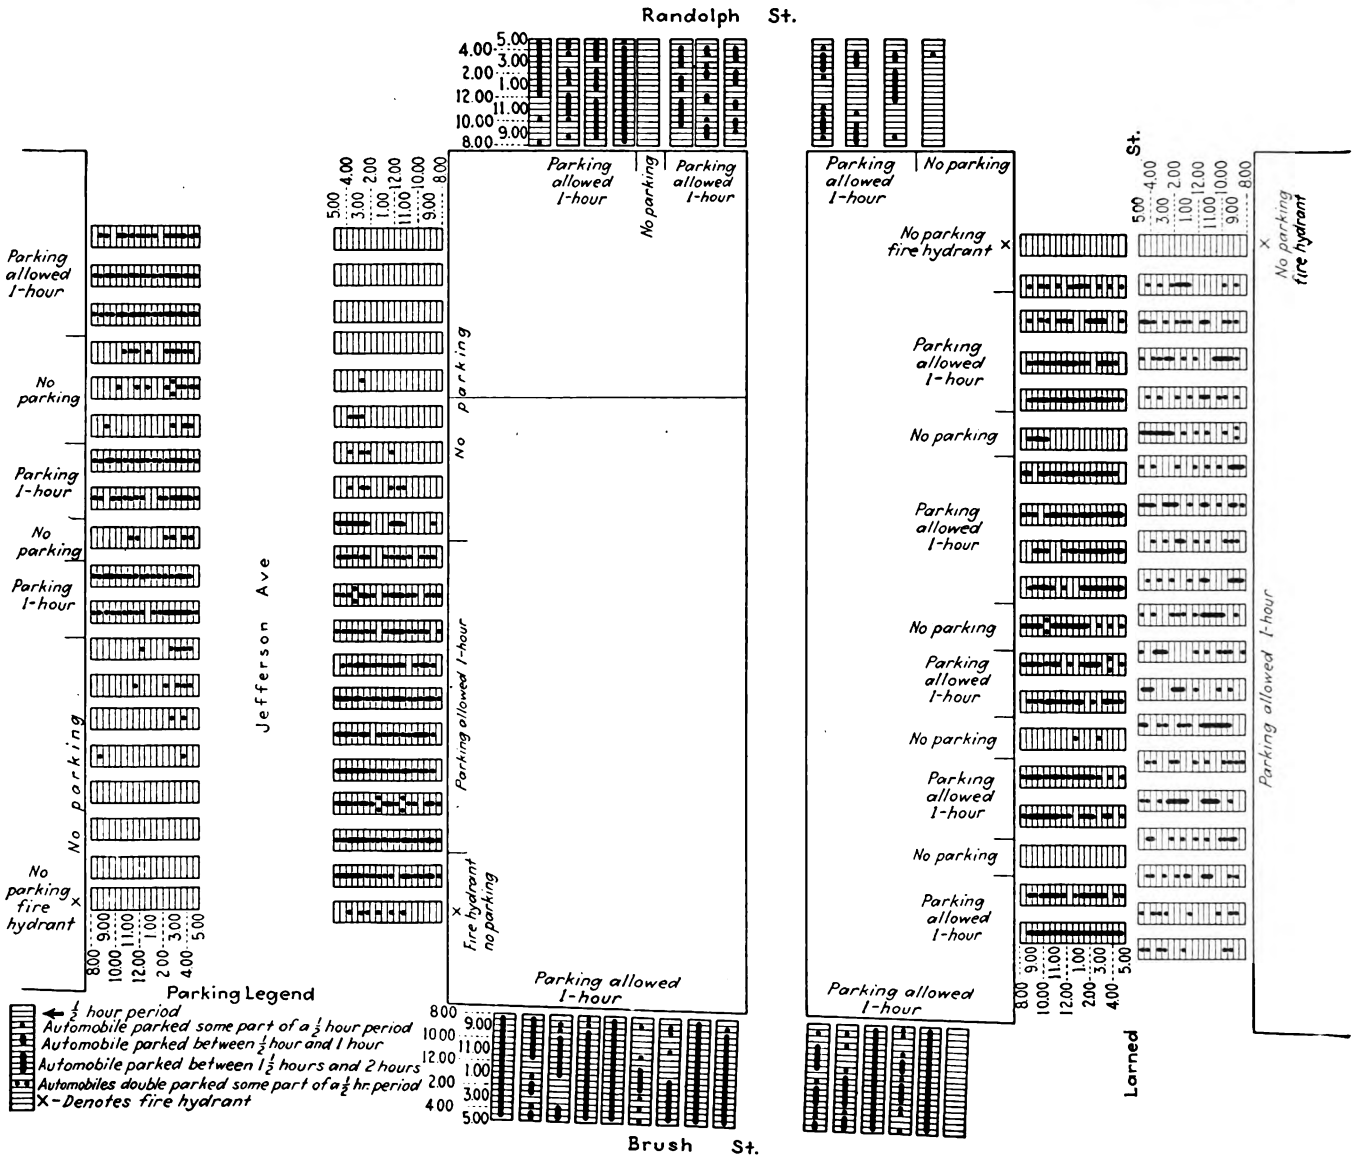
A vehicular traffic flow map shows the volume of travel on the various streets within the downtown business district. It is intended to use this map and other traffic flow data in planning the further installation of automatic traffic signals.

The following suggestions were made with respect to traffic signals and vehicular speed: That the present automatic signals on Cass Avenue be re-equipped as progressive-type operated signals for tests, preparatory to the general adoption of this type of control; that the installation of additional automatic signals be postponed until the above mentioned test has been completed and only after field tallies and analyses show that the proposed signals meet the conditions of controlled routes, rather than controlled isolated locations; and that a reduction be made in the number of stops of all vehicles, particularly street cars. In the sections outside of the downtown business district, surveys were made of garages and parking lot facilities, night street storage of vehicles, freight and merchandise handling and transportation, cruising taxicabs and private automobiles, pedestrian control, school crossing protection, accident statistics and their use, public transportation agencies, traffic direction and volume and development of outlying business centers.

Even outside the central business district, unrestricted parking was found to limit seriously the number and capacity of movement lanes. An extensive survey of garages and parking lots available showed a marked deficiency in the number needed. It was suggested that this deficiency could be met in part by the use of rear lots, vacant lots and the space between the curb and sidewalk. Expenditures need not be made for street widening unless there is a legitimate demand for space for moving vehicles that cannot be met by existing facilities. It was suggested that private companies provide parking spaces wherever possible; that merchants of a neighborhood use collectively a near-by vacant lot; that the space between the curb and the sidewalk be used; that automobile parking be prohibited on certain thoroughfares dur-

IT has been estimated that Detroit, in common with most large American cities, is less than 50 per cent efficient in the use of its streets, and that the annual economic loss due to traffic congestion and delays is more than $30,000,000.

Digitized by Google



The volume of street parking and the turnover thereof in the central business district was surveyed and the data for 48 sections charted as above. Each chart shows by half-hour periods how long vehicles were parked, vehicles parked double and those occupying "No Parking" spaces

ing certain periods of the day, and that alleys outside the business district be paved and illuminated. A chart was prepared to point out the possibilities of the use of parking lots just outside of the downtown business district to take the overflow of cars which at any time cannot be accommodated properly within the district.

Night street storage in Detroit has become a big problem in face of the increasing number of motor vehicles and the several serious drawbacks to this mode of storage. Where the number of cars owned per block is in excess of the off-street storage facilities, street parking occurs. A survey was made in twelve representative districts to determine the number of alley garage spaces, divided into vacant and rented; the average monthly rental therefor; the capacity and average amount of vacant space in public garages, and the number of night parked vehicles block by block. The survey shows that the amount of vacant garage space is inadequate to house the vehicles which the records show were stored in the street. This condition is particularly true in districts where apartment houses predominate. On the other hand, many of the garages were nowhere near filled and the conclusion was reached that garages will not be used to capacity while free street storage is so easily procured. High rates and inaccessibility of garages are contributing causes to night street storage.

The presence of unguarded vehicles in the streets during the night is a temptation for theft. A majority of thefts occur between midnight and 6 a.m.

The movement of commercial vehicles, the control of pedestrian traffic, and the modes of travel used by 101,541 persons in reaching their homes from eleven employment districts will be discussed next week.

Of especial interest to public transportation operators!

A map showing the travel habits of 101,541 persons in Detroit will be presented in Part II of this article.

Don't fail to read it!

Gas-Electric Cars Cut Railroad Costs

Fuel and crew costs are reduced on branch lines of steam railroads by substituting gas-electric equipment

By W. R. Stinemetz
Assistant to Transportation Sales Manager
Westinghouse Electric & Manufacturing Company

GAS-ELECTRIC cars, because of their low operating costs, are useful for the light and infrequent traffic of branch line service of railroads. Their use also stimulates traffic by providing the traveler more attractive accommodations than those of obsolete rolling stock usually assigned to steam branch line service.

To show how much a gas-electric car can save a railroad, a typical example of an average month's operation of a motor car and trailer actually substituted for a branch line steam train will be given. The steam equipment consisted of a locomotive and tender, a combination baggage car and smoker, and a passenger coach. The gas-electric train consisted of a combination baggage-smoker motor car and a passenger-trailer coach. The trains had the same space accommodations but the steam train with its locomotive and tender totaled more ton-miles. One round trip was made per day over the 40-mile line for 30 days, with the results given in Table I.

The gas-electric system shows a net saving of $1,568 per month or $18,816 per year, largely accounted for in three items—fuel, crew wages and repairs. This amount represents about 31 per cent of the investment for the gas car and trailer, allowing no salvage value for the steam train equipment replaced.

Eliminating Brakeman Effects Further Savings

Further savings have been effected on other roads by arranging the two-car train so all passengers enter or leave by one platform, and eliminating the brakeman from the train crew. One road using the system is handling the same amount of traffic as with the old four-car steam trains, and with passengers better satisfied. The average cost to run the steam trains was $1.08 per train-mile whereas the motor train gave the same service for a year at a cost of 38 cents per train-mile. On the foregoing basis, one of these train units costing $60,000 gross would show, with a daily service of 100 train-miles, a saving of $25,550 per year, or 43 per cent on the gross investment.

A 60-ft., 250-hp. electric car of the Philadelphia & Reading Railroad at the Trenton, N. J., station

When traffic is too heavy for single power units and trailers it is entirely feasible to use multiple-unit gas-electric car trains in a manner similar to multiple-unit car operation on an electrified line. The savings which could be expected with multiple-unit gas car operation under more congested conditions are shown in the following

TABLE I—30-DAY EXPENSE RECORD OF GAS-ELECTRIC AND STEAM TRAIN OPERATIONS

	Gas-Electric	Steam
Fuel (coal or gasoline)	$338.20	$603.00
Lubricants	17.11	35.00
Water	.....	10.00
Cleaning cars or engine	56.52	35.00
Supplies	6.86	35.00
Engineers' wages	297.72	297.72
Conductors' wages	288.56	288.56
Trainmen's wages	214.54	453.46
Firemen's wages	.....	220.30
Engine house expense	46.87	101.00
Running repairs	210.36	966.00
Totals	$1,476.74	$3,045.04
Average cost per passenger-mile, cents	1.21	2.49
Average cost per train-mile, cents	59.80	123.00

Elevation and floor plan of Lehigh Valley car arranged to handle passengers, baggage and mail

TABLE II—ANNUAL OPERATING EXPENSES FOR STEAM AND GAS-ELECTRIC OPERATION

	Steam Operation		Gas-Electric Operation	
	Cents per Train-Mile	Total Cost per Year	Cents per Train-Mile	Total Cost per Year
Crew expense	38.58	$282,720	31.460	$230,557
Fuel (coal or gasoline)	23.90	175,113	19.090	139,879
Locomotive repairs (motor car)	29.70	217,610	6.036	44,227
Locomotive supplies (oil)	1.70	12,359	1.794	13,151
Engine house expense	7.70	56,419	2.414	17,692
Train supplies and car expense	8.00	58,616	2.753	20,172
Totals	109.58	$802,837	63.547	$465,658
Cost of yard switching and facilities	.....	55,900	.....	18,650
Total main line and yard	.....	$858,737	.....	$484,308

comparison. The 190-mile division considered joins a large city terminal and a moderate-sized city. In addition to several through trains daily the large city terminal handles ten local passenger trains in each direction, in the suburban zone of 40 miles. The smaller city also has a suburban zone of 40 miles, and requires four trains in each direction daily. To handle the service with steam requires six Pacific-type passenger locomotives, sixteen passenger locomotives for local service and 75 passenger and express cars, with a total salvage value of $275,000.

To maintain the same schedules with complete new gas-electric motor cars and revamped steam trailers and provide express and passenger service would require 37 motor cars at $39,500 each and 37 revamped trailers at $2,500 each, a total cost of $1,554,000. Allowing a salvage value of $238,000 for the locomotives and 38 cars the net investment would be $1,316,000.

Annual Expenses Considerably Lower for Gas-Electric Equipment

The annual operating expenses of the equipment, based on reliable data, are given in Table II. Here again the principal savings are in crew expense, fuel and maintenance. The standby fuel losses are eliminated and the gas car consumes fuel only when doing actual work. The large maintenance saving is due to the age of the steam locomotives as compared with the new gas-electric equipment. This factor, however, is balanced by the higher fixed charges incurred by the net investment for the new equipment. In Table III comparative data are given showing the saving of gas-electric operation over steam operation. Using the figure of $1,316,000 for the net investment of gas-electric equipment, the fixed charges, including interest, insurance, taxes and depreciation total $170,477. This figure added to the annual operating expense of $484,308, indicated in Table II, gives a total annual cost of $654,785. The corresponding figure for steam is $990,954, so that a saving of $336,169, or 25.6 per cent of the net investment, is shown for gas-electric operation over steam.

TABLE III—COMPARATIVE DATA SHOWING SAVING OF GAS-ELECTRIC OPERATION OVER STEAM OPERATION

	Steam	Gas-Electric
Net investment	.....	$1,316,000
Annual operating expense	$858,737	484,308
Fixed charges*	132,217	170,477
Total operating expenses	990,954	654,785
Saving over steam operation	.....	336,169
Per cent saving on net investment	.....	25.6
Per cent saving without fixed charges	.....	28.5

*Include interest, insurance, taxes and depreciation.

The heavy electric traction committee of the American Electric Railway Engineering Association has as one of its subjects for investigation, "Branch line electrification, and self-propelled cars and locomotives." This committee has presented much valuable data on the operation of gas-electric cars, particularly in the reports of 1925, 1926 and 1927.

Snow Costs Depend on Kind of Snow

DESPITE the popular belief that the lack of snow is a big help to the financial affairs of a street railway, the Worcester Consolidated Street Railway, Worcester, Mass., has produced figures which lend an interesting light to the situation, revealing that it is not a question of how much snow but what kind of snow.

Costs of snow removal for five years cannot be taken for a barometer of the snowfall, it was found. Some months when there is little or no snow, the snow costs are heavy due to frozen switches, and that dreaded succession of snow, rain and freezing weather.

In December, 1927, which was considered a very open month, the cost of snow removal for the Worcester system was $3,056, less than one-third of the cost for the year before, which was $11,794, but nearly twice as much as for 1925, which was $1,893.

Last year February's snow removal cost was $8,058 and in March $4,098. In 1926 the February cost was $31,235 and March $5,835. In 1925, March was more like a lamb, costing only $343, but February snow cost $8,579. Only once in the three preceding years did the figure for either month fall below $5,000.

Electrification Reduces Smoke Pollution

SMOKE damage to the Chicago Art Institute has been measurably reduced, according to a statement by the superintendent of the Institute, since the electrification of the Illinois Central Railroad suburban service. The through trains are still steam-driven. Approximately 4 tons of soot were taken from the building's roof during 1927, whereas during the previous year 13 tons were removed. The smoke and cinders falling on the roof of the building and seeping inside deface costly paintings, statues and fabrics, and the thin coating which forms on everything results in disintegration. The reduction of smoke pollution is of great value to the Art Institute.

Ventnor Heights bus at Albany and Atlantic Avenues, where connection is made with the street cars

Feeder Bus Service Stimulates Riding

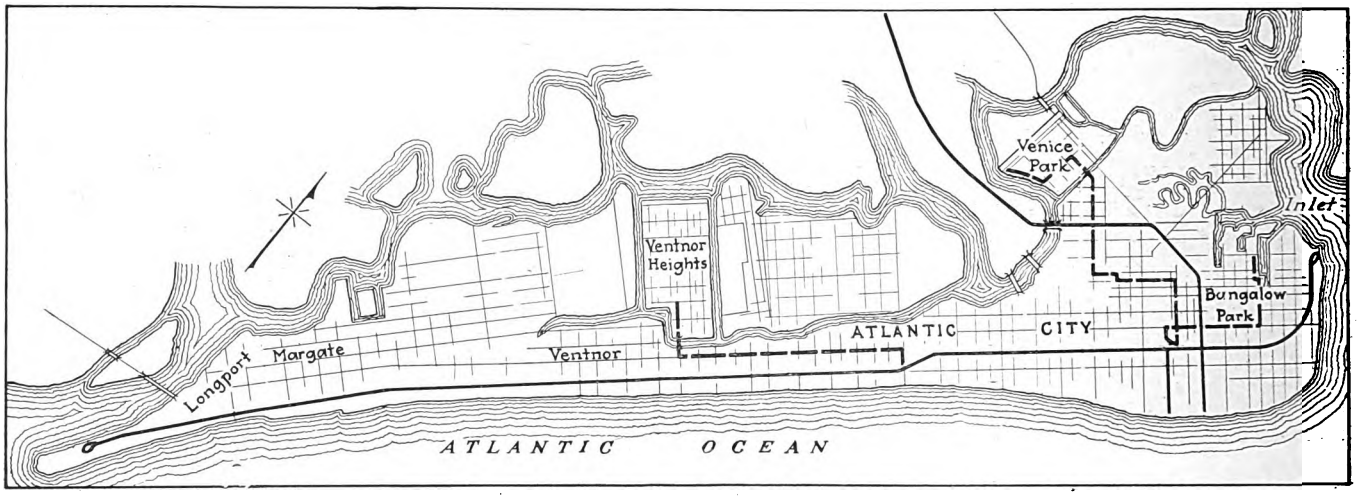
Operation of three routes in recently developed residential districts has brought Atlantic City & Shore Railroad a substantial volume of new business

FEEDER bus service established last summer by the Atlantic City & Shore Railroad, Atlantic City, N. J., has proved a valuable adjunct to the rail lines. Two of the three bus routes operated by this company serve newly-developed residential districts, while the third is partly a replacement of a former car line and partly an extension into new territory.

The geographical arrangement of Atlantic City is unique, lying, as it does, on a narrow strip of sand between the Atlantic Ocean and extensive salt marshes. The railway operates two principal car lines. One is an interurban called the "Shore Fast Line" which starts at the Boardwalk in Atlantic City, crosses the marshes to the mainland and continues thence to Ocean City. The local car route is somewhat L-shaped, about 8 miles long, extending from Absecon Inlet on the north via Maine

Terminal of the Venice Park and Bungalow Park bus routes opposite the Pennsylvania Railroad Station

Digitized by Google



Three bus routes operated by the Atlantic City & Shore Railroad supplement the local trolley service

and Atlantic Avenues to Longport on the south. The center of the business district of the city is about 1½ miles from the northern end of this car line.

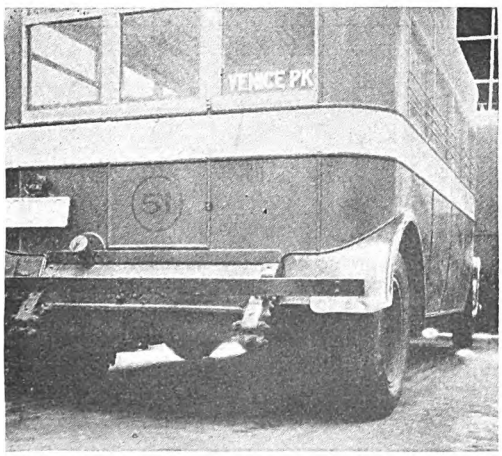
Throughout the greater part of its length the city is so narrow that the car line on Atlantic Avenue is within easy walking distance. At its northern end, however, the width is somewhat greater. The short leg of the L of the car line serves a portion of this district, and another car line on South Carolina Avenue formerly served another portion of the territory lying west of Atlantic Avenue. It is this second car line that has been replaced by a bus line, except for a short section between Atlantic Avenue and the Boardwalk, where a shuttle car is operated. The bus line starts in front of the Pennsylvania Railroad Station, west of Atlantic Avenue. A second bus line starting from the same point serves an adjacent district which has been newly developed. These routes are called Venice Park and Bungalow Park. The third bus route, Ventor Heights, is located some distance away. This connects the new suburban district of that name with the car line at Atlantic and Albany Avenues.

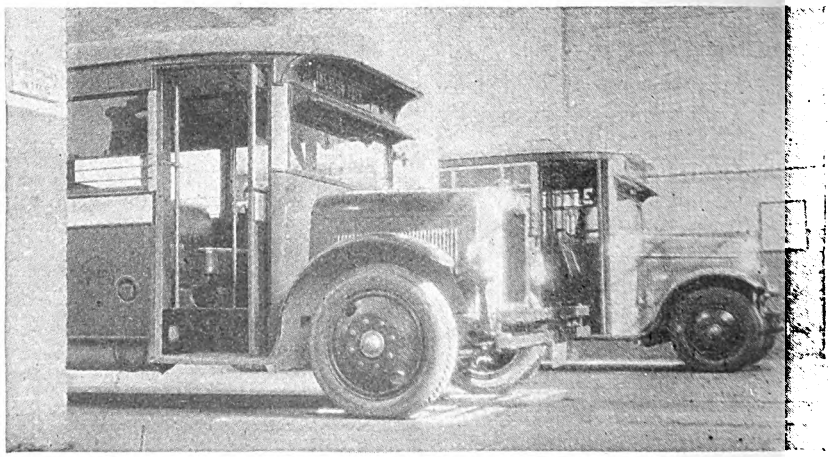
The Venice Park bus route, the most important of the three, began running in May, 1927. In February, 1928, approximately 750 passengers per day were being carried. The route is 2.2 miles long and the running time is thirteen minutes. The schedule speed is 10.2 m.p.h. A total of 167 bus-miles per day are operated on this route.

The Bungalow Park bus route, which serves an adjacent neighborhood, was started at the same time. Its length is 1.3 miles and the running time nine minutes. Schedule speed is 8.65 m.p.h. About 280 passengers per day are carried on this route and the buses operate 88 miles.

Passengers alighting from an inbound bus at North Carolina and Atlantic Avenues

The Ventnor Heights bus route was established in September, 1927. At the present time 240 passengers per day are being carried and the buses operate 126 miles. This route is 1.75 miles in length. The running time is eleven minutes and the schedule speed 9.55 m.p.h.





At left—A small sign in the rear window makes it easier for the passenger to determine on what route the bus is operating. At right—When not in service buses are stored in an unused bay in the carhouse

Digitized by Google

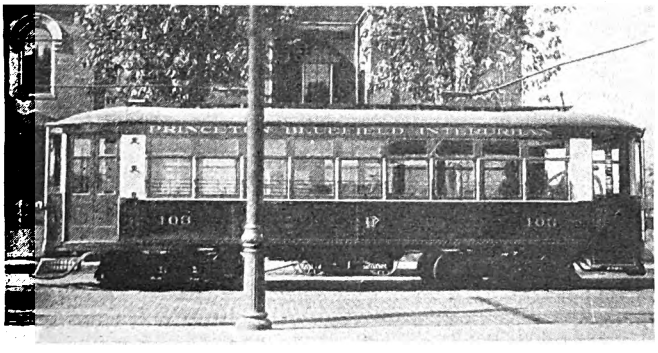
Operations are conducted under the name of the Central Transportation Company. This was derived from the name Central Passenger Railway, an underlying company. Fares on the buses are 10 cents with free transfer to the cars. The car fare is 7 cents and a 3-cent charge is made for transfer to the buses. The revenue per bus-mile averages about 30 cents, while the cost of operation is slightly over 33 cents per bus-mile. It is expected that the revenue will increase as the districts served build up. While these buses act principally as feeders to the rail line, they have actually developed traffic that did not previously exist.

The company has a total of seven buses. Of these, six are 21-passenger Yellow model X buses and one is a 29-passenger Yellow model Z. In addition to the standard equipment of roll signs in front, each bus carries a small route sign in the rear window. This has proved particularly useful because the Venice Park and Bungalow Park lines have their terminal west of Atlantic Avenue in such a location that most of the passengers approach from the rear. The rear sign makes it possible for an approaching passenger to tell whether it is his bus or another which is standing at the terminal.

The buses are housed in one bay of the company's carhouse. Maintenance and inspection work is done in the railway shops. For this purpose the buses are run over the pits in the same way as a car. The work is not done by the regular shop men, however, but by a special group of bus mechanics. When in service buses are operated by former car operators.

Light Interurban Has Good Record

ONE of the first light-weight interurbans to be placed in service anywhere is car 103 of the Princeton Power Company, operating the interurban connecting Princeton, W. Va., Bluefield, W. Va., and Graham, Va. The car, which has been operated continuously since 1917, is still in excellent condition and should remain in service for many years more, according to S. J. Evans,



Light-weight interurban car of the Princeton Power Company which has operated continuously since 1917

president and general manager of the company. It has proved most satisfactory to operators and patrons alike. Its low energy consumption, averaging 0.8 kw. per car-mile, has effected a great saving. Its high rate of speed, 40 m.p.h., is especially appreciated by the patrons.

The car is a 41-passenger combination unit with smoking compartment. It was built by the Cincinnati Car Company, is all-steel, weighs 21,000 lb., and is equipped with Westinghouse No. 506 motors mounted on 26-in. steel wheels.

London Underground Uses Ticket-Issuing Machines

In spite of its zone fares the London Underground has been successful in employing automatic machinery in its fare collection

MECHANISM which is largely automatic is used in a system of fare collection which has been developed on the London Underground System, although zone fares are charged. Originally, on this system, tickets were sold at ticket windows, as on steam railroads. They were printed with the names of the initial and final station and were surrendered by passengers as they left the destination station. This acted as a safeguard against overriding.

The next step, introduced some twenty years ago, was the installation of slot machines for the sale of tickets. Not all tickets were sold by machine, only the denominations most commonly used, as 2-penny and 2½-penny tickets. The others were sold from a window (or booking office as it is called in London). The machines relieved the ticket agents, however, of considerable work and also helped the public by shortening the time of waiting to buy a ticket. Lettering on the machine showed clearly the amount of money which had to be deposited to secure a ticket and the station or stations to which such a ticket would entitle a passenger to ride. Such a slot machine is shown in an accompanying illustration.

These machines, while useful, were of rather primitive design and noisy in operation. In their original form they also were open to fraud by the use of slugs. They served the purpose, however, and many of them, although greatly improved, are still in use. They still require the exact amount of money to be inserted. They do not make change.

The latest type of slot machine in use on the London Underground System will take either the exact fare or will make change if the traveler inserts a 6-penny coin or a shilling coin. It also weighs the coin inserted and tests it electrically for conductivity to determine whether it is spurious, or not. It then prints, dates and issues a ticket instead of taking one from a supply. All this is done at the rate of a ticket a second. There is only one money slot, no matter what the coin or coins that are dropped into it.

It is believed that this type of machine, when generally installed, will greatly increase the use of slot ticket machines, as experience has shown that 90 per cent of all the passengers at the Underground ticket offices are in possession of either copper penny pieces for the fare, or sixpences, or one shilling pieces.

The type of slot machine just mentioned is not the only one being tested out by the London Underground. Three other forms are also in use. One, shown in Fig. 4, is purely mechanical and has the advantage that it occupies less space than that shown in Fig. 3, though it does not make change. Another advantage possessed by a purely mechanical machine is that it can easily be moved from one station to another. Hence, it is especially convenient for use at outlying stations on days when they are to be used by a large number of people, as for a Rugby game or other athletic event.

Fig. 5 shows how five of these machines designed for different rates of fare have been brought together at one station to occupy a circular space only 3 ft. in diam-

Digitized by Google

eter. Fig. 6 shows another form of this machine. It is designed to be tall so as to take up very little floor space. It is especially useful in passageways where the room is limited.

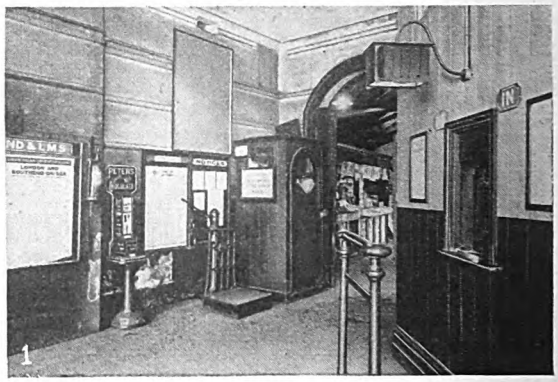
Besides these ticket-issuing machines, the company is testing out turnstiles, or passimeters, on rather an extensive scale. These machines have to differ from those used in the United States, because in addition to registering the fare they have to issue a ticket showing the destination to which the fare is paid.

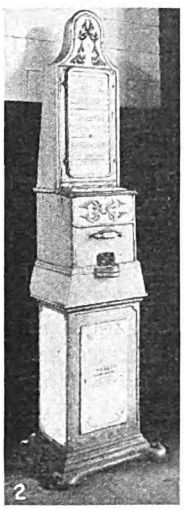
One of the latest turnstile designs is illustrated in Fig. 7. If the passenger drops two pennies in the slot of the 2-penny passimeter, he will receive his ticket printed and dated. At the same time the turnstile is automatically released, thus providing admission to the train platform. If a 6-penny or a shilling coin should be dropped in the slot the same procedure is followed except that the passenger also receives his proper change.

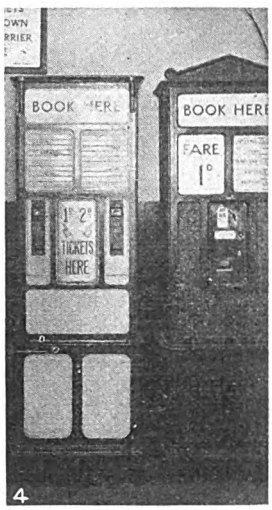
Still another form of passimeter station is shown in Fig. 8. Here, as the passengers pass through the station, pay for and receive their tickets, they are registered on meters in the ticket office. With this system, as well as with the passimeter illustrated in Fig. 7, the inspection of tickets, which has to be done with all the other plans, is dispensed with except for holders of season tickets and return tickets. These represent only about 20 per cent of the traffic.

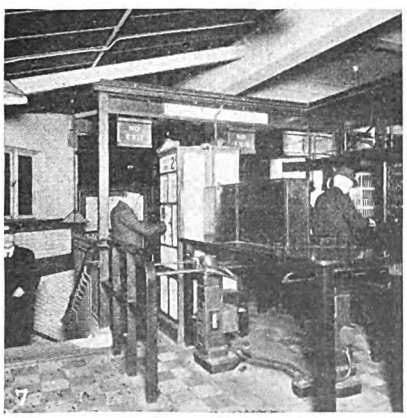
The latest office ticket issuing machine in use on the London Underground is shown in the final engraving, Fig. 9. This machine, which is also used with a passimeter, prints, dates and numbers the ticket from plain rolls of paper, and has a capacity of four tickets per second. It is primarily intended for the issue of tickets of the less common denominations, i.e., tickets which have to be issued from an office.

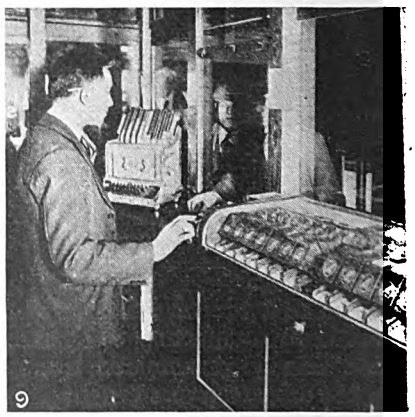
The clerical staff much prefers this machine to the former plan where tickets had to be taken out of the case one at a time. In fact, the work is so much easier that it has been found practicable on the deep underground lines to locate the electrical switches which control the elevators to the station platforms in the ticket office.











Old and new ticket-selling and fare collection methods on the London Underground railway system

1. The earliest method used in London, where tickets were sold at a window and punched at a barrier.
2. First ticket-issuing machine.
3. This machine issues 2-penny tickets and gives change for larger coins.
4. This double machine issues 1-penny or 2-penny tickets and is mechanically operated. It does not make change.
5. Several automatic machines grouped in the form of a kiosk.
6. A high design with small floor area for narrow passageways.
7. The passimeter and change-making machine which dispenses with both ticket seller and ticket puncher at entering stations.
8. Through type of passimeter station.
9. Ticket printing and issuing machine for office issue, used in conjunction with passimeter.

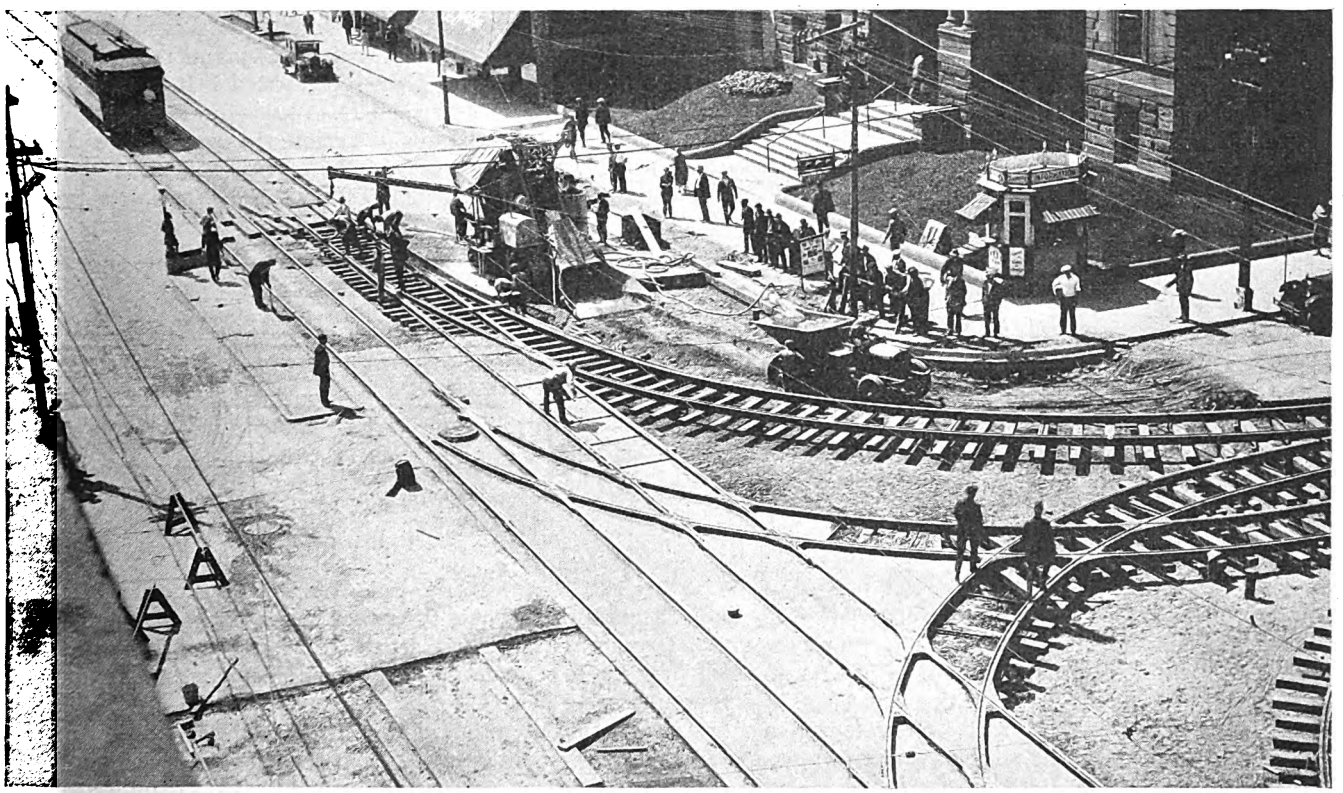
Pontiac, Mich.,
Improves Its Principal Street

Extensive program involves widening and repaving of Saginaw Street and the relocation and rebuilding of 1½ miles of double track



Street car service was uninterrupted during the construction. One track was poured at a time and operation continued on the other track

INCREASING traffic needs caused the city of Pontiac, Mich., to adopt an extensive program of street widening and opening, the major part of which was the widening and rebuilding of Saginaw Street, the principal business thoroughfare and a continuation of Woodward Avenue of Detroit. The improvement, described in an article in *Engineering News-Record,* involved not only the repaving and the complete rebuilding of 1½ miles of main thoroughfare, but also the removal, relocation, rebuilding and repaving of more than 1½ miles of double-track street railway.

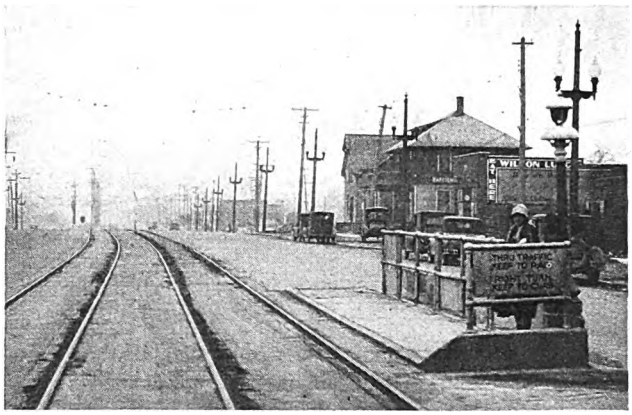
In the rebuilding of the street the Detroit United Railway, which operates both the local transportation system and the interurban service to the city of Detroit, completely rebuilt its double-track line. The condition of the rails and ties did not warrant their use in the type of new construction demanded by the city. On about 2,000 ft. of street in the business section there existed three tracks, all of which were in poor condition. The plans for rebuilding eliminated one track and called for a new double track in the center of the street. This rebuilding of the street railway system is the more interesting since the franchise for the Saginaw Street line expired on May 17, 1927, and on May 24 a day-to-day agreement was entered into, whereby the street railway company agreed to a number of things, chief of which was the rebuilding of its tracks under city specifications, supervision and inspection.

Plans Prepared in City Engineer's Office

All plans and specifications for the new construction, with the exception of special-work layouts, were prepared under the direction of the city engineer and approved by the street railway, of which J. M. Mudie is chief engineer. G. J. Wagner & Company, consulting engineers, of Grand Rapids, Mich., retained as consultants on transportation matters, acted in an advisory capacity on plans and specifications and helped supervise construction of the tracks.

The trackwork consists of 6-in. 100-lb., A.R.A.(A) rails, with thermit-welded joints. The ties are sawed white oak, 6x8 in., 6 ft. 8 in. long, 2 ft. c. to c. and cased

Digitized by Google



Safety zones and platforms were installed at all important street railway stops in the business district

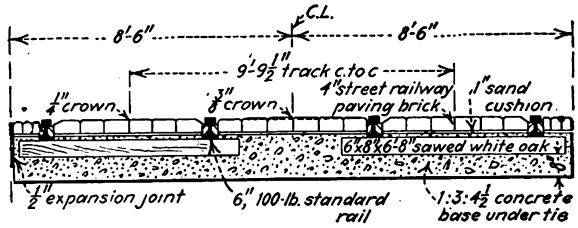
in a monolithic mass of concrete extending from 8 in. below the ties to 1 in. above them. The paving consists of 4-in. wire-cut paving brick laid on a 1-in. sand cushion and having the joints poured with asphalt filler. Rail filler was used with all regular T-rail sections, together with a special brick nose-block. The concrete was designed for a minimum strength of 2,500 lb. per sq.in. at the end of fourteen days. Actually the test cylinders averaged 2,788 lb. at that time. A carefully proportioned aggregate was used, consisting of a 1 : 3 : 4½ mix, with the mixing time not less than two minutes. The concrete was placed as dry as possible consistent with workability.

In construction, one track was poured at a time and car service was given over the other until the concrete had attained the desired strength. This required not more than fourteen days, as shown by compression test cylinders. In a few instances, where it was impossible to discontinue service, each tie was well blocked and concrete of a richer mix and longer mixing time poured to within 1 in. of the bottom of the ties. When this had attained sufficient strength the track was relined and reblocked with shims resting on the concrete and the remainder of the concrete was poured. Where this method was used, the base concrete attained a strength of 2,500 lb. after four days and showed no sign of disturbance from the uninterrupted service.

For the 120-ft. right-of-way an 80-ft. pavement was designed, with a 20-ft. sidewalk on each side. This provides for the double-track street car line, four 10-ft. lanes for moving traffic and two 10-ft. lanes for parallel parking. The wide parking space was provided for two reasons: If parking is prohibited during rush hours, the street will accommodate eight lanes of moving traffic; and the wide parking space will allow greater ease and safety in parking, with less inconvenience to moving traffic.

Pavement Constructed to Withstand Heavy Traffic

The pavement base, of 1 : 3 : 4½ concrete, is 11 in. thick, reinforced by ⅝-in. rods spaced 2 ft. c. to c. longitudinally and ½-in. rods 3 ft. c. to c. laid crosswise. Adjoining the street railway section, the base is thickened to 14 in., which decreases to the regular thickness in a distance of 3 ft. from that section. A 3-in. straight paving



The ties are cased in a monolithic mass of concrete. Four-inch paving bricks are laid on a 1-in. sand cushion

guard doweled to the base forms a division between the asphalt surface and the street railway brick paving. That paving is completely separated from the street pavement by a ½-in. expansion joint extending from the surface to the subgrade.

During the rebuilding of the street the interests of the merchants and business men were held of paramount importance. All underground work was carried on without closing the street, and the work was confined to limited areas until finished. All backfilling from excavations was mechanically tamped in thin layers. In some instances additional dirt had to be supplied to fill the trench completely, showing that a compaction had been secured greater than that of the original soil. By keeping the various activities spread apart no portion of the street was closed for any great length of time, although it was necessary to barricade the same area more than once. The various operations, involving excavation, curb and gutter, concrete base and asphalt surface, followed in quick succession.

Traffic is so heavy and constant that safety zones with platforms were installed at all

The Saginaw Street improvement included the complete reconstruction of 1½ miles of double track

Digitized by Google

important street railway stops in the downtown district. These zones, one of which is illustrated, are of the raised concrete type, having a protective curb and iron railing with a splash apron and caution light at the end of each zone. All important street crossings are protected by stop lights, the timing of which is progressive. In addition to the lights, the crossings have galvanized metal markers, and it is hoped that these, in conjunction with the lights, will discourage jay-walking and minimize traffic accidents.

An interesting feature of this 1½ miles of street rebuilding is that the only poles will be combined light and trolley-span support poles 120 ft. apart. These poles are of fluted steel with old-bronze lacquered finish and are 23 ft. high. Each pole carries an ornamental cross-bracket supporting two 600-cp. lamps. Before adopting this pole exhaustive tests were made at the manufacturing plant, which showed that it corresponded in deflection to a 6-7-8 in. tubular steel pole weighing 887 lb., except that the safe load on the fluted pole was 3,500 lb., as against 1,544 lb. for the tubular pole. Under a load of 2,000 lb. the deflection was only 5¼ in.; at 4,000 lb. it was 11⅝ in. and upon removal of the load the pole returned to within ⅜ in. of its original position. The vibration tests also were satisfactory.

Des Moines Reduces Fire Insurance Cost 44.4 Per Cent

By O. H. Bernd

Secretary the Des Moines City Railway, Des Moines, Iowa, and Member Insurance Committee American Electric Railway Association

Since Nov. 13, 1923, the Des Moines City Railway has reduced its insurance costs $6,315 per year, or 44.39 per cent. In other words, the average rate has been reduced from 47.3 cents per $100 to 26.3 cents per $100 of insurance.

Early in January, 1924, the insurance was placed on a three-year term, at 2½ times the annual premium, effecting a saving of approximately $2,300 per year.

The company then directed its efforts to the matter of housekeeping. All of the recommendations made by the local insurance rating bureau, in co-operation with its affiliated organizations, which did not involve any considerable expenditures, were carried out. All wooden lockers for workmen were replaced by approved steel lockers equipped with slanting tops to prevent the storage of any articles on top. Old waste cans were replaced with new approved types and properly distributed throughout the shops and carhouses. Additional fire extinguishers and sand pails were placed in accord with bureau recommendations. All dead or abandoned electric wiring was removed from the various carhouses. In addition to these physical improvements, the program included a general campaign among workmen to induce them to keep their work places clean and free from accumulations of rags and rubbish, resulting in a marked improvement in the performance of their work.

The company has recently completed the installation of automatic sprinkler systems in its car shops and one of its two carhouses. The second carhouse is a temporary frame building, and does not warrant the expenditure necessary to equip it with a sprinkler system.

These automatic sprinkler systems were installed at an approximate cost of $16,900. As an offset to this expenditure, there was received by the company in return premiums, on account of the reduction in rates, the sum of $8,484, so that the actual cash outlay for these sprinklers was less than $8,500.

The total annual insurance saving effected by them is $3,636. The largest saving is in the car shop. This is a one and two-story brick and concrete building with composition roof, erected in 1904 and partially rebuilt following a fire in 1912. Before the installation of sprinklers the average rate for this building and contents, except rolling stock, was $1.291 per $100, while the present rate is 22.4 cents per $100 of insurance, effecting an annual saving of approximately $2,668.

The carhouse, which was equipped with automatic sprinklers, is of brick with composition roof, and has a storage capacity of 45 passenger cars. While the average rate on this building and contents, except rolling stock, was reduced on account of the sprinkler installation from 76.4 cents to 28.3 cents per $100 of insurance, the annual saving effected is but $230, as only $48,000 insurance is carried on the building and contents, except rolling stock.

The sprinkler installation in the car shops and carhouse resulted in an insurance saving on the company's rolling stock of $747, or approximately 10 per cent—a substantial saving, when it is considered that the combined storage capacity of both car shops and carhouse is but 53 passenger cars, or less than one-third of the company's rolling stock.

In addition to the direct savings on insurance premiums we consider the sprinklers a good investment because of the protection they afford, as a serious fire in a carhouse or shops might easily result in crippling the service and prove more costly than the sprinkler installation.

School for Arc Welders

For many years a school of welding has been conducted in the shop of the Lincoln Electric Company, Cleveland, Ohio, but just recently it has been reorganized and re-equipped. No tuition or fees are charged. The equipment includes a number of standard 200 amp. Stable-Arc welders installed in line with a series of booths in which the pupils work. All wiring except the necessary leads to the electrode holders are in conduit and the floor space is kept clear. The individual compartments are curtained by heavy material.

A 30-day course is given in twelve lessons which include the following: (1) The contact of the arc, its characteristics and manipulation; (2) the nature of welding rods and depositing materials; (3) the operation and care of the welding machine; (4) the nature of vertical and overhead welding; (5) testing welds for porosity and strength; (6) welds on cast iron and their percentage of strength; (7) the advantages and future of carbon arc welding; (8) welding of copper and bronze castings; (9) the use and abuse of pressure welding; (10) the assistance to the human element in Stable-Arc welding rods; (11) the construction of welded machine tools; (12) the simplicity and strength of welded fixtures.

Pupils work under the direction of a trained inspector who teaches them both as a class and as individuals. With 30 days intensive training men are able to acquire a sound working knowledge of the fundamentals of electric arc welding, and are fitted to engage competently in the trade.

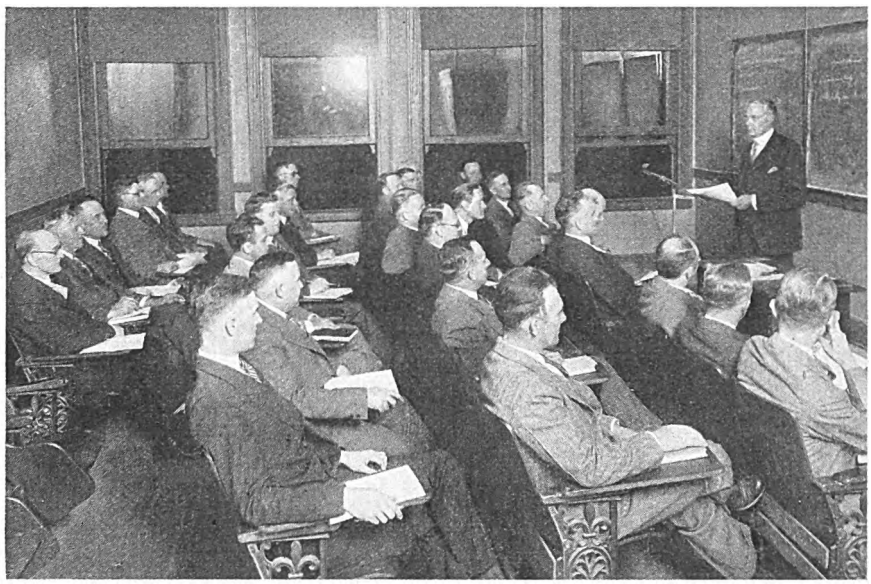
Pacific Electric Has Balanced Educational Program

Los Angeles Board of Education furnishes paid instructors for the classes. More than 2,000 men and women enrolled in four years

THAT a well planned educational program for employees of public utility corporations can be carried on with advantage both to workers and the management is demonstrated by the experience of the Pacific Electric Railway of Los Angeles, Cal. The success that has been achieved by this large interurban railway system is evidenced by the present enrollment of more than 600 employees, and by the total enrollment of more than 2,000 men and women in the four years since the plan was inaugurated.



An interested group of Pacific Electric employees in one of the class rooms at the company's headquarters in Los Angeles

One of the discouraging elements for public utilities conducting educational work on a large scale is the prohibitive cost often involved. The Pacific Electric, however, has reduced the cost so that it is negligible compared to the results achieved, by co-operation with the city's educational board. When inaugurated four years ago under the direction of Earl W. Hill, appointed educational director, the only class was one of traffic management. Interest grew and results from this first effort were so satisfactory that broadening of the program and problems incident thereto were discussed with the Los Angeles Board of Education. The school authorities were deeply impressed with the interest created, and promised aid to the movement by furnishing paid inspectors in any class when attendance of fifteen students could be maintained. Thus encouraged, the educational director began broadening the program.

Two rooms located in the Pacific Electric Building were set aside for exclusive use as class rooms. Desks, blackboards, typewriters, books and other equipment were supplied by the company. Interest of employees was stimulated through the columns of the company's monthly magazine and by encouragement from departmental heads. The work done in this regard, however, was more of an advertising nature, it soon being learned that, given a bit of encouragement, there is an inherent desire in the average individual to broaden his knowledge. With the program well established, there has been no lack of interest on the part of employees; on the contrary, over-enrollment has become the problem frequently.

At present seven studies are being taught, six of which are presided over by teachers supplied by the Board of Education. The subjects are traffic management, personal leadership, public speaking, mathematics, business English, shorthand and typewriting. The classes are held in the afternoon from 4:45 to 5:45 and in the evening from 7 to 9.

Incentive to complete the courses is stimulated by issuing diplomas to those who attend regularly and successfully complete their studies. Furthermore, each employee is advised that his respective department head will be notified of the awarding of a diploma, and will be told of the employee's desire to improve.

Inasmuch as the Pacific Electric operates in four counties and its employees reside in widely scattered districts, the educational director has another duty to perform. He keeps in close touch with and knows the various studies available at all the institutions of learning within the district. Employees are urged to consult with him and he in turn recommends the school where their needs may be cared for best. Approximately 500 employees are placed in schools over the system through contact with Mr. Hill. Reports are furnished to the educational director from the school superintendent, the procedure lending encouragement to the students.

The interest manifested by the employees is exemplified in a recent class in personal leadership which had an attendance record of 98.5 per cent, and for which applications exceeded the capacity of the school room by 50 per cent when the class was reorganized.

Port Arthur Grants New Franchise

SEVERAL interesting provisions are contained in the franchise granted Jan. 11, 1928, by the city of Port Arthur, Tex., to the Eastern Texas Electric Company. The life of the franchise is 50 years. The clause on fares provides that the single fare is to be 10 cents. Tokens are to be sold at three for 25 cents, and weekly tickets for 40 cents, with an additional payment of 5 cents per ride. The franchise declares that in the future, the city may "fix and regulate a fair price for the service to be performed under this franchise." On the other hand, the railway has the right to abandon any line or lines which do not give fair returns on their valuation, or it may abandon a line on any street about to be repaved, if it desires to do so. If any change is made in the grade of any street the city must bear the cost of making the railway tracks conform to the new grade. The company pays $25 a year annually to the city as reasonable compensation for this franchise.

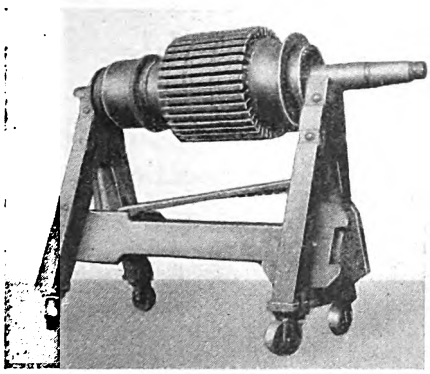
Maintenance Methods *and* Devices

Adjustable Armature Winding Stand

SOMETIMES it is advantageous to have adjustable, movable armature winding stands in a shop. In the armature shop of the Binghamton Railway, Binghamton, N. Y., armatures of various sizes are in service which require different pedestal centers for mounting on the winding stand and shop conditions require



Convenient type of adjustable armature stand

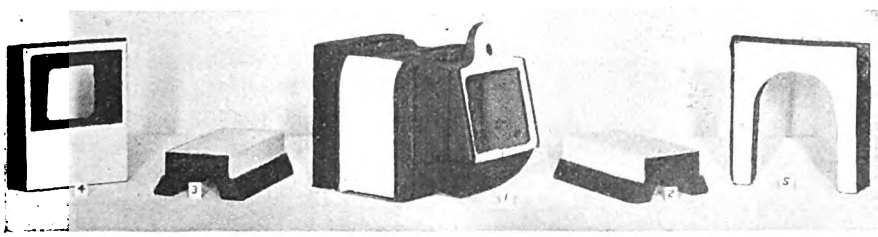
frequent movement of the armatures to make room for other work. The stand shown in the accompanying illustration was designed to meet this condition. The A pedestals of this stand, which are 32 in. high over all and 22 in. wide, are made of 2¼-in. x 4-in. oak, reinforced and bolted together, and equipped with 3-in. x 1¼-in iron swiveled wheels. One end of a 1-in. x 4-in. plank is bolted to either side of the inside of each leg of the stationary pedestal and the other end enters a guide on the movable pedestal formed by bolting two 1-in. x 2-in. oak blocks on the inside of either leg of the movable pedestal. This permits one pedestal to be moved toward or away from the stationary pedestal to accommodate the various sizes of armatures. A safety latch is also provided to prevent the movable pedestal from passing beyond its maximum safe limit.

Life of Journal Boxes Increased by Chilling

WEAR on journal boxes comes principally where the truck pedestals make contact. The pedestal gibs can be replaced easily when they wear, and they are not expensive. The wear on the journal boxes, however, cannot be taken care of so easily, and frequently this becomes so excessive as to cause a large amount of lost motion in the trucks. Finally the box is worn through to the oil chamber in the bottom, particularly where cars operate on streets paved with chert or slag.

To overcome this trouble the Birmingham Electric Company, Birmingham, Ala., uses journal boxes chilled with a cast-iron chill in the mold. Some of these have been in service five years and show little wear, while soft gray iron boxes do not last more than three or four years. The use of chills for the journal boxes at the point where the pedestal comes in contact was found so successful that it was decided to carry the chilling still farther. Now the boxes are chilled where the cover fits on and also at the back where the box goes over the axle. This not only gives a much better casting but eliminates all machine work.

Referring to the accompanying illustration the part marked 1 shows the journal box with the chill surfaces painted white. Parts 2 and 3 are the chills used in the pedestal ways. Part 4 is the chill used where the cover fits and part 5 is the chill used for the back of the box where it goes over the axle.



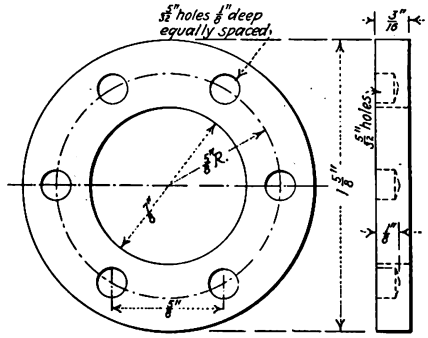
1. Journal box with chilled surface painted white.
2 and 3. Chills used in pedestals.
4. Chill used where cover is applied.
5. Chill for back of box where it goes over axle.

A careful check of these journal boxes made with chilling shows that they are just as accurate to dimensions as if they had been machined and the life is increased considerably while the cost of machine work is eliminated.

Sticking M-28 Brake Valves Cured

By G. E. Graubner
Foreman Cincinnati Street Railway, Cincinnati, Ohio

CONSIDERABLE trouble has been experienced on the Cincinnati Street Railway with M-28 brake valves becoming stiff. The cause was that the leather key washer gripped



Details of key washer made from babbitt metal and turned to exact size in lathe

the brass seat in the valve casting after a few applications of air. After trying various kinds of oils, greases and compounds without much success, we hit upon the idea of making these key washers out of babbitt metal and turning to size in a lathe. These washers are made the same diameter as the leather washers but they are $\frac{3}{16}$ in. thick instead of $\frac{5}{32}$ in. Six $\frac{5}{32}$-in. holes were then drilled $\frac{1}{8}$ in. deep, spaced equally around the face. These holes were filled with graphite plugs, made by melting a good grade of No. 3 cup grease and stirring in as much finely ground graphite as it would hold. The valves receive their regular greasing at each "B" inspection, at intervals of 900 car-miles, at which time they are taken apart and greased thoroughly with a good grade of No. 3 cup grease. Some of these washers have been kept in use for more than four months without showing any signs of stiffness on valves that previously had given much trouble.

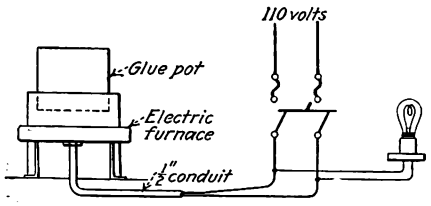
Safety Lights Warn and Save

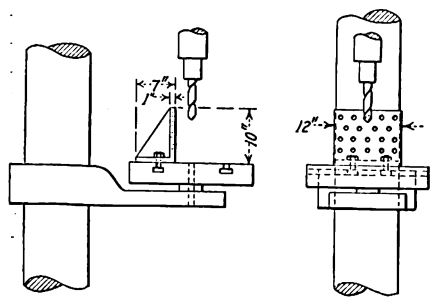
SAFETY is of prime importance in the shop of the Binghamton Railway, Binghamton, N. Y. Here all machines are guarded carefully to prevent accidents and the shop organization receives intensive instruction in the advantages of playing safe at all times. An indicating or warning light is installed wherever electricity is used for heating solder, glue, etc., or where there is a possibility of damage being done if the men forget to turn off the current. The lamp burns continuously while the current is on the machine. The accompanying sketch shows how a lamp is connected across the terminals of an electrically heated glue pot inside the switch so that when the switch is opened the light is extinguished. It acts as a warning to the men that the current is on and can be observed readily from nearly any angle of the shop. At the close of the day it is easy to see at a glance whether or not all of the circuits have been disconnected.



Connections for safety lamp at glue pot

Lever Support and Safety Stop for Drill Press

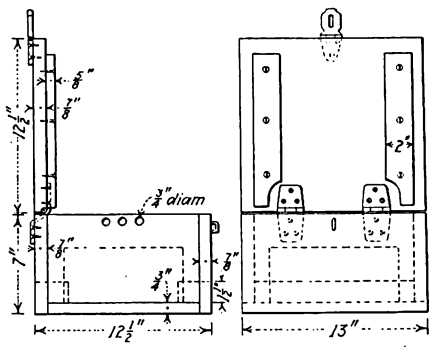
SPEED of production is considered of prime importance in the Woodside shops of the New York & Queens County Railway, Long Island City, N. Y. A large amount of drilling of small pieces is often necessary. Formerly it was the practice to align and clamp each piece to the drill press table. This clamping and unclamping took considerable time and resulted in low production. A casting was made up to eliminate this work. It was designed to be bolted to the drill press table. The face is drilled with numerous $\frac{5}{8}$-in. holes, which are used to anchor one end of a lever held by the operator to hold the work in position without clamping. This bracket also acts as a safety stop if control of the piece being drilled is lost. A noticeable saving has been effected by this simple casting.

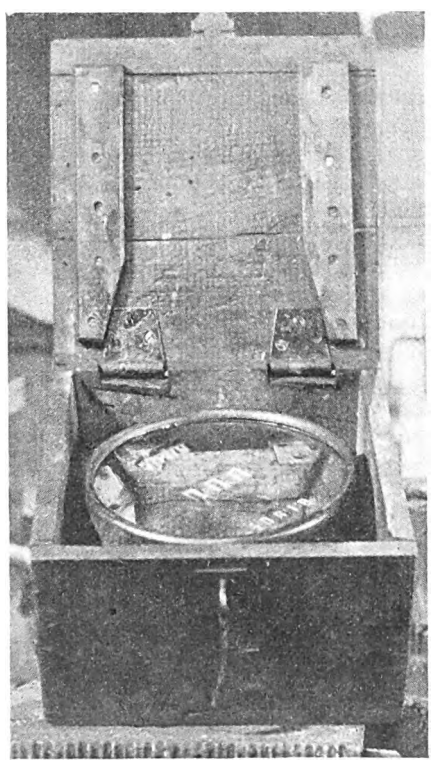


Drill press lever support and safety stop

Protecting Fare Registers from Injury

FARE registers on the New York & Harlem Railroad, New York City, are changed on a definite time basis and repairs and tests are made at the shop. Most of them are changed at the inspection houses which are located at some distance from the shop. They are transported to and from the shop in a supply car. The car transports all kinds of material at the same time and it is found necessary to protect the registers against mechanical injury. This is being done by placing each one in a specially designed box. The box is made of $\frac{3}{4}$-in. and $\frac{7}{8}$-in. oak and is $12\frac{1}{2}$ in. wide, 13 in. long and 7 in. deep. It is designed with a substantial, hinged cover and provided with a hasp and staple to permit locking. Movement of the registers within the box is prevented by suitable blocks properly spaced and fastened to the bottom of the box. Three $\frac{3}{4}$-in. holes bored near the top of each side board provide a means for lifting.



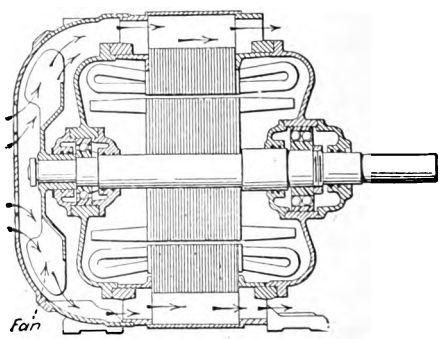


Protective casing for transporting fare registers

New Equipment Available

Air-Jacketed Motors for Dusty Locations

PRESENCE of dust, fumes and moisture in excessive quantities makes the use of standard electric motors undesirable. For such places an air-jacketed motor has been developed by the Wagner Electric Corporation, St. Louis, Mo. The entire motor is surrounded by a jacket open at both ends. Fan blades on the shaft extension between the sealed motor and its outer jacket draw air around the motor. The interior of the motor is virtually sealed, even the bearing housings being closed so that no impurities can get past the grease packing.



Cross-section of motor showing ventilating arrangement

No changes have been made in the electrical principles of the motors themselves, the only changes being external. The frame housing, the motor proper and all bearings are substantially air-tight. The end shield is made of cast iron. It is rib-reinforced and has a substantial grating which protects the fan and provides an opening for incoming ventilating

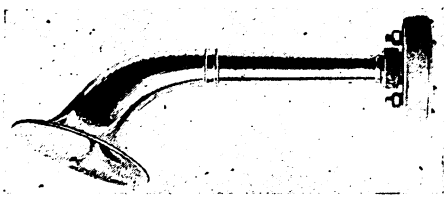
Digitized by Google

air. The center shield is made of heavy sheet steel held in place by slot-head bolts. The fan is built in one piece. The conduit box is mountable in four positions.

The ball bearings are grease lubricated and sealed in dust-proof housings. The shafts are made slightly longer than those for standard motors to permit mounting of the fan.

Harmonious Tone to New Horns

"PNEUMOPHONIC HORN" is the trade name of a warning signal device being marketed by the Westinghouse Air Brake Company, Wilmerding, Pa. It has a clear, harmonious tone which is distinguished easily from other right-of-way noises. It uses little air and, as it requires no special reducing valve, operates successfully over a wide range of pressures and is of sturdy and durable design. The diaphragm or vibrating unit inclosed in a cast base is a substantial phosphor bronze disk uniquely balanced by a small weight. The bell of the horn is highly burnished, heavy-gage instrument brass.



Warning horn

This horn is available in various types and sizes to obtain different tonal qualities and in combinations for producing a pleasing chime effect.

Portable Lighting Unit

MANY advantages are claimed for a powerful portable acetylene flare lamp which has been added to the line of the Oxweld Acetylene Company, New York, N. Y. It is intended for night construction work and subway or tunnel building.

The fuel used is produced from Carbic, supplied in the form of cylindrical cakes of uniform size. Enough to operate the flare continuously for twelve hours can be placed in the lamp at one charging. If the use of the lamp is discontinued before the entire charge is used, the portion remaining can be left in the holder, or, being dry, solid and clean, can be slipped back into the drum for use later.

This flare is planned to operate in all climates and in all weathers. It has a storm-proof burner, permitting its use even in the most violent gales. Construction is rugged and simple. There are but three parts, and these cannot be assembled incorrectly. Charging requires only a few minutes' time of one man. When put in operation the lamp needs no further attention until the charge is exhausted.

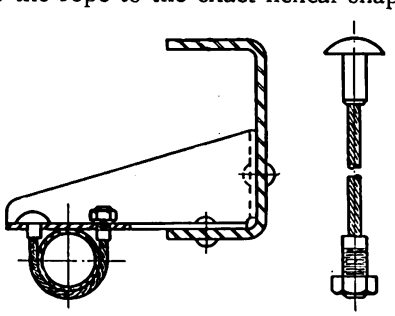
An automatic feed allows water to come in contact with the lowest cake of Carbic until sufficient acetylene is generated to drive the water out of the gas bell to a level below the bottom of the cake. This process is repeated as needed and gas is maintained at a pressure less than 1 lb. per sq.in. The Carbic never rests on a pad of sludge since the residue settles to the bottom of the water. If the lamp is upset accidentally, the water runs out of the container and gas generation stops immediately.

The Carbic light is available in several styles, which range in size from a hand lamp to the 8,000 cp. "Standard" model, which weighs 36 lb. empty and 115 lb. charged and stands 6 ft. 7 in. high with reflector raised. A double burner model, which illuminates in two directions, is furnished in about the same size as the "Standard" model.

Flexible Bolt Developed

DEVELOPMENT of the pre-formed type of rope makes possible attachment of fittings so that they become an integral part of the rope. For this purpose the American Cable Company, Chicago, Ill., has brought out a flexible bolt, which can be used to advantage for fastening piping, conduits or other equipment on cars where ordinarily a rigid U-bolt might be used.

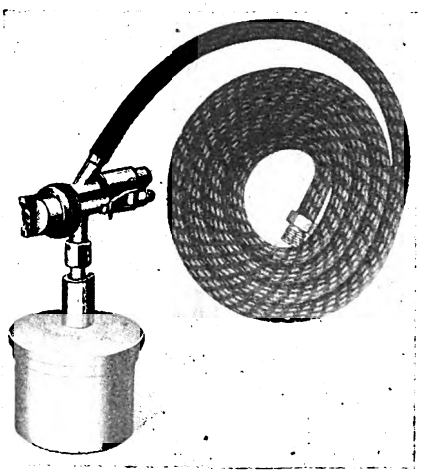
Pre-forming the wires and strands of the rope to the exact helical shape that they must assume in the completed rope results in a cable that does not require seizing and may be cut like a rod. This type of rope permits a close-fitting attachment to be slipped over the unseized end of the rope and to be processed so that the steel of the fitting cold flows into the interstices of the rope and thus becomes practically an integral part thereof. Such fittings can be capped for a head and threaded for a nut.



Method of attaching conduit by means of the flexible bolt

Touch-Up Spray Gun

FOR USE in painting where a fine spray is required the Alexander Milburn Company, Baltimore, Md., has recently developed a new touch-up gun. The extremely fine mist, or spray, procured with this gun is desirable for blending of colors on any surface, touching up scratches, mars or dents, stenciling and numerous other fine painting operations, using lacquer, varnish or other finishes.



Touch-up spray painting gun

The new gun is quick in operation, is well balanced, has a stable base and is handled easily. Slight pressure on the trigger produces a very fine mist, so compeltely atomized that the color is blended with the surrounding painted surface. The gun can be adjusted to procure a hair-line spray for the finest kind of work. It is designated as K-Jr.

Six feet of air hose, with connections, are furnished with the gun. Various containers, either aluminum or glass, can be furnished so that many different colors can be kept on hand ready for use. Each container can be had with an air-tight cap so that paint can be kept in condition while in the cup. Aluminum cups are 8 oz. size; glass containers, 8, 16, and 32 oz. sizes.

American Association News

Executive Committee Meets

REPORTS of the several standing committees of the American Electric Railway Association, made to the executive committee at its regular meeting at association headquarters on March 30, indicate progress in the formulation of plans for the 47th annual convention in Cleveland next fall. A tentative outline of the convention program submitted by Chairman Frank R. Coates and a report by J. H. Alexander, chairman of the exhibit committee, were received and approved. The executive committee also discussed developments in national legislation of interest to electric railways and reviewed the status of association membership and finances.

Those present at the meeting included the following: R. P. Stevens, L. S. Storrs, J. R. Fitzpatrick, H. E. Weyman, Adam Meyer, G. C. Hecker, J. S. Kubu, S. J. Cotsworth, R. I. Todd, E. F. Wickwire, D. W. Snyder, Jr., W. H. Sawyer, Edward Dana, Labert St. Clair, F. C. J. Dell, John A. Miller, Jr., E. J. Murphy, Leslie Vickers, F. R. Coates, T. W. Casey, C. E. Morgan, G. A. Richardson, Charles Gordon, E. P. Waller, M. B. Lambert, T. A. Kenney, C. R. Ellicott and J. W. Welsh.

At the suggestion of C. E. Groesbeck, A. S. Grenier of the Electric Bond & Share Company was elected a member of the executive committee to fill the unexpired term of Mr. Groesbeck.

Report of the finance committee by Chairman T. A. Kenney indicates that dues received from member companies are within the budget estimates and that the process of absorbing directly in the dues of the association the expenses formerly covered by special assessments is proceeding satisfactorily in accordance with the plan in view when the constitution was changed last fall.

Work of the committee on publicity was outlined by J. W. Welsh in the absence of Chairman Paul Shoup. Mr. Welsh said that the advertising section of the association has aided several railways in the preparation of local advertising campaigns. Posters and booklets have been distributed to operating companies as aids in the merchandising of transportation. The moving picture films entitled "Wheels," "Readiness to Serve," "Mr. Auto Rider Becomes Mr. Car Rider," and "Fashion Show of Local Transportation" have been shown in a total of 508 places during a period of four months.

Convention Plans Discussed

The general subject of "Economics of Transportation" is contemplated for the first day's program of the Cleveland convention, according to the report of Frank R. Coates, chairman of the program committee. The second day will be devoted to the subject of modernization, the third day to outside viewpoints of the transportation industry. It is planned to devote Thursday's program to a discussion of the national aspects of the association's activities. Widespread interest in the luncheon meetings last year indicated the desirability of continuing this plan for the coming convention. Subjects contemplated for these luncheon meetings include rates of fare, interurbans, traffic, financing, taxation, management, employee relations, advertising, bus operation, and car design. It was suggested during the meeting that a luncheon session be devoted to the discussion of manufacturing problems in the industry. Another suggestion was that the time for serving luncheons be cut down this year so as to make more time available for the discussion of the several subjects. The general plan of the program committee was approved by the executive committee.

L. S. Storrs, managing director, who has returned to his duties after a period of illness and a trip to the Pacific Coast, reported for the committee on national relations in the absence of Chairman J. H. Hanna. Mr. Storrs outlined content of bills pending in Congress which affect electric railways. These include a bill defining the difference between commercial electric railways and street and interurban railways, which would take the latter out from under the jurisdiction of the Interstate Commerce Commission. This bill, introduced by Representative Johnson, is H. R. No. 12108. A bill to regulate interstate buses, introduced by Congressman Parker and known as H. R. No. 12380, seems to be receiving the approval of all parties interested in the interstate bus situation, according to Mr. Storrs, and shows promise of being passed at this session of Congress. The managing director supplemented his report for the committee on national relations by briefly reviewing his trip to the Pacific Coast and the situation of some of the far western transportation companies. In answer to a question by C. R. Ellicott, Mr. Storrs said that the new policy with respect to the publication of *Acra* seems to be working out satisfactorily and that the association's magazine in its new form is meeting the approval of the industry. President Stevens called attention to the diversity of articles in the April issue and to the manner in which *Acra* is interpreting the activities of the association and giving emphasis to the human element in transportation operation.

D. W. Snyder, Jr., read a letter addressed by the Illinois utilities associations to the National Electric Light Association calling attention to the misleading information that is being circulated regarding the operation of the Springfield, Ill., municipal lighting plant.

Report of the committee on co-operation with manufacturers was made by Chairman E. F. Wickwire, and President Stevens for the Charles A. Coffin committee reported that there are indications that approximately ten entries will be made in this year's Coffin contest.

More Space for Exhibits This Year at Cleveland

A letter from Chairman J. H. Alexander of the exhibit committee was read by Mr. Welsh. The exhibit layout this year provides for a total of 135,000 sq.ft. of space, which is considerably more than that available last year. By agreement between the program, exhibit and entertainment committees, the day set aside for annual inspection of exhibits will be Tuesday of convention week instead of Wednesday as heretofore. It is also planned to open the exhibits at 9 a.m. on Saturday, Sept. 22, and a recommendation was made to the transportation committee that special trains be arranged to arrive in time so that delegates may take advantage of this earlier opening of exhibits. Mr. Welsh announced that bulletins and reservation blanks regarding hotel reservations will go out in a few weeks.

A tentative outline of the entertainment program was presented by President Stevens, who reported that the entertainment commmittee considers dancing one of the most popular forms of entertainment and is planning to provide more time on the entertainment program than has been available for this feature in recent years.

President Stevens called attention to the coming meeting of the United States Chamber of Commerce and suggested the value of attendance by electric railway men. Requests have been received by the association from the Baltimore Chamber of Commerce and from the Birmingham Chamber of Commerce asking support for E. B. Jeffery, candidate from the Second District and Oscar Wells, candidate from the Fourth District, respectively.

The next meeting was scheduled for Wednesday, May 9, at 3 p.m. in Washington, D. C., during the meeting of the United States Chamber of Commerce.

New Association Members

FIVE companies, four state and sectional associations and ten individuals were elected to membership in the American Electric Railway Association at the meeting of the executive committee held on March 30. A list of

Digitized by Google

the companies and associations elected to membership follows.

RAILWAY

St. Paul City Railway, Minneapolis, Minn. This membership substituted for the Twin City Rapid Transit Company.

Wilkes-Barre & Hazleton Railway, Hazleton, Pa. This membership substituted for the Wilkes-Barre & Hazleton Railroad.

Boston, Revere Beach & Lynn Railroad, Boston, Mass.

MANUFACTURER

Anderson Brake Adjuster Company, Omaha, Neb.

The Collier Construction Company, Cleveland, Ohio.

STATE AND SECTIONAL ASSOCIATIONS

Central Electric Railway Association, Indianapolis, Ind.

Maryland Utilities Association, Baltimore, Md.

Midwest Electric Railway Association, Kansas City, Mo.

Pennsylvania Street Railway Association, Harrisburg, Pa.

Engineering Proceedings Ready

Proceedings of the Engineering Association covering the committee work and convention for the year 1927 are now being distributed to members. At last year's convention committee reports were presented at simultaneous divisional meetings, thereby making available more time for the general sessions. As a result a number of interesting papers on timely engineering topics were presented. These papers and the ensuing discussions are published in full in the Proceedings.

The papers included cover such subjects as track construction and maintenance, economies with modern cars, automatic substations, overhead maintenance, trends in motor coach engineering, and commercial aviation.

The work of the four general divisions of the Association covers many subjects of importance to the industry, together with a discussion of these matters on the convention floor. For the way engineer, such subjects as alloy steels other than manganese for special track work, rail corrugation, arc welding processes, wood preservation, and welded rail joints, will be found especially interesting. Rolling stock men will find in the reports of the Rolling Stock Division reports on motor coach design, car design, car lighting, noise reduction and other equally important subjects. The Power Division reports contain valuable information on automatic sub-stations, mercury arc rectifiers, trolley construction, and other matters of interest to power engineers.

The standardization work of the various divisions is another important phase of the Engineering Association work. Revisions of existing standards and practices, as well as new ones established, will be found throughout the committee reports.

Preferred Numbers Proposed

Preferred numbers have been proposed by the American Engineering Standards Committee. These have been informally approved by that body and are recommended to American industry for trial and criticism. According to a statement from P. G. Agnew, secretary of the A.E.S.C., preferred numbers have as their purpose the elimination of economic loss involved in the haphazard and often needlessly numerous gradations of size that characterize most of our common commodities.

The fundamental elements of the system lie in the proposal to arrange standard size series so that each succeeding model in a series shall be larger than the preceding size, not by a definite amount, but by a fixed per cent. By decreasing the number of sizes within a certain range while retaining a sufficient number of sizes in all parts of the range a system of preferred numbers makes it possible to effect savings in materials, labor, storage space, gages, containers, catalogs, sales cost, etc. An example of increase by a fixed per cent rather than by a definite amount is found in the Brown & Sharpe wire gage which has been in successful and wide use since 1857.

C. E. Skinner is chairman of the general committee on preferred numbers and H. H. Norris is the representative of the American Electric Railway Association, while L. P. Alford is chairman of the working committee.

Three series have been approved informally, being geometric series that give respectively five, ten, twenty and 40 gradations in passing from one to ten, ten to 100, etc. The attached table gives the four series for the range from one to ten. For the range from 0.1 to 1.0 the numbers are approximately one-tenth as large. The committee states:

So far as possible, the numbers of the five series are to be used in preference to those of the ten series, these again in preference to those of the twenty series and these, finally, to those of the forty series. It is permissible to pass over from one series of preferred numbers to an adjacent series.

TABLE OF PREFERRED NUMBERS

Informally approved by the American Engineering Standards Committee

COMING MEETINGS OF *Electric Railway and Allied Associations*

April 25-27—American Society of Civil Engineers, spring meeting, Washington Hotel, Washington, D. C.

April 25-27 — American Welding Society, annual meeting, 33 West 39th Street, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City, Mo.

May 2-5 — Southwestern Public Service Association, Dallas, Texas.

May 4 — Metropolitan Section, A.E.R.A., 33 W. 39th Street, New York, N. Y.

May 6-12—Union Internationale de Tramways, de Chemins de Fer d'Interet Local et de Transports Publics Automobiles, Rome, Italy.

May 8-11—United States Chamber of Commerce, Washington, D. C.

May 9—A.E.R.A. Executive Committee, Washington, D. C., 3 p.m.

May 9-10—Central Electric Railway Master Mechanics' Association, Erie, Pa.

June 4-6—Midwest Electric Railway Association, Hotel Baltimore, Kansas City, Mo.

June 6-8—Canadian Electric Railway Association, annual convention and exhibits, Toronto, Canada.

June 20-27 — American Railway Association, Div. 5—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), annual convention and exhibit, Atlantic City, N. J.

June 21-22 — American Railway Association, Motor Transport Division, Atlantic City, N. J.

June 28-29—Central Electric Railway Association, Cedar Point, Ohio.

July 8-12—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.

July 25-27—Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio.

July 27-28—Central Electric Railway Accountants' Association, Detroit, Mich.

Aug. 16-17 — Wisconsin Utilities Ass'n, Transportation Section, Sheboygan, Wis.

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

News of the Industry

New Wage Contract Sought By New York State Men

Employees of the New York State Railways in Rochester, Utica and Syracuse have filed a petition with President James F. Hamilton of the company, asking a new wage and labor contract and providing for a straight increase of 8 cents an hour and certain changes in working conditions. The increase would raise crew conductors and motormen from 55 cents to 63 cents; one-man car operators from 60 to 68 cents an hour; interurban operators from 57 to 65 cents an hour.

The union bases its demands for more pay on fare increases granted the company in the three cities. The railways will oppose this plea on the ground of ever-increasing maintenance costs, especially in paving.

Any settlement agreed upon in conferences between railway and union officials must be ratified by joint vote of the workers in the three cities.

President Hamilton is non-committal as to the company's stand on the wage demand, but said he would hear arguments of the union officials April 15 or thereafter. The new contract is effective May 1 and, in case an agreement is not reached by that time, any subsequent pact becomes retroactive.

Wage Negotiations in Prospect for Eastern Massachusetts

Employees of the Eastern Massachusetts Street Railway, Boston, Mass., are preparing negotiations for a wage increase when the present agreement is terminated on May 2.

Under the present agreement the wage scale is 69½ cents per hour. Operators are said to be seeking 82 cents per hour and one new uniform a year. The demands are in line with present concessions and remuneration granted employees of the Boston Elevated Railway. The various unions in cities served by the Eastern Massachusetts Street Railway have voted favorably for a wage increase.

Sunday Passes in Gary

A special Sunday pass, costing 25 cents and entitling the bearer to travel during the entire day anywhere on the interurban or city system, will be adopted April 15 by the Gary Railways, Gary, Ind. The Sunday passes will be good for any number of rides but only on the Sunday on which they are purchased. Passes may be purchased either from car operators or at regular ticket agencies.

The longest interurban line operated by the company runs from Gary to Valparaiso, a distance of 26 miles. Other intercity lines connect Gary with Hobart, Hammond and East Chicago.

Locust Street Tube in Philadelphia Approved

An ordinance providing for construction and operation of the Locust Street surface-car subway was approved March 30 by the transportation and public utilities committee of the City Council of Philadelphia, Pa., and reported to the Council with a favorable recommendation. Where the new line will be connected with the Delaware River Bridge was not decided. The sum of $10,000,000 has been appropriated for the abandoned Chestnut Street tube project which the Mayor and the Council will transfer to the Locust Street work upon approval of the voters at a referendum in the forthcoming primary. The entire project will cost about $40,000,000 and construction will take three years. Under the ordinance the Philadelphia Rapid Transit Company will pay the fixed charges on the money borrowed by the city for the subway construction. After the cost of the project is met out of the rentals, the title to the line will be vested in the city.

Mayor Mackey has stated that he will call a conference on the Broad Street subway operating agreement soon after the primary of April 24. He stated that a conference on this point might have been called three months ago, but he preferred first to obtain engineering and operating facts for use in the negotiations. It was also announced by the Mayor that he had asked Comptroller Hadley to study the McChord finding and to report on the question of condemning the properties of the Philadelphia Rapid Transit underliers.

Council Adopts Belt Ordinance for Oklahoma City

The construction of an electric freight belt line at Oklahoma City, Okla., to cost approximately $1,250,000, was assured March 27, when the City Council adopted ordinances clearing the way for this project. This line is to be constructed by the Oklahoma Railway to connect its Oklahoma City-El Reno line with the line connecting Norman, Oklahoma City and Guthrie, and intermediate points. The route lies mostly outside the western city limits. The road will be used for hauling freight traffic. Material is being assembled and about 250 men will be employed on the project. This improvement was described in detail in the ELECTRIC RAILWAY JOURNAL issue of March 10, 1928.

Contract Ratified in Scranton

Employees of the Scranton Railway, Scranton, Pa., are now working under a new agreement with the company, following the recent vote to ratify the pact which replaces the one that expired April 1. Under the new agreement motormen and conductors were not granted an increase. However, carhouse men under certain classifications were given an increase of 2 cents an hour, and bus drivers 3 cents an hour. Trainmen will profit by a change in working conditions as regards "tripper" or rush-hour lines. Under the new contract trippers will not leave the carhouse before 1:30 p.m. and will not work later than 7:30 p.m. Four hours pay will be the minimum rate for this kind of work.

The new agreement also provides for the issuance of 75 passes per month to motormen, conductors, and bus drivers, which will be good on all rail and bus lines of the company. Workers also approved their subscription of 50 cents monthly to be assigned to the pension fund.

A general increase of 5 cents an hour for all employees had been sought by the men.

Report on Knoxville Awaited

Until the report of Harland Bartholomew & Associates, planning engineers on the transit facilities of the city of Knoxville, Tenn., is received and passed upon by the city planning commission an ordinance conferring franchise rights on the Knoxville Rapid Transit Company to give service on six separate bus routes is being held in the Council's files. The ordinance is subject to passage on final reading, after amendment to conform with the recommendations of the engineers, the planning commission and the act of the Council, when it is determined that the Knoxville Power & Light Company will not give the service sought.

Under its contract with the city to conduct the survey the firm of St. Louis engineers was to submit its findings not later than April 1, the local commission to receive same and pass the survey along to the Council with recommendations. Briefly the report, which will probably now be ready by May 1, is expected to develop the needs of Knoxville in the way of transportation facilities with recommendations for meeting such needs.

The engineering firm is committed, to an extent, to a policy whereby the company now furnishing transportation service shall have the right to meet the additional transit ordered by the Council, and where such an agreement is not harmoniously reached any independent company or companies be granted franchises for furnishing this service.

Maryland Commission Denies Fare Decision Was Confiscatory

The Maryland Public Service Commission has answered the bill of complaint which has been filed by the United Railways & Electric Company, Baltimore, Md., and under which the company seeks to restrain the commission from preventing it from charging a straight 10-cent fare and charging two fares to the Halethorpe section. The commission recently handed down a decision permitting the United to charge 9 cents straight fare with three tokens for 25 cents. Hearings of the suit of the United Railways will open in the Circuit Court of Baltimore on April 30.

The commission declares that the maximum rate of fare the company is permitted to charge was adequate to provide for the necessary expenses and yield a fair return on the value of its property; that the percentage that was found would be the rate of return upon the fair value of the company's property, yielded by fares established by the order of the commission, was a sufficient rate of return to compensate the company for the use of its property in the public service; that the amount that was determined would be a proper annual allowance out of the earnings to provide for depreciation of the company's property was adequate for that purpose, and that the commission lawfully and properly required the company to abolish the second fare upon the Halethorpe line. When the commission handed down its decision it placed the Halethorpe territory on the one-fare zone.

The commission wants the court to dismiss the bill filed by the railway.

Articulation of Reading Lines with P. R. T. Suggested

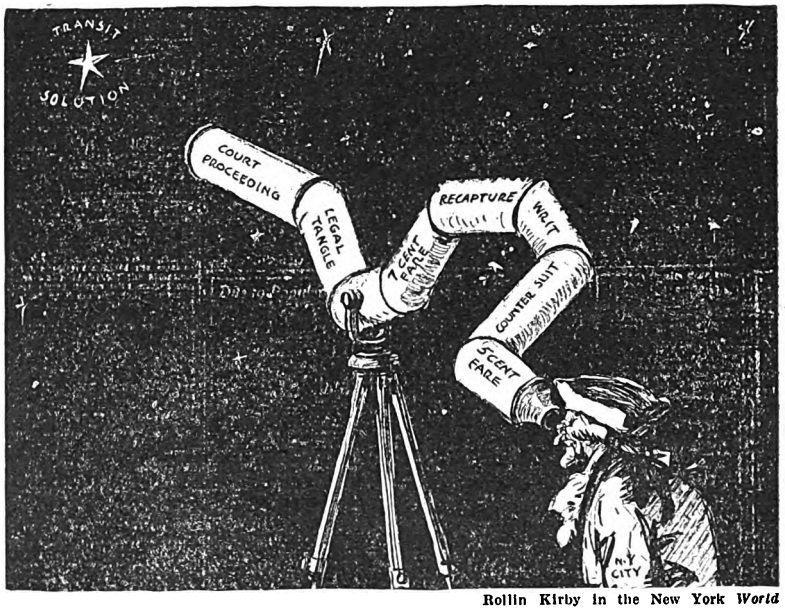
The Philadelphia Rapid Transit Company, Philadelphia, Pa., proposed on March 30 that the Reading Company sell the two steam lines now in operation to Chestnut Hill, Newtown and Bustleton to the city of Philadelphia so they could be electrified immediately and made to serve as essential feeders to the $100,000,000 Broad Street subway. Officials of the transit company pointed out that the Reading Company would be able to abandon operations of the Chestnut Hill division and that the city could effect a saving in time and money through the immediate creation of a feeder line which would be considerably more costly to construct.

The Philadelphia Rapid Transit Company's proposal was coupled with an offer to join with the Reading Company in 50-50 operation of buses in territories which both companies plan to serve. The new subsidiary under the P.R.T. plan would hold the certificate of operation between Philadelphia and Easton, Philadelphia and Trenton and on a new line to operate along Old York Road making possible the abandonment of trains by the Reading Company on the New Hope branch.

Through Agnew T. Dice, the Reading Company's attitude toward the Philadelphia Rapid Transit's proposal was defined. He said that the suggestion that the city condemn railroads engaged in interstate commerce raised a grave question of law; that while the company did not object to conferences in the matter with anyone interested, it must be remembered that the plans of the Reading Company for electrification of all of its suburban lines, including those in question, was now nearing completion.

Final Briefs Filed in Interborough Fare Case

Briefs were filed on April 4 by the Interborough Rapid Transit Company, New York, in the case before the statutory court which is considering an application by the company for an interlocutory injunction preventing all parties concerned from interfering with the collection of a 7-cent fare. With the case closed and all the briefs, affidavits and exhibits, numbering thousands of pages, before the judges, a decision is expected within a week or ten days.



Rollin Kirby in the New York *World*

Star gazing

Schedules Revised in Toledo

Schedules on the Cherry Street line of the Community Traction Company, Toledo, have been revamped so that much better railway service may be provided to compete with other means of transportation. The new schedules provide for an average speed of 11 m.p.h., which will cut nearly fifteen minutes time off the round trip formerly in effect. Rush-hour service has also been speeded up, and at the peak there will be a 3½ minute headway.

Another new feature of the service on the line is the proposal to establish bus service on the owl runs.

New stops have been marked with a brilliant orange stripe around near-by poles at the curb, adding to the visibility and conforming to the color of the cars on the line.

System in Houston Offered to City

A proposition to sell the railway system of the Houston Electric Company to the city was made by Jeff Alexander, manager of the company, at a hearing before the City Council to consider the removal of the car tracks from one of the principal streets and the substitution of bus service. He is reported to have said:

I should like to ask you to consider seriously the possibility of the city taking over the railway and running it as a city-owned project. It is impossible for any private corporation to continue giving something that costs more to operate than is received for the service.

We've been losing money since 1920. Then our properties were valued at $6,000,000. Now the valuation has jumped to about $9,500,000. Our earnings haven't increased in proportion to our capital investment and we can't go to the stockholders each year and ask them to put more money in the railway on the strength of promises. Out-of-town investors just won't continue to invest their money here in a losing proposition.

The city must buy the company or subsidize it, or the matter will end in the courts, he declared. Mr. Alexander is also reported to have said:

The taxpayers are going to have to pay for the railway service in the end, so why not let the city supervise that expenditure. Let the city buy the system. People are not getting the service they are entitled to, and we can't give it to them. We'll be glad to have the properties appraised by any fair board of appraisers you appoint and take their offer.

Pointers from Cleveland

Personal Pointers, containing information pertaining to employee activities, is to be distributed from time to time by the Cleveland Railway, Cleveland, Ohio. These sheets will also tell about the workers of the safety, welfare and employment divisions of the company.

Status of Massachusetts Bills

All the propositions pending before the Massachusetts Legislature concerning the future of the Boston Elevated Railway are now before the House committee on ways and means. The bill which has the backing of a committee report is house bill 1129, which calls for public ownership, and on which the fight is centering at the present stage.

This bill could create a metropolitan transit commission and invest it with authority to purchase the Boston Elevated under the option contained in the 1918 control act and to operate the system in Boston, Cambridge, Somerville, Medford, Malden, Everett, Revere, Chelsea, Newton, Arlington, Brookline, Watertown and Belmont. Advocates of this measure contend that there is no other bill that has any reasonable expectation of passing the Legislature, and opponents of it are backed by the Boston Chamber of Commerce and by a strong minority committee report in the Legislature.

It may be significant that the House committee on ways and means has authority to consider all the Elevated bills, and can report any one of them as it is or in amended form, or can report a resolve for further study of the situation.

Express Service for Hartford Baseball Fans

The Connecticut Company, Hartford, Conn., is to cater to the baseball fans of the city during the coming summer. In a recent conference between N. J. Scott, manager of the Connecticut Company at Hartford and J. W. Pyne, business manager of the Hartford Baseball Club, it was arranged that the company would operate express trolleys to the ball park. Complete details have not been announced but preliminary plans provide for express cars to run in advance of regular cars, thus cutting the running time a half hour.

Employees of insurance and brokers' offices quit work early enough in the afternoon to witness the Eastern League games played at the Buckeley Stadium, but in the past it has been difficult for them to reach the stadium by trolley in advance of game time due to the many stops.

Sleet Storm in Ohio Damages Utilities

Damage to the extent of more than $750,000 to various utilities is reported as the result of the sleet storm which swept over northwestern Ohio on March 29. The city of Findlay was without wire communication and electricity for more than a week. The Toledo, Bowling Green & Southern Traction Company was able to restore partial service April 1, but it was said that it would be several days before Findlay is completely lighted again. Many poles were thrown across the tracks of the interurban between Toledo and Findlay, and while service was badly crippled it was stated on April 4 that the road was rapidly emerging. The loss to this company is placed at $100,000.

The Taxi and Railway in Seattle

Declaring that the present taxicab rates are making deep inroads into the earnings of the Seattle Municipal Railway, Seattle, Wash., Robert MacFarlane, representing a group of unnamed business men, recently filed a request with the City Council for an exclusive franchise for a taxicab-operating $1,000,000 organization, to be formed by a merger of existing taxicab concerns. Mr. MacFarlane said the group he represented was prepared to post $25,000 bond if the Council would consider its offer. His plan provides that the taxicab concerns given the franchise would pay the city 2 per cent of its gross earnings, with a minimum of $25,000 a year. Details of regulation, rate-making and parking would be left to the City Council under the proposed plan. In effect the plan calls for a monopoly for the organization operating the taxicabs. The plan stipulates that if a franchise be given another taxicab company the 2 per cent earnings tax would be forfeited. Mr. MacFarlane said:

> Lack of proper regulation and supervision has made a "jitney" out of practically every taxicab today in certain classes of service, it is actually cheaper to ride in a taxicab than on a street car. An actual survey discloses that present taxicab rates are resulting in an increase of approximately $600,000 a year. This means a correspondingly less volume done by the street cars.

The proposed merger has not met with unanimous approval of the taxicab operators. Organized labor is also expected to take an active hand in the question, since the rate war has directly affected wages of drivers, members of the taxi union declare. Present union agreements with operating companies expire May 1, and new agreements are now in the making. It is stated drivers will insist on a straight zone-rate wage being paid on cabs operating on a zone-rate or part zone-rate basis. City officials have voiced their approval of any "reasonable plan" that would end competition.

The *Seattle Daily Times* says the figures show a steady decrease in railway revenues during the last few years, but fail to show that the recent low-rate taxicab competition has had any marked effect on railway revenues. The *Times* statistician states that during October, November and December, 1927, and January, 1928, a period when the taxicab rate war had gathered full momentum, the total in railway fares collected came to $1,910,332. He also shows that during similar months of the preceding year the receipts were $1,955,749, so that there was a decrease of $45,526. This decrease appears to be a part of a steady decline in railway riding. During the last few years the decrease has been marked.

Reconstruction Order in Omaha Termed Unfair

The Nebraska Supreme Court has sustained the appeal of the Omaha & Southern Interurban Railway, Omaha, Neb., from an order of the State Railway Commission that it reconstruct a highway bridge over its lines at a point in Sarpy County, and ordered the case dismissed without prejudice to another order should conditions warrant one in the future. According to the court the commission is without jurisdiction or power to order a crossing of this kind at the expense of a common carrier to meet a contingency that may never happen, and it may make such an order only when it is clear that the public convenience or necessity requires such construction. This overhead crossing formerly carried a road used before automobiles came into use, but was abandoned by drivers because of its grade. When the bridge collapsed the county board brought suit to require its reconstruction.

The court says that the intent of the Legislature was that safe and adequate means for crossing railroad tracks be provided where they were needed; further, that it would be assumed that the legislators knew that as the cost of such construction eventually was paid by the public, it would not require that to be done at public expense which was not for its convenience and use.

Yesterday, Today and Tomorrow Via the Trolley

The trolley may be troubled, as indicated by Raymond S. Tompkins in the April issue of *American Mercury*, but the conclusion of the author, after a careful study, is that the future of the electric railway industry looks reasonably bright, at any rate to those who take the view that in the big cities nothing else but street cars will do the transportation work efficiently. In the face of many discouraging features Mr. Tompkins, affiliated with the United Railways & Electric Company, Baltimore, and a former newspaper man, sees optimism all along the line in the possibility of restoration of the electric railway as a transportation service to full vigor and efficiency. He traces briefly the history of the electric railway from the day of the horse car to the glamorous installation of electric cars in Baltimore, Cleveland and Richmond. One of the big movements in this industry stressed by the writer is the change in attitude on the part of the railway managements toward the public they serve. With them today public relations is a telling factor in the selling of rides.

Extension Again in Chicago

The franchises of the Chicago Surface Lines have been extended by the City Council for another 30-day period. This is the fourteenth time that the franchise, which expired Jan. 31, 1927, have been extended.

Transportation Progress Noted at Connecticut Exhibit

The Connecticut Company featured the Home Progress Exposition, held at Hartford, Conn., March 24-31, with the exhibition of one of the latest model street cars. This booth attracted much attention and elicited considerable praise. So attendants at the booth might explain the mechanism the body was cut away exposing the motors and brakes. The car formed only part of the company's exhibit.

L. S. Storrs, formerly president of the Connecticut Company, and now managing director of the American Electric Railway Association, presented to Yale University a quaint model car, which the university was kind enough to loan to the company in connection with the exhibit. The model is a replica of the pioneer electric car operated in Derby, Conn., in 1888. This car marked, it is said, the advent of the overhead trolley in Connecticut. The car was 18 ft. long.

At the booth were interesting photographs from days gone by depicting cars, long out of commission, and gangs of bearded working men. There was a picture of the State Street carhouses, Hartford, taken in 1885. There was also a picture of the original trolley car operated in Meriden in July, 1888, and the first car to make its appearance in Hartford on Sept. 12, 1888, on the Wethersfield Avenue line. The photograph of a Hartford horsecar taken 50 years ago came in for much attention and comment.

Columbus Council Postpones Franchise Negotiations

Action on the new franchise for the Columbus Railway, Power & Light Company, Columbus, Ohio, has been postponed by the City Council until May 15.

The chairman of Council's utilities committee presented the company's suggestions to Council after conference with C. G. Slater, president and general manager of the railway. Mr. Slater said that extensions sought would be granted and better service would be provided on all lines if the company were permitted to speed up its cars. He wants the legal limit raised to 25 m.p.h., the "skip stop" system established and all streets with car tracks designated as main thoroughfares as a means for speeding up service.

Unless the concessions are made it will be impossible for the company to grant the extensions requested by Council. Mr. Slater said the company had been losing money because of the taxicab rate war and price cutting competition.

The Columbus Railway, Power & Light Company has been operating in the city without a franchise since Feb. 4, 1926. A 25-year franchise was rejected by the company in October, 1926, after the City Council had amended an ordinance to compel the company to extend Broad Street service from Hague Avenue to the west corporate limit. The company contended this could not be accomplished because of the difference in gage of track. This together with objections to other minor stipulations was given by the company as its reasons for rejecting the franchise.

Municipal Ownership Defeated in Madison

At the election on April 3 the people of Madison, Wis., by a vote of about 8,000 to 5,000 defeated the referendum question providing for the acquisition of the Madison Railways by the city. Official figures are not as yet available. Madison also defeated municipal ownership of the railway eight years ago.

Both newspapers in the community, one a conservative and the other a La Follette organ and avowed municipal ownership newspaper, favored acquisition of the property. In fact, the conservative paper staged meetings in favor of municipal ownership, at one of which Carl D. Thompson, secretary of the Public Ownership League of America, appeared.

Swope District Pushing Through Service in Kansas City

Members of the Swope Land Improvement Association and residents of the Swope district of Kansas City, Mo., are agitating for the extension of railway and bus service to the downtown district. A number of civic meetings has been held and petitions circulated, and some support for the project has been promised in the City Council. More than 500 names have already been obtained on petitions requesting rerouting, and 1,000 are expected by the time the mass meeting is held.

F. G. Buffe, vice-president in charge of operations, said the Kansas City Public Service Company could not seriously consider the request for through cars until September, due to the unusual number of cars taken from service during rehabilitation. The small cars now used on the Swope line are not suitable for downtown use, and the company would not have enough other cars to use until the program of rehabilitation has been completed this fall.

Foreign News

English Tramway to Use Buses

At the annual meeting of the Yorkshire Electric Tramways, West Riding, England, it was decided that no dividend would be paid on the ordinary shares in order to preserve all available money to buy buses for use on the tramway lines which have been abandoned. It was said that owing to bus competition the element of good will has disappeared, reserves have been expended and further abandonments would doubtless follow.

Charge for the Return of Lost Articles in Glasgow

Small fees are now charged by the Glasgow Tramways to owners of property which has been lost on the cars when they go to the lost property room to reclaim it. Last year more than 20,000 articles found on the cars were returned to their owners.

New Tramway Line for Tallinn, Esthonia

Construction of a tramway line is now under consideration by the city street car administration of Tallinn, Esthonia, a republic on the Baltic Sea. The proposed line would connect the Vabaduse Platz in the center of the city with Kipli, the peninsular district of the suburbs, a distance of 6 miles. The cost is estimated at $367,000.

When the new line is completed it is planned to lay a double line in the Suur Tartu Maantee. Construction of a street car connection between Tallinn and Pirita, a popular seaside bathing beach and summer resort some 5 miles distant, is also contemplated.

Austria Criticised for Abandoning Railway Electrification

Great disappointment and surprise are felt throughout Austria at the decision of the authorities to proceed no further with the electrification program of the Austrian State Railways and to utilize for other ends the remainder of the funds set aside for this purpose out of the international loan.

It is claimed that portions of the electrified lines now in operation are working at a financial disadvantage. Owing to the consideration of the possibility of imported coal becoming cheaper and too favorable estimates of the cost of electrification, the initial calculations are said to be inaccurate.

This decision is being very sharply criticized by those who had praised the soundness of the government's former argument that the development of the country's water power would keep within Austria vast sums of money now spent on coal from abroad.

German Railway Bonds Offered

The Vestern Electric Railways Corporation, which operates interurban electric railway and automobile bus lines in Westphalia, Germany, offered on March 1 $1,750,000 first mortgage twenty-year sinking fund 7 per cent bonds in the American market at 98 and interest, to yield about 7.20 per cent. Earnings are guaranteed by the municipalities which own these lines.

Recent Bus Developments

$5,392 for Louisville Franchise

The Louisville Railway now owns the blanket franchise to operate buses on the streets of Louisville, Ky., for twenty years. At a perfunctory auction, at which no other bidders appeared, Thomas B. Crutcher, member of the Board of Public Works, awarded the franchise. The upset price named in the ordinance, under which the franchise was sold, was $5,000 and the $392 represents half of the advertising cost. James P. Barnes, president, bid in the franchise for the railway and deposited a certified check for the amount. The sale now goes to the General Council for ratification. Service on the announced bus lines will be started at once.

John Chandler, attorney for a group of jitney bus operators, asserted in a statement afterward that the sale for a mere nominal price to the Louisville Railway justified the allegation of the petition of the independent bus operators that the ordinance was passed exclusively for the Louisville Railway, in order to give it a monopoly of the city streets. The case may go to a Court of Appeals.

Protest from Washington Property

Officials of the Washington Railway & Electric Company will protest to Maryland authorities over an attempt of a bus line operating between Gaithersburg, Md., and Washington, to secure an intrastate rating. Over a large part of its course the bus line parallels an interurban line of the Washington Railway & Electric Company. Although under the present laws there can be no regulation of the interstate business of this bus route between Maryland and the District of Columbia, the electric railway will ask the state authorities to deny the bus line permission to compete with its line between Maryland points.

Protection for Railway in Ohio

The Ohio Supreme Court has upheld the Stark Electric Railroad in its fight against competition of the Sebring-Alliance Bus Company. Carrying a state certificate to the Supreme Court on the ground that it was illegal, the Stark Electric won a ruling which prevents the Sebring-Alliance Bus Company from making Sebring and Alliance, 4 miles apart, terminals.

Passengers boarding buses in either city must alight at the corporation line of the other, the Supreme Court ruled in referring the bus certificate back to the Ohio Public Utilities Commission for a revision. This ruling was made in face of petitions from bus riders, and also in face of testimony which shows that the two transportation companies enter Alliance at points more than half a mile apart.

The fight was led by E. W. Sweezy, general manager of the Stark Electric Railroad, who for months has authorized court battles preventing increased competition between the railway and bus companies.

P.R.T. Seeks Approval of Bus Purchase

The Philadelphia Rapid Transit Company, operated by Mitten Management, Inc., has bought the Quaker City Cab Company and three small suburban bus concerns for $1,825,000, $2,325,000 less than their combined assets. This was announced by Ralph T. Senter, president of the transit company, before the Public Service Commission on April 4 in support of an application for approval of the transaction.

In an effort to prove that the rival companies were bought at "bargain prices," Mr. Senter introduced a consolidated balance sheet showing their assets as $4,150,000. Separate statements revealed that all except $650,000 of the assets belonged to the cab company. Its excess of assets over liabilities was given as $3,500,000.

The Mitten organization operates the Yellow Cab Company, local trolley, subway-elevated and bus lines in the city of Philadelphia and several interurban bus lines running out of that city.

Contention Over Operations in Milford

A bus war is being waged in Central Massachusetts with Milford the strategic point. The cause is bound up with the filing of petitions of the Johnson Bus Lines Company, Inc., and the Medway & Dedham Bus Lines for permission to operate. Officials of the company have informed the selectmen of Milford they do not intend to operate buses over the proposed routes as long as railway service is maintained, but that they understand some of the railway lines of the Milford & Uxbridge Street Railway, which now serves that territory, are to be discontinued. On the other hand, word has also reached the Milford Selectmen that a new trolley and bus line company is in process of formation as a result of the recent sale of the Milford & Uxbridge Street Railway to Citron-Byer Company, Clifton, N. J.

The bus company operating between Medway and Dedham was also opposed recently before the Massachusetts Public Utilities Department by Fred A. Cummings, representing the public trustees of the Eastern Massachusetts Street Railway. He contended that a certificate granted to the bus company for operation between Blackstone and the Boston-Dedham boundary line would have a disastrous effect on the railway lines in Walpole, Norwood, Westwood and Dedham.

Parker Bill Up on April 10

The Parker interstate bus bill will be considered at a hearing April 10, according to an announcement from the Interstate Commerce Committee of the House. The legislative sub-committee of the American Automobile Association's bus division, which sponsors the measure, will present witnesses at the hearing. It is understood that the electric railway bill introduced by Representative Johnson of Indiana will be given a hearing after the bus measure is disposed of, although the exact date for this has not been determined. Extended reference to the provisions contained in the Parker bill was made in the issue of the ELECTRIC RAILWAY JOURNAL for March 31, page 559.

Franchise Sought by New York & Queens County

The Queens-Nassau Transit Lines, Inc., is petitioning for a franchise to operate a bus route to be known as the Murray Hill route. In effect, it will be an extension of the system of electric railway routes now operated in the Borough of Queens by Lincoln C. Andrews as receiver of the New York & Queens County Railway. The rate of fare on the proposed Murray Hill route will be 5 cents. It is proposed that free transfers be issued upon payment of cash fare from the cars of the New York & Queens County Railway to the buses of the Murray Hill bus route. Nine advantages of this route are listed in the application. The Murray Hill section would be connected with Jamaica, College Point, the Main Street section of Flushing, Jackson Heights and Corona by the free transfer privilege.

The Queens-Nassau Transit Lines, Inc., is organized under the Transportation Law of the state of New York. All its stock is held by the receiver of the New York & Queens County Railway. The receiver has received the consent of the bondholders committee of the railway to operate the proposed bus route. The present organization of New York & Queens County Railway will be used to operate this route.

Don't Need Bus in Brighton

The City Council committee on jitney licenses has rejected the petition of the Boston Elevated Railway, Boston, Mass., asking for authority to operate a bus line in Market Street, Brighton, between Western Avenue and Washington Place. An opinion derived from a hearing on the matter showed the public in that section to be favorably inclined to the railway service now in existence there.

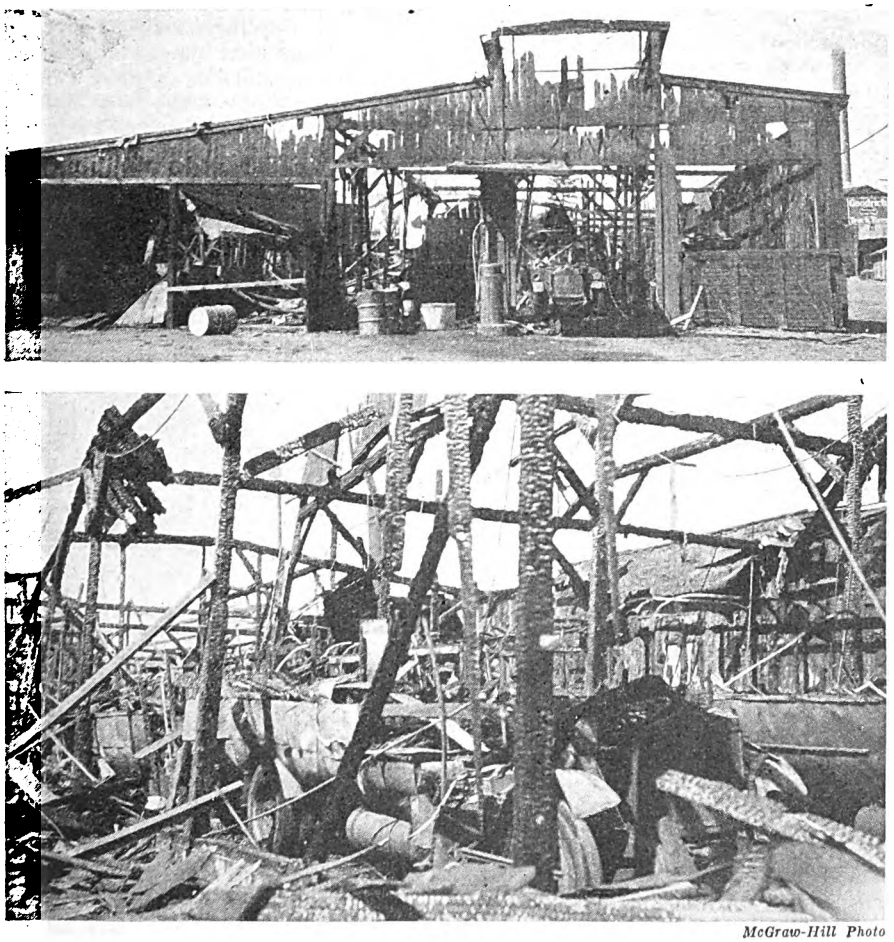
Twenty Buses Destroyed in Newburgh Fire

Fire destroyed the garage of the Newburgh Public Service Corporation, Newburgh, N. Y., on the morning of March 30. Of the 20 buses in service in the city only one was saved. In addition, three private automobiles and five trucks were burned. The loss may exceed $200,000, but the plant and equipment were fully covered by insurance.

The city was entirely without bus service Saturday morning, but arrangements were made at once to furnish a temporary service. Spare buses were secured from the Hudson Transit Corporation and the Cornwall and other lines, and arrangements were made to secure buses from out of town.



McGraw-Hill Photo

Fire did deadly work when it destroyed all but one of twenty-one buses

All the buses in the garage had been filled with gasoline immediately after the finish of the day's run and were arranged in the garage so they might be run out quickly when the morning work was resumed. The bus that escaped destruction by the fire was one used to take the employees to their homes after the system was shut down for the night. It was engaged in this task when the fire was discovered.

The garage was located on Wisner Terrace near the South Plank Road. The building was principally frame. It was built originally to house the street cars, but since the buses were installed to replace the local trolley lines, it had been used to store the buses when they were not in regular service. The building covered a plot 200 ft. by 60 ft. It was valued at $30,000.

Bus Scheme by Jamaica Company Not Sanctioned

The management of the Jamaica Public Service Company, Kingston, British West Indies, has been in communication with the government over the proposal to establish a bus service in the corporate area. The company intends to operate five or six buses of about 4½ tons but the scheme has been held up because it is in conflict with the motor car law, which prohibits motor vehicles of more than 2½ tons on the island.

Evansville & Ohio Petition To Be Heard

April 9 has been fixed by the Indiana Public Service Commission as the date of a public hearing on a petition of the Evansville & Ohio Valley Railway for the right to run passenger bus service from Evansville, Ind., to Henderson, Ky. The company has been operating an interurban railway from Evansville to Henderson since 1912, over leased tracks of an abandoned line of the Illinois Central to the Ohio River where the interurban cars were ferried across the river and then operated into Henderson, Ky. It is proposed to succeed this service very shortly by bus operation with the same hourly schedule rendered by the interurban. On March 16 the receiver of the company was authorized to make this substitution by the court.

The service is being installed because of the possibility of a bridge being constructed across the Ohio River between Evansville and Henderson in the next two years. Work will very likely start some time this year and after the bridge is in operation, service by interurban over the ferry would be slow and undesirable to the public. The company has therefore requested to use buses.

Reading and the Bus

Public Service Commissioner Benn has approved the plan of the Reading Company to spend $1,000,000 for buses and garage facilities at Pottsville and Doylestown during the first year of operation by the newly formed subsidiary, the Reading Transportation Company. The company is petitioning for transfer of 95 per cent of the stock of the subsidiary to the Reading Company. The testimony before Commissioner Benn dealt mainly with the program of bus operation intended for Schuylkill County. He overruled the objection of the Schuylkill Railways, Schuylkill County Railway and the Schuylkill Transportation Company that an interstate carrier such as the Reading Company could not acquire stock in an intrastate company.

When the hearing was concluded Commissioner Benn announced that the Reading application would be laid before the entire Public Service Commission with a recommendation for favorable approval.

Permanent Franchises Sought for Syracuse

Permanent franchises, to supplant the present temporary permits which expire this summer, are sought by the Syracuse Co-ordinated Bus Lines, Inc., which operates the bus lines of the New York State Railways in Syracuse.

Action by the municipal administration is expected soon, according to Benjamin E. Tilton, vice-president and general manager of the railways. Mr. Tilton will base his argument for the proposal on the fact that his company has put bus feeder lines and extensions into operation and has plans for many more similar lines.

The company will ask a fare for bus lines similar to that on the trolley lines. The bus fare now is 7 cents with transfer privileges. The trolley fare is 10 cents cash and 7½ cents for tickets.

Substitution on One Line in Oakland

The Key System Transit Company has been authorized by the California Railroad Commission to abandon service on its Rockridge line in the city of Oakland. It is planned to substitute bus service over the temporary route now in operation.

Financial and Corporate

Legislative Status at Boston Stockholders' Meeting

At the annual meeting of stockholders of the Boston Elevated Railway, Boston, Mass., held April 2 all acts of the directors in 1927 were ratified by a vote of the stockholders. No other business was done at the meeting, but a number of questions was asked about the status of proposed legislation. The only definite information that could be given was that no matter what the Legislature did this year there could not be any material change in the operation of the property in much less than two years. Should public ownership be adopted it might not require a full two years to execute the taking of the property.

After the Legislature has acted the stockholders will be called into special session immediately, if their vote or opinion is required; they will have nothing to say about the conversion of the property to public ownership, however, because that can be done by the commonwealth without their approval, under the option clause in the public control act of 1918.

Traffic, Fare and Wage Figures

Electric railway passenger traffic continued to fall off at an increasing rate during the month of December. The number of revenue passengers, including bus passengers, reported by 193 companies to the American Electric Railway Association for December, 1927, compared with December, 1926, is as follows:

December, 1927	819,663,893
December, 1926	844,205,989
Decrease, per cent	2.91

The average cash fare in cities of 25,000 population and over:

	Cents
Jan. 1, 1928	8.0177
Dec. 1, 1927	7.9993
Jan. 1, 1927	7.7790

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate cents	Index Number 1913 = 100 Per Cent
Jan. 1, 1928	57.27	210.17
Dec. 1, 1927	57.27	210.17
Jan. 1, 1927	56.88	208.73

Dividend Passed in Harrisburg

For the first time since April, 1921, the Harrisburg Railways, Harrisburg, Pa., has been forced to pass the semi-annual 3 per cent dividend on its preferred stock. This makes a total of 29 per cent in unpaid dividends on the preferred stock accumulated in the last twelve years.

During 1927 the Harrisburg Railways transported 31,141,287 passengers as against 32,477,229 for the year previous. In 1923 the number of passengers hauled was 34,560,489. Despite the falling off in traffic last year the company's cars operated 12,700 more car-miles than in 1926. The company paid out in 1927 $131,259 for track renewals and this year's program is estimated at approximately $133,000, exclusive of what the railway will have to pay toward the cost of widening a subway in Harrisburg's business district.

Deal May Be Delayed

Modification of terms suggested for plan by which Insulls would enter other Indiana Railways

TERMS of security exchange in the Insull-Morgan plan and agreement for consolidation of the Terre Haute, Indianapolis & Eastern Traction Company properties with the power distributing properties of the Central Indiana Power Company have been so altered that many more months may elapse before the consolidation will be presented for approval of the Indiana Public Service Commission.

Committees acting for security holders of the Indianapolis & Martinsville Rapid Transit Company, the Indianapolis & Northwestern Traction Company and the Indianapolis, Crawfordsville & Danville Electric Railway have been notified by Halsey, Stuart & Company, readjustment managers, that guarantees of interest and sinking fund payments had been withdrawn in the plan for securities they were to receive in the new consolidation setup.

Question of Guarantees Provokes Discussion

New stock and bonds were to have been issued by the consolidation in the name of the Indiana Central Rapid Transit Company, formed by consolidation of the three interurban divisions. It was part of the first agreement that the new bonds and stock of this company be protected by annual sinking fund charges and interest payments guaranteed by the Indiana Electric Corporation, the operating company.

While the Central Indiana Power Company would like to add the electric distribution territories covered by the railway lines to its own far-flung Indiana system, the tone of the recent notice makes it appear that the Insull utility does not intend to assume responsibility for profitable operation of the railway lines. The power companies could expect profitably to devote some of their earnings to rehabilitation of the interurban lines, whose power distributing business they would like to have, but they do not appear to care to hazard the risk of operating the railway lines to the extent of making irrevocable guarantees.

Additional Securities to Be Authorized for Richmond

At the annual meeting of the Virginia Electric & Power Company, Richmond, Va., to be held on April 16, stockholders will be asked to vote on the question of authorizing the issuance of $8,000,000 of first and refunding mortgage gold bonds. This is part of a $20,000,000 issue, of which $12,000,000 is now outstanding.

Stockholders also will vote on amending the charter to provide for an increase of $5,000,000 in the authorized preferred stock of the company. The increased stock is to be 6 per cent cumulative preferred of the same class as the 6 per cent cumulative preferred now outstanding and is to be sold from time to time as the directors shall determine.

This action by the stockholders is desired in order that the company may have further securities of these classes available for prompt issue from time to time in the event it is deemed advisable to finance future requirements in this way.

Inclusion in New York Central System Sought

The Fonda, Johnstown & Gloversville Railroad, a short line connecting with the New York Central Railroad, has filed a brief with the Interstate Commerce Commission asking that the commission take action providing for its inclusion in the proposed system to be created by the lease by the New York Central of the lines of the Big Four and the Michigan Central railroads, for which application is now pending before the commission. The brief says:

> We submit that in order to preserve and maintain this intervener's line in a healthy condition to serve its territory as a part of any national system of transportation, it must be included in the applicants' system, and that since the applicants are seeking the benefit of a portion of the consolidation legislation enacted by the Congress for the purpose of establishing such national system of transportation, they are under the duty of either including it in their system or making in their plan reasonable provision for its inclusion therein.
>
> We, therefore, respectfully request that this commission shall take such action in the premises as it may deem necessary for the purpose of bringing about this result.

Results in Toledo Improve

Increased industrial activities and more favorable weather conditions have improved railway and bus operating results in Toledo. February operations of the Community Traction Company showed $298,909 total revenue as against $294,147 for the corresponding month last year. There was, however, a net deficit of $15,090 to the stabilizing fund after expenses, taxes, reserves and charges made under terms of the Milner ordinance. This brings the total deficit to $1,303,073.

The sinking fund requirements have

Digitized by Google

now ceased and indications are a change in results will be shown favorable to wiping out the deficit over a period of years. The sinking fund requirements have been $25,000 or more each month.

Under the terms of the Milner ordinance in less than three years the voters will be called upon to extend the grant or begin a fifteen-year period of amortization of the property through fares collected. It is hoped to make a big cut in the deficit in this period or else reach some agreement on a new way out of the situation.

Merger Proposal in Washington Modified

The Public Utilities Commission of the District of Columbia has made public its changes in the merger agreement covering the Capital Traction Company, the railway lines of the Washington Railway & Electric Company and the Washington Rapid Transit Company. The changes now go to the companies for their approval.

The $50,000,000 rate base called for in the agreement, which has been one of the features most vigorously attacked, was approved for a temporary period of ten years, after which the commission prescribes a revaluation.

The commission, however, removed the 7 per cent return provision from the agreement, and in its place inserted a clause which declares that the merged company shall be "entitled to earn a fair and reasonable" return on the $50,000,000 valuation.

The commission also added another provision which stipulates that the present rate of fares shall continue in force for one year after the merger.

A letter outlining the modifications made in the agreement will be sent to the companies, with a recommendation that the changes asked be made, so that the document may be sent to Congress without further delay for ratification.

Among other changes which the commission recommended were:

That the commission be relieved of duty of nominating the three public representatives to serve on the board of directors of the merged company.

That the companies be relieved of paying certain costs for paving between their tracks.

That the companies continue to share the expense of repairing bridges over which their lines operate.

That nothing be included in the revised agreement which would limit the powers of the commission.

Morris County Receivers Directed to Pay Tax

Federal Judge William N. Runyon, of Newark, N. J., has signed an order directing the receivers of the Morris County Traction Company to pay taxes due to nineteen municipalities through which the defunct company operated railway lines. The total of taxes due is $102,769 to be paid out of $260,470 realized from the sale of assets.

More Passengers Carried in New Jersey

627,153,013 persons were transported by Public Service Corporation subsidiaries, of whom 266,079,948 were handled by bus. Net income of railway in red, but not income of buses $513,668

A CONDENSED summary of the results of operations of Public Service Corporation of New Jersey and subsidiary utility companies for the twelve months ending Dec. 31, 1927, follows:

Operating revenues, gross earnings		$115,005,908
Operating expenses	$49,035,808	
Maintenance	11,885,135	
Depreciation	10,084,133	
Taxes	11,930,113	82,935,191
Net income from operations		$32,070,717
Other income		906,178
Total		$32,976,895
Deductions (fixed charges, etc)		18,642,579
Balance for dividends and surplus		$14,334,315
Dividends on preferred stocks of Public Service Corporation of New Jersey:		
8 per cent cumulative preferred stock	$1,722,496	
7 per cent cumulative preferred stock	2,023,539	
6 per cent cumulative preferred stock	1,286,117	5,032,152
		$9,302,163
Dividends on common stock of Public Service Corporation of New Jersey		8,018,926
Net increase in surplus		$1,283,237

During the last months of the year a large new engineering and construction company was formed under the name of United Engineers & Constructors, Inc., combining therein: The U. G. I. Contracting Company, Public Service Production Company, Dwight P. Robinson & Company, Inc., and Day and Zimmerman Engineering & Construction Company.

The new enterprise will be the largest of its kind in the world. Public Service Corporation of New Jersey will, hereafter, instead of owning all the stock of Public Service Production Company, own 40 per cent of the capital stock of the new company. It is expected that the new company will execute annually a large volume of work in a manner that will result in the clients of the company receiving the best of service at the lowest cost.

There were 627,153,013 passengers carried on Public Service cars and buses during 1927, an increase of 29,822,141 over the number carried in 1926. This gain was due in part to the normal increase in traffic in the rapidly growing territory served and in part to the acquisition of bus lines from independent operators, the putting into service of new lines, extension of routes and the inauguration of lines giving a higher grade of service at a higher fare.

These various steps are in line with the announced policy of Public Service to create a co-ordinated system of car and bus transportation which will provide the kind and quality of service by street cars and buses needed to meet public requirements.

In the case of a number of street car lines of light traffic, it has been deemed advisable in the interest of economy and improved service to substitute bus service for the cars. In all such cases the results have been satisfactory.

There was established in January a charter car and bus department in charge of a general passenger agent. The result has been a substantial increase in the volume of charter bus and car business done. Special service has been operated to amusement parks, resorts, and to football games and like public gatherings. The possibilities of developing this service is indicated by the fact that on Sept. 11 as many as 109 buses were under charter.

On Oct. 28, a bus terminal for Williamstown buses, previously operat-

INCOME ACCOUNT FOR THE TWELVE MONTHS ENDED DEC. 31, 1927

	Public Service Railway	Public Service Transportation	Public Service Railroad	Other Affiliated Companies	Total
Operating revenues	$18,231,215	$14,893,121	$291,009	$1,954,260	$35,369,607

*Change in classification of accounts effective Jan. 1.

ing to the Reading ferries, and Mount Holly and Swedesboro line buses, which had previously operated to the Pennsylvania ferries, was established at the Court House, Camden. This plan met with the approval of the citizens of Camden who desired to have "the transportation package broken" in that city and provided direct connection with Pennjersey buses operating over the Camden bridge into Philadelphia.

The labor turn-over in 1927 was the lowest in a number of years. The no-accident bonus system resulted for the year in payments made to 3,871 operators, and in an appreciable reduction in the number of accidents. The system modified in the light of the year's experience will be in effect during 1928. In addition to individual bonuses, awards will be made to the men assigned to the carhouse or garage in each division which makes the best showing in reducing accidents in each of three four-month periods into which the year is divided.

During the year the Public Service Rapid Transit Railroad was organized to take over the North Jersey Rapid Transit Company, the lines of which extended from Ridgewood Junction to Suffern, N. Y.

On Dec. 31, 1927, the mileage of railway and railroad lines amounted to 878.319 miles. During 1927 single-track extension amounted to 1.066 miles; 18.101 miles of track were relaid with new rail and 2.024 miles with old rail.

Six hundred and fifty-two cars were completely overhauled, 2,288 cars received general repairs, 1,272 cars were painted, vestibule window cleaners were installed on 1,355 cars, ten improved type snow sweepers were built, and a large amount of other work was done in the company shops.

The bus fleet was added to and improved. One hundred and fifty-six new buses for additional service and 125 new buses for replacement were purchased in addition to 146 buses bought from independent owners. Eighty-two buses were completely and 639 buses partially overhauled, 926 buses were painted, 384 bus engines were overhauled, 65 bus bodies and two wrecking cars were built in the company shops.

On August 4, 1927, the Board of Public Utility Commissioners handed down its decision upon the application of Public Service Railway and Public Service Transportation Company for the adjustment of fare zones. The petition, in which was embodied the new tariff, was handed to the commission on Dec. 13, 1926. The operation of the tariff was suspended by the board and a number of hearings held thereon. Under the order of the board, the street car and fare zones under consideration, with some modification of the tariff filed by the company, were made coincident.

$1,562,714 Paid to City by Chicago Railway

Authorization was given by Federal Judge James H. Wilkerson to the receivers of the Chicago Railways, comprising the north and west lines, to pay to the city by April 10, $1,562,714. This amount is the 55 per cent of the net receipts of the company due to the city under the franchise for the fiscal year ending Jan. 31, 1928.

Earnings in Kansas City Short of Agreed Limit

Earnings of the Kansas City Public Service Company, Kansas City, Mo., in 1927 fell 25 per cent below the amount permitted under the new franchise. In January, 1927, the shortage was $14,188 and for January this year the shortage was $45,303. For the first two months last year the shortage was $45,028, and in a similar period of this year it was $109,747.

According to the company it should have earned $2,065,110 last year under the franchise allowance, while the net earnings were only $1,611,689. Under the franchise the company is allowed to earn $2,000,000, plus 8 per cent on additions to capital. The figures in the statement as to the capital earnings are based upon estimate of 50 per cent of the amount spent for improvements as capital expenditures.

From Jan. 1 to March 18 revenue car passengers decreased 879,836 compared with a similar period in 1927.

Denton-Terrell Operation Shows Loss

Operations of the lines of the Texas Interurban Railway, one running from Dallas to Denton and the other from Dallas to Terrell, showed a loss of $241,720 on March 1, according to figures compiled by Richard Meriwether, vice-president and general manager of the company. The Denton line, placed in operation Oct. 1, 1924, is $307,584 short of earning the interest charges on its notes, while the Terrell line, started Jan. 14, 1923, has earned a net income of $65,864 in its slightly more than five years of operation.

Operating revenues of the Denton line have dropped each month since the line was placed in service, and the Terrell line has failed to earn operating expenses during the last two months. Up to March 1, the Denton line showed operating revenues of $421,498 and operating expenses of $493,986. The Terrell line did fairly well the first two years, but business has been poor re-

cently. During its operating life, up to March 1, the line showed a net operating revenue of $440,465 and a non-operating revenue of $15,513, or a total revenue of $455,978. The interest charges totaled $390,114.

Hourly service, installed when the line was started, is being maintained.

The Denton line is 38.5 miles long, the tracks of the Missouri-Kansas-Texas Railroad being used most of the distance. The Terrell line is 30.5 miles long. Both were built under terms of an agreement made when the city of Dallas awarded a new franchise to the Dallas Railway, now the Dallas Railway & Terminal Company.

Net Income in Buffalo $100,146

Comparative income accounts for the years 1927 and 1926 have been submitted by B. J. Yungbluth, president of the International Railway, Buffalo, N. Y., to the stockholders. The figures are as follows:

INCOME ACCOUNT OF INTERNATIONAL RAILWAY YEARS ENDED DEC. 31,

	1927	1926
Passenger revenue	$10,006,590	$10,284,382
Other revenue	355,773	365,989
Operating revenue	10,362,364	10,650,371
Way and structures, equipment and power		
Maintenance	1,545,790	1,571,709
Depreciation and renewals	1,016,000	1,016,000
	2,561,790	2,587,709
Power operation	618,573	648,086
Conducting transportation	2,778,973	2,999,941
General and miscellaneous	2,212,214	2,216,135

Net income	$100,146	$48,609

$263,055 Available in San Diego for Charges and Surplus

The San Diego Electric Railway, San Diego, Cal., reports to the Railroad Commission its 1927 operating revenue at $1,676,501 compared with $1,667,519 for 1926. The operating expenses, excluding taxes for 1927, are $1,381,324 and $1,350,373 for 1926, leaving a net operating revenue of $295,176 for 1927, and $317,146 for 1926. During 1927 taxes charged to operation amounted to $124,387 and for 1926 to $113,828. Deducting the taxes leaves operating income of $170,789 for 1927, and $203,318 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus of $263,055 for 1927, compared with $292,053 for 1926.

4 Per Cent Public Utility Bonds

PERHAPS the most vivid illustration of the downward trend in bond yields during the past few years has taken place in the list of public utility securities. Investment bankers recall that only a few years ago the ruling rates on utility bonds ranged from 6 and 7 to 8 per cent. In no other group, however, has the refunding operations into lower interest bearing issues been so rapid or extensive as among the utilities and perhaps in no other group has the intrinsic value of securities appreciated more. With many of the recent 4½ per cent offerings now selling substantially above par, a 4 per cent coupon rate on utility bonds may not be far off. —*Wall Street News.*

Expansion in Maine Reported by Insull Interests

The Insull interests are negotiating for the control of the Cumberland County Power & Light Company, Portland, Me., to be merged with the Insull-controlled New England Public Service Company. The latter company operates properties in Maine, New Hampshire and Vermont.

$973,544 Paid in Tampa for Transportation

Transportation earnings of the Tampa Electric Company, Tampa, Fla., for the year ended Dec. 31, 1927, were $993,214 compared with $1,279,941 for the year ended Dec. 31, 1926. According to the annual report of the stockholders 18,756,851 passengers paid $973,544 for transportation; the revenue balance of $19,669 came from miscellaneous sources such as special concessions, special cars and rent of equipment. Operating expenses in the transportation department were $548,208 and transportation maintenance was $166,613.

The company owns 158 cars and 31 buses.

The number of passengers carried, excluding transfers over a period of years, was as follows:

1916	10,872,102	1922	17,032,058
1917	11,107,645	1923	16,451,400
1918	11,958,831	1924	16,123,569
1919	14,247,180	1925	21,641,839
1920	15,260,820	1926	23,920,188
1921	17,224,084	1927	18,756,851

Nebraska Interurban to Go Out of Business

The Omaha, Lincoln & Beatrice Railway, built only to the Lincoln suburb of Bethany but with a roadbed constructed for some distance out of Omaha, is shortly to go out of existence, according to General Manager Bramlette. Although it has never paid operating expenses its owners, residents of Akron, Ohio, were content to keep it running. Recent orders on paving by the City Council have placed a burden of cost that the road is reluctant to assume, and abandonment of the track within the proposed paving district has been asked.

Holders of Illinois Power & Light Urged to Convert Preferred

Clement Studebaker, Jr., president of the Illinois Power & Light Corporation, Chicago, Ill., in a statement made to the holders of the preferred stock of the company enclosed with the April 1 dividend checks said:

You previously have been advised of the possibility of your 7 per cent cumulative preferred stock being called for redemption at $105 a share plus dividend accrued to date of call, and of the plan to create a new class of cumulative preferred stock to be offered in its place.

As stated, this plan is subject to the favorable action of the stockholders and the approval of the Illinois Commerce Commission. After such acceptance and approval, the call will be made.

It is gratifying to us that the 7 per cent stock has proved such a profitable investment for each of our stockholders and when definite notice of call and offer is received, we trust you will accept our offer to reinvest your funds with us in our new $6 dividend cumulative preferred stock. Many stockholders have indicated their desire to reinvest their funds in this company, with whose affairs they have grown so familiar, and we sincerely hope you will not dispose of your 7 per cent preferred stock or make commitment for reinvestment until you have received our exchange offer.

The plan of the company to call the 7 per cent preferred stock was described in the ELECTRIC RAILWAY JOURNAL for Feb. 25, page 339.

New Director for Scioto Valley Line

Gilbert L. Fuller has been elected a member of the board of directors of the Scioto Valley Railway & Power Company, Columbus, Ohio, to fill the vacancy caused by the death of the late F. R. Huntington, Columbus banker.

Defunct Material Taken Over in Olean

The city of Olean, N. Y., will take over the bridges, real estate, power lines and tracks of the defunct Olean, Bradford & Salamanca Railway, within the city limits, on or before May 1. The compromise has been agreed upon between the receivers for the company and city officials following a year's litigation.

At the time the railway suspended operations it was in arrears more than $10,000 in city taxes and in excess of $26,000 in paving assessments.

In the summer of 1927 Supreme Court Justice Noonan issued an order authorizing the receiver of the Olean, Bradford & Salamanca Railway to discontinue operation of the interurban line between Bradford, Pa., and Salamanca, N. Y., and scrap the properties.

Legal Notes

CALIFORNIA—*Duty of Person Driving Automobile on Car Track.*

While a person who is driving a vehicle along or in close proximity to a car track is not bound to keep a constant watch behind for approaching cars, it is his duty to turn off the track when he sees or hears a car approaching from the rear, or could see or hear it by the exercise of reasonable care. He should listen for signals of approaching cars and should heed any that he may hear. [Berguin vs. Pacific E. R. Co. 263 P., 220.]

FEDERAL CIRCUIT COURT—*Jurisdiction of Federal Court Should Be Liberally Exercised. Duration of Grants Without Time Limit.*

When the jurisdiction of a federal court is called in question, the subject should be construed liberally so that the case in point may be indubitably heard and determined. When acting in a proprietary capacity, a city is subject to many of the same restrictions as a private individual. Where grants by a city of right-of-way to a street railway are unlimited as to duration and contain the power of assignment, the grants are without time limit in the absence of constitutional or statutory limitations. [City of Denver vs. Denver T. C., 23 F. (2d), 287.]

ILLINOIS—*Commission Cannot Grant Certificate to Competing Company When Existing Service Is Adequate.*

Overwhelming testimony indicated that the service a bus company was giving was adequate. A competing company received a certificate because it offered a longer route. It was held that that the commission could require additions to and modifications of the service of the existing company, but could not refuse to renew its certificate if it was willing to make these changes. [Wilcox Transportation Co. vs. Commerce Commission, 159 N.E. 788.]

MASSACHUSETTS—*Street Railway Is Liable for Injuries Caused by Improper Removal of Snow From Its Tracks.*

A street railway has the right to remove snow from its tracks, but it is bound to exercise reasonable care and diligence in doing so, and if it negligently produces an obstruction rendering traveling unsafe, it is liable for injuries caused thereby. [Graul vs. Boston Elevated Railway Co., 159 N.E., 606.]

NEW YORK.—*Operation of Motor Bus Without Authority Does Not Preclude Recovery for Injury to Bus in Collision.*

A motor bus in New York was operating under a permit from the Department of Plant and Structures of the city, but the Public Service Commission had not given its approval to the operation so that the bus was illegally carrying on the business of a common carrier of passengers. This violation of the statute, however, had no direct connection with the injury which it suffered from a collision. The illegality consisted not in the operation and use of the streets by the bus, but in the carrying of passengers for hire. It is only in the case where a violation of a statute or an ordinance has such a direct connection with the injury which has been received as to form and be a part of the act causing the injury that the law bars recovery for the injury received. Moreover, the statute governing the licensing of common carriers prescribes penalties for failure to comply with them. The courts must not add other penalties. It cannot be said that the bus, within the meaning of the law, was a public nuisance and interfering and obstructing the streets when it was legally on the streets, although used for an unauthorized purpose. Hence, when a street car negligently injured such a bus in a collision, the railway company was responsible. [Klinkenstein vs. Third Avenue Ry., 158 N. E., 886.]

NEW YORK—*Power of Railway Company to Control the Union Affiliations of Its Employees Is Defined.*

This was a suit of injunction brought by the Interborough Rapid Transit Company against E. P. Lavin individually and as president of a union to prohibit him and other defendants from inducing the company employees to leave its employ. It also asked damages for acts during the strike in July, 1926. As a result of that strike the defendants were discharged from the employment of the company. The court held it could act in labor disputes only where there was a probability of unjustified interference with the company's rights. It held that the company could determine for itself the conditions of employment on its railway which will best assure the interests of public and company, provided it can induce sufficient workers to accept these conditions. It may refuse to employ workers who will not make an agreement that they will not join a particular union or combination of workers while in the company's employ. The company claimed that it had done this when it had accepted the constitution of a brotherhood of its employees, one of whose rules obligated its members not to become identified in any manner with the Amalgamated Association, or any other association of street railway or other employees, with the exception of the brotherhood, and that a violation of this agreement would constitute cause for dismissal from the employ of the company. The court held that this condition did not necessarily imply a binding contract between the company and each individual employee, as the parties directly concerned were the brotherhood and the employees. Efforts of the defendants to instigate a strike while in the employ of the company or to recruit members for the Amalgamated Association after they had left the company's employ are not necessarily unlawful acts, though they may be so. Extracts from this portion of the decision were published on page 92 of the issue of this paper for Jan. 14, 1928. In the belief that the original injunction was too broad, the Court of Appeals remitted the motion to the special term, so that it might exercise its discretion as to whether an injunction of more limited scope should issue upon the facts contained in the record. [Interborough Rapid Transit Co. vs. Lavin et al. 159 N. E. 863.]

OHIO.—*Stoppage of Automobile on Wrong Side of Street Except Because of Emergency or Some Regulation of Law Is Negligence per se and Not Prima Facie Negligence.*

While an automobile was crossing a bridge over a steam railroad, smoke from a passing train partly obscured the roadway and to avoid it the driver turned to the left-hand side of the road where he was struck by a trolley car. In the trial court the judge read to the jury sections of the general code which forbade a driver to obstruct the left-hand side of the road except "by reason of other lawful regulations or emergencies." Judgment for the plaintiff was reversed in the Court of Appeals on the ground that this action gave the jury the impression that the action of the driver was justified. It was not, as there was no such emergency. Violation of a statute is negligence per se and not prima facie negligence. [Cleveland Ry. vs. Kuncic, 159 N.E., 96.]

TEXAS—*Injury to Automobile Guest Where Motorman Discovers Peril After Driver's Negligence.*

In a personal injury action against an automobile driver and a railway company by an automobile guest, the jury found the railway was negligent after the peril was discovered. This was held not to affect the error of the trial court in refusing to submit to the jury the issue whether the automobile driver's negligence in failing to keep a lookout was not the sole proximate cause of the injury. [Northern Texas T. Co. vs. Woodall et al., 299 S.W., 220.]

WYOMING—*Grant by Commission Subject to Change by State.*

A certificate of public convenience and necessity, issued to a transportation company, may be altered later as it is subject to a reasonable exercise of the state's police power. Anyone attacking a statute as unconstitutional must point out the specific constitutional provisions claimed to be violated and show that the statute is unconstitutional as to himself, not merely that it is unconstitutional as to other persons or classes. [Salt Creek T. Co. vs. Public Service Commission, 263 P., 621.]

Personal Items

Frank Pick of London Honored

Frank Pick, formerly joint assistant managing director, of the Metropolitan District, London Electric, City & South London, and Central London Railways, and the London General Omnibus Company, has now become managing director.

In 1902 he entered the service of the North Eastern Railway under Sir George Gibb, then general manager, and worked successively in the statistics office, district superintendent's offices at Sunderland and Newcastle-on-Tyne, the rates offices and, finally, in the general manager's office. In 1906 he removed to London with Sir George Gibb when Sir George took over the management of the Metropolitan District and London Electric Railways. Upon Mr. Gibb's retirement in 1907, Mr. Pick was transferred to the staff of A. H. Stanley, now Lord Ashfield. He was born at Spalding in Lincolnshire in 1878. He was educated at St. Peter's School, York, and was later articled with George Crombio, solicitor, York. In 1902 he qualified as a solicitor and in 1903 became L.L.B. (London University).

C. E. Morris in Toledo

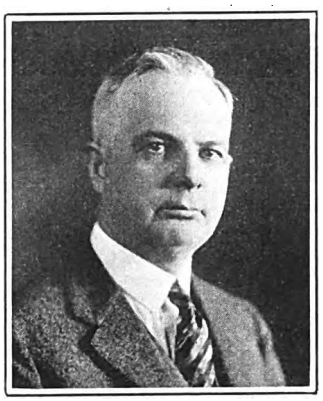
Coincident with the announcement of plans to speed up the service of the Community Traction Company, Toledo, Superintendent Forsgard made it known that C. E. Morris, until recently schedule engineer with the Cleveland Railway, Cleveland, Ohio, has been named superintendent of schedules for the Community Traction Company. Mr. Morris previously had considerable experience in schedule work for the United Railways & Electric Company of Baltimore. He is making a study of the schedules on a number of lines other than the Cherry Hill one, on which changes have been made, and similar plans for bettering service on other lines are to be announced soon.

"Goofy" Complaints in Omaha Investigated

The difficulties of pacifying railway employees and patrons in Omaha, Neb., were recounted in the March 11 issue of the Omaha *Bee-News* in an interview with William C. Baughman, the new head of the newly-established complaint department of the Omaha & Council Bluffs Street Railway. Mr. Baughman tells about the wailings of the woman who tore her sheer hose and the argument of the defiant motorman who just wouldn't let a passenger open the window on a freezing night. He at one time piloted one of the cars on the Dundee line. After serving as trainman for eight years he spent eight more years in the lost and found department and the claim department. He hasn't much time to complain himself—he's so busy adjusting the troubled affairs of others. When President Shannahan moved to Omaha he announced that every deficiency in the service had to be eliminated and this complaint department is part of this idea. But Mr. Baughman says "we don't think much of the ordinary knockers, the folks who write in and tell us what is wrong with the service, but refuse to sign their names." He adds that where the complaints were merited additional service had been installed as a result of their reception.

Official of Binghamton Railway in City Post

Vine W. Burley, superintendent of the Binghamton Railway, Binghamton, N. Y., is a railway official who has given serious heed to the admonition of the soothsayers of the electric railway



V. W. Burley

industry that men engaged in railway work shall do something for communities other than just run their railroad, no matter how well they may do that. In consequence, ever since Jan. 1 Mr. Burley has been commissioner of public work of Binghamton, to which office he was appointed on Jan. 1 by Mayor-elect Norman A. Boyd.

It is said that at first Mr. Burley doubted his ability to serve two masters successfully, but if he did have any doubts his mind was relieved of them by William H. Riley, receiver of the railway, who would not listen to the idea of the railway losing so competent an official. As a result the city is happy, Receiver Riley is happy, and the employers of the Binghamton Railway are happy—and Mr. Burley is happy, but busy. Not only is Mr. Burley getting lots of different kinds of experience in his city post, but he is enjoying the work. He spends certain hours each day with the railway, and it is perhaps not without the pale and in accordance with facts to say that he really likes his work with the railway better than he does that with the city.

In announcing his selection of Mr. Burley, Mayor-elect Boyd said the appointment was a purely personal one and had been made without reference to politics, as he had not inquired whether Mr. Burley was a Republican or a Democrat. The Mayor said:

I have chosen Mr. Burley because I believe him to be well qualified for the important position he is called upon to fill, and that the best interests of the taxpayers will be served in making this appointment.

Mr. Burley is a man of wide experience in handling men, has held responsible executive positions in the past and is possessed of ability that will prove of great value to the taxpayers.

Certainly the Mayor appraised him correctly when he said Mr. Burley would aim to operate the department of public works on a practical basis and give the taxpayers full value for money expended.

Mr. Burley was born in Mills, Pa. He worked his way through Cayuga College, graduating with the highest honors in his class. He became associated with the Pennsylvania Railroad and rose to a position that gave him charge of the engineers and firemen on that road. His headquarters were in Philadelphia, and he was connected with the road for ten years, leaving Philadelphia seventeen years ago to go to Binghamton as superintendent of the Binghamton Railway.

Obituary

Dr. Delos F. Wilcox

Dr. Delos Franklin Wilcox, franchise and public utility authority, author and lecturer, died of pneumonia on April 4 in New York after a brief illness. In his practice as a public utility expert he advised many cities on franchise, rate and valuation matters. Dr. Wilcox was much in the public eye in connection with this work, but was probably most widely known for his advocacy of municipal ownership and for his book in two volumes "Municipal Franchises." Dr. Wilcox was also the author of many shorter treatises on municipal problems. His writings were noted for their clearness and the force with which he presented his ideas.

Born in 1873 near Monroe, Mich., Dr. Wilcox was educated at the University of Michigan and Columbia University, receiving the degree of Ph.D. from the latter. For some years he was engaged in work relating to improved city government, first in Cleveland and later at Grand Rapids and Detroit.

In 1907 he came to New York to become chief of the bureau of franchises of the Public Service Commission for the First District, which was then being organized. He resigned in 1913 to enter private practice as a public utility expert. In 1914 he was appointed deputy water commissioner of the City of New York by Mayor Mitchel. He resigned from this post in 1917 to resume his private practice. In 1919-20 he acted as adviser to the Federal Electric Railways Commission.

Manufactures *and the* Markets

Employment Situation Basically Sound

Surveys by government departments and others indicate less unemployment than some persons have intimated. A great readjustment in industrial employment is taking place

By Julius Klein
Director Bureau of Foreign and Domestic Commerce

IN ESTIMATING the present situation there seems to be a prevailing tendency simply to take statistical soundings as to the depth of the business stream at random spots, with only an occasional effort to gage the force and direction of its current, its general trend, whence it has come and whither it is carrying our commercial and industrial crafts—and at what speed. After all, the outstanding feature of our business life is its extreme mobility.

The type of queries as to current conditions which are now coming to the Department of Commerce—and our inquirers now number 10,300 a day on the average—indicate certain definite shortcomings of our present business statistical apparatus. In the first place, there is entirely too much of it; at least the average merchant or industrialist who hasn't a staff of business analysts in his own business organization seems to think so. He feels the necessity of having segregated for him a few outstanding figures of prime utility for his purposes. This task of selection is clearly one in which his trade association and business papers can be of immediate and special help. The business community no longer wants "bigger statistics," but better ones. Secondly, our correspondents complain of a persistent tendency to overwork available figures.

Thirdly, on the major problem of unemployment, we are clearly behind Europe in the accuracy of our statistical data. It is most gratifying that the Department of Labor has undertaken an authoritative study, and it is hoped that it may lead to a systematic check of this highly important problem.

A characteristic instance was in the case of the Baltimore figures, which were given at the outset as 70,000 by one group of advocates, subsequently as 36,000 by another agency, whereas the actual house-to-house count by the Department of Labor revealed only 17,000.

A fourth weakness in our business figures, as currently interpreted, has been revealed in miscalculations in some quarters based upon the returns from chain stores and mail order houses. The increasing gross returns from these sources have been taken to indicate improved buying power in spite of the clearly evident factor that in each case the number of stores involved has been notably increased. If deductions are made for this factor, the returns in the main do not indicate any *relative* increases in business.

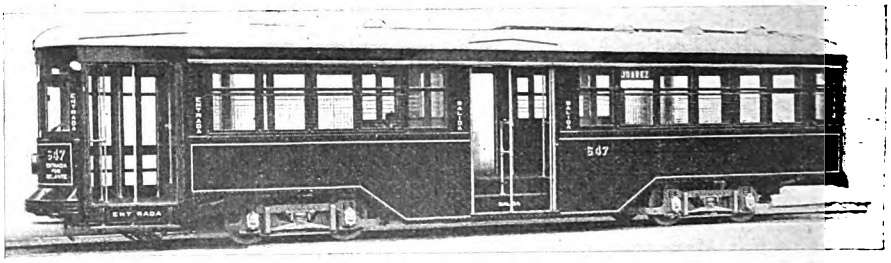
Broadly speaking, there are just a few outstanding figures which, for current average use, seem to be of special value. The trend of electrical energy consumption offers a decline gage in a wide range of industries. Incidentally, the February figures, as tabulated by the McGraw-Hill Company, indicate a substantial increase over February of last year for every industrial group with the exception of lumber. In some cases the gain is unusually high—nearly 42 per cent in the case of rubber, nearly 40 per cent in automobiles, nearly 29 per cent in stone, clay and glass, more than 26 per cent in metal working plants, 21 per cent in rolling mills and steel plants, and 18.5 per cent in chemical and allied products.

Another figure, which seems to be getting wider currency, is that of the Department of Commerce on building contracts, as distinguished from simply permits. Here again the figures are encouraging, running 10 per cent higher during the first ten weeks of 1928 as compared with a year ago. Indeed, in residential building the figures of the first two months of this year are 32 per cent over 1927.

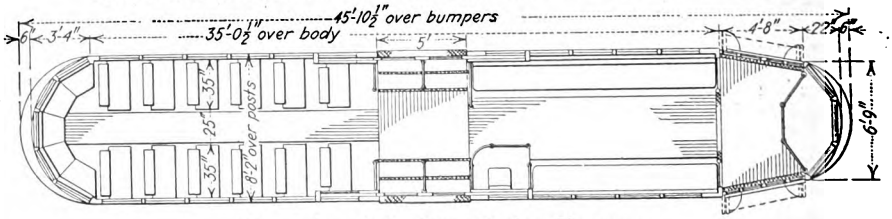
Inventories are also being more and more widely used as a ready clue to the actual mobility of demand. Here, the situation in mid-March is not at all discouraging. Of course, from the point of view of the manufacturer the increas-

Twenty Units Delivered to Mexico Tramways

Twenty cars for the Mexico Tramways, Mexico City, Mexico, have been delivered by the J. G. Brill Company, Philadelphia, Pa. The cars are of the two-man, single-end type. They weigh 38,950 lb., are 45 ft. 10½ in. long and are arranged for pay-as-you-pass fare collection. They seat 49 passengers.



One of the twenty units delivered to the Mexico Tramways Company



Floor plan of the New Mexico City cars

Name of Railway	Mexico Tramways
City and State	Mexico City, Mexico
Number of units	20
Type of unit	Two-man, motor, passenger, city, single end
Number of seats	49
Builder of car body	The J. G. Brill Company
City and state	Philadelphia, Pa.
Date of order	May 27
Date of delivery	October 27
Weights: car body	19,625 lb.
Trucks	11,935 lb.
Equipment	7,390 lb.
Total	38,950 lb.
Bolster centers	23 ft. 3½ in.
Length over all	45 ft. 10½ in.
Length over body posts	35 ft. 0½ in.
Truck wheelbase	4 ft. 10 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	10 ft. 11½ in.
Window post spacing	2 ft. 5 in.
Body	Semi-steel
Roof	Arch
Doors	Center-exit, end-entrance
Air brakes	General Electric
Armature bearings	Plain
Axles	A.S.T.M. annealed
Car signal system	Faraday buzzers
Compressors	CP-28-D
Conduit	Metal
Control	Type K
Couplers	Brill self-supporting radial
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Folding-end, sliding-center
Fare boxes	Cox
Finish	Enamel
Gears and pinions	General Electric Grade M
Glass	D.T.A.
Hand brakes	Brill
Hand rails	Aluminum
Headlights	Crouse-Hinds
Headlining	Agasote
Interior trim	Cherry-stained and aluminum
Journal bearings	Plain
Journal boxes	Brill
Lamp fixtures	General Electric
Motors	Four G.E.-275A, outside hung
Painting scheme	Durban red
Roof m terial	Canvas
Safety car devices	Door interlock
Sash fixtures	National Lock Washer Company
Seats	Brill
Seat spacing	2 ft. 4½ in.
Seating material	Cherry slat
Steps	Front-folding, center-stationary
Step treads	Feralun
Trolley catchers	Earle
Trolley base	U. S.-13
Trolley wheels	General Electric No. 48
Trucks	Brill 76-E-1
Ventilators	Brill exhaust type
Wheels, rolled steel	28 in. diameter
Wheelguards	Root lifeguard

ing tendency toward hand-to-mouth buying, which is in part the explanation for the prevailing favorable low position of inventories, is not an altogether attractive indicator.

Two commodity figures, which are less widely used but which offer attractive possibilities as definite indicators, are the trends in consumption of machine tools and of office appliances. These are both rather definite indices of the readiness of the manufacturer and merchant to back up their judgment as to the outlook with concrete preparations.

In addition to these factors there are, of course, the basic ones of the availability of credit and the conditions in such major industries as automobiles and steel. Automobile production, exclusive of the Ford operations, is now more than 33 per cent over figures for the corresponding period of 1927.

March operations in iron and steel continued at the February rate of 85 per cent compared with 91 per cent a year ago. Price advances are being maintained and the prospects continue favorable.

The trend of our imports is also being noted by competent observers as a useful index of the growing demand for raw materials. February imports exceeded $353,000,000, which was 13.5 per cent larger than February, 1927, though, of course, it must be remembered that there was one more day in the month this year.

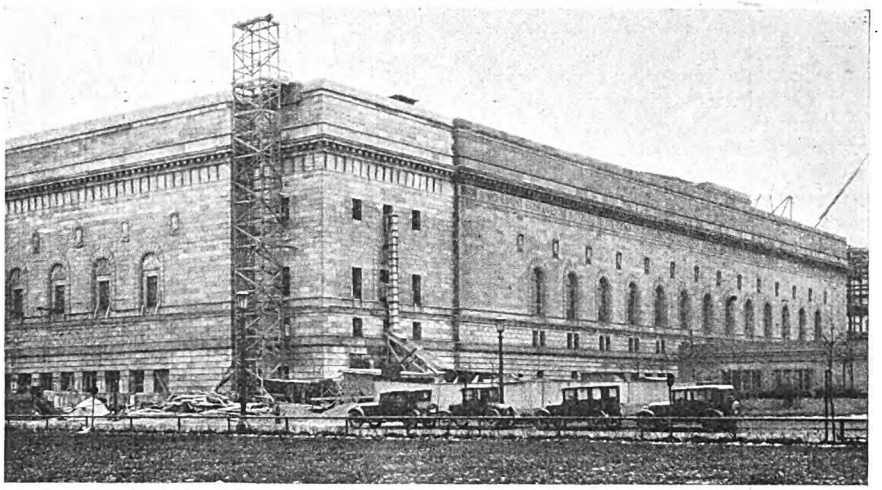
With reference to the unemployment situation, precise figures are not available at this writing, but preliminary indications are that the totals revealed on the basis of accurate samplings now being taken in various districts will be very materially below the estimates of recent weeks. As Secretary Davis quite properly pointed out, three-quarters of a million, even a million, unemployed is a more or less normal feature of any such vast industrial area as the United States, particularly at this seasonal turn of the year. Our real objective should be the elimination of surplus *employable* labor.

Much of the recent situation was quite evidently seasonal, and even more of it was sharply regional. The tendency of all too many casual observers was to generalize on the basis of momentary local observations. Fundamental variations are constantly going on, not only as among different regions at any one time, but also in any one region over a period of seasons. This obvious truism seems to have been overlooked by some current observers.

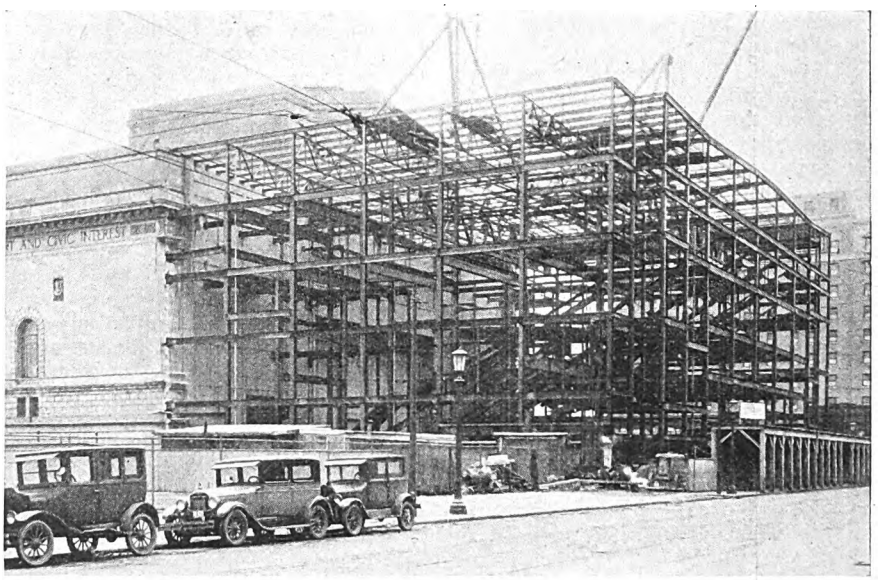
The shrewdest perception of our most erudite counsellors has revealed no one panacea for this situation, not even the rigid maintenance of a high wage scale. Invaluable though that factor is as a rule, it can on occasions be carried to disastrous extremes. One of the most helpful contributions toward the alleviation of this regrettable accompaniment of every profound industrial evolution such as ours, was that recommended by Secretary Hoover at the time of the Unemployment Conference in 1921. At that time he urged the "accurate study by civic bodies of the character of the industries in their respective centers in an endeavor to discover opportunities for integrating industries to intermesh with each other in the reduction of seasonal idleness." Another corrective which is now very much to the fore is the allocation of public works to the slump periods in the employment curve.

One of the inevitable costs of our progress in waste elimination and in more efficient protective methods has been the displacement of labor. This

Space Applications for A.E.R.A. Show Ready



The Lakeside Avenue side of the Cleveland Public Auditorium, which is almost completed. It contains lobby accommodations, restaurant, lounge, meeting room and a grand ball room



When the St. Clair Avenue side of the auditorium is finished it will have facilities for two theaters

Applications for show space at the 47th annual gathering of the American Electric Railway Association, to be held in Cleveland from Sept. 22 to 28, inclusive, will be mailed to all members on April 14. The Cleveland show will open promptly at 9:00 a.m. Saturday, Sept. 22. All applications received up to the close of business May 14, will be awarded space by the exhibit committee, which is scheduled to meet May 16 to make the official allotment. If any space remains unsold after the initial allotment has been made, it will be assigned by the director of exhibits, in the order in which applications are received.

Exhibits will occupy both floors of the Cleveland Auditorium as well as the entire annex. The two buildings are connected with a covered passageway in which there will be operating maintenance-of-way exhibits. Track space for the display of street cars will also be provided.

Railway material, cars, buses and bus accessories, shop tools, garage equipment, etc., will be shown, as well as many other items pertinent to the transportation industry. An unusually large and varied display is expected. Last year there were 293 exhibiting companies and a total of 8,024 delegates.

Digitized by Google

development, plus the deflation of our wartime industrial abnormality, has resulted in a net decrease in employees in our factories of something like 917,000 since 1920. This substantial figure, if added to the 800,000 represented in the decline of employees in agriculture and the 240,000 relieved from the railroads since the war, gives a formidable total of displaced labor of nearly two millions.

There has, however, been a most helpful corrective, which has taken up most, though perhaps not all, of the slack, namely the astonishing increase in non-manufacturing pursuits. For example, since 1920 there has been an increase in the number of workers in automobile servicing and distribution of nearly 760,000. There are nearly 100,000 more insurance agents clamoring at our doors today than in 1919. Another 100,000 increase is estimated in the service employees of electric refrigeration, light and power, and oil heating establishments. The management, servicing, and general direction of construction accounts for an increase of another 100,000 in the same time. There are 232,000 more teachers and professors required today than in 1919. The increase in motion picture servitors, exclusive of production, accounts for another 125,000 added to the cinema industry since the war. It is not hard to explain the increase of 170,000 barbers and hairdressers during the same time. Service personnel of hotels and restaurants has increased by 525,000.

All of this is offered as by no means an attempt to dispute the perfectly evident fact that there is unemployment, perhaps in greater quantity today than for some months past. It is offered solely as one phase of the employment situation which is apt to be overlooked, and without which any observations upon the over-capacity of industries, or the alarming deflation of our factory payrolls through greater efficiency, simply cannot be properly understood.

The first and indispensable safeguard of our prosperity is to minimize waste, to concentrate every possible individual exertion toward widening the present rather narrow margin of profit by cutting in on production cost on the one hand and the expenses of distribution on the other. Our chief task in the future seems to lie in further economies in distributive effort. The volume of output, however, economically achieved, is of no ultimate value whatsoever in our operations without a corresponding volume of profit to the manufacturer.

Root Snow Scrapers for Holland

The Noord-Zuid-Hollandsche Tramweg Maatschappij, Haarlem, Holland, has ordered from the Root Spring Scraper Company, Kalamazoo, Mich., two No. 1 and two No. 8 snow scrapers.

An order for 38 Root life-guards has also recently been received from Pittsburgh. The 125 cars recently shipped to Detroit and the twenty cars shipped to the Mexico Tramways, Mexico City, were equipped with Root life-guards.

Northwestern Pacific to Improve

Northwestern Pacific Railroad, San Francisco, Cal., has been ordered by the California Railroad Commission to undertake immediately, and to carry out to consummation with all reasonable diligence and expedition a program of improvements of its service and facilities. The decision is the result of extensive hearings conducted by Commissioner Leon O. Whitsell, and embodies the program of improvements proposed by the engineering department of the commission, and agreed to in the main by the defendant corporation during the progress of the hearings.

In the program of improvements, the railroad was ordered to construct, in accordance with plans to be approved by the Commission, new stations at Union Station, B Street Station and West End Station, San Rafael, Marin County, Ukiah, Mendocino County, and Healdsburg, Sonoma County and reconstruct or improve, in accordance with plans to be approved by the Commission, its stations at Sausalito, Tiburon, Mill Valley and Ross, as well as maintain a reasonably high standard at other stations on its line. It is to construct, in accordance with plans to be approved by the Commission, shelter stations on the west side of the track at Almonte, Baltimore Park and Kentfield and to file with the Commission, for its approval, within three months from the date of the order, a plan providing for the elimination of the hazard of third rail operation on Second Street, San Rafael, and upon the approval of the Commission the company shall have such plan put into effect as expeditiously as possible. The third rail is to be protected with a covering at all stations and throughout the entire territory traversed by the line, except that if the company so elects, such third rail covering may be omitted in marsh territory on that portion of the line between Pine Street, Sausalito, and Almonte and between Almonte and west end of Corta Madera Tunnel, between Baltimore Park and Green Brae and between California Park and San Rafael, except at station grounds. Protective covering for third rail contact shoes and other exposed energized surfaces on all interurban equipment is also to be made.

The company must submit for the Commission's approval, within three months from the date of the order, a plan of improving the service on its San Geronimo Valley line and proceed to carry out all the recommendations with respect to improving grade crossings. It is ordered to carry out all the recommendations with respect to correcting impaired clearances and unsafe conditions in tunnels and on bridges, to proceed to improve the power situation on its lines substantially in accordance with the recommendations in the Commission's exhibit No. 2 and to submit, for the Commission's approval, a plan of renewing equipment and to promptly proceed to purchase and place in operation five new motor cars and five new trailer cars, of a detail design to be submitted to the Commission for approval within three months.

ROLLING STOCK

NEWBURGH PUBLIC SERVICE CORPORATION, Newburgh, N. Y., successor to the Orange County Traction Company, lost all but one of its fleet of 21 buses on March 30 in a fire which destroyed its garage and contents. It is understood that an order is being placed for fifteen buses to replace this equipment.

WASHINGTON RAILWAY & ELECTRIC COMPANY, Washington, D. C., has received four new double-end one-man cars from the J. G. Brill Company. These cars are the first of an order of twelve, at a total cost of $160,000.

TRACK AND LINE

TRENTON & MERCER COUNTY TRACTION CORPORATION, Trenton, N. J., will erect a new railroad crossing at State and Canal Streets.

SPRINGFIELD STREET RAILWAY, Springfield, Mass., is preparing for rehabilitation work from Holly Street to Oak Street, Indian Orchard, at a cost of approximately $17,000; special work at the corner of Main and Oak Streets, Indian Orchard, at a cost of about $6,000; and on White Street from Orange Street to Sumner Avenue at a cost of approximately $19,000.

TRADE NOTES

STANDARD AUTOMATIC SIGNAL CORPORATION, Chicago, Ill., has appointed Frank J. Lepreau as sales manager. Mr. Lepreau was formerly Chicago representative of the L. S. Brach Manufacturing Company, Newark, N. J.

IDEAL COMMUTATOR DRESSER COMPANY, Sycamore, Ill., has appointed Syracuse Supply Company, Syracuse, N. Y., as exclusive sales representative in the Syracuse territory.

W. P. BROWN & SONS LUMBER COMPANY, Louisville, Ky., has moved its creosoting department to Fourth and K Streets, Louisville.

Market Analysis an Important Part of Merchandising

WHILE discussions among electric railway men have for some time included the subject of merchandising transportation there still is a wide gap between the use of the term and its concrete application to the sale of transportation service. This is strikingly evidenced by the lack of definite information regarding the travel habits and preferences of the people in a given community.

In these days of keen competition and consequent need for intensive merchandising activity in the marketing of all classes of products, a market analysis has come to be recognized as one of the first essentials to scientific merchandising. The object of such a study is to acquire information regarding the number, location and buying habits of potential customers, and to determine the character of products and the nature of the appeals that may be expected to prove attractive to them.

Obviously, since this interest in the possibilities of merchandising transportation is of comparatively recent origin, "market analysis" is a strange term in the vocabulary of the electric railway industry. Nevertheless, it is highly important that transportation men understand the travel habits of those who do not use the street car or bus, so that they can study and learn the reasons why other modes of travel are being used and take steps to secure as much of this business as possible. Considerable interest, therefore, attaches to the survey of the riding habits of more than 100,000 persons in Detroit, made incident to the traffic survey in that city and discussed in the concluding article on this survey, published in this issue.

Questionnaires collected in eleven employment districts gave the place of employment, place of residence, mode of transportation used and reason, time required in traveling from home to work, and the number of blocks walked to and from mass transportation vehicles, if such were used. All of this information was classified for each of the eleven employment districts. It was classified, also, for 155 arbitrary residential sections and a chart was prepared showing how many of the total number tallied lived in each section, and the number using each type of transportation.

The charts prepared from the survey give a wealth of merchandising information. They show wide variations in the travel habits of the people in the several districts and illustrate the kind of market data that is needed to work out a really comprehensive transportation merchandising program. By using the information on the charts to check the actual transportation facilities provided, there is the opportunity for making service changes that will win increased patronage from those who for several reasons may be using other means of travel. The extent of this use of other agencies represents the "unsold" market for public transportation. In sections where automobiles are used extensively increased speed and more attractive equipment may be the appeal needed to win riders. Where walking is the chief competitor, reduced headways and special fare concessions for short distances may prove effective. In each instance there is the opportunity for adjusting service to the requirements of a given section. After that, local advertising or selling effort may be directed toward the prospective riders on each transportation line, rather than dissipated in general appeals to an entire community.

The Detroit survey was made to determine the general causes of traffic congestion, and this analysis of travel habits was incident to that general objective. There was apparently no thought of a transportation "market analysis" in the minds of those in charge of the survey. But the information obtained and the way in which it was compiled illustrate rather strikingly the opportunity which exists for public transportation companies to apply scientific marketing methods to the problem of merchandising transportation service.

Indeterminate Franchise Measure a Bright Spot in New York Legislation

GOVERNOR SMITH was right, in the main, when he said that the session of the New York Legislature which drew to a close recently was the least fruitful one he had witnessed in 25 years. Out of the ruck, however, there did emerge some railway measures that may have an important bearing, particularly on the situation in New York City. Among them are the so-called Thayer bills. These companion measures amend the transportation corporation law and the railroad law by providing for terminable permits for stage, omnibus and motor vehicle lines and for street surface railroads. Under them a municipality would have the right to acquire by purchase all or any part of the property, plant and equipment of a stage, omnibus, or motor vehicle line, or of a street railway. Subject to the approval of the Public Service Commission or the Transit Commission, cities are empowered to grant terminable permits to operate stage, omnibus or motor vehicle lines, or street railway lines.

The prediction was borne out that the bill designed to extend relief to railways in paying for paving would fail of passage. A law was passed, however, giving the city of Ogdensburg the right to compromise its paving claim with the Ogdensburg Street Railway. Despite the passage of the so-called Mastick bill, intended to confer upon the Port Authority the power to deal with a comprehensive surburban transit plan, the Governor vetoed that measure.

The bills intended to further the railway unification plan of the city of New York were lost. One of these measures was drafted at the behest of the Transit Commission, presumably as a part of its work in carrying

Digitized by Google

out the Legislature's own mandate to it to prepare a plan for transit readjustment. The bill was iniquitous in that in reality it provided for a 5-cent fare perpetually, under the guise of authorizing the Board of Estimate and Apportionment of New York to appropriate funds and issue certificates of indebtedness to make up any deficit incurred.

Naturally, there has been some recrimination in New York City at the failure of the so-called city bills to pass. Samuel Untermyer, special counsel to the Transit Commission, deplores the failure of these measures, but Mayor Walker pretends not to be specially concerned about them since three or four more years must elapse before the system of rapid transit lines now under construction by the city and intended to be operated by the municipality will be ready to be put into service.

Apparently the Legislature was more alert than might at first be suspected, for, under the attractive bait of transit unification in New York, was poorly hidden another attempt to get rid of the fare requirement of the present law under which the city's municipal subway is being constructed. It will be remembered that the rate of fare on the municipal subway must after three years of operation be put at a figure sufficient to make the system self-supporting. A municipal system charging an 8 or 10-cent fare while privately operated companies are held to 5 cents, would have only one ultimate result—complete collapse of the city's untenable and ridiculous fare policy. Therefore the city administration made what appeared to be a somewhat casual effort to get rid of the requirement in the law which promises to become increasingly embarrassing as the municipal subway approaches completion. As long as the law remains as it is at present, continued effort may be expected to include the new municipal subway in some form of rapid transit consolidation. Any really sound plan must provide an adequate rate of fare. Since that is desirable from the standpoint of efficient transportation it is a good thing for the people of New York that the Legislature refused to "bite" on Mr. Untermyer's bait.

A New Bus Deal in Louisville

REAL co-ordination of the transportation services in Louisville is now assured. The Council has passed and the Louisville Railway has purchased a bus franchise that makes for co-operation not possible in the past. The grant is for twenty years. The provisions are published elsewhere in this issue. Like the railway franchise the new grant calls for the operation of the buses under the service-at-cost plan. This plan naturally possesses marked advantages where the matter of designating the amount and kind of service that are to be given is vested in the city.

The company at present has 30 buses available for use in a service which as now proposed contemplates the use of only 21 vehicles. It is to be expected, however, that this service will be augmented from time to time, particularly since Louisville has grown rapidly in recent years. Service somewhat similar to that now contemplated in the new grant has been given by the company in the past, but was largely the successor to that furnished by the original jitneys. The previous efforts of the company were hampered by the limitations under which it was permitted to function. It would appear now that all the previous handicaps have been removed. That, of course, is a good thing for the railway, but it is a particularly good thing for the city since it insures operation by a responsible public servant capable under the principle of co-ordination and service-at-cost of functioning under proper supervision to the best advantage of the public. In short, the city has enrolled its name along with those other progressive municipalities in the United States which have recognized that transportation, properly supervised by governmental agencies, is a natural monopoly.

The Bus Is Finding Its Economic Place

APPLICATION of the Kansas City Public Service Company for a 15-cent bus fare raises anew the question of the economic place of the bus in city service. That there is a place—and a large one—for the automotive vehicle is today beyond question. But that place stands out with increasing clearness as one in which there must be an entirely different conception of service standards and rates of fare than exist for street cars. The bus is dependent for its major development upon assuming its place as a transportation agency in its own right and not as a mere substitute for existing services.

The bus-rail problem by no means stands alone in the history of transportation. When the railroads began to throw their steel bands across valley and mountain, the river barge was doomed to oblivion in the minds of many. Nevertheless the lower Mississippi last year carried the largest freight tonnage in its history. When the automotive triumvirate—the automobile, the truck and the tractor—began to change the habits of a nation, old Dobbin seemed destined for the glue factory. Yet hay is still an important farm product and harness makers don't complain for lack of business. It is one of the characteristics of transportation that demand increases with increased facilities, speed, convenience and comfort.

At present there is a wide gap between the cost, the convenience and the attractiveness of an automobile, and a transportation ride in the basic low-priced agency—the street car. Between these two limits there is a broad field into which the bus fits due to its inherent advantages. By giving a service at rates varying from 4 to 5 cents a mile, it becomes possible to offer convenience, attractiveness and comfort in city service at a price which can compete favorably with the private car or taxicab and which at the same time offers an attractive margin of profit. As parking difficulties and traffic congestion become more acute, the attractiveness of such service by buses is increased.

All this is not to say that there is no place for the bus in service of the feeder or supplementary type at rates of fare approximating street car rates, where the density of traffic does not justify the investment in rails. Under such conditions the rubber-tired vehicle offers an excellent expedient for reducing the losses that would be entailed in giving car service. But as experience with the bus increases it becomes clear that it is a mistake to establish bus operation on a large scale at rates which do not permit it to render the preferred class of service for which it is inherently fitted. Farsighted bus manufacturers today are devoting their attention to the economics of bus operation in a way which promises rapid expansion in the use of the new vehicle. They are concentrating upon the application of their vehicles in services

Digitized by Google

which will prove really profitable to the operator. In that objective they still encounter the competition of the salesman who has not yet learned that low fares, once established, are difficult to raise and that an unprofitable operation does not produce repeat customers.

The Kansas City move for a 15-cent fare directs attention again to the Pittsburgh operations in which a preferred form of transportation with buses was initially established at 25 cents and has since been expanded rapidly and profitably. The character of service offered attracts a very considerable number of riders who formerly operated their private cars regularly. The secret of the success achieved seems to lie in the fact that the character of the operation and the rate of fare charged have been properly balanced to give a service which is really attractive and self-supporting.

Saving Money by Spending It

SEVERAL interesting features are involved in the recently opened carhouse and storage yard of the Detroit Department of Street Railways on Coolidge Highway. According to an article elsewhere in this issue, the management estimates that savings approximating $500,000 a year will be effected. That is a large sum, even for a system the size of Detroit's. An analysis of the reasons for it is of interest.

The major part of the saving comes from a reassignment of the cars of the Grand River Avenue line. Since the Jefferson Avenue cars have been running express the former through-routing of the two lines has been discontinued. It is estimated that assignment of the Grand River Avenue cars to the new station will effect a saving of $225,000 annually through the elimination of waste car-miles. Other savings come from the arrangement of the storage tracks so that rotary movement of all cars can be obtained, reducing waste time for backing the cars out, and through the use of a portion of the property for storage of track and paving materials for distribution to locations on the west side of the city as needed.

One of the noteworthy items in connection with the selection of the site is that there has been an increase in realty values in the neighborhood. Years ago the erection of a carhouse depreciated the adjacent property materially. One reason for the difference here is that the railway management has followed the plan adopted by many theaters, hotels, and other business concerns which need entrances only on the main thoroughfare. The space reserved for the railway has only sufficient street frontage to provide entrances for the cars and space for the inspection building. The remainder of the property used for open storage of cars is at some distance back from the street, leaving the portion in front vacant. The department plans to resell a frontage of 663 ft. along Coolidge Highway, and it believes that the amount that can be realized will be nearly equivalent to that paid for the entire plot.

By attention to the details it thus has been possible to plan new facilities so that they do not add anything to the cost of the property. If the savings estimated are realized, the entire cost of land and building will be returned in less than one year. It takes relatively few projects such as this to spell the difference between success and failure in these days when the margin of profit is small.

Exaggerated Optimism May Disturb Business Stability

FUNDAMENTALLY, business conditions are sound. But the present industrial world has undergone a readjustment in recent years the portent of which is disconcerting in its magnitude. In an article on page 602 of last week's issue of the JOURNAL, Julius Klein, director of the Bureau of Foreign and Domestic Commerce, cites the fact that the mechanization of industry and war deflation has reduced the number of factory employees in the United States 917,000 since 1920. Added to this are decreases of 800,000 employees in agriculture and 240,000 on the railroads, making a total of approximately 2,000,000.

This trend has been quite apparent and has been widely discussed for several years. Not so widely recognized, however, has been the balancing effect of the rapid increases in non-manufacturing or service occupations cited by Dr. Klein. Automobile distribution and service, insurance, domestic appliances, education, motion pictures, barbers, hotels and restaurants have shown large increases in number of employees engaged. Thus the increased standard of living that has resulted from productive efficiency seems to be producing in considerable measure the demand for labor needed to balance the replacement of factory employees.

As Dr. Klein points out further, the first and indispensable safeguard of prosperity is to minimize waste, to concentrate every possible individual exertion toward widening the present rather narrow margin of profit by cutting in on production cost on the one hand and the expenses of distribution on the other. This advice is particularly significant since at this time the margin of profit in nearly every line of business shows unmistakable signs of growing narrower.

Closely related to business, of course, is the security market. There is always danger when the income return from stock investments crosses on its downward path the curve of the return from bonds. That point was reached long since. As that conservative commentator the *Financial Chronicle* says, prices on the Stock Exchange are being boosted with a rapidity and daring that is perfectly dazzling. Eventually securities must reach a level more nearly in line with their intrinsic worth, and that intrinsic worth is inexorably fixed by earning power. If the inevitable deflation of security prices is orderly, there may be no very grave consequences, but if the downward trend that follows is subject to anything like the violent gyrations of the upward movement, the consequences may be far reaching in their general effect.

Apparently, the country has been able to absorb some very heavy shocks. It would seem on the surface that there has been no other consequence than the rocking of the boat as a result of the Florida hurricane, the Mississippi Valley flood, the Ford suspension and the Presidential year unsettlements, but that is by no means certain. Again let it be said that business is sound, but it will remain so only as the responsible men in industry bend every effort to keep it so. And that presumes that they shall do everything within their power to discourage exaggerated optimism. Unbridled speculation in securities is a threat to stability. Wall Street is no less subject to abuse as a market than are other markets. It is in the abuse of the security market that the most immediate danger to industry seems to lie at this moment. Business prosperity is not helped by the hysteria of the gambler.

Modern Equipment Used for

Instructing Toronto's Trainmen

This school has been provided to make the work of preparing new men for their duties easy. Old employees also attend the school and learn methods for doing their work better

By W. R. McRae
Superintendent of Rolling Stock and Shops
Toronto Transportation Commission, Toronto, Canada

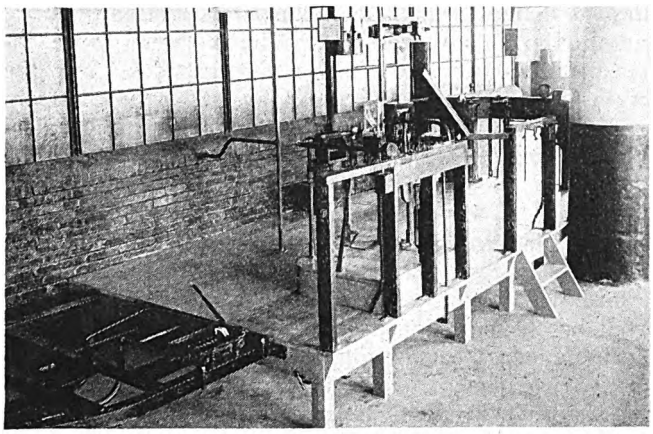

Fig. 1—Platform showing standard car equipment

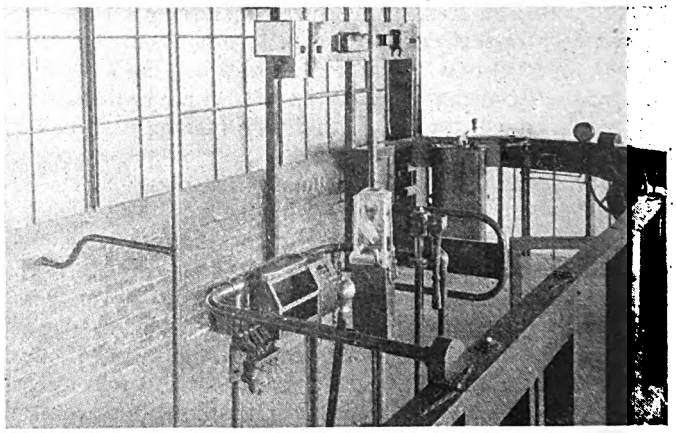

Fig. 2—Near view of equipment shown in Fig. 1

WHEN the city of Toronto took over the street railway from the Toronto Railway in 1921, and put responsibility of operation upon the Toronto Transportation Commission, the building used for the activities of the school of instruction was found unsuitable in many ways, and this important section, which has such a huge bearing on the success or failure of street railway operation, has for some time been located in suitable quarters.

The new premises, situated adjacent to the Hillcrest shops, which are centrally located, are thus convenient of access to employees from all carhouses.

In addition to the standard training of new platform employees the school of instruction is extending its usefulness to all employees, regardless of length of service or department.

Platform men of 20 or 30 years standing are making voluntary visits with a view to learning all they can of the equipment in use and a desire to clear up doubts regarding certain points. To date more than 60 per cent of the platform men (about 1,200) have visited the school of instruction, heard the lecture, and have had demonstrated to them the various pieces of equipment with which their work brings them in contact.

The benefits to be derived from a visit to the school appeal not only to platform men. Shed employees have attended in good numbers, and the clerical staff which deals with the correspondence, accidents, equipment, reports, etc., has also attended lectures and gained knowledge which enables it to carry out duties more efficiently.

The school of instruction is in charge of Chief Instructor Grant, who is assisted by six instructors. A better understanding of the school may be obtained by reference to the illustrations, which show the equipment in considerable detail. The following paragraphs give a brief explanation of this apparatus:

An important piece of equipment is a raised platform, Fig. 1 and Fig. 2, at one end of which is mounted in relative position the equipment as in the vestibule of a standard Peter Witt car. Near the middle is located a conductor's stand as in a three-door trailer. This layout was chosen because in addition to having the usual equipment of farebox, change counter, door control levers, signal lights, etc., it also has the movable barrier which permits of using the middle door as either entrance or exit. This unit is not a "live" one, but is used to familiarize the student with the appearance and location of the various pieces of the equipment. It also teaches him the purely mechanical movements necessary in handling the controller, motorman's brake valve, etc. The movable barriers used to represent doors are provided with switches in circuit with the control switch and motorman's signal lights so that the door interlocking features may be demonstrated. A supply of compressed air permits gage indications to be shown.

At the rear end of this platform, Fig. 3, is a struc-

Digitized by Google

ture on which is mounted a Tomlinson coupler, with a drum switch and air cocks. A second Tomlinson coupler makes it possible to demonstrate how the cars, air lines and electrical circuits are connected and disconnected.

Those cars not equipped for train operation are not fitted with Tomlinson couplers, an adapter being used in order to couple the standard Victor drawbar to the Tomlinson coupler. The Victor drawbar head and the adapter are shown in the foreground of Fig. 3. Their use is illustrated in Fig. 4.

Figs. 5 and 6 show the side and end views respectively of a platform upon which is mounted a complete equipment of safety devices, including a treadle-operated exit door. The controller, motorman's valve, etc., are arranged so that the operator faces the equipment and can see the action of the brake cylinder, line switch, treadle door and sanders. For this last a board is provided with a pointer showing sand "on" and "off."

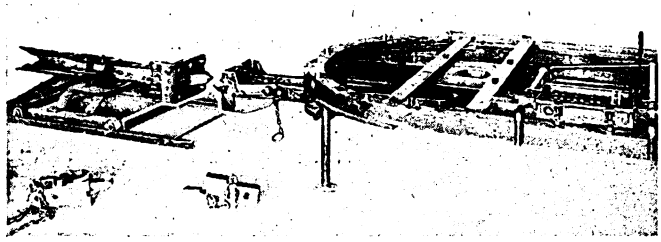

Fig. 3—Demonstration equipment for coupling cars

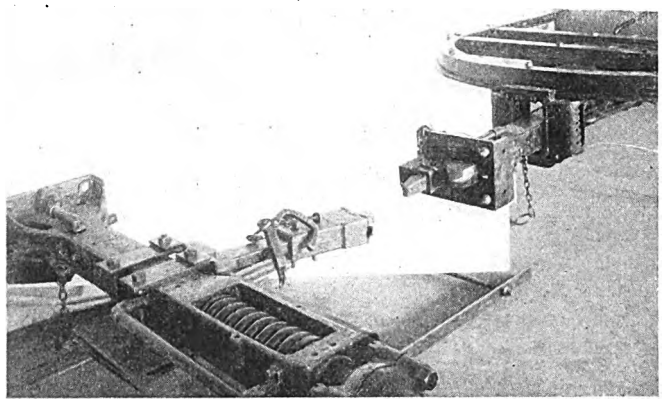

Fig. 4—Use of adapter for connecting automatic and non-automatic couplers

A white lamp, located at the line switch, lights when the switch closes, and a red lamp at the brake cylinder lights when the piston moves out. Both lamps are in line with the operator's eye and serve to impress upon him that when an emergency application of the brake is made from the controller handle, the power is cut off and the brakes applied as well.

Midway on this platform is a unit representing a section of the side of a car with which is mounted a Peter Smith hot air heater with the intake exposed, and a short section of air duct showing how fresh air is drawn from outside and circulated through the car after heating. A standard ventilator is fitted to the roof section and appropriate notices give details of the amount of fresh air handled by each.

One of the simplest but most useful pieces of equipment of the school is shown in Fig. 7. This is a board on which are painted some simple circuits. The upper diagram of the control circuit through the door interlock

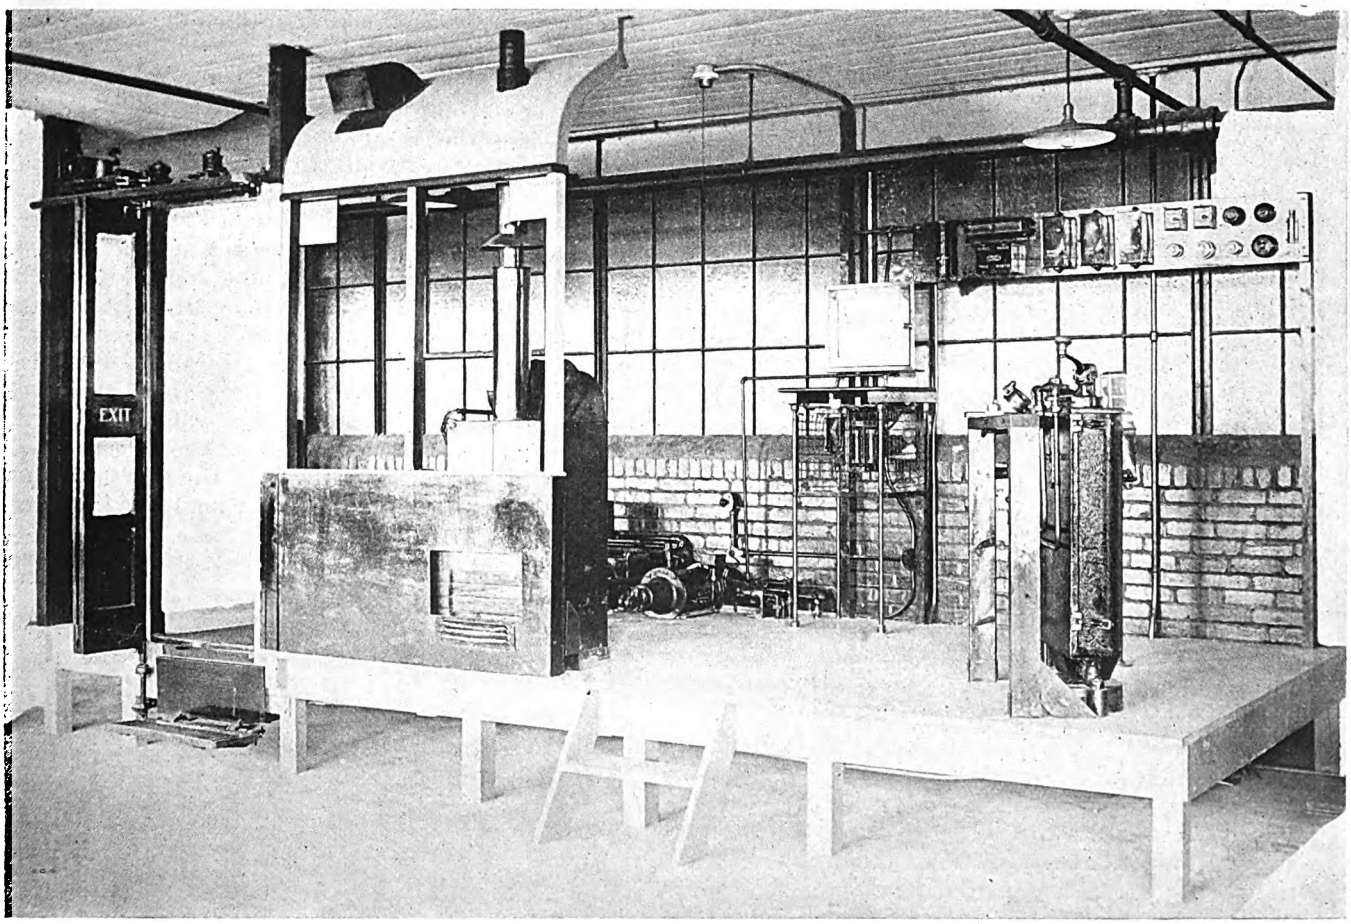

Fig. 5—Platform equipped with full set of safety devices

Digitized by Google

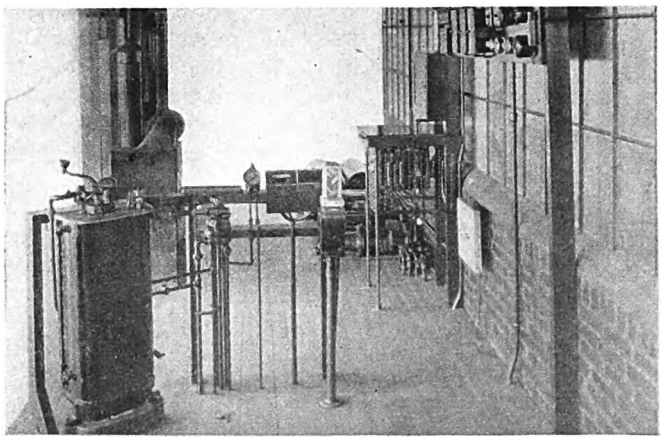

Fig. 6—End view of the safety device exhibit shown in Fig. 5

switches, etc., illustrates clearly by means of a small wooden bar, which represents the blade of the emergency switch, how, in the event of a failure, the coupler, door switches, etc., can be cut out and a separate feed from trolley secured in order to keep the car moving. The two lower diagrams to the left show the series-parallel arrangement of the motors, and by means of movable dummy switches the action when the controller cutout switches are used is illustrated. At the lower right-hand side is a standard diagram of the various car circuits.

Fig. 8 shows the demonstration board on which the more common failures of the electrical equipment are illustrated, with instructions as to the proper steps to take to get the car moving. On this board are mounted four electric fans and four small lamps, representing the armatures and fields, respectively, of four motors. A number of lamps to represent the rheostat and a line switch are also installed. The board is appropriately painted to show the conduits and wiring to the motors and rheostat; the whole is regulated by a K-6 controller, together with the necessary control switch fuses, etc. Concealed snap switches are mounted behind the board

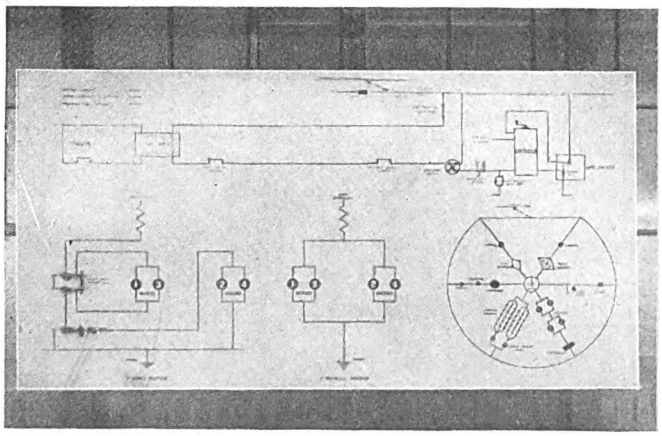

Fig. 7—Simple circuits of motors and equipment of a modern car

with the stems projecting through to the front. Small pointers fastened to these stems under the buttons are painted in uniformity with the lines representing the wires.

The student comes to this board from the one previously described, and is, therefore, familiar with the series-parallel arrangement of the motors. Here he is shown normal operation first. After closing the control switch and getting signal lights, the controller is put on the first notch and the line switch is seen to close. The whole rheostat is shown in circuit, and the four motors start slowly. In a similar way all the steps to the full parallel position are illustrated.

For demonstrating defects, two of the concealed switches are used to illustrate open motor leads. Two show grounded motors, two more show defects in the rheostats—one a ground, the other a broken grid. Open leads are demonstrated by turning the switch pointer through 90 deg. showing a break in the painted line representing the wire. As the controller is notched up

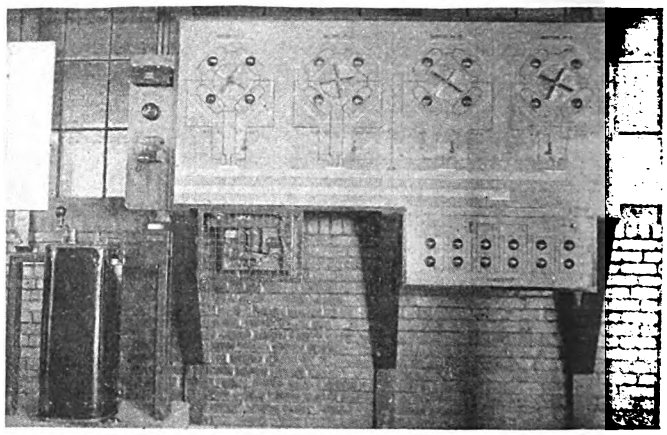

Fig. 8—Demonstration of common failures of electrical car equipment

the second motor of the pair with a broken lead is seen to spin very fast, while the other two motors run comparatively slowly.

Grounds are illustrated by turning the pointer to register with a ground wire painted on the board, and the student is instructed that the current, instead of following its normal path through the motor, takes the easier path to ground through the defective insulation at the point illustrated. Two concealed snap switches behind the switchboard to the left, for the instructor's use, illustrate how the line switch will open when a ground has occurred, one for the series notches and the other for the parallel. For example, with a ground in No. 1 motor, the instructor turns the first concealed switch as well as the pointer illustrating the ground. On turning the controller handle the line switch closes and the rheostat is shown alive, but due to the ground there is no movement of the motors. Advancing the K-6 controller to third position results in the line switch opening. The student is then shown how to cut out the defective motor.

The armature shown in Fig. 9 is used to let the student see what damage may result from improper handling of

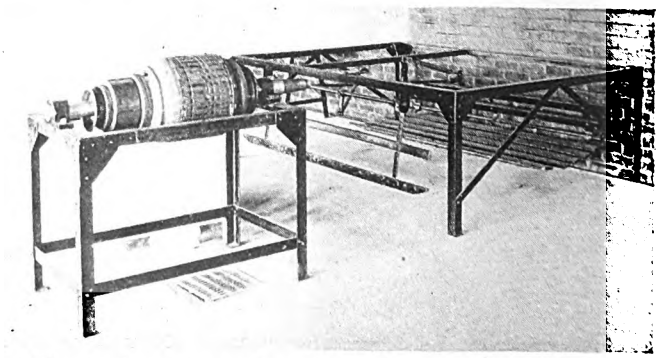

Fig. 9—Armature used to illustrate damage from improper handling. In the rear is a complete lifeguard

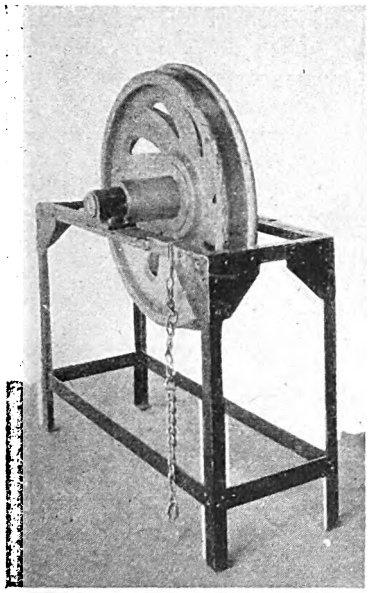
Digitized by Google



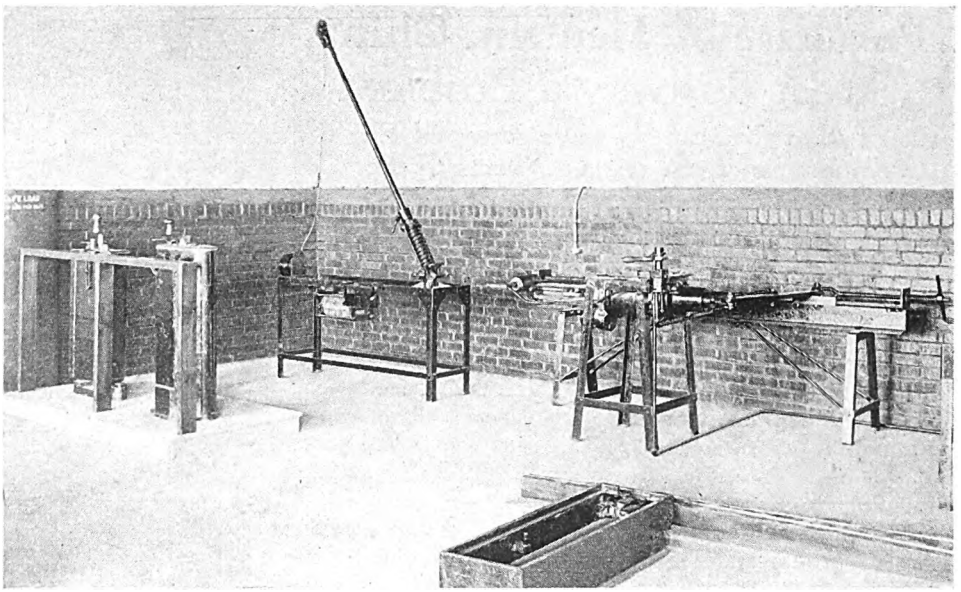


Fig. 10 (at left)—A flat wheel is shown, together with a chain removed from the track groove. Fig. 11 (at right)—Models of an electric track switch, various controllers, trolley pole, catcher, fuse box and rheostat

the car or failure to cut out a defective motor. The instructor adds a few words relative to the expenses incurred and loss of revenue incidental to failures of this kind. An H-B lifeguard is also seen in this view. It is mounted so that all parts are clearly visible and its working can be explained easily.

A cast-iron wheel with a flat spot is shown in Fig. 10. The instructor remarks on the cost of flat wheels and their prevention. The piece of chain hanging on the stand is a sample of the material which finds its way into the groove of the rail, doing a great deal of damage to wheel flanges if not removed promptly.

Of the four units shown in Fig. 11 one is a model of the electric track switch which is standard on this system and is used to demonstrate how in the event of the switch failing to work a link may be removed allowing the tongue to move independently of the actuating mechanism. This link in the model is painted red. Another is a stand on which are mounted a K-10 and an English Electric Company Q-2 controller. In the corner is a stand on which are mounted a trolley pole and base with rope and catcher, a trolley fuse box and a section of rheostat. The last is a set-up to which a supply of air is connected, which is used to demonstrate the working of the automatic brake slack adjuster. A white mark painted on the piston sleeve indicates standard piston travel. Then some slack is introduced in the system and the action of the adjuster noted.

Fig. 12 shows the seating plan in the class room. In this room are the standard schedule and notice cases and a section of a "signing in" desk, all as used in the various carhouses of the system. On the walls are frames containing sample transfers, badges, etc., together with a large map of the city.

Purchase of Tientsin, China, Street Railway a Problem

Chihli state government, while contemplating the purchase of the system, objects to the railway company's sale price

By H. O. Kung
Secretary the Chinese Engineering Society American Section

PURCHASE of the street railway system in the city of Tientsin, the "Chicago" of China, is proving a difficult problem for the Chihli state government. The present company operating the street railway system demands a price fifteen times the average annual profit of the three preceding years, which the government is unwilling to pay.

The provisions of the franchise concerning distribution of profits and the purchase of the system by the government are peculiar. The purchase terms involve the profit earned by the company, and the profit to be retained by the operators, in turn, is determined by investment. Since the owners have never disclosed the true investment figures, the government officials are unable to arrive at a correct purchase price. The whole problem has now resolved itself into evaluating the street railway properties.

The city of Tientsin, the great trade center of north China, is about 80 miles southeast of Peking, the capital of the Chinese Republic. A few generations ago Tientsin was a very small town, but now it has a population of more than 900,000. Of this number 1 per cent are foreigners, most of whom are engaged in trading, either importing or exporting. All the street construction and trade buildings are modern, except those within the former city walls. Tientsin resembles in many respects the American cities of Cincinnati, Ohio, and Pittsburgh, Pa.

Franchise Outlines Detailed Method of Distributing Profits

The street railway was constructed in 1904 by a Belgian trade company, which also installed the power and light distribution system for the city. The nominal capital has been given as $1,000,000, but the actual investment of the company is unknown to the state government officials. The company paid $5,500 to the Chihli government for the issue of a franchise for a period of 50 years. A detailed system of distributing profits was outlined in the franchise tendered the railway, as follows: The company shall contribute each year to the Chihli government a sum which shall be 3½ per cent of the gross revenue and may earn a legal profit of 12 per cent on the investment. If any profit should remain after deducting for expenses and maintenance, 12 per cent of the amount shall be contributed to the government as royalty. Dividends on the stock may then be paid up to 15 per cent of par. Should any balance remain undivided after paying the 15 per cent dividends, 20 per cent of this remainder shall be paid the government and 20 per cent retained by the company as surplus.

According to the general contract, the Chihli government may purchase the properties of the operating company after the first twenty years of service at a price which shall be fifteen times the average annual profit of the three immediately preceding years. In no case shall the price be less than all the expenses for construction and installation of the entire system, including buildings, trolleys, tracks, machinery and equipment. Should the Chihli government not purchase the properties of the operating company at the end of the first twenty years, a seven-year extension service shall be allowed to the same company. After 50 years of service, however, all the property shall be transferred to the government free of charge and in good condition.

It is obvious that the operating company would hold a decided advantage should the Chihli government decide to purchase the road at the end of the 49-year period. However, should the government await the termination of the 50-year period, the tables would be turned. The general contract was signed on April 26, 1904, and the franchise for furnishing electric energy and street car services will be legally terminated in 1954. The seventh elapsed period would terminate in 1953.

GROSS REVENUE, EXPENSES AND PROFIT FOR 1922, 1923 AND 1924

Year	Gross Revenue: Street Railway	Gross Revenue: Lighting	Gross Revenue: Total	Expenses	Profit
1922	$845,529	$1,387,519	$2,233,048	$775,399	$1,457,649
1923	854,075	1,586,397	2,440,472	749,974	1,690,468
1924	872,308	1,766,176	2,638,484	784,325	1,854,159

The financial conditions of the operating company for a few years past are extremely interesting. The gross revenue, expenses and profits for the year 1922, 1923 and 1924 are shown in an accompanying table. The average annual profit for this period was $1,667,435, so that the purchase price, figured according to the terms of the contract, would be $25,011,525. It is quite natural that there should be disagreement between the company and the government over the "fifteen times yearly profit" clause.

The general contract provides that the Chihli government may acquire control of the company's property if it can be found that the company has earned any illegal compensation. As a result of several months investigation conducted by a special committee, the operating company has been found to have earned illegal profits. On the basis of this discovery, the government assumed control of the property in August, 1927, and demanded a purchase price to be set by the company. The company complied with the request and in a note sent to the government claimed $26,305,395 as the purchase price of the entire property. This amount the government has refused to pay. Because the purchase price is determined from the average annual profits over a three-year period, and since the amount of profit to be retained by the company is determined by the actual investment in the property, there has been a further dispute over the actual amount invested in the property. The government has set about to determine a reasonable valuation from which it can establish a true purchase price.

To arrive at such a reasonable valuation the following three elements should be considered and given their proper relative weight in determining the final price: First, the actual and historical investment of the company should be disclosed to the appraisal engineers; second, the market value and the amount of the outstanding stocks and bonds also should be disclosed; third, a brief but complete financial statement of the company for each year, from the first year of operation to the present, should be presented. Based upon these three elements in applying the equal profit ratio depreciation method a just valuation of the company's properties may be determined.

One of the 50 light-weight city cars bought by the Springfield Street Railway last year

Million Dollar Rehabilitation

at Springfield

Purchase of new cars and new buses, extensive track reconstruction, and increase in shop and garage facilities are among the improvements made during the past year. Further track reconstruction planned for coming season

MORE than a million dollars was spent by the Springfield Street Railway, Springfield, Mass., in the improvement and rehabilitation of its property during 1927. This was one of the first big steps in the plan of the New York, New Haven & Hartford Railroad to modernize the street railways which it controls. The rehabilitation was not undertaken from altruistic motives, but for fundamental economic reasons. Investigation convinced the management of the New Haven that the street railway is now, and will remain for a long while to come, the backbone of the local transportation service in Springfield. The officials of the railroad believe that transportation, like any other commodity, cannot be produced economically with obsolete equipment. Furthermore, it is their belief that transportation service should be made attractive. You cannot sell a man what he does not want. With these thoughts in mind, an extensive program of improvements was undertaken. Some of them have already been carried out, and others will be made during the present year.

Approximately $800,000 was spent last year for 50 new light-weight city cars. Before the purchase of these cars the company had been engaged in the development of an experimental car in collaboration with the Wason Manufacturing Company. This experiment was one of the outstanding developments in the electric railway industry last year. So many radical features were included in this new design, however, that it was considered undesirable to adopt it for a large order of cars before these new departures had been thoroughly tried out in actual service. The lot of 50 cars bought last year, therefore, were designed along more conventional lines. They were described in detail in ELECTRIC RAILWAY JOURNAL for March 26, 1927.

The company also bought nine new buses last year. Of these three were 29-passenger Yellow coaches model Z. Six were Macks of the same seating capacity. All the new buses are being used on city routes in Springfield, taking the places of older buses which have been transferred to lighter traffic routes in outlying districts. In all, the Springfield Street Railway is now operating 41 motor coaches. The former freight station has been converted into a garage. Owing to the discontinuance of through electric railway operation between Worcester and Springfield, freight service had been abandoned and the former freight station became available for other uses.

More than $300,000 was spent for track improvement last year. The program was planned after a careful survey of the property had been made to determine what resconstruction work was needed. On account of increasing traffic and to speed up the service a considerable amount of double-tracking was undertaken. In all 1.78 miles of new track was added to the system and 6.07

		Constructing new track	1,600	.....	.....	.....	.....

miles was rebuilt. Thus work was co-ordinated with the city's paving plans. Similar improvements will be made this year.

The work that was done covered nearly all lines in the system, as may be seen from the accompanying map. It comprised fourteen major jobs, which are indicated by numbers on this map and in the table which presents a summary of the work.

Reasons for Rebuilding

Single track on Belmont Avenue from the intersection of Sumner Avenue to the East Longmeadow line, a distance of about 5,000 ft., and on Sumner Avenue from Lenox Street to Lindale Street, about 2,500 ft., was replaced with double tracks. At the intersection a double-track crossing consisting of sixteen frogs, a single-track connecting branch-off, a single-track right-hand branch-off and three cross-overs were installed. On the map this work is indicated as jobs 1 and 2. The old 7-in., 70-lb. T-rail which was laid in 1896 and 1901, without ballast and in bituminous macadam, was removed. The new track replacing it was constructed with 7-in., 103-lb. girder rail installed on new ties on ballast of 6 in. of trap rock. The new paving consists of 3 in. of asphalt on 6 in. of concrete. The work cost $125,000 and took 63 working days to complete.

On State Street between Oak and Hancock Streets 1,200 ft. of double track was reconstructed. The old construction used 9-in., 125-lb. girder rail, which was installed in 1910 with sand ballast on a 6-in. slab of concrete. This was taken out and new 7-in., 103-lb. girder rail was put in. Here the sub-grade was not the same but trap-rock ballast was substituted for sand and a 6-in. concrete base was installed for the new asphalt pavement. This piece of work cost $16,350 and was completed in fourteen working days.

Farther out on State Street, from Benton Street to Pine Point, the city repaved with asphalt, using the old cement-macadam paving as a base. It therefore became necessary to raise the company's tracks 3 in. for a distance of 4,200 ft. New 7-in., 103-lb. girder rail was laid on steel ties in concrete with a 6-in. concrete base for the asphalt pavement, replacing the old 9-in., 107-lb. girder rail which was installed in 1902 and was laid on dirt ballast. The time taken for this work was 37 working days and the cost was $61,400.

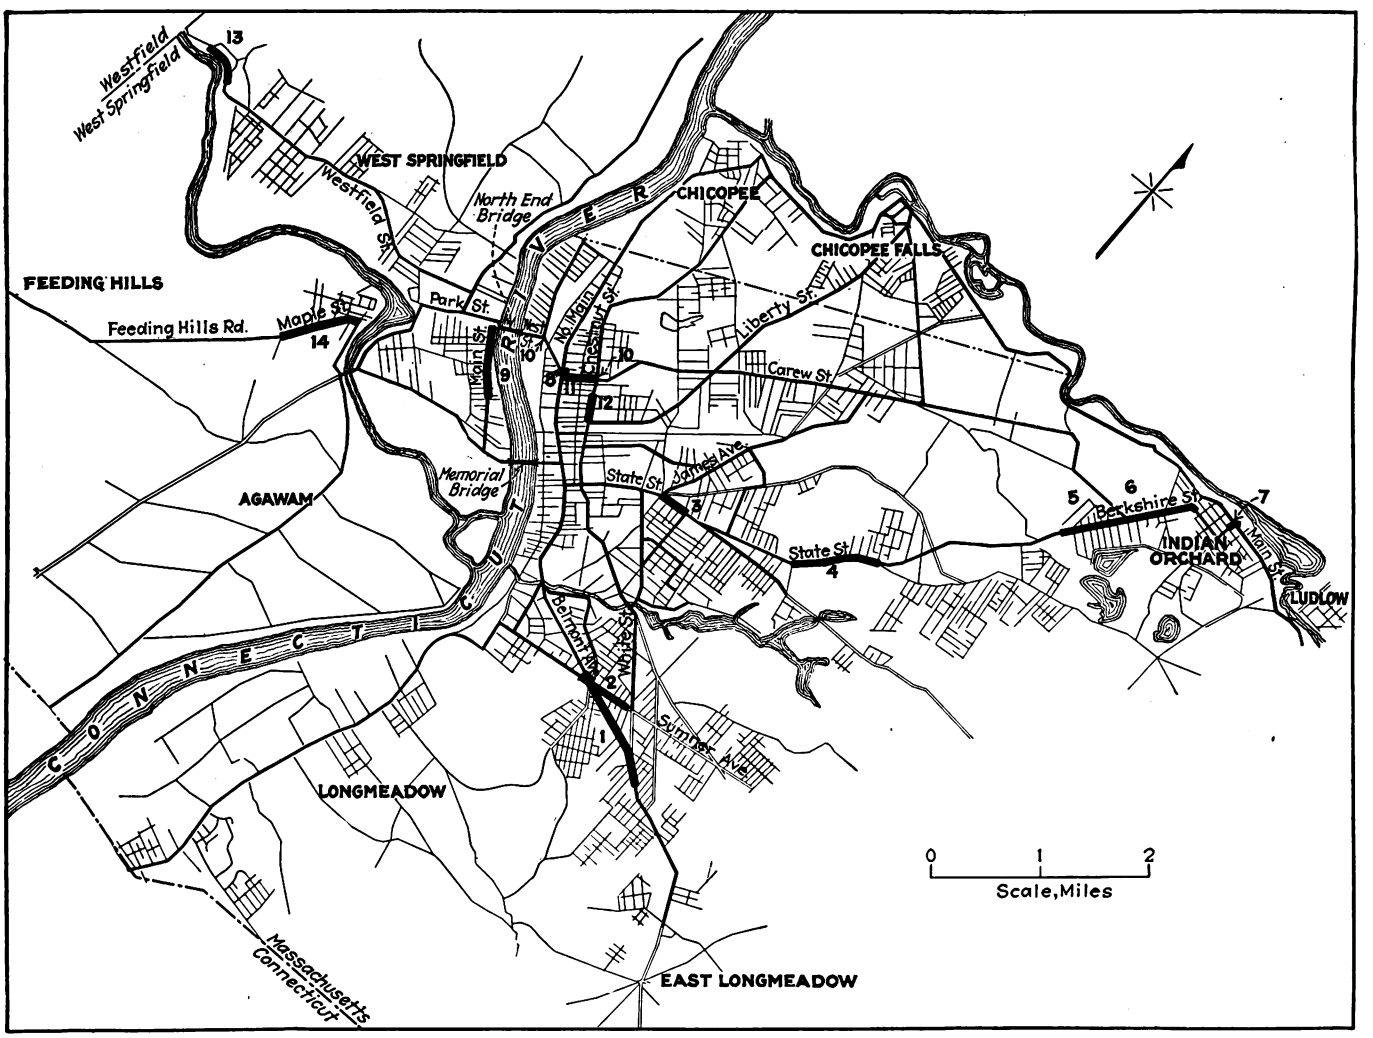
An unusual looping arrangement installed at Memorial Square

The outbound track on Berkshire Street, westward from Page Boulevard, 2,700 ft. long, was rebuilt. The old 7-in., 70-lb. T-rail which was taken out was installed in 1902 on gravel ballast, the paving consisting of water-bound macadam. The new track was laid with 6-in., 100-lb. T-rail on 6 in. of trap-rock ballast. This work cost $12,175 and took ten days.

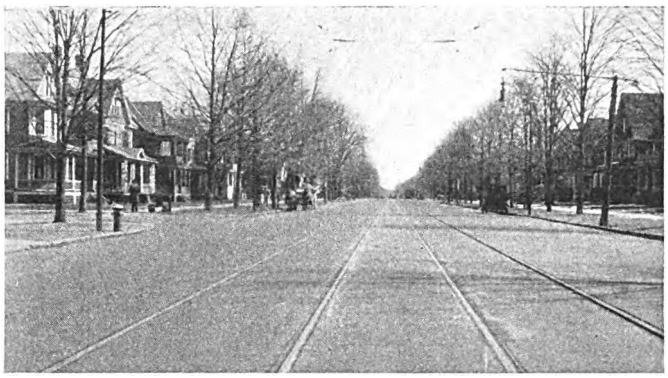
Beyond Page Boulevard, as far as Holly Street, 2,700 ft. of double track on Berkshire Street was rebuilt with 6-in., 100-lb. T-rail, replacing the old 7-in., 70-lb. T-rail which was installed in 1902. The same method of construction was followed as on the job previously mentioned. This work took 21 days and cost $30,000.

The special work indicated on the map as job 7 is a double-track left-hand branch-off, installed at Main and Oak Streets, Indian Orchard. Trap-rock ballast rolled to a depth of 6 in., and a 6-in. concrete paving base with a 3-in. asphalt top dressing has been used. This work

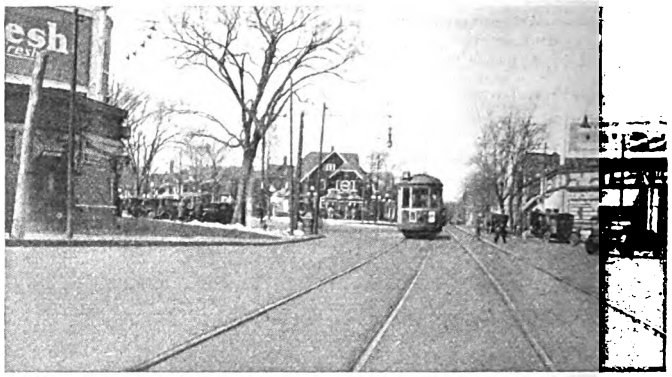


Fourteen track reconstruction jobs were done in Springfield, Mass., last year at a cost of $312,290

Digitized by Google



New double track on Sumner Avenue east of Belmont Avenue



Double track installed on Belmont Avenue to speed up the service on a heavy traffic line

cost $6,300. An unusual installation made at Memorial Square is a single-track connected branch-off with gauntlet construction. Memorial Square is a terminal of several lines and this loop was installed to facilitate the turning of cars. The track was ballasted with 6 in. of trap rock and 3 in. of asphalt top dressing on a 6-in. concrete base. The work cost $7,000 and was completed in 21 working days. This is indicated as job 8. The single track on Main Street, West Springfield, from Park to Burford Avenue, 3,024 ft. long, was rebuilt. The original track consisted of 6-in., 60-lb. T-rail installed in 1901 with gravel ballast and water-bound macadam paving. This was replaced with 7-in., 103-lb. girder rail with 6-in. trap-rock ballast and a 6-in. concrete paving base. The job cost $18,000 and was done in thirteen working days. It is indicated as job 9 on the map.

At Chestnut and Carew Streets and at Plainfield and West Streets two electric switches were installed at a cost of $665. On Carew Street, from Main Street to Chestnut Street, 1,580 ft. of single track was rebuilt. The old 6-in. 60-lb. rail which was installed in 1894 was replaced by 7-in. 103-lb. girder rail. The old paving was macadam and the new rail was laid on 6-in. trap-rock ballast and 6-in. concrete base for the paving. Six working days were consumed in doing the work which cost $8,600.

Reconstruction of 1,350 ft. of single track on Chestnut Street, from Liberty Street to Linden Street, and also renewing right-hand branch-off into Liberty Street was done in six days at a cost of about $8,000. New 7-in. 103-lb. girder rail with 6-in. trap-rock ballast and 6-in. concrete base for paving was installed in place of the old 9-in. 107-lb. girder rail installed in 1904, gravel ballasted with granite block pavement on a sand base. On the Westfield-Springfield line on account of the relocation of the state highway about 4,000 ft. of single track was shifted and the double track extended a distance of 300 ft. The job cost $8,200.

Relocating 3,500 ft. of track on Maple Street, Agawam, from O'Brien's Corner to Bridge Street and constructing 1,600 ft. of track on Maple Street, from Bridge Street to Walnut Street, Agawam, on account of the construction of a new highway, took twelve days and cost $10,600. It shortened the distance of the Feeding Hills line 3,500 ft.

New track on State Street laid in comformity with the city's paving program

Cincinnati Finds Foremen's Conference Helpful

UNDER the leadership of E. J. Jonas, superintendent of equipment, foremen's conferences are being conducted monthly by the Cincinnati Street Railway for the heads of the mechanical department. These meetings are attended by the assistant superintendent of shops, the equipment engineer, the general foreman, and all shop and carhouse foremen. As a rule the day foremen get together in the morning while the night foremen meet on the evening of the same date. An occasional joint meeting is scheduled, at which the attendance is 30 or more.

The meetings are usually opened with a constructive talk by the chairman or a guest. At times a special subject—such as accidents, pull-ins, economy or supervision—is assigned in advance of the meeting. This gives the members an opportunity to come prepared to discuss such subjects fully. These constructive talks and discussions have proved to be well worth while.

Time is provided on the program for each member to bring out suggestions, problems and tests of various kinds on which he has been working. These are discussed, committees are appointed to make further investigation, or any other necessary action is taken. In this way each member gets to know what the others are doing and how they are going about it. Many subjects come up in this way that are of general benefit to the entire department.

Car-miles per pull-in increased about 61 per cent in the last four months of 1927 over the same period of the previous year. This upward trend is continuing, and the improvement is attributed largely to the effect of these meetings.

Even though an automatic traffic signal is provided at this intersection pedestrians are using all crosswalks

Detroit Survey

Develops Basic Traffic Data

Commercial vehicles use only a few routes. Jaywalking and crossing against the red traffic lights are common practices. Extensive survey of travel habits shows wide variations in modes of transportation used

PART TWO

Unfavorable conditions existing in the alleys of Detroit, the parking situation, vehicular traffic flow and the movement of passenger transportation vehicles were covered in Part One, which appeared in the April 7 issue of this paper. The second and final article treats of commercial vehicle movements, regulation of pedestrians, the causes of accidents, a survey of travel habits, annd suggestions for traffic improvement submitted by citizens.—EDITOR.

FREIGHT vehicles, being slow moving, impede the general movement of traffic to a considerable extent. Traffic congestion has been laid at the doors of the freight vehicles, and it has even been suggested that horse-drawn vehicles be prohibited in some districts during certain times of the day. Valuable information on the use of freight vehicles was obtained from several wholesale and retail merchants. A total of 5,435 commercial vehicles were owned and rented by the merchants who replied to the questionnaires. Of these 1,308, or 24 per cent, were horse drawn. Only 677, or 12.4 per cent, of the total horse-drawn vehicles were in use during the normal working day, so that they were not considered an important factor in the traffic situation.

The origin, route and destination of freight-carrying vehicles to and from the principal freight station within the downtown business district was the subject for another survey. A marked tendency was revealed for freight vehicles to move over a few selected routes. Other routes were available and just as short, but freight truck drivers found them less desirable to use, either because the paving was in poor condition or because parking interfered with the movement of their vehicles. The report recommends that freight pick-ups and deliveries be confined to the night hours in so far as practicable. This plan not only would speed up general traffic during the daytime, but also would prove economical for the trucking interests. The lack of spaces in which to park for unloading and picking up freight results in costly cruising. Of equal importance with the delivery and pick-up of wholesale freight is that of vehicles engaged in retail delivery. Though there is a marked diffusion of delivery routes, there is a natural tendency to follow the best and main arteries.

Traffic movement is hampered by cruising, as it is generally termed. Three types of vehicles indulge in this practice: private automobiles, trucks and taxicabs. Cruis-

Detroit has its share of the jaywalking habit, a pedestrian count revealed

The chart shows graphically the relative jaywalker and crosswalk movements. Of 293,195 pedestrians tallied, 27,521, or 9.4 per cent, were offenders. Detroit accident statistics showed that of the total pedestrian accidents, 42.4 per cent of the fatalities and 54 per cent of the injuries involved jaywalkers.

ing is classified in the report as a high-class nuisance and a very distinct obstruction to traffic movement. To determine the amount of cruising at certain locations in the downtown district, tallies were made which revealed that it assumes surprising proportions. To remedy the taxicab situation it was suggested that more stands be provided and that automatic control boxes be installed.

Regulated Pedestrian Traffic Movement Necessary

Impatience is a pronounced pedestrian characteristic at controlled intersections, and the unwillingness to proceed in accordance with the signal indication is clearly shown in a survey made. The tally showed that of 12,566 pedestrians using a principal intersection, 44.33 per cent ignored the safety feature of the traffic signal and crossed through the traffic. Fatalities and injuries are very material from this cause, since the actual street hazard is 2½ times as great when crossing against the red signals. Pedestrian subways, overhead bridges, automatic control devices, marked lanes on the sidewalks and other means of bringing relief have been suggested, but their practicability is questionable.

Another survey of pedestrian traffic movement showed that of 293,195 pedestrians tallied, 27,521, or 9.4 per cent, were jaywalkers. This figure might seem insignificant, but of the total pedestrian fatalities and injuries in Detroit, 42.4 per cent of the fatalities and 54 per cent of the injuries were directly traceable to this class. The jaywalker not only endangers his own life and the lives of others, but he also interferes materially with the movement of traffic. Remedial measures should be applied through educational channels, and regulation resorted to only when it becomes necessary.

Surveys of the number of pupils attending 40 public schools and the respective places of residence were compiled from the records of the Board of Education. The present methods of protecting the children while crossing the streets were determined from a field survey, which revealed that there was a need for additional protection. Suggested means for school locations were the installation of more automatic traffic signals, the use of pedestrian subways and the stationing of more policemen.

Information gathered by the Accident Investigation Bureau during the first four months of 1927 gives the details of 146 accidents involving 185 persons. Of these totals, 80 accidents involving 94 persons occurred in unprotected safety zones, one accident involving one person occurred in a protected safety zone and 65 accidents

Distribution by residence divisions of 80,000 persons leaving the downtown district between 5 and 6 p.m., with mode of transportation used

The insert shows how the detailed information of the mode used is shown on the map. A chart of this nature is particularly interesting to public transportation operators, since it indicates the travel habits of residents in every section of the city moving to and from any particular employment section. The areas of population increase and decrease show a movement from the closer-in section to the outer districts. Population figures were not available for seventeen districts.

involving 90 persons were caused by vehicles colliding with protected safety zones. Of the 65 collisions with protected safety zones, 59, or 90.8 per cent, occurred from 6 p.m. to 6 a.m., a large proportion of which was considered chargeable to improper illumination. Corrective measures are being adopted through the installation of base lamps on the lighting posts in the safety zones. It was suggested that the ordinance requirement of "no parking opposite safety zone" be amplified to include a space of at least 30 ft. at both ends of all safety zones and car stops.

TABLE II—SUMMARY OF PERSONS TALLIED IN ELEVEN EMPLOYMENT DISTRICTS, DETROIT, MICH.

		Totals				Per Cent

The origin, route and destination of passenger travel, as well as the type of vehicles used, why they are used and the time consumed in travel are important traffic studies. To determine the travel tendencies of persons employed in several sections of the metropolitan area, mode of transportation questionnaires were distributed among certain enterprises in representative employment districts, and 101,541 usable replies received.

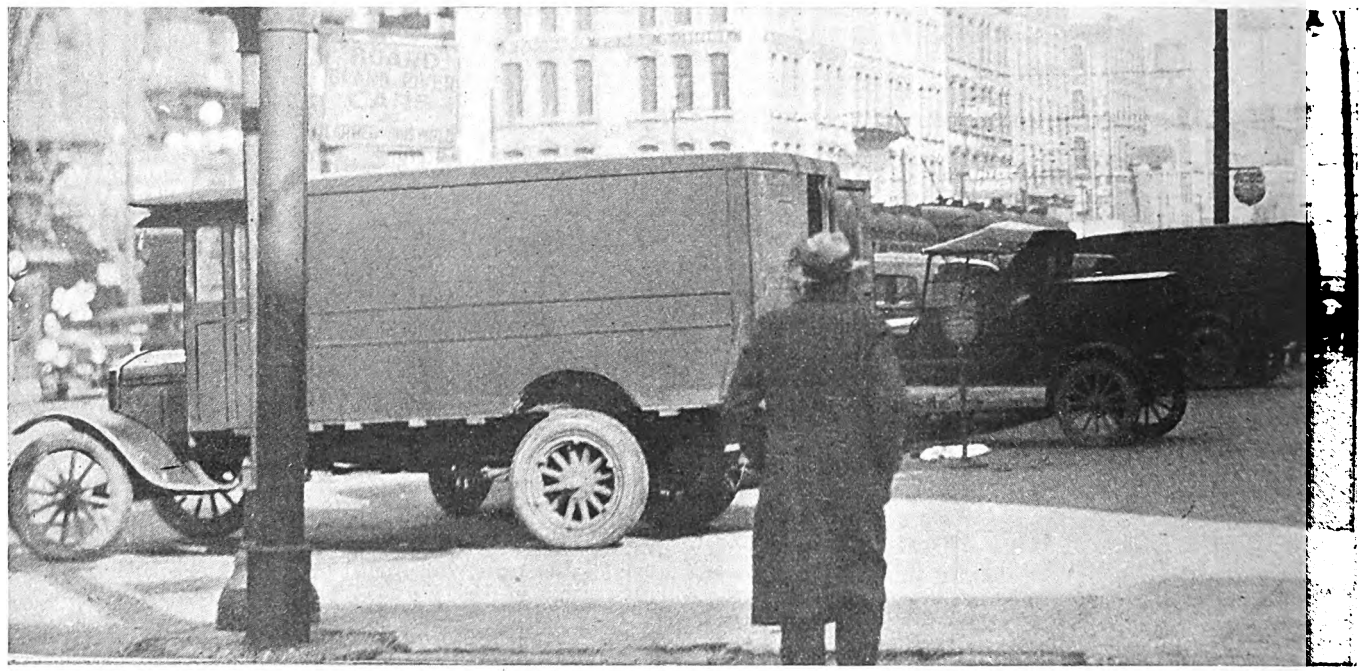
The questionnaires requested place of residence; place of employment; normal mode of transportation used between residence and place of employment; the total time required in traveling between residence and place of employment; if using mass transportation vehicles, the number of blocks walked between residence and such vehicle and the number of blocks walked between such vehicle and place of employment; if automobiles were used, whether they were parked in the streets or in a garage or parking lot; and the reason for the mode of transportation used.

An analysis of the 101,541 replies showed that 16.64 per cent of the persons walked, 19.07 per cent rode in automobiles, and 64.29 per cent patronized mass transportation vehicles of one kind or another. The proportion of walkers was found to be a minimum in the downtown district and a maximum in the east side district. The minimum and maximum number of persons traveling in motor cars were recorded in the Highland Park and West Warren Avenue districts, respectively. As for mass transportation vehicles, the minimum was recorded in the Hamtramck district and the maximum in the downtown district.

Further analysis showed that of the 101,541 persons tallied, 5.71 per cent procured their transportation through the use of friends' automobiles; 54.95 per cent rode the cars or buses of the Detroit Street Railway; 1.26 per cent were carried by jitneys; 4.23 per cent by the Detroit Motor Bus Company; 0.50 per cent by the Detroit United Railway and 3.34 per cent by steam trains and miscellaneous transferring means.

To obtain detailed information regarding each part of the city, the replies were separated into 132 residence divisions for Detroit and 23 divisions outside the city limits. The summary for one division, which is typical, is given in Table I. Summarized data for the eleven employment districts A to K are given in Table II. The per cent using mass transportation vehicles varies from 50.24 in the Hamtramck district to 74.96 in the downtown business district.

The data obtained from this survey were tabulated and charted to show the travel tendencies graphically. One of the accompanying maps shows the distribution by residence divisions of 80,000 persons leaving the Loop district between 5 and 6 p.m. and the mode of transportation used. The city was divided into 132 residence divisions for the purpose of the survey, and 23 divisions outside of the city limits were designated. In each division included on the map is a circle drawn to scale to represent the number of persons going to that division. Each circle, in turn, is divided into segments to show the relative numbers using the various modes of travel.



View on Jefferson Avenue showing angle-parked commercial vehicles blocking the street and part of the sidewalk as well

A summary of the reasons given by 9,954 people for the mode of transportation used by them is presented herewith: Most convenient—trolley cars; only means—trolley cars; quickest—automobiles; most economical—trolley cars; quickest and most convenient—automobiles; cheapest and most convenient—trolley cars; healthful and economical—walking; quickest and cheapest—trolley cars; dependable—trolley cars; and comfortable—automobiles.

Of those traveling by automobile to four employment districts surveyed, 33 per cent consumed more than 30 minutes of travel time; of those utilizing mass transportation vehicles, 57 per cent required time in excess of 30 minutes. A reduction in travel time to the aforesaid 77 per cent who use mass transportation vehicles would be a distinct contribution to the welfare of this number of employees. A reduction can be obtained either by workers living closer to their places of employment or by providing a faster mode of transportation.

To obtain figures on traffic direction and volume, pas-

Digitized by Google

senger and vehicle tallies were made at four approximately concentric cordons from 7 a.m. to 7 p.m. on a certain day. With these data and data secured at certain other critical locations, a vehicular traffic flow map was prepared. This map is shown in an accompanying illustration. Another exhibit was prepared showing the origin, destination and route flow of passenger automobiles, the data being secured by questioning passing motorists on the day of the cordon count.

Car Heating at Low Cost

Use of resistor losses for car heating in combination with regenerative braking has proved successful in an experimental car in Joliet, Ill.

Look for the feature article on this subject

In Next Week's Issue

which is devoted to MAINTENANCE AND CONSTRUCTION.

The results show that motor traffic tends to concentrate on certain well-known routes even though alternative routes are available. It was learned, however, that certain habitual motorists used routes that they had found from experience permitted them to avoid the congested main thoroughfares.

Improvement in street pavement, parking restrictions and automatic signals were advocated as means of diluting the traffic now concentrated on a few thoroughfares. One-way streets and reversible center lines were named as possible improvement measures for certain streets.

TRANSPORTATION CONTROLS COMMUNITY DEVELOPMENT

The trend of business and building development can be controlled to a great extent through the medium of transportation. If the business district is easily accessible there is no reason to anticipate a reduction of people traveling into and out of that district. The important requirement is that transportation, both quantitatively and qualitatively, keep pace with the development of the business district, or, better still, keep ahead of it. By this is meant, where mass transportation vehicles are concerned, there must be a sufficient number to avoid undue crowding of passengers, and the headways should be such as to make long waits unnecessary; the speeds should compare favorably with those procured through the use of individual transportation units; and last, there should be in evidence the elements which contribute to bodily comfort—that is, comfortable seats, adequate lighting, proper heating and ventilation.

Through the medium of questionnaires an attempt was made to ascertain the present trend of shopping habits. A summary of the replies received from 80,000 shoppers shows that the trend is toward downtown purchases of clothing and furniture and toward neighborhood purchases of other commodities. Sixty per cent of the replies indicated that neighborhood stores are patronized more now than was the case five years ago. Recent proposed office building construction in the downtown district permits the inference that the number of people requiring transportation to and from the district will increase, bringing about centralization rather than decentralization.

It is assumed that the merchants and property owners in the downtown business area are interested in the procurement of efficient transport to and from that area. It is further assumed that such interest is not confined to them but is distributed throughout the metropolitan area and even in the suburban territory. Because of a universal demand for more efficient transport, plans should be made to provide additional mass transportation facilities. Also, more attention should be given to speed, comfort and shorter routes.

A material increase in persons to be carried from the downtown district can be met by an increased use of mass transportation vehicles and a decreased use of private automobiles. The automobile, the bus and the trolley car have definite places in the transportation field and each must be recognized. The automobile occupying 60 to 90 sq.ft. of street space and carrying an average of 1.8 persons is far more wasteful of space than either a street car or a bus. Where there is a reasonable amount of street space available for all types of vehicles, the traveler should be allowed to exercise his option as to the type he prefers. For work, and for economic or other reasons, it is deemed necessary to curtail the use of the automobile and every consistent effort should be made to substitute a service comparable in speed and comfort.

In the conduct of the traffic study invitations were extended by letters, through broadcasting stations, personal contact and questionnaires to interested persons and organizations in Detroit to send in suggestions on traffic control and regulation. The keen interest of the general public was evidenced by the hundreds of replies received. Suggestions in regard to alley traffic were as follows: (1) Pave or cinderize, clean and illuminate the alleys; (2) enforce the rules regarding parking; (3) make the alleys wider. Those concerning safety zones were: (1) Enforce the safety zone parking law; (2) provide caution lights; (3) allow automobiles to pass the post type safety zone; (4) prohibit passing safety zones on the left. Many requests were received for more one-way streets. There was little agreement on turns and turning. The principal suggestion, however, was to prohibit left turns off the main arteries. Many asked that all streets with car lines be made stop streets.

Many ideas were evoked with regard to the parking situation. The more popular suggestions were: (1) Prohibit all-night parking; (2) allow no double parking; (3) prohibit parking on stop streets; (4) permit no parking on car line streets; (5) abolish parking within the Loop district; (6) have more free parking space in the Loop district.

No Change in Chicago Parking Ordinance

IN AN abstract of an article on traffic and traffic control in various large cities by Dean J. Locke, published on page 548 of the March 31, 1928, issue of ELECTRIC RAILWAY JOURNAL, a statement was made "Within the past few days opponents of the plan have succeeded in securing an amendment to the ordinance permitting ten-minute parking of passenger automobiles within the Loop district of Chicago." It now appears that no modification of the ordinance effective Jan. 10, 1928, prohibiting parking in the Chicago Loop section during business hours has been made. It also appears that the few who earlier were opposed to the ordinance have now been converted and that there is no agitation to change it.

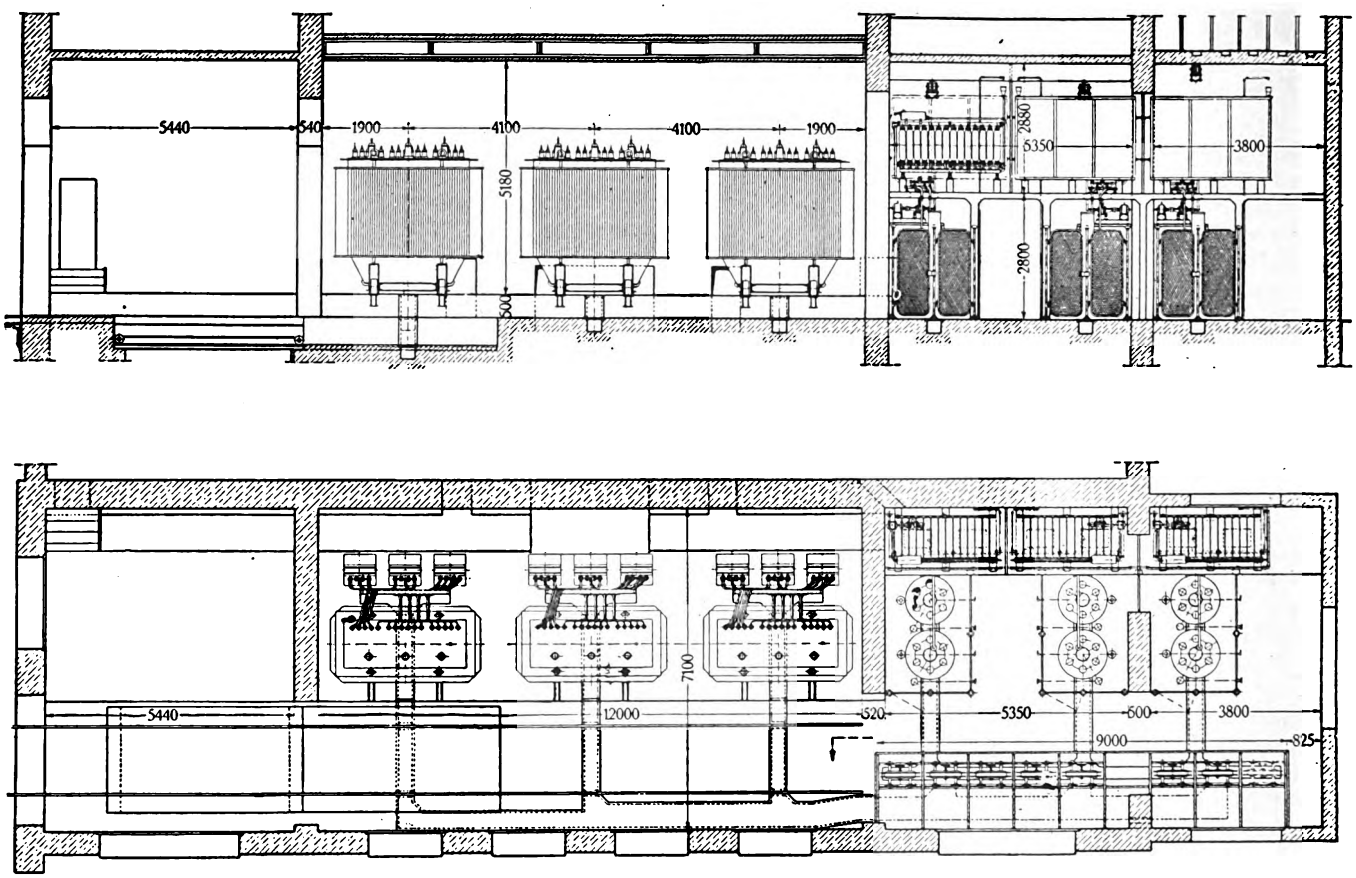
Mercury-Arc Rectifier Substations Used on European Railways

Adoption of 1,500-volt direct-current system by French government has necessitated extensive changes in power supply of Midi Railway



Plan and elevation of Montrejeau Station of the Midi Railway, furnishing 1,500-volt direct current through six 600-kw. mercury-arc rectifiers

CONSIDERABLE interest is being shown in Europe in the adoption of mercury rectifiers for substation operation on electrified main lines, and the outstanding success achieved by the first rectifier stations to be used on normal gage lines at a tension of 1,500 volts has stimulated inquiries for this equipment for similar pressures on other main lines. These first mercury-arc rectifiers for railway substations were installed at Pau, Lourdes, Tarbes and Montrejeau on the Midi Railway of France, by the British Brown-Boveri Company, Ltd.

The French government decided some time ago to standardize both the primary and trolley wire currents of all the electric railways, so that various power plants could work in parallel and the locomotives could be used on any of the electrified lines. Finally a line pressure of 1,500 volts direct current was decided on, and the Midi Railway was faced with the difficult task of transforming the already existing plants and of drawing up a new program of electrification.

The equipments of the four substations given above are identical, and consist of three three-phase, oil-immersed transformers with natural cooling and short-circuit proof-winding supports, each built for 1,750 kva., pressure ratio 60,000/1,425 volts (twelve phase); six absorption choke coils, each 188 kva., 150 cycles, with natural cooling; three absorption choke coils, each 188 kva., 300 cycles, with natural cooling; six mercury-arc rectifiers, type GRZ 156, each built to deliver 600 kw.; three vacuum pump sets; three circulation cooling equipments; 60,000-volt a.c. switchgear; 1,500-volt d.c. switchgear and auxiliary equipment.

Another substation on the same system, that at Lannemezan, is similarly equipped, but contains four transformers, each of 1,750 kva.; eight absorption choke coils for 150 cycles; four absorption choke coils for 300 cycles; and eight mercury-arc rectifiers, each 600 kw.

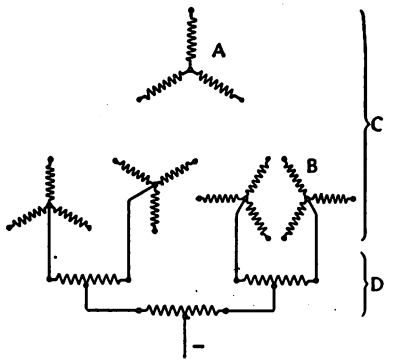
Each transformer with three absorption choke coils and two mercury-arc rectifiers with accessories forms a set with rated output of 1,200 kw. The output of each of the four substations is therefore 3,600 kw., and that of the Lannemezan station is 4,800 kw. The aggregate

Digitized by Google

output of all the substations amounts to the total of 19,200 kw. In each station one set serves as a stand-by.

The 60,000-volt high-tension switchgear presents no new features. The twelve anodes of the rectifiers forming a set are directly connected to the twelve phases of the transformer over anode disconnecting switches. The secondary winding is subdivided into four three-phase systems displaced one from the other by 90 electrical degrees, and the four star points of these systems form the negative pole of one set, as shown in one of the diagrams. The cathodes of both rectifiers, which form the positive pole of the d.c. system, are connected to one another over two disconnecting switches. They have a common d.c. automatic circuit breaker by means of which the set can be linked up to the positive busbar.

The interlocking of the primary and of the d.c. automatic switches is shown in the special wiring diagram. The switching in push button B_1 serves to operate the



The four secondaries of the main three-phase transformer provide a twelve-phase circuit for the rectifiers

A. Primary winding.

C. Transformer.
D. Absorption choke coil.

oil switch, which is provided with switching-in and tripping solenoids. This push button causes relay C_1 to act, which puts the switching in coil E under pressure. The oil switch and relay C_1 can, however, only be operated when the following conditions are fulfilled: (1) The oil switch is open; (2) the door of the protecting screen round the rectifier is closed, and (3) the hand switch F is closed.

The push button B_1 is used to trip the oil switch by connecting the tripping coil D_1 to the auxiliary busbars. The position of the switch is indicated by the two lamps H. The d.c. automatic circuit breaker is equipped with an over-current coil and a tripping coil and has to be closed by hand. The tripping coil is so connected to the oil switch on the primary side that it is only possible to close the automatic circuit breaker after the oil switch has been closed. If the primary oil switch trips, the automatic circuit breaker is immediately tripped as well. The object of this interdependence of the two switches is to prevent rectifiers A_1 and A_2, for example, being put under pressure from the d.c. side. As, contrary to other machines and apparatus, the casing of the rectifiers is under pressure when in service, this precaution is essential for the protection of the operators.

Further protection is afforded by the screen round the rectifiers, the door of which is provided with a special lock, which can only be opened or closed when its interlocking coil is energized. In order to make it only possible to open the door when the oil switch is open, the circuit of this interlocking coil is led over an auxiliary contact on the oil switch shaft, which contact is only closed when the switch is open. Further, in order to cut off the current through the coil during a long interruption of service, a two-pole hand switch, F, is provided, over the second pole of which the current of the switching-in relay C_1 is led, so that it is impossible to put the set into service again under these conditions.

To cut out a set, the d.c. automatic circuit breaker is first operated by hand and then the push-button switch B_2. If, on the other hand, a set is to be cut out suddenly for some reason, it is simply necessary to operate push-button switch B_3, which is specially marked and which

causes both tripping coils D_1 and D_2 to act simultaneously, thus isolating the set from both sides.

In order to protect the rectifier from excessive temperatures resulting from heavy loading, high surrounding temperature or failure of the cooling water supply, special alarm devices are provided which are influenced by the contact thermometers G_1 and G_2 mounted on the anode plates. As soon as the temperature exceeds 50 deg. C. a disk relay acts and operates an alarm bell. This disk shows which of the rectifiers has caused the alarm device to act. A second contact, which closes when 60 deg. is reached, acts on relay C_2, the closing contact of which is in parallel with push-button switch B_3, and puts the tripping coil D_2 of the d.c. automatic circuit breaker under pressure.

Digitized by Google

The auxiliary circuit, supplied at 200 volts, 50 cycles, feeds the motor of the circulating pump and that of the air pump, as well as the heating plate belonging to the high vacuum pump. To ignite the rectifier two small motor generator sets, each of 0.6-kw. output, are installed in each station.

The rectifiers are composed of two high-grade steel cylinders, one above the other and of different diameters. The lower and wider of the two forms the arc chamber. It is welded round its lower circumference to the funnel-shaped steel baseplate, in which is located the cathode. The upper and narrower cylinder forms the cooling dome or condensing cylinder in which the mercury vapor condenses in the form of drops and flows back to the cathode. The top and bottom of this cylinder are welded to massive steel plates. The upper plate carries the bosses for the connections of the vacuum piping and ignition gear. The latter is composed of a solenoid, to the iron core of which the ignition rod is attached in the vertical axis of the cylinder. The lower plate forms a ring and constitutes a cover for the arc chamber. It carries the six main anodes and the two excitation anodes, placed round the condensing cylinder. The arc chamber is not welded to the anode plate and the joint between them constitutes the primary mercury seal of the apparatus. If necessary, therefore, the upper part of the apparatus, together with the anodes, can be raised for inspection of the rectifier.

All the electrodes are carried into the arc chamber through porcelain bushings of high heat resisting qualities and mechanical strength. The electrodes are carefully insulated from the chamber. The mercury seal serves as a packing between the electrodes and the bushings, as well as between the latter and the arc chamber. It is also used between the anode plate and the arc chamber.

The cylindrical anodes are of polished iron, carrying at their upper ends terminals for the leads supplying the rectifier. To facilitate cooling, ribbed cast-iron sleeves are drawn over the upper part of the anodes. The cathode is built as a receptacle and holds about 48 kg. (104 lb.) of chemically pure mercury. It is situated in the baseplate and the joint is sealed with mercury. Both the arc chamber and the condensing cylinder are surrounded by a sheet-metal casing which serves as a water-cooling jacket. Each pair of rectifiers is equipped with a two-stage vacuum pump to exhaust the air and obtain the high vacuum essential. Each rectifier set is equipped with a separate cooling system.

An elevation and plan of the Montrejeau station, which is typical of the others, are shown in one of the illustrations. About half the total space in the substation was available for the equipment proper, the other half being required for the 60,000-volt apparatus. The rectifier transformers with the absorption coils were lodged in the rooms which formerly held the single-phase transformers when rotary converters were used. To carry off the heat generated by the losses of the naturally cooled transformers and choke coils, apertures which existed already between the cellar and transformer room were available, and these provide sufficient cold air draft. Parallel to their length there is a gangway with a standard gage railway track on which a special truck can be run, and placed exactly opposite the transformers. To aid in lifting the active part out of the tank, when necessary, there is a special pit with hoisting gear.

The rectifiers with their accessories and the switchboard are installed close to the place originally occupied by the auxiliary machines and apparatus. The rectifier sets are situated by themselves and are under easy supervision from the switchboard opposite. The ignition and excitation apparatus is located in the switchboard.

In order to ascertain the efficiencies of the plants installed, the power received was compared with the power delivered, with the following results:

Load	1/4	2/4	4/4	5/4
Input, kilowatts	350	692	1,325	1,670
Primary pressure, volts	7,775	7,725	7,650	7,600
Primary current, amperes	30.0	54.5	102	131
Direct current, amperes	195	403	790	1,010
Direct-current pressure, volts	1,671	1,642	1,598	1,569
Output, kilowatts	326	655	1,262	1,585
Power factor	0.805	0.905	0.962	0.965
Efficiency attained, per cent	93.2	94.7	95.3	95.0
Efficiency guaranteed, per cent	92.0	94.5	95.1	95.0

The rectifiers have proved very satisfactory in service, and during the first six months of installation each station had to withstand about 230 short circuits. The station operators are said to prefer working on rectifiers to rotary converters on account of the noiseless operation of the rectifiers.

Modern Carhouse at Detroit Completed

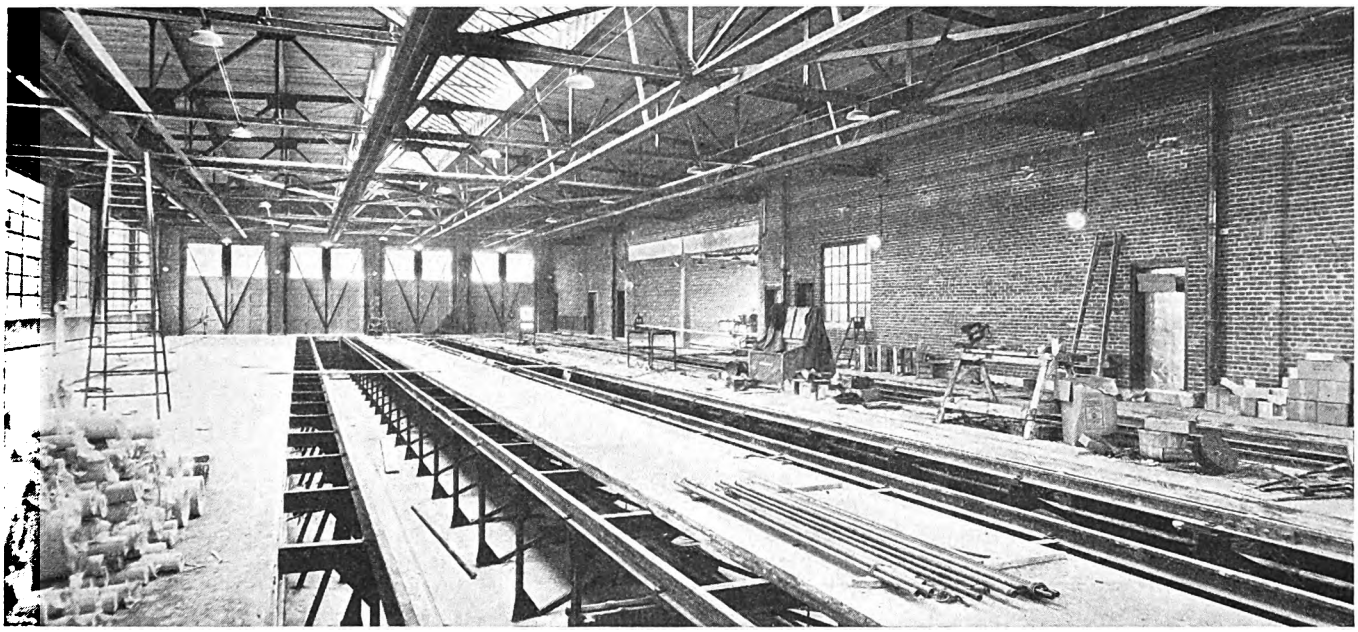
Constructed at a cost of $75,000, it will effect a huge annual saving. The terminal has outside storage facilities for 250 cars

In addition to the repair shop the carhouse has ample office space, sleeping quarters and assembly rooms for the trainmen

RECOGNIZING a long-felt need for suitable terminal facilities in the northwestern section of Detroit and realizing that a saving of approximately $500,000 annually could be effected, the Department of Street Railways determined to provide the needed facilities. Accordingly during the early part of 1927 the management purchased a 20-acre tract for the development of such a terminal. The land is located on Coolidge Highway and cost $280,000. Construction began soon afterward and the building, costing $75,000, was formally opened on Feb. 26 of this year. It was built according to plans and specifications drawn by the department engineers and is modern and practical. It was designed and constructed to serve efficiently as both a storage and repair terminal for the street cars of the northwestern district. Segregation of the Grand River Avenue and the Jefferson Avenue lines will be made possible by the new terminal.

The carhouse has four tracks extending the entire length of the building. Three of these have work pits accommodating four cars each so that twelve cars may

Digitized by Google



Four tracks extend the entire length of the carhouse, three of which have work pits accommodating a total of twelve cars

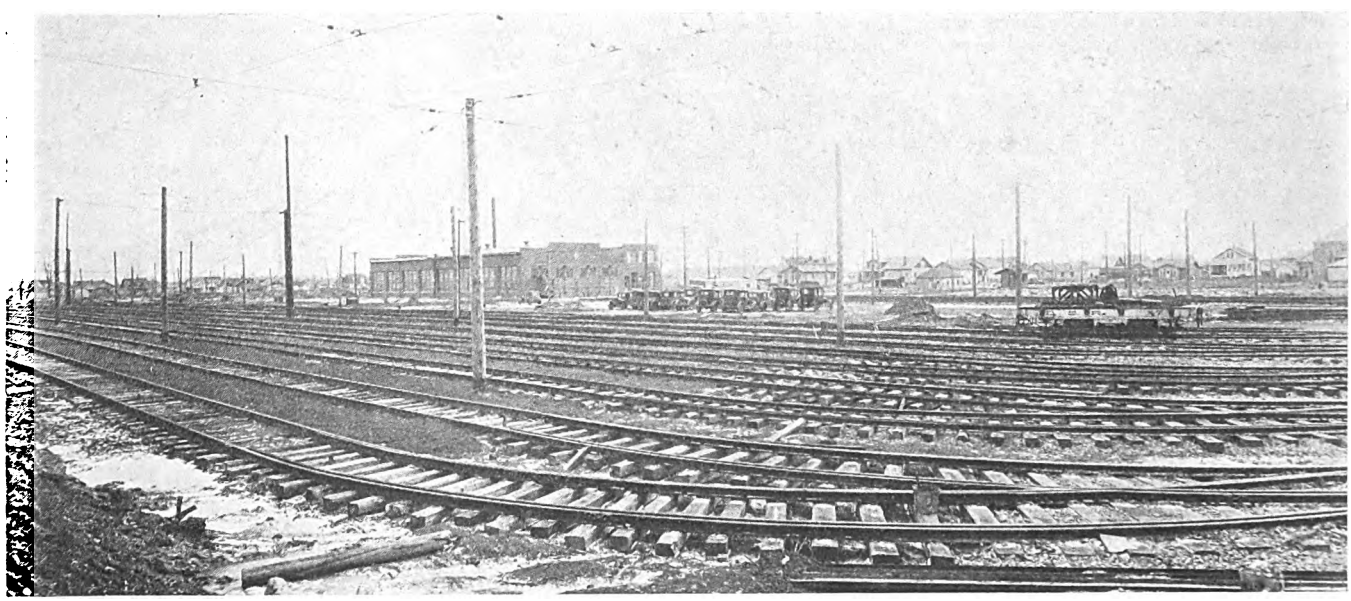
undergo repairs at the same time. Along the fourth track is a shower-spraying device through which the cars pass for their semi-weekly bath. Another portion of the building is devoted to offices of the division superintendent and terminal clerks, while the trainmen's lobby occupies the remaining portion of the ground floor. On the second floor are the trainmen's assembly room and dormitories which provide sleeping quarters for the men who have certain late and early runs.

The storage tracks, adjacent to the building, will accommodate 250 cars and provides for rotary movement, making it unnecessary to back or turn any cars in entering or leaving the property. The Grand River line will be the first to utilize this new terminal station, and this arrangement alone will result in a saving of approximately $225,000 annually through the elimination of waste mileage now consumed in storing the Grand River cars at the East Jefferson Avenue carhouse.

The terminal has a spur track leading to one of the principal railroads, so that raw materials like sand, gravel, crushed stone, steel rails, ties, etc., can be transferred conveniently. They will be stored in the yard and distributed to locations on the west side of the city as needed.

Work has been started on a modern garage on the same plot which will store 80 motor coaches. Most of these are now being kept in rented garages in the northwestern section. The new garage will be ready for occupancy in 90 days, and it is anticipated that by midsummer 1,000 men will be working from the combined railway and bus terminal.

Realty values showed a decided upward trend with the development of the tract. The construction plans of the Department of Street Railways were laid out to allow for a frontage of 663 ft. along Coolidge Highway available for resale. It is believed that this may be sold for a sum nearly equivalent to that paid for the entire tract.



The new terminal for the northwestern section of Detroit has outside storage facilities for 250 cars

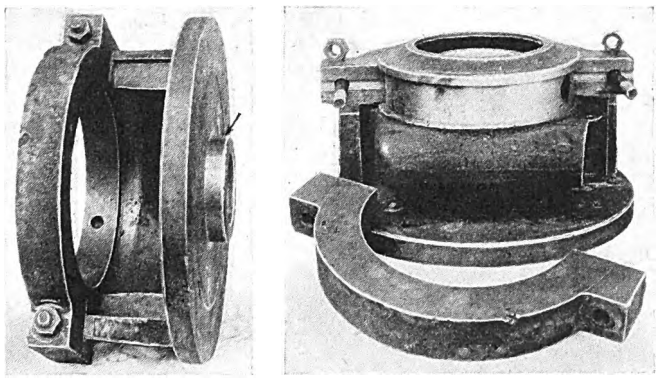
Maintenance Methods and Devices

Jig Insures Accurate Boring of Armature Bearings in Housings

By J. A. Duffy
Superintendent of Equipment Monongahela West Penn Public Service Company, Fairmont, West Virginia

BORING of armature bearings after they have been pressed in motor housings is the practice of the Monongahela West Penn Public Service Company. To make certain that the bore of the bearing is centered accurately from the outside finished portion of the housing, a special jig is used. This is shown in the accompanying illustrations, arranged for a Westinghouse type 306 motor housing. The jig is for split frame motors but can be used for any motor by having suitable filler rings. After the bearing has been pressed in, the housing is clamped in the jig and is then set on a face plate or put in a lathe for boring. One end is arranged as a guide for the boring bar. This self-centers the job ready to be bored out.

It is also the practice of the railway to build up the outside portions of Westinghouse 306 motor housings that have been worn and so are somewhat loose in the motor shell. The housing is placed in a welding and grinding machine so that the housing is rotated as it is welded. An extension welding arm is arranged so as to get close to the work. When the machine is started the welding head automatically does the welding of one bead and the operator shifts the arm when the machine automatically welds up another bead without further attention.



At left—Type of jig used for boring out motor housing. Arrow indicates face plate which self-centers the job ready for boring. At right—Jig with housing in place ready to be clamped

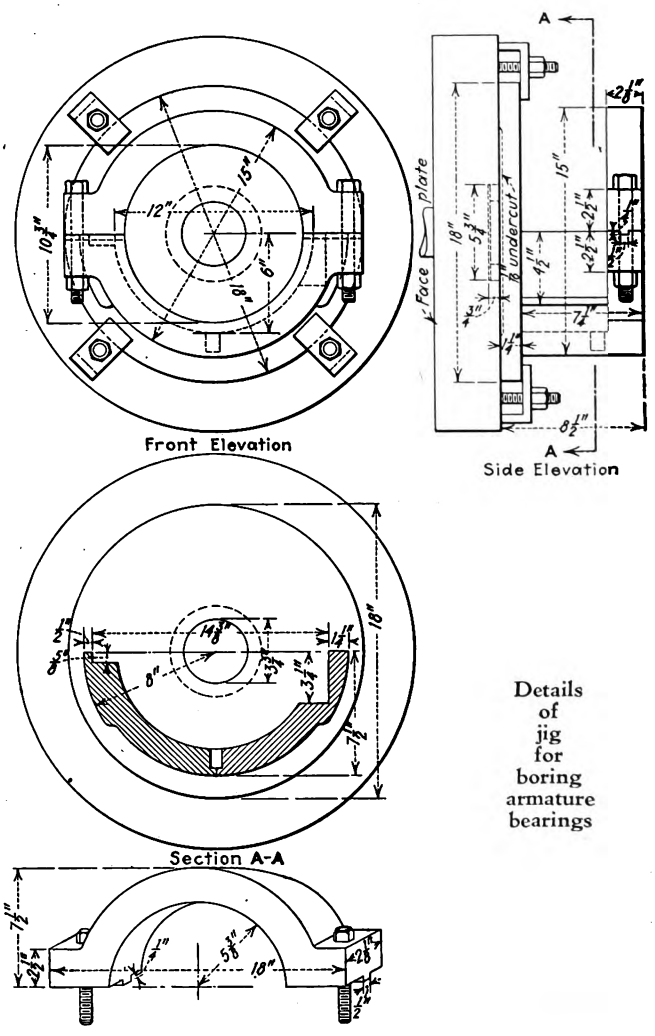
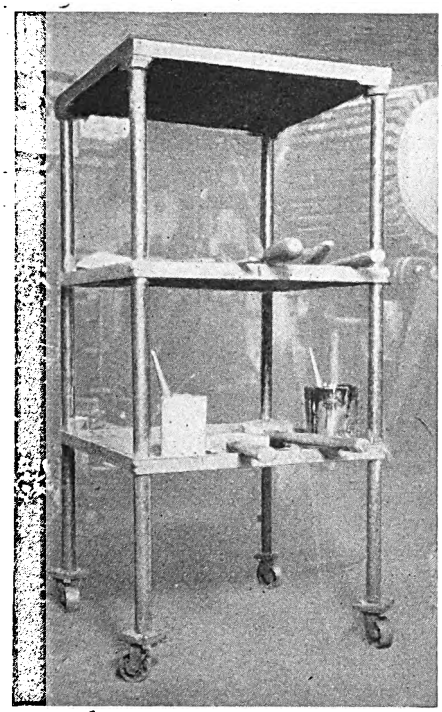
Winders Portable Tool and Material Rack

SINCE considerable time is lost when material and tools are not within easy reach of the armature winder and as a result production suffers, General Foreman Johnson of the Binghamton Railway, Binghamton, N. Y., designed and constructed a portable rack to avoid the delay caused by going for tools and material frequently. This rack is all metal and is made of angles, sheet steel and pipe. Four ¾-in. conduits form the corner posts. The top of each is



Details of jig for boring armature bearings

Digitized by Google



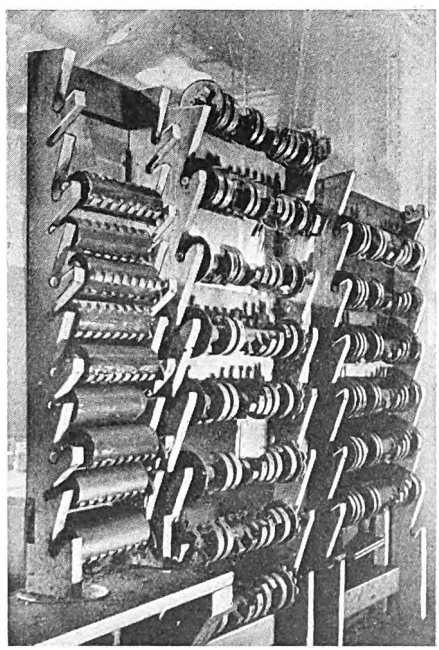
Convenient material rack for the electrical repair department

fitted with a ¾-in. 90-deg. flange and the bottom with a 2-in. swivel roller. A tray 18 in. square and ¾ in. deep is made of 1-in. angles and ⅛-in. plate. All joints are acetylene welded. This tray is bolted to the 90-deg. flanges by ⅜-in. machine bolts. A similar tray is installed 13 in. below this and still another one 12 in. further down. It should be noted that the angle framework for the middle and lower trays is shaped around the outside of the ¾-in. posts and fastened to the post by a ⅜-in. through machine bolt. The sheet steel bottom of these trays is welded to the angle in the same manner as was done in constructing the top tray. This rack is very well constructed and no motion exists between any of the parts. Since it contains three 18x18-in. trays ample space is provided for the storage of practically all the material and tools necessary for a complete winding job. The rollers permit of easy movement to any position convenient for the performance of the work.

Controller Main and Reverse Cylinder Racks

IF OVERHAULED controller cylinders are not taken care of properly prior to installation in the controller, there is a possibility of damage. Where this occurs it is not detected very often until after installation or when a road failure has developed and interrupted service. Where this possibility exists it is important that some precautionary measures be taken. On the New York & Harlem Railroad, New York City, care is exercised to protect repaired controller cylinders. A cylinder storage rack adjacent to the overhauling bench is used for the storage of the cylinders until they are required for service. The rack referred to is shown in the accompanying illustration. The main cylinders are stored on a rack made from 2x5-in. oak boards installed vertically at the proper centers to accommodate the cylinders and tied together top and bottom by a 1x3½-in. oak board. The front of these uprights is provided with 1x8½-in. notches cut at an angle of 25 deg. on 6-in. centers. These notches provide a safe and substantial support for the cylinder shafts. Each rack will hold seven cylinders. The same construction is followed for the reverser cylinders except that the boards are 4 in. wide, the slots 1x2½ in. and the centers 4 in. It will accommodate eleven cylinders.

These racks contain completely overhauled cylinders and every man in the shop knows that any cylinder stored here is available for service.



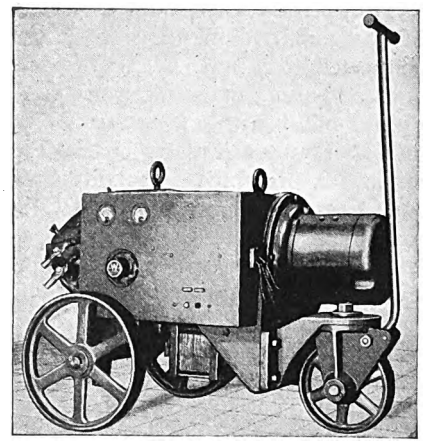
Storing cylinders in this neat and systematic manner has improved the shop appearance and lessened the possibility of mechanical injury prior to installation

They serve a further purpose in that the overhauler can see the exact number of O.K. cylinders on hand at a glance.

New Equipment Available

Single Operator Arc-Welder

PUSH-BUTTON control features a Westinghouse, 200-amp. single-operator welding set, designed to meet requirements in both shop and field. The set is started by connecting directly across the line by means of a line starter and line-start motor.



One-man 200-amp. arc welder

Starting and stopping are accomplished by a push button. A single rheostat varies the arc current over the entire welding range. Accurate adjustment from 60 amp. to 300 amp. is afforded by steps of 5 amp.

The motor-generator and control equipment are assembled in a totally inclosed frame. The exciter, which is overhung from the motor end, is fastened securely to the unit frame, guarding the operator against injury and protecting the set from dirt and falling objects.

Steady welding current, insuring thorough penetration and fusion of the weld, is obtained from a constant-current generator. A separate exciter insures a high speed of welding, and a generator voltage that responds to any changes in arc conditions. This tends to maintain a constant rate of fusion of the electrode.

The unit is rated at 200 amp., 1 hour, 50 deg. C. temperature rise on a resistance load at 25 volts. This conforms to the standard rating of the

Digitized by Google

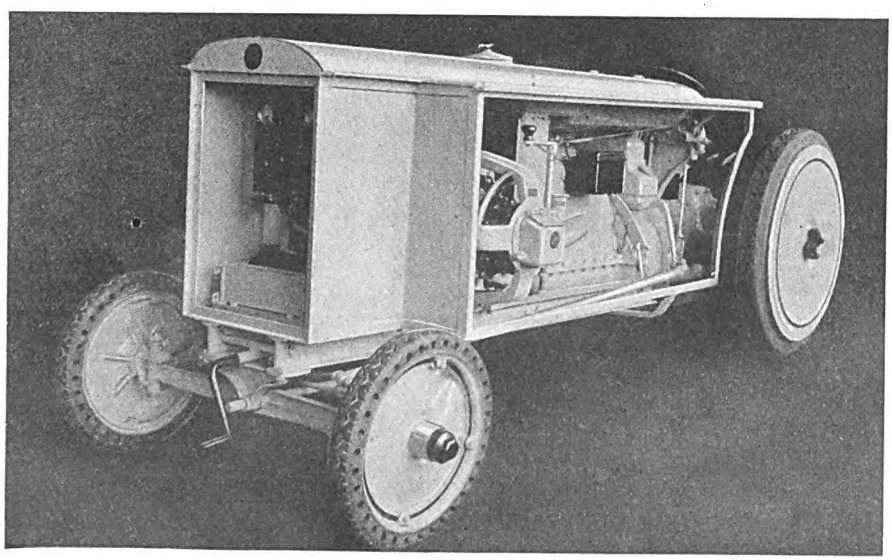
National Electrical Manufacturers' Association. The motor is wound for 220 or 440 volts and is assembled with the necessary connections made for driving from a three-phase 60-cycle circuit. For use on a 440-volt, three-phase, 60-cycle circuit, it is only necessary to replace the operating coil on the magnetic starter and to reconnect the motor leads.

Welder Tractor Combination

COMBINATION of an electric arc welder with a Fordson tractor in an improved form is now offered by the General Electric Company, Schenectady, N. Y. The chief improvements of the outfit consist of the substitution of a new type welding equipment and the addition of head and tail lamps and a protective cover.

The principal equipment consists of a standard Fordson tractor, belt-connected to a type WD-300-A, 25-volt, 300-amp., one-hour rated 1,750-r.p.m., ball-bearing generator. This unit is mounted directly on the tractor and is protected by metal canopy and canvas side curtains. Other equipment includes governor, power take-off, muffler, waterproofed pulleys on engine and generator, belt and belt tightener, industrial disc-type rubber-tired wheels front and rear, extension frame, off-set crank, control panel and reactor, head and tail lamps, and battery and charging control. Light industrial spoke-type wheels front and rear or standard Fordson farm wheels front and rear, and any other desired accessories are optional.

The over-all length of the complete unit is 12 ft.; the height is 4 ft. 8 in.; the width is 5 ft. 2 in., and the net weight is approximately 4,900 lb. The utility of the tractor as a hauling device has not been impaired. For field use, the unit will haul equipment and tools to the job and then supply welding current. For welding along railroad rights-of-way, extra long welding leads are not necessary because the equipment is so easily moved at a moment's notice. The battery which supplies current for the lights and ignition is charged while the welding generator is operating. It is provided with ammeter and automatic cutout.

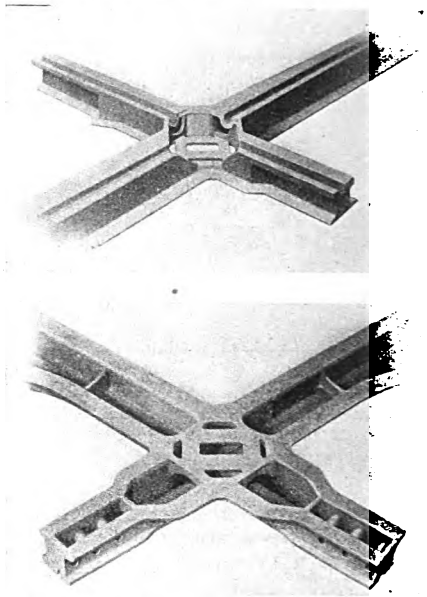


Fordson tractor used for welder mounting

Manganese Crossing Designed Scientifically

DESIGNED for use in electric railways where they cross steam runs or for heavy steam railroad traffic, a scientifically constructed manganese crossing is announced by William Wharton, Jr., & Company, Inc., Easton, Pa. This has been brougnt out as a result of a scientific investigation and study of manganese crossing designs made during the last four years by engineers of the company. The investigation was made from two major viewpoints: first, to obtain minimum unit stresses in the structure when in service, and, second, to determine just what sections could be cast and heat-treated with the assurance that the metal would be sound throughout.

The new type of crossing incorporates a number of new features. In the first place, there is uniformity in the metal sections under the tread and groove surfaces, an advantageous feature which became evident early in the investigation. There are no supporting members joining the under side of the tread and groove metal, thereby eliminating the danger of shrinkage, cavities and heat treatment defects in the metal surrounding the intersection of the gage lines, the point where most crossings fail. A bottom grid or floor beneath the intersection of the flangeways forms a



Features of the manganese crossing

hollow, box-like structure at this point, which is said to give the crossing extreme resiliency and strength, and at the same time avoids excess weight.

Cross-members in the arm sections of the crossing form a strong tie to prevent the side walls from spreading, but these members do not come in contact with the under side of the tread or groove surfaces, thereby avoiding the possibility of interior defects which so frequently cause cupping in the tread surface. The side walls of the crossing are tapered, being thicker at the top where they join the under side of the tread and guard sections.

This feature was incorporated to decrease the unit stresses in the groove and to permit a gradual transition of metal sections, from the thick tread to the thin outer flange of the base.

In arriving at the new features of this crossing, the Beggs method of analyses of stresses was followed, using a Beggs deformeter, and studying the resulting stress reactions under the microscope. The findings in these studies were checked by Prof. Mortimer F. Sayer of Union College, employing a photo-elastic model method of polarized light analysis, and the results produced were found to be remarkably close.

American Association News

Rules for Engineering Committees

MEMBERS of the various committees of the Engineering Association are receiving from General Secretary J. W. Welsh copies of a pamphlet giving the regulations governing committees, the adoption of standards, and the style of specifications. This is a revision of a former publication on the same subjects. It includes sections on the purpose and scope of committee work, committee organization, instructions to committees, committee reports and standardization rules, American Engineering Standards Committee, illustrations, style of specifications, Engineering Manual and changes in rules.

The instructions to committees give clearly the procedure in conducting committee work and joint work with other organizations, a list of abbreviations and material to be included. Specific instructions are given for the preparation of reports, formulation of recommendations, and methods of preparing illustrations and specifications.

Purchases and Stores Accounting

MEMBERS of two association committees held a joint meeting in the offices of the Cincinnati Street Railway, Cincinnati, Ohio, on March 19. These were the purchases and stores committee of the Engineering Association and the stores accounting committee of the Accountants' Association. Subjects discussed were the review of the Engineering Manual, led by J. Fleming; unit piling and standard packages, led by W. E. Scott; investment in materials and supplies, led by C. A. Harris, and price records and pricing materials and supplies, led by A. A. Ordway.

Those present were J. Y. Bayliss, chairman; A. A. Ordway, vice-chairman; W. J. Walker, secretary; B. W. Forkner, A. L. Fischer, A. E. Hatton, C. A. Harris, H. B. Kirkland, F. E. Wilkin, W. S. Stackpole, A. S. Duncan, W. E. Scott, E. A. Murphy and John Fleming.

T. W. Casey to Represent Association at Rome

THOMAS W. CASEY, president National Pneumatic Company, has been appointed by the American Electric Railway Association its official representative at the Rome convention of the Union Internationale de Tramways, de Chemins de fer d'Intérêt Local et de Transports Publics Automobiles. Mr. Casey sailed on the *Roma* for Naples on April 13.

Mr. Casey is a member of the executive committee of the association.

A.I.E.E. Regional Meeting at New Haven

INSPECTION trips and technical papers of unusual interest make up the program of the fifth annual meeting of the Northeastern District, American Institute of Electrical Engineers, to be held at the Hotel Taft, New Haven, Conn., May 9-12.

A major part of the four technical sessions will be devoted to four unique engineering developments in the vicinity. These include a hydro-electric project, electric railway power from rectifiers, variable-ratio frequency changers and mercury turbines. A paper will be presented on the exclusive use of mercury-arc rectifiers for supply power to a trolley system and another on inductive co-ordination between the railway feeder system and local communication circuits where these rectifiers are in use. The economics of power supply for railroad electrification will be covered by another paper.

Two papers will deal with 25-cycle power obtained through two variable-ratio frequency-changer sets, one deriving power from another 25-cycle source, and the second, power from a utility system at 60 cycles.

Members of the purchases and stores committee and the stores accounting committee in session at Cincinnati

Left to right: B. W. Forkner, A. L. Fischer, A. E. Hatton, C. A. Harris, H. B. Kirkland, W. J. Walker, J. Y. Bayliss, A. A. Ordway, F. E. Wilkin, W. S. Stackpole, A. S. Duncan, W. E. Scott, E. A. Murphy and John Fleming.

COMING MEETINGS OF *Electric Railway and Allied Associations*

April 25-27—American Society of Civil Engineers, spring meeting, Washington Hotel, Washington, D. C.

April 25-27—American Welding Society, annual meeting, 33 West 39th Street, New York, N. Y.

April 26-28—Missouri Association of Public Utilities, Jefferson City, Mo.

May 2-5—Southwestern Public Service Association, Dallas, Texas.

May 4—Metropolitan Section, A.E.R.A., 33 W. 39th Street, New York, N. Y.

May 6-12—Union Internationale de Tramways, de Chemins de fer d'Interet Local et de Transports Publics Automobiles, Rome, Italy.

May 8-11—United States Chamber of Commerce, Washington, D. C.

May 9—A.E.R.A. Executive Committee, Washington, D. C., 3 p.m.

May 9-10—Central Electric Railway Master Mechanics' Association, Lawrence Hotel, Erie, Pa.

May 24—New England Street Railway Club, annual meeting, Boston, Mass.

Ultra Modern Chicago

Surface Lines engineer urges three-level streets and rigid traffic code to improve safety

Public safety in the city of Chicago is being hindered by the present deplorable physical condition of its streets, E. J. McIlraith, traffic engineer for the Chicago Surface Lines, told delegates to the Midwest Safety Conference recently held in that city.

Mr. McIlraith blamed poor paving outside street car tracks and rough pavement on many streets in residential sections for the hazards and delays to traffic. In order to provide funds for necessary repairs he recommended that a new gasoline tax law be enacted to take the place of the one recently declared unconstitutional and revoked by the Illinois Supreme Court.

Safe travel in Chicago's densely congested streets, he said, would be greatly enhanced by provision of a three-deck street system in the downtown business district. Such a system should include a subway, an intermediate thoroughfare for pedestrians and at the present street level a street for motor traffic. He declared:

Chicago is in a deplorable condition for lack of transportation facilities, continuous streets, smooth paving, grade separations and convenient access to radial highways.

Sufficient through streets are lacking because everywhere they are interrupted by railway yards, embankments, rivers, canals, parks and undivided areas.

Simple planning and reasonable investment, however, will make a marvelous improvement in traffic convenience. Improvements for the future must also include grade separations and perhaps two-level highways where justified.

The outstanding fault responsible for most traffic accidents, it was said, was the laxity of law enforcement. Mr. McIlraith advocated the adoption of a traffic code that will inflict severe punishment on the careless and law-ignoring drivers who annually kill hundreds of Chicagoans and injure thousands.

He added that since the no-parking ordinance was put in effect on downtown streets last January, a survey has shown that accidents have decreased more than 30 per cent.

One-Fare Extensions Considered by Missouri Body

The Missouri Public Service Commission has under advisement several applications for an extension of the St. Louis, Mo., one fare zone to various sections of St. Louis County. Commissioner John H. Porter on March 29 concluded a hearing on the proposals at the St. Louis City Hall. The city of St. Louis and the St. Louis Public Service Company opposed the proposed fare concessions while numerous real estate dealers and officials of some of the incorporated communities which are located in St. Louis County favored the applications.

The company and the city of St. Louis contended that the county lines are now operating at a loss and any deduction from the revenues of the Creve Couer Lake and Clayton lines as proposed would tend to react unfavorably on the rates in St. Louis. William B. Bennett, valuation engineer for the company, testified to the average revenue per car-mile in St. Louis and declared that if transfers to the Clayton line were permitted and each car carried the maximum number of passengers the line could not pay.

At present transfers are furnished from the Olive-University to the Kirkwood-Ferguson cars going to Clayton and vice versa. The railway company favors doing away with this concession now that other parts of the county are seeking a similar privilege.

Fare Changes in Los Angeles

Local charges on Pacific Electric are reduced to 5 cents. Suburban reductions range from 20 to 25 per cent. Experimental rates to go into effect between certain cities

SWEEPING changes in the Pacific Electric Railway's fare schedule in Los Angeles and adjoining counties were announced by the California Railroad Commission on April 7. Approximately two-thirds of the one-way and round-trip fares charged by the company, affecting about that proportion of the bulk of the company's business, are to be reduced. The order is to be put into effect within twenty days and to remain in force until further ruling of the commission.

Local fares in Long Beach, Glendale, Riverside, San Bernardino, San Pedro, Santa Monica and other centers are to be reduced by the commission's order from 6 cents to 5 cents. In Los Angeles the present fare of 6 cents which the Pacific Electric has been charging is to be reduced to 5 cents, but the fare zones are to be made smaller. Reductions on suburban one-way and round-trip fare schedules will range from 20 to 25 per cent. At the same time the commutation rates are to be increased from 10 to 20 per cent on practically all lines. An experimental monthly pass, good for daily travel between Los Angeles and Pasadena and entitling the holder to local transportation on both ends of the line, is to be issued for $9. A Sunday pass, good for unlimited travel on all lines of the road west of Upland and exclusive of the Mount Lowe division, will sell for $1. This pass will be limited in use to the Sunday for which it is sold. The commission's order states that the commutation rate structure is simplified by the elimination of some of the forms of tickets to be sold, namely, the monthly, 30-ride and 10-ride tickets.

The order reads in part as follows:

The general basis of the experimental fare structure authorized and directed by the decision is the so-called Glendale experiment which has been in progress for nearly a year, and from which satisfactory results were obtained. In general, the Glendale experiment provided for an increase in commutation fares and a substantial decrease in one-way and round-trip fares.

Under this Glendale experiment patronage of the line gradually increased until the financial results to the company were more satisfactory although, on the whole, the fares were lower than formerly.

The schedule, the commission announced, is an experimental one to test its theory—that keeping fares at or close to 5 cents will develop more business, and thus eventually result in increased revenues.

Experimental fares, between Los Angeles and Venice and Santa Monica, of 30 cents one-way and 50 cents round-trip have been ordered. In general round-trip fares will be double the one-way fare, less 5 cents where the one-way fare is 15 cents, and not more than 25 cents, and less 10 cents where the one-way fare is in excess of 25 cents.

Survey Bill Killed in St. Louis

The St. Louis Board of Aldermen on March 30 killed by a vote of nineteen to nine Mayor Miller's bill for the establishment of a transportation survey commission which presumably would have paved the way for a rapid transit system in the city. The bill was brought before the Aldermen for the approval of amendments offered by Mayor Miller, but the opponents took advantage of this situation to force a vote on a motion to file it. The fight on the measure centered on the Mayor's proposal that the city be refunded $100,000 by the St. Louis Public Service Company for a similar appropriation to be made by the city to defray the costs of the survey. Opposition to this plan was led by Walter J. G. Neun, president of the Board, who relinquished his chair to Vice-President Neumann and opened the debate on the floor. He said that he was in favor of the bill, but was opposed to the provision that the railway should defray the expenses of the survey.

Fifteen-Cent Bus Fares Sought in Kansas City

The Kansas City Public Service Company has submitted to the City Council of Kansas City, Mo., a request for a 15-cent bus fare for the downtown buses. Up to this time that fare has been 10 cents. New bus routings were embraced in the suggestions filed with the city clerk, together with a detail report of losses under the bus operations of the last two years.

In this document Powell C. Groner, president of the company, pleads that the street car rider should not be asked to make up a deficit occasioned by those who prefer a more luxurious service downtown, with a seat guaranteed.

Twelve suggested bus routes are offered in place of the existing eleven. The Country Club Express line, formerly a 25-cent line, would be 15 cents, with ordinary instead of the present de luxe equipment. The infrequently used Blue Valley line would be discontinued, and the Leeds line developed into a crosstown line to St. John Avenue. This feeder line would have a 10-cent fare. Three distinctly new lines are proposed: a Chestnut line, an Oak Street feeder line, and a 63d Street crosstown line, all feeder lines each with a 10-cent fare. The company estimates a 10 per cent decrease in patronage on the trunk lines under the 15-cent fare.

An estimate of yearly earnings was submitted to the Council, based on halting trunk line service at 11 o'clock, and stopping service on some of the feeder lines at 8 o'clock. It is estimated that with this service there would be an annual deficit of about $140,000 as against the 1927 deficit of $210,204 and a 1926 deficit of $319,790. Mr. Groner says:

> The proposed plan would not make the bus system self-supporting. This is due to the large amount of feeder mileage. It is very doubtful if for years these feeders will pay operating costs. The substitution of bus service for railway service at the eastern end of the Fifth Street car line would eliminate the rebuilding of tracks at a cost of $77,000.

Eliminating interest on the investment, the Armour-Paseo double-deckers were the only buses to earn a profit last year, the profit being $431.

Mr. Groner concedes the new bus franchise or permit should not run for more than five years, due to the present experimental state of such services as those proposed to be rendered.

Initial North Jersey Line Plan Announced

Tentative specifications for the rapid transit line proposed to connect Newark, Paterson and Hackensack as an initial step in the development of rapid transit throughout Northern New Jersey have been announced by the North Jersey Transit Commission. They will be used in detailing costs, construction types, and rights-of-way in preparation for presenting definite recommendations for financing and construction to the State Legislature at its 1929 session. According to the announcement the plan involves a total of approximately 22.6 miles of construction in connecting the three terminal cities. Approximately 2.3 miles will be in subway, 7 miles on elevated, and 13.3 miles on grade and fill with all grade crossings eliminated.

Give and Take Proposed in Ohio City

The railway situation in Springfield, Ohio, appears to be rapidly approaching a crisis. On April 10, W. H. Sawyer, receiver of the Springfield Railway, notified the city that service on the Madison-Ludlow Avenue line would be discontinued on April 15 and that during the week cars on that line would operate on a 20-minute schedule only between the hours of 5:30 a.m. and 9:30 a.m. and from 2:30 p.m. to 6:30 p.m. The receiver declared that curtailment was necessary as part of the program to make the railway pay, if possible.

When he took over the lines, the receiver issued a statement indicating that buses would be substituted on some routes and that probably an increase in fare would be requested. The action on the Madison Avenue division is the first concrete move to be made.

City Manager Flack has declared the situation would have to be solved by "give and take." He said:

> There is no question in my mind that the railway system has too much financial overhead to bear. Even if we granted a fare increase and even if we waived payment of cost of paving between the tracks, the company would still operate at a loss. Springfield needs a transportation system, and the city must make some concessions, but we must also demand that the railway also make concessions.

The city manager pointed out that if the city refused to take any action the property would be practically valueless. In conclusion he said:

> But we must have some kind of service and I believe that some basis for adjustment can be reached.

In an effort to clarify the controversy, between Springfield and the Indiana, Columbus & Eastern Traction Company over the railway paying its share of the cost of paving two streets, city officials with J. M. Pogue, general manager of the company, will interview Federal Judge Killits to determine the attitude of the court toward permitting the utility to assume a share of the paving cost.

In one case, the Springfield Railways, operating the city lines, discontinued service on a street and tore up its track when the city sought to have it share in the paving. Railway operators hold to the view that it is unfair to require the utilities to help with the burden of paying for paving to make streets better for a competitor—the automobile. Nothing came of a proposal made recently by one of the railways to help pay if the city would ban parking in the congested district downtown.

No Purchase of Interurbans by Erie Railroad

Any ideas that may have been harbored by officials of the Erie Railroad looking toward the purchase of the Buffalo & Lockport, Lockport & Olcott and Buffalo-Niagara Falls high-speed interurban lines from the International Railway, Buffalo, are reported in newspaper dispatches from Washington to have been abandoned. The reported plan to take over the electric lines was said to be part of the proposed railway mergers in the East and Middle West involving several lines. The Erie is said to fear that any purchase of interurban electric lines by it as freight and passenger feeders would merely serve to intensify competition from motor carriers.

Governor of New York Signs "Death Avenue" Bill

Included in 99 bills signed on March 28 by Governor Smith were several important New York City measures. One is expected to pave the way for the elimination of "Death Avenue" on the west side of Manhattan. The first step toward the elimination of "Death Avenue" is expected to be brought about under Assemblyman Samuel Hofstadter's bill relating to the removal of grade crossings in New York City. Under this measure the city authorities will be able to negotiate with the New York Central Railroad for the elimination of the tracks on Eleventh Avenue and for the general improvement along the west side of New York City through which the tracks of the New York Central run.

Controversial Points Being Cleaned Up in Toledo

A new power rate for the Community Traction Company, Toledo, which will settle an issue at least four years old and result in a rebate of approximately $150,000 to the company, with the effective rate based on consumption rather than on a theoretical demand, has been agreed upon by Commissioner E. L. Graumlich and David H. Goodwillie, member of the street railway board of control, representing the city, and R. E. Burger, representing Henry L. Doherty & Company, according to the report to Mayor W. T. Jackson.

The railway will make an effort to settle the back paving claim of $185,000 and also go along with the city administration in its paving program for this summer.

On the other hand, the city will seek to pass legislation which will enable the company to control the bus operations within the city, extend lines by means of additional buses, and take over some existing lines.

The whole plan is to be worked out under the Milner ordinance with the idea of cleaning up controversial points and eliminating competition so that the railway may be operated at a profit and

Digitized by Google

gradually work out of the deficit accumulated in the last seven years. Sinking fund charges have ceased under the terms of the ordinance.

Appraisal Expenditures Under Fire in Indiana

Alleged practice of Indiana utilities of charging to operating expenses the sums incurred by audits, appraisals and attorney fees was attacked on March 23 by the Indiana Public Service Commission with the adoption of a resolution that in the future will force such expenditures to be made from the net income and paid from the utility's own pocket.

According to Calvin McIntosh, commissioner, the resolution is the result of a hearing he conducted recently in which an increase in rates was sought. He presented figures to show that attorneys fees charged in connection with the hearing, which continued about one day, amounted to $3,000 for one firm, $750 for another and $350 for a third. In addition he said that although appraisals and audits of the property and books were made by the Public Service Commission engineers and accountants, owners of the company paid $5,000 for an appraisal to one commercial engineer and $500 to another and that $750 was paid by the company for a separate audit of the books, besides that made by the commission's accountant.

Rerouting Plan Discussed in Baltimore

Rerouting of cars of the United Railways & Electric Company, Baltimore, Md., was discussed at length at a recent meeting of the special commission appointed by Mayor Broening. The result was the appointment of Dean J. Locke, of the United, and William G. Albrecht, a member of the City Council and sponser of the suggested one-way street system, as a committee to work out the details of this part of the program for submission to the commission. The commission will report the entire one-way traffic subject to Mayor Broening and the City Council in the near future.

Jacksonville Paper Has New Growth After Seven Years

Because *Trollicar Topics* has become so popular with patrons of the Jacksonville Traction Company, Jacksonville, Fla., it has been increased in size from four to six pages. More space will now be devoted to informing the car riders of the problems of the company and other railway properties. The leaflet first appeared more than seven years ago. Since that time it has been explaining the operation of the company to its readers. Hundreds of letters have been received approving *Trollicar Topics* in its new form.

Reduced Fares on Pacific Northwest

Reductions in fares on the Pacific Northwest Traction Company, Seattle, Wash., are in effect on the routes between Seattle, Wash., and Vancouver, British Columbia, through Everett, Mount Vernon, Bellingham and Blaine, Wash., and New Westminster, British Columbia. The principal changes in fares are as follows:

Miles		Old Fares One-way	Old Fares Round-trip	New Fares One-way	New Fares Round-trip
31	Between Seattle and Everett	$0.75	$1.30	$0.75*	$1.30*
70	Between Seattle and Mount Vernon	2.15	3.30	1.35	2.50
98	Between Seattle and Bellingham	3.00	4.65	1.95	3.65
157	Between Seattle and Vancouver	4.50	8.00	3.00	5.50
39	Between Everett and Mount Vernon	1.40	2.00	.75	1.40
67	Between Everett and Bellingham	2.40	3.25	1.35	2.50
126	Between Everett and Vancouver	4.00	7.01	2.85	5.30
28	Between Bellingham and Mount Vernon	1.00	1.35	.55	1.00
59	Between Bellingham and Vancouver	2.15	3.65	1.50	2.75

* No change.

Fares reduced proportionately are in effect between other points. These fares are put in for a trial period which expires June 15, 1928.

"Skip-Stop" Service Approved By Columbus Council

Inauguration of "skip-stop" service and establishment of all railway streets as main thoroughfares have been approved by the City Council of Columbus, Ohio. Opposition to the measures was offered by Councilman Worley, who contended that the main thoroughfare clause was a scheme of the railway to seek legal immunity from accidents.

The legislation would establish "skip-stops" in all parts of the city except in the downtown district, allow cars to operate at 25 m.p.h., in the outlying districts and require all vehicles to come to a full stop before entering or crossing streets with car tracks. The present speed limit in the outlying districts is 20 m.p.h. These changes in service had been requested by C. C. Slater, president and general manager of the Columbus Railway, Power & Light Company.

Columbia Now Served by Buses

The transportation situation in Columbia, S. C., in more or less of a muddle since the cars of the Columbia Railway, Gas & Electric Company stopped running in March, 1927, bids fair to be cleared up in the near future. At the present time the city is being served by the Columbia Bus Company, a concern which has in operation nine 16-passenger Studebaker machines, with ten additional buses expected about the middle of April; also in operation are a number of unregulated 10-cent jitneys.

An ordinance has been passed by the City Council effective this month which provides that all motor vehicles operated for hire shall run on prescribed routes fixed by the City Council. A similar ordinance was passed several months ago. A jitney driver who violated it was technically placed under arrest, and the case taken direct to the State Supreme Court to determine the constitutionality of the ordinance. Since that time, however, the General Assembly of the state has met, and it passed an act which specifically gave the Columbia Council authority to regulate motor traffic on the city streets. As a result of this act the case before the Supreme Court was dismissed before a decision was handed down. It is not believed that the jitneys' union will contest this second ordinance, passed since the General Assembly passed its measure authorizing the Council to regulate motor transportation.

A municipal campaign late this month for the election of two members of the City Council is now in progress. At the various meetings the transportation situation has come in for much discussion.

Petitioners Ask for Referendum on Chicago Traction Legislation

Petitions signed by nearly 400,000 Chicago voters were filed at the election commissioners' office on April 6 asking that three questions of public policy regarding the city's railway problem be submitted to a referendum of the voters at the judicial election on June 4. Circulated under the auspices of the Amalgamated Improvement Association, these documents seek to make it compulsory upon Mayor Thompson and Governor Small of Illinois to submit all railway legislation for Chicago to the voters before it can become effective; they ask that voters be given an opportunity to determine whether the traction fund of $50,000,000 shall be used to build a "loop" subway, and also whether the city should not at once provide buses for districts now without adequate transportation.

In explaining why the petitions were filed, August Knickels, president of the association, stated that Governor Small had been in office for seven years and Mayor Thompson for nine years, during which time they have both refused to give Chicago home rule.

Richmond to Journal Editor

"Transportation in Richmond Yesterday and Today" is a feature article in the March issue of *Richmond*, by G. Watson James, Jr., Assistant Editor, ELECTRIC RAILWAY JOURNAL. In this article Mr. James tells the story of transportation from the period of mule cars to the present-day riding on de luxe cars and buses.

Skip Stops Effective in St. Louis

Passengers on the Olive Street lines of the St. Louis Public Service Company have been saved six minutes on each trip following the installation of a skip-stop plan between Twelfth Boulevard and Channing Avenue, St. Louis, Mo. The limitation of car stops was suggested by Mr. Brooks, director of streets and sewers, to speed up the reconstruction and paving of Olive Street.

Franchise at Jacksonville Still Under Discussion

The principles involved in the proposed new citizens' committee franchise for the Jacksonville Traction Company, Jacksonville, Fla., were discussed publicly at a recent meeting of the Council. There is still disagreement on some of the major points, but the consensus of opinion is that the matter is nearer a settlement now than at any other time since the movement for a new 30-year permit was launched two years ago.

Representatives of the citizens' franchise committee, appointed by the Council to prepare a franchise, and Peter O. Knight, Tampa, general counsel for the company, discussed the proposed bill of privileges in detail. The Council finally voted unanimously to request Mr. Knight to prepare drafts of two franchises of different types that would be acceptable to his company. These drafts will be compared with citizens' committee plan for its final modification into an operating agreement that will be acceptable to both city and company.

Giles J. Patterson, local attorney, who was chairman of the citizens' committee, and George C. Bedell, attorney, spoke for the committee. Mr. Patterson opened the discussion with a review of the committee's work. He elaborated on the proposal to establish the office of city railway director, made in the drafted franchise, saying that the plan has been successful in other cities and that the sole purpose of the directorship was to give the city closer and more intelligent supervision of the company's operations and to make possible co-operation between the city and company for better service.

Mr. Knight went into considerable details concerning the simple, broad franchises granted to other utility companies in which he is interested and said that all the binding factors in a franchise may be placed on two sheets of paper. He said that all the Jacksonville company wants is "the right to live, a fair valuation of its property and a fair return on that investment." These were the only features necessary to put into a franchise, he declared.

"Above the Clatter of Wheels and the Hum of Motors"

A group of railway men attained the unusual distinction of furnishing music to the entire world on Saturday night, March 31, in a joint good-will program furnished by employees of the Cleveland Railway and the Pittsburgh Railways and broadcast through the courtesy of radio station KDKA of the Westinghouse Electric & Manufacturing Company.

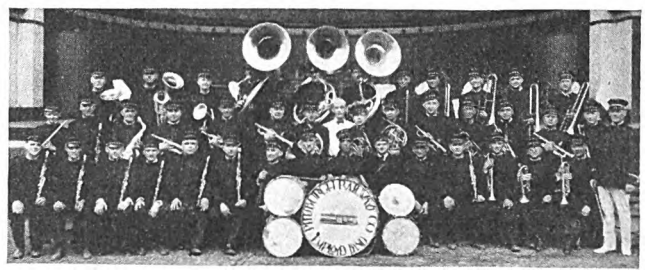
The Cleveland group included a 150-voice male chorus and a male octette, both under the direction of Charles Dawe, while the Pittsburgh contingent consisted of a 50-piece band under the direction of Alois Hrabak. The groups alternated on the air from 10 until 11:30 p.m. The program was sent out from KDKA over three wave lengths, 27, 62 and 316 meters, the low wave being used especially so that the 80-year old mother of Mr. Dawe might listen to the program at her home in Wales. This also was the official night KDKA broadcasts to the Far North.

In order that the home folks might hear the program from their local station a special line was maintained from KDKA to WTAM at Cleveland and the latter station rebroadcast the program from 10 until 11 p.m.

The Cleveland men arrived in Pittsburgh by special train Saturday forenoon and were the guests of the Pittsburgh Railways at luncheon and for an inspection trip of the system during the afternoon. At 6 p.m. the combined groups arrived by special street cars at the Westinghouse plant at East Pittsburgh and were the guests at a banquet and entertainment in the officers' dining room on the eleventh floor of their new office building.

The broadcast program was opened by a word of welcome from Thomas Fitzgerald, vice-president of the Pittsburgh Railways, to Col. Joseph Alexander, president of the Cleveland Railway. Other members of Mr. Alexander's staff present were Ralph W. Emerson, vice-president; Fred Bullock, assistant to the president; Clinton D. Smith, director of personnel, and J. H. Cox, superintendent of welfare. Members of Mr. Fitzgerald's staff present were J. B. Donley, director of public relations, and T. W. Noonan, general manager of the Pittsburgh Motor Coach Company.

Through a special set-up the broadcast of this exceptionally large group was made direct from the Westinghouse officers' dining room.



A glimpse of those who made March 31 a gala event

Paving Charges in Ogdensburg to Be Settled

Governor Smith has signed the Thayer bill, as chapter 577 of the laws of 1928, authorizing the city of Ogdensburg, N. Y., to enter into an agreement with the Ogdensburg Street Railway compromising, adjusting and settling all differences between the city and the railway for paving charges due the city.

Over the Waves With Williams on WJAR

Five minute talks are broadcast to the people of Rhode Island every Friday evening from station WJAR, Providence, by Alonzo R. Williams, general manager of the United Electric Railways, Providence, R. I., a shrewd observer of men and events, a wit and an unusually versatile forensic orator.

Recent Bus Developments

New Installation in Quincy On April 1

The Illinois Power & Light Company instituted bus service April 1 on the North Fifth Street line in Quincy, Ill., supplanting cars which have operated on that route 61 years. Bus service was also established from Tenth and Cherry Streets to the Soldiers' Home. The North Fifth Street line was the oldest car line in Quincy, the first section being built in 1867 when the Illinois Legislature awarded an exclusive privilege for operating horse-drawn cars over the street, giving a 50-year charter. Six new Yellow coaches have been installed for operation on the substitute service, each with 21-passenger capacity.

Would Consolidate Service in Section of Pennsylvania

The applications of the Johnstown Traction Company, Johnstown, Pa., for the right to purchase the controlling stock of the Southern Cambria Railway was heard by the Public Service Commission on April 5 without protest. It was brought out in the testimony that the purpose of the consolidation was to co-ordinate the railway and the bus service operated by the two companies in that section of the state.

Files Protest Before Missouri Commission

D. L. Fennell, general superintendent of transportation of the Kansas City Public Service Company, has filed a protest with the Missouri Public Service Commission against the operation of proposed bus service connecting Kansas City, Independence and Odessa, by the Chicago & Alton Railroad.

He said his company had no objection to the railroad operating a bus line to Odessa as long as it did not carry passengers to Independence or from Independence to Kansas City. The steam railroad officials assert that the proposed service between the two cities has been necessitated as a matter of self-preservation against competing bus carriers.

Terms of New Louisville Grant

Twenty-year grant awarded to Louisville Railway. Initial fare 10 cents. Provisions of grant reproduced in detail

EXCEPT for the preamble the following are the terms of the franchise for the operation of buses in Louisville, Ky., awarded recently to the Louisville Railway following its successful bid for the grant:

SECTION 2—FRANCHISE CREATED

There is hereby created and established a franchise or privilege to operate gasoline buses, or other automotive vehicles, for the carriage of passengers for hire upon and over all the streets and highways of Louisville upon the terms and conditions hereinafter set out.

SECTION 3—OPERATING RESTRICTIONS

The enjoyment of the franchise grant hereby created shall be subject to the following conditions:

1. All operations hereunder shall be conducted according to established schedules over regular routes and between fixed termini;

2. Any route within the limits of this grant may be established, modified, discontinued, or re-established with the consent of the Board of Public Works of Louisville; but not otherwise;

3. The said Board may require the discontinuance of any route established hereunder;

4. The said board shall have power to require the establishment and operation by the holder hereof of such transportation routes upon any of the streets of Louisville, and to require such additional service upon any established route or routes, or modification thereof, as may be reasonably necessary to furnish adequate and a complete transportation service, provided, however, that said board shall first make, or cause to be made by such city agencies as it may designate, a survey of each proposed route or additional or modified service, which survey shall include a report on the patronage to be expected, the desirability of and the reasonable necessity, if any, for such new route or routes, or additional or modified service;

5. If it shall be held by any court of last resort, having jurisdiction, that any of the said powers hereunder enumerated may not lawfully be vested in and exercised by the Board of Public Works, then such of said powers shall be vested in and exercised by the legislative department of the city of Louisville, it being the intent and purpose of this ordinance that all of said powers to be exercised hereunder by the city of Louisville shall be vested in and be exercised by whatever department of the government of the city of Louisville may lawfully exercise the same.

SECTION 4—DURATION OF FRANCHISE

The said franchise or privilege shall continue for a period of twenty years from and after the approval of this Ordinance.

SECTION 5—RATE OF FARES

The holder of this franchise may charge and collect toll during the first year of operation hereunder at a rate not exceeding 10 cents for each passenger carried within the city limits, with free transfers between bus lines in the making of a single continuous trip. Transportation of school children shall be furnished at one-half fare and to policemen, firemen and park guards, when in uniform, free.

Provided, first, that if this franchise be acquired by a person or corporation operating, in Louisville, a system of electrically propelled street cars running on rails, or by a subsidiary of such corporation, then such person or corporation shall furnish free and reduced fare transportation hereinbefore set out and in addition shall give and receive transfers for the making of a single continuous trip within the city limits upon terms as follows: From bus line to bus line, and from bus line to electric car line, free; and from electric car line to bus line for not more than the differential between electric car fare and bus fare. The bus fare for the first year of operation shall not exceed 10 cents, and shall thereafter be controlled in the same manner and upon the same principles as the electric car fare, and

Provided, secondly, that by whomsoever the franchise may be acquired, in the adjustment of bus fare, electric car fare and/or transfer rules and charges, the rate or rates for service shall be such as to yield to the holder hereof a reasonable return upon the fair value of its entire and combined properties used and useful, employed in its city transportation service.

SECTION 6—ASSIGNABILITY OF FRANCHISE

The holder of this franchise shall not sell or assign the same to any person or company engaged in competitive transportation, or about to engage in competitive transportation, in the city of Louisville, provided, that nothing herein shall prevent the said holder from mortgaging such franchise in connection with its other properties and rights.

SECTION 7—BOND

The purchaser or assignee of this franchise shall within 30 days of its acquisition, as approved by the General Council, deposit and maintain throughout the term of operation hereunder, with the Board of Public Works, a bond with corporate surety approved by said board, in the sum of $100,000 running to the city of Louisville, conditioned as follows:

1. That the holder shall fulfill the obligations of this franchise during its entire life:

2. That in the event of any injury or damage to any person or property growing out of any negligence in the operation of the motor vehicles used by the franchise holder in the business herein, provided for, the person so injured in his person or property shall have a right of action thereon:

3. That said applicant will pay to the city of Louisville all sums due said city for any license, tax, or other liability, including all fines, and forfeitures assessed against such franchise holder by the final judgment of any court, and also to indemnify the city against any loss or damage for accidents arising out of negligence in the operation of such motor vehicles:

4. That said bond shall not be void upon first recovery, but may be sued on and recovery had until the full sum thereof is exhausted;

Provided: Should the holder of this franchise fail within 30 days from its acquisition to give bond, as in this section provided, or fail to make good any impairment in such bond within 30 days of such impairment, such failure in and of itself shall render this franchise void and of no effect, and no act or omission on the part of the city shall constitute a waiver. Approval by the Board of Public Works of bond of any holder hereof shall release all prior bonds except as to liabilities then outstanding against said prior bonds, or any of them.

SECTION 8—ADVERTISEMENT
SECTION 9—UPSET BID

In the sale of this franchise the Board of Public Works shall offer the same at an upset bid of $5,000.

Digitized by Google

SECTION 10—PAYMENT AND DEPOSIT OF CERTIFIED CHECK

The bidder to whom such franchise or privilege shall be awarded shall pay the amount of such bid in cash to the treasurer of the said city within ten days after the same shall have been approved by the General Council, and no bid shall be received or considered by the said Board of Public Works unless such bidder shall deposit with his bid a check, payable to the treasurer of the said city, for the sum of Five Thousand ($5,000.00) Dollars, and which shall have been duly certified by a bank established and doing regular business in the city of Louisville, and which sum of money shall be treated as part of payment by the successful bidder, in case he shall comply with his bid; and if he shall not, it shall be treated and retained as liquidated damages due to the said city. Checks deposited by unsuccessful bidders shall be at once returned to them respectively.

SECTION 11—SUPERVISING DUTIES OF BOARD OF PUBLIC WORKS

The Board of Public Works shall perform the duties herein imposed upon it of supervising the management of the operations of the holder hereof. To enable the said board to perform such supervisory duties, such technical and engineering force, auditors, accountants, inspectors and clerks may be employed as the General Council may, by ordinance, from time to time authorize; the said appointees and assistants to be named by the Mayor by and with the approval of the General Council.

SECTION 12—ACCOUNTS AND ACCOUNTING RECORDS

The Board of Public Works, or such other person or persons as may be authorized or delegated by said board or said city, shall have access to all books, records, correspondence, files, engineering studies, data and all other recorded information of any kind or character whatsoever kept by the holder of this franchise, however and in any way relating to the affairs of the said holder, past, present or future, and refusal to permit such access shall bring said company in default under the penalty clause hereinafter set out.

The accounts of the said holder shall be kept in accordance with the uniform classifications of accounts for Class A bus companies as from time to time prescribed and promulgated by the National Association of Railroads and Utilities Commissioners, unless the Board of Public Works shall from time to time agree with the said holder to modify such system of accounting.

Under the system of accounting then in force, the said holder shall render to the Board of Public Works complete monthly statements in writing.

SECTION 13—PENALTY CLAUSE

In the event the holder of this franchise knowingly fails or refuses to abide by the terms of this ordinance, or any one or more of them, or the terms of any ordinance or resolution passed pursuant to the provisions of this ordinance, it shall be subject to a fine of not less than $50 nor more than $100 for each offense, and each day's failure or refusal shall constitute a separate offense.

Whenever any penalty is imposed under this section, same shall be paid by the said holder out of corporate funds, and shall not be charged as an operating expense.

Nothing in the ordinance shall be deemed to barter away or to impair the police or rate-making powers of the city of Louisville, but on the other hand, the city expressly retains these powers free and unimpaired. The General Council shall exercise free and unimpaired its police powers in respect of the kind and character of service to be rendered under this franchise.

The sale of the franchise to the railway company has been approved by the Council.

The Louisville Railway has 30 buses ready to place in service under the new bus franchise, but for the present will require only 20 of them.

James P. Barnes, president of the railway, has announced a new fast light-freight service between Louisville and Lexington. Buses of the company will carry freight from end of the electric line of the company at Shelbyville to the beginning of the electric line operating between Frankfort and Lexington.

Hearing on Interstate Bill

Various interests advocate passage of regulatory measure declared to represent joint views of state commissions and of operators

REPRESENTATIVES of bus operators and of state public utilities commissioners testified on April 10 at a hearing before the House Committee on Interstate and Foreign Commerce, in support of the bill (H. R. 12380) introduced by Representative Parker, of New York, chairman of the committee, to provide a system of federal regulation of interstate operations of motor vehicles carrying passengers as common carriers.

S. A. Markel, chairman of the legislative commmittee of the bus division, American Automobile Association, and John E. Benton, of Washington, general solicitor, National Association of Railroad and Utilities Commissioners, explained that the Parker bill represents a much simplified and shortened redraft of the earlier Parker bill, on which they and other organizations interested had collaborated, and that it had been presented in an effort to obtain legislation at this session.

The new bill does not apply to truck operations. Mr. Benton attributed the origin of the new bill largely to Mr. Markel's organization, although he said it had been generally approved by others, and that his association, through its officers and committees, had expressed approval, as far as the bill goes, without changing their attitude represented in the earlier bill.

Counsel for the American Railway Association and the American Short Line Railroad Association, representing the steam railroads, and of the American Electric Railway Association, also were present to give their views.

Mr. Markel said that at conferences between those he represented and the public utilities commissioners and railway interests, it was agreed that the bill is in the public interest, although bus owners were not unanimous in approving all the terms of the bill. He explained that the bill would provide for actual regulation to be administered in the first instance by joint boards of state commissioners, which appeal to the Interstate Commerce Commission.

Mr. Markel said that 44 states have regulatory laws governing intrastate operations of motor vehicles and that the bus operators have confidence in the state commissions. The language of the bill he said follows state regulatory procedure as far as possible. An attempt has been made to simplify the bill by leaving the machinery of regulation as far as possible to the commissions. The bill is not intended to cover "contract carriers," such as sightseeing buses that make contracts with parties for special trips.

Mr. Benton said the organization of the state commissioners had been interested in legislation of this character ever since March, 1925, when the Supreme Court of the United States held that no state could restrain operations of vehicles in interstate commerce, which left about 10 per cent of the motor traffic beyond the state jurisdiction.

F. T. Singleton, chairman of the Public Service Commission of Indiana, made a brief statement, saying Indiana is especially interested in the bill because much motor traffic passes through that state.

Representative Wolverton said that an intolerable situation had been created as the result of the great increase in the volume of interstate passenger bus traffic over the bridge between Philadelphia and Camden, which now amounts to over 280 buses a day, and that the New Jersey municipalities are greatly handicapped by lack of power to regulate interstate operations. He therefore urged that action be taken at this session if at all possible.

Rehearing Granted in Staten Island Case

A rehearing will be held on April 23 by the New York State Transit Commission on the application of the Tompkins Bus Corporation for certificates of convenience and necessity for the operation of buses on eighteen routes in the Borough of Richmond (Staten Island) specified in the contract of franchise between the city of New York and the bus company dated Aug. 4, 1927. The grounds on which the commission acted in its previous refusal to approve the appeal of the company were reviewed in the ELECTRIC RAILWAY JOURNAL for March 10, page 416. Any action the state body may take in the matter is regarded as important since it may be considered as defining the attitude of that body as contrasted with that of the city in the matter of passing on the competency of operators seeking bus rights that might result in competition with existing carriers.

Financial and Corporate

Cortland County Traction Sought by Power Interests

Application has been made to the Public Service Commission of New York State by the Mohawk Hudson Power Corporation for consent to acquire more than 10 per cent of the capital stock of the Cortland County Traction Company, Cortland, N. Y., which operates 18 miles of electric railway, runs bus routes and does a lighting and power business. The capital stock of the Cortland Company consists of 3,200 shares, par value $100.

The petition of the Mohawk Hudson Company states that an agreement has been reached between all the owners of capital stock of the Cortland Company and the Mohawk Hudson Company for exchange of the stock of the Cortland Company for certain stock of the Mohawk Hudson Company on the following basis:

For each share of the capital stock of the Cortland County Traction Company one share of the preferred stock of the Mohawk Hudson Company, 2½ shares of the second preferred stock and six shares of the common stock. The shares to be exchanged are without par value. The preferred stock is entitled to cumulative dividends at the rate of $7 a share per annum and the second preferred stock at the rate of $7 per annum after payment of dividends on the preferred stock.

Sale of Equipment Trust Stock Approved

A compromise sale price of $45 net on preferred stock of the Indianapolis & Cincinnati Car Trust Equipment Company is reported to have been agreed on between a stockholders' committee and representatives of the Indianapolis & Cincinnati Traction Company. The agreement will permit Charles T. DeHore and L. E. Eastman, prospective owners, to proceed to improve the road and possibly extend it.

Terms of the agreement have received the approval of Judge Robert C. Baltzell in federal court to the extent that the receivership action will be continued while the plan is being worked out. Letters are to be mailed shortly to holders of the equipment company's series A preferred stock inviting them to deposit their stock with the Fletcher Savings & Trust Company, Indianapolis, for sale to the DeHore and Eastman interests.

Before the compromise, DeHore and Eastman, it was reported, had offered stockholders $33.50 a share, or one third of the face value of the securities. This offer has stood for some weeks, with the representatives of the interurban asserting they would provide the road with entirely new equipment rather than pay more for the stock.

Members of the stockholders' committee said the price of $45 net to be paid under the agreement was more than they might hope to realize if the equipment being used on the lines was withdrawn and sold at its depreciated value. In this instance the equipment trust was somewhat unusual in that it covered rolling stock and certain power installations pledged some years ago when the road changed from single-phase to high-voltage direct current.

Buffalo Company Certifies Change in Capital

The International Railway, Buffalo, N. Y., has notified the Secretary of State of an increase in authorized capital stock to 195,000 shares from 175,000 shares. New capital will consist of 20,000 shares of $100 par preferred stock and 175,000 shares of no par common stock. Present authorized capital consists of 175,000 shares of $100 par capital stock. The change which has now been certified to the state has been the subject of extended comment in previous issues of the ELECTRIC RAILWAY JOURNAL.

Net Income Increases

Trustees of the Eastern Massachusetts Street Railway report an increase of $37,222 in net income of company. Operating expenses decreased. Company active in promotion of new business

THERE was a decrease of $162,601 in revenue from all sources of the Eastern Massachusetts Street Railway, Boston, Mass., in 1927, compared with 1926. The net income available for dividends in that year was $772,060, an increase over 1926 of $37,222. This fact was disclosed in the annual report of the company's trustees for the year ended Dec. 31, 1927. Unfavorable weather conditions were almost entirely responsible for the large decrease in revenue. The railways revenue would have shown a greater decrease except for an active campaign to promote more business by the introduction of a dollar Sunday and holiday ticket in July, 1927, and the addition during the summer of 50 new de luxe light-weight cars. The cost of the 50 new cars was $778,000. During the year 241 cars were reconditioned and 537 cars repainted.

Total passenger miles operated in 1927 were 17,912,322, as compared with 17,731,483 in 1926.

The cost of operation before taxes, interest, and rental charges was $169,412 less in 1927 than in 1926. The reduction in expenses would have been greater except for an increase in wages of 1½ cents an hour, effective May 2, 1927, under an agreement with the union. The actual expenditures for maintaining passenger cars were $514,845, compared with $422,585 in 1926. The activities of the rolling stock department in 1927 were devoted mostly to improvement of passenger car equipment. The work in this department and the increased rate of wage are the real causes of the larger operating expense. There was an increase in the cost of group insurance due to the employment of a larger number of men under the enforced change from the nine-hour day to the eight-hour day.

During the year the company rebuilt 14.5 miles of track, of which 9.7 miles were in paved streets. As a result of the continued intensive supervision and improvement on rails, derailments due to defects in the track during 1927 were only one-fourth of those in 1922, and were 22 per cent less than in 1926.

On the subject of bus operation, the report said that 1,435,817 bus-miles were operated in 1927, an increase of 148,650 over 1926. All of the bus lines operated in 1926 were continued in 1927, and in addition a bus line was started between Lowell and Lawrence by a new route south of the Merrimac River. This line replaces a local trolley line in Lowell, and also serves new territories in Tewksbury and Andover. Bus revenues for the entire system increased $60,058, and expenses increased $15,697. During the year the company failed, however, to earn bus operating expenses and depreciation, not including taxes and interest, by $24,900, compared with a loss of $62,207 in 1926. Ten motor coaches were purchased at a cost of $89,290. At the present time the bus investment is $538,482. The buses are operated in 26 towns and cities. To aid in snow fighting on bus lines, three caterpillar snow plows were purchased during the year at a cost of $14,100. There are now 23 bus snow-fighting units on the system.

Dividend payments amounting to $866,201 were made in 1927 as follows:

First preferred	$248,013
Sinking fund	1,260
Preferred B	181,368
Adjustment	435,560
	$866,201

Under the group insurance and pension plan, insurance policies aggregating $40,700 in eighteen death cases, and monthly allowances to pensioners were paid during the year aggregating $22,242. Twenty-seven other employees are receiving monthly payments under the total disability clause of the insurance plan. Six new pensioners were added in 1927 and four died. The total is now 39.

On the first preferred and sinking fund stocks, payments of 3 per cent were made on Feb. 15 and Aug. 15. On preferred B, payments of 3 per cent were made on Feb. 1 and Aug. 1. On adjust-

COMBINED INCOME STATEMENT OF ALL DISTRICTS OF EASTERN MASSACHUSETTS STREET RAILWAY

	1927	1926
Street car revenue	$8,472,602	$8,699,914
Auto bus revenue	381,375	321,317
Express and other revenue	36,773	41,879
Rentals and advertising	190,171	198,051
From sale of power	262,275	272,527
Interest and other income	282,238	254,347
Total revenue	$9,625,434	$9,788,035
Expenses:		
Way and structures	$1,221,227	$1,229,616
Equipment	1,240,498	1,230,046
Power	1,270,720	1,281,790
Car operation	2,249,449	2,378,475
Injuries and damages	252,050	262,166
Insurance	73,003	73,810
Law expenses	15,217	40,255
Rent of tracks	82,382	80,167
General wages and expenses	241,583	235,724
Pensions	22,242	23,045
Group insurance	69,314	64,866
Stationery and printing	33,917	37,201
Stores and garage expenses	56,652	53,299
Miscellaneous expenses	45,307	68,210
Auto bus expenses	399,221	383,524
Total operating expenses	$7,272,782	$7,442,194
Total operating expenses and taxes	$7,631,676	$7,807,332
Gross income	1,993,758	1,980,703
Interest and rentals	1,221,698	1,245,865
Net income	$772,060	$734,838

Operating expenses include charges for depreciation amounting to $848,467 in 1927 and $917,940 in 1926. During the year 1927, $616,463 of the depreciation reserve was applied to reconstruction and amortization.

ment stock, payments of 2½ per cent were made on April 1 and Oct. 1.

Bonded obligations of the company were retired and paid at maturity as follows: $129,000 Bay State equipment 6's due Aug. 1, 1927; $300,000 Eastern Massachusetts series A 6's due Jan. 1, 1928; $105,000 Eastern Massachusetts series C 6's due Feb. 1, 1927; $107,400 Eastern Massachusetts series C 6's due Sept. 15, 1927; and $64,000 Peoples Street Railway 5's due Jan. 1, 1928.

The final serial payment of $129,000 of Bay State equipment 6's was made on Aug. 1, 1927. These ten-year serial 6 per cent gold notes were issued by the Bay State Street Railway on Aug. 1, 1917, to cover in part the cost of 200 Laconia semi-convertible cars, on which a cash payment of $323,000 was made at the time of the purchase, the total cost being $1,631,000, and the original issue of notes $1,308,000, of which the unpaid principal amounting to $1,177,000 was assumed by the Eastern Massachusetts Street Railway at the time of the reorganization.

Items showing decreases in revenue were:

Street car revenue	$227,312
Express and other revenue	5,106
Rentals and advertising	7,880
Sale of power	10,252

Items showing revenue increases were:

Auto bus revenue	$60,058
Interest and other income	27,891

Principal increases in expenses were:

Equipment	$10,452
Rent of tracks	2,215
General wages and expenses	5,859
Group insurance	4,448
Stores and garage expenses	3,353

Principal decreases in expenses were:

Way and structures	$8,389
Power	11,070
Car operation	129,036
Injuries and damages	10,016
Law expenses	25,038
Stationery and printing	3,284
Miscellaneous	22,903

J. F. Collins Made Receiver of Detroit-Jackson Line

John F. Collins, vice-president and general manager of the Michigan Electric Railway Lines, Jackson, Mich., has been appointed receiver for the Detroit, Jackson & Chicago Railway, succeeding A. L. Drum. The company he will now direct operates the interurban line connecting Jackson, Ann Arbor and Detroit.

The Jackson-Detroit line certainly would appear to be more naturally a part of the Michigan Electric Railway system than the Detroit United Railway group with which it has been connected in the past. Under his new receivership, Mr. Collins contemplates operating through passenger cars from Kalamazoo to Detroit without transfer at Jackson. Other improvements in through service probably will be instituted as a result of the new arrangement.

Receiver in Charge of Puget Sound Electric Railway

The Puget Sound Electric Railway, Tacoma, Wash., is now under the direct operation of Scott Z. Henderson, local attorney, as receiver, as a result of a cancelation of the contract of Stone & Webster, Inc., Boston, effected recently under authorization of Judge Edward E. Cushman of the United States District Court. The petition for cancellation was filed in the court by the receiver. No immediate changes in the road organization will be made.

The interurban line went into receivership on Feb 21 this year, and until now its affairs have been administered by Stone & Webster, its operating managers for the last 25 years. The action in no way affects the control and operation of the Tacoma Railway & Power Company, owned by the Puget Sound electric road, this remaining in the hands of the Boston corporation.

The circumstances surrounding the affairs of the Puget Sound Electric Railway were reviewed at length in ELECTRIC RAILWAY JOURNAL for July 30, 1927, page 209.

New Member Elected

At the recent directors' meeting of the Philadelphia & Western Railway, Norristown, Pa., Archie D. Swift was elected an additional member of the executive committee.

Bondholders of New York Interurban Ready to Act

Holders of the first mortgage 5 per cent gold bonds of the Syracuse, Lake Shore & Northern Railroad, Syracuse, N. Y., due May 1, 1947, are advised that the protective committee now has a majority of the bonds of the company and is about ready to take possession of the road for the bondholders through foreclosure proceedings. Those who have not yet deposited their bonds are urged to do so at once.

In 1927 the road showed earnings of $44,933 before bond interest requirements, but after depreciation of $16,266 and after taxes.

The bondholders are urged to exercise their right to take over the road since there is apparently a definite earning power in the main property. The committee says that it "desires to accomplish the best results possible for all of the bondholders and thinks that it will be to your best advantage to deposit your bonds with it and participate in a reorganization of the property rather than merely to take your proportionate share of the price which may be bid for the property upon a foreclosure sale."

$1,372 Net Income in Detroit in February

In presenting the financial statement of the Department of Street Railways of Detroit, Mich., for February, 1928, and for the year ended Feb. 29, 1928, William M. Hauser, auditor for the department, included a statement officially presented to the administrative officers of the city of Detroit, in part to show the position of the auditor and also to make it clear that the accounts of the department have been kept in accordance with scientific practice.

The balance of net income for the month of February, 1928, is $1,372 after the payment of sinking fund charges. This shows a decrease of $42,017 compared with a similar month in 1927. The semi-annual interest payment on certain of the construction bonds was made on Feb. 15, 1928, in the amount of $55,000. At the end of the month $173,224 was paid covering the 23rd quarterly interest payment in the unpaid balance of the purchase contract with the Detroit United Railway. This brings the total amount so paid out for interest under the terms of the contract to March 1, 1928, to $5,005,015. Not one cent of this money has been contributed by the taxpayer, it is pointed out by the auditor. It has all come out of the rate of fare.

The auditor refers to a report by Price, Waterhouse & Company, dated Nov. 29, 1927, with respect to the audit of the accounts of the Detroit Street Railways for the year ended June 30, 1927, in which it is stated "as pointed out in our previous reports it is to be regretted that a more specific statement as to what was to be contained in the expression 'fixed charges' was not set forth in the charter, especially with regard to the element of depreciation. From an accounting standpoint depreciation is generally considered as a fixed charge, so that from the standpoint the city charter requires that the rate of fare shall be sufficient to cover both the elements of debt requirement and depreciation."

The auditor of the department does not agree with the standpoint taken by Price, Waterhouse & Company in several respects and suggests that on account of the different views with respect to depreciation it would seem that the corporation counsel should be asked to give an opinion as to just what is meant

Digitized by Google

by the section in the city charter under fixed charges. The auditor states that if this opinion is given it will clear up the much-discussed difference in the reports, namely $1,283,159, which Price, Waterhouse & Company, claim has not been provided for in the accounts of the department for the year ended June 30, 1927.

Under date of Feb. 21, 1928, or practically eight months after the close of the fiscal year ended June 30, 1927, the auditor received from Price, Waterhouse & Company, so-called audit adjustments in connection with the accounts of the department at June 30, 1927. The auditor states that he is now engaged in auditing and checking these adjustment items.

Quebec Company Reported in Deal

Shareholders of the Quebec Railway, Light, Heat & Power Company have approved the sale of the company as a going concern to the Quebec Power Company. The price obtained is sufficient to discharge all outstanding obligations of the company, including principal, interest and redemption premium of outstanding bonds, including all outstanding bonds of Quebec-Jacques Cartier Electric Company, the properties and assets of which are to be taken over by Quebec Railway, with the purchase price sufficient to enable the company on liquidation to pay to all holders of the company's outstanding common shares a sum of $80 in cash.

Homestead Line Bought by Pittsburgh Railways

Purchase of the Homestead & Mifflin Street Railway, Homestead, Pa., has been made by the Pittsburgh Railways. The lines were taken over April 1. They include 3¼ miles of track, overhead lines, and eleven street cars.

The new owner of the line has filed with the Public Service Commission a petition asking permission to charge the usual rate of fare, 10 cents, with three checks for a quarter, in addition to granting transfer privileges which patrons of the line do not have at present. The present fares will remain until the commission renders its decision.

$126,014 Available on Petaluma Line for All Changes

The Petaluma & Santa Rosa Railroad, operating in Petaluma to Sebastopol and Santa Rosa, Cal., reports to the Railroad Commission its 1927 operating revenue at $561,474, compared with $579,119 for 1926. Operating expenses, excluding taxes for 1927, are $417,212, and $426,257 for 1926, leaving net operating revenue of $144,261 for 1927, and $152,861 for 1926. During 1927 taxes charged to operation amounted to $32,746, and for 1926 to $34,394. Deducting the taxes leaves operating income of $111,514 for 1927, and $118,466 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income (which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus) of $126,014 for 1927, and $125,607 for 1926.

Penn-Ohio and Northern Ohio in Deal

A special meeting of Penn-Ohio Edison stockholders has been called for May 1 to ratify an exchange offer to stockholders of the Northern Ohio Power Company, according to which two-thirds of a share of Penn-Ohio Edison common stock plus an option for an additional one-third share will be issued in exchange for each share of Northern Ohio Power common stock. The options will entitle the holder to purchase Penn-Ohio Edison common at a rate of $50 a share until Dec. 31, 1928, at $55 in 1929, and at $60 thereafter until Nov. 1, 1935.

The Northern Ohio Power Company owns more than 99 per cent of the common stock of the Northern Ohio Power & Light Company, which has assets in excess of $55,000,000 and operates electric light and power properties in Akron, Canton and Massillon, Ohio, and electric railways and bus systems in northern Ohio with trackage entrance rights into Cleveland.

The Penn-Ohio Edison Company controls a group of companies supplying the entire electric light and power, street and interurban railway business in eastern Ohio and western Pennsylvania.

$258,158 Net in San Francisco

This figure was carried to surplus of the Market Street Railway after 1927 operation. Many improvements in effect and accidents reduced. Funded debt being reduced steadily

TOTAL operating revenue of the Market Street Railway, San Francisco, Cal., was $9,819,570 for the year 1927, a decrease of $72,097 compared with 1926. The decline in passenger receipts was due to unemployment, increased use of automobiles, and particularly to easier egress from the city on account of increased ferry service, especially noticeable during the week-ends. For the greater part of the year the number of unemployed approximated 30,000, as the result of reduction in building and manufacturing activities. This explanation was made in the annual report of the company.

Operating expenses, including taxes, were $8,245,858, an increase of $226,764 over 1926, due to an increase in wages of employees, to better maintenance of equipment and to increased cost of efforts to obtain new business. The wage increase became effective March 1, 1926, and consequently, for purposes of comparison, the first two months of this expense for that year were correspondingly larger than the similar two months of the preceding year.

OPERATING STATISTICS OF THE MARKET STREET RAILWAY FOR THE YEAR ENDED DEC. 31, 1927

Passengers carried:	
Cash fares 5 cents each	192,792,769
Special car passengers	14,750
School and other tickets, 2½ cents each	3,721,267
Other tickets 5 cents each	27,211
Total revenue passengers	196,555,997
Free transfer passengers	67,111,448
Total revenue and transfer passengers	263,667,445
Free passes	518,073
Total passengers	264,185,518
Percentage of transfer passengers to revenue passengers	34.14
Passenger revenue per revenue and transfer passenger in cents	3.72
Car-hours	2,978,282
Car-miles	26,666,192
Miles of single track operated	270.59
Miles single track leased	17.59
Miles of single track owned	253.69
Number of passenger cars owned	776
PERCENTAGE OF OPERATING REVENUE	
Operating expense	77.81
Taxes (railway only)	6.16
Operating expense and taxes	83.97
Operating income	16.03
Non-operating income	.42
Gross income	16.45
Deductions from income	13.81
Net income	2.64

The net operating revenue was $1,573,712, while the sum of $258,158—after allowance of $500,000 for depreciation reserve—was carried to surplus, making a total of $3,426,793 for this account as of Dec. 31, 1927. The funded debt of the company in the hands of the public was reduced from $11,695,000 to $11,001,500, a decrease of $693,500, which amount represents bonds acquired for the sinking fund and treasury. The sinking fund provision in the trust indenture securing the bonds requires that $500,000 be deposited with the trustee annually at the rate of $125,000 quarterly. These funds are used to purchase bonds and, when so acquired by the sinking fund, such bonds remain alive and continue to draw interest for the retirement of additional bonds.

The sum of $671,390 was expended for the maintenance of ways and structures, and $691,269 for the maintenance of equipment. A new line was opened and an additional bus line was established. As a means of increasing traffic on Sundays the Sunday Pass system was installed Oct. 30, selling at 20 cents for unlimited rides for the day.

Education of the public, through the children, to the efforts of the company to improve service in every way has been given much consideration. A special "Comfort Car" (formerly the president's car) was dedicated to school and other deserving children and put into service with a view of

Miscellaneous	2,264	
Total		$125,830
Surplus Dec. 31, 1927		$3,426,793

acquainting them with the details of street car operation and the mechanical features involved.

Twenty-six electric comfort cars of the latest improved pattern were built at the company's shops during the year. Considerable overhauling, rebuilding, remodeling and repainting jobs were accomplished. These many improvements, with others made in rolling stock, elicited much favorable comment from the public. The work of track improvement was continued, 0.467 mile of electric track (single track measurement) having been built and 6.667 miles of electric track rebuilt.

While the number of autos registered in San Francisco increased in 1927 over the year previous from 128,240 to 135,729, there has been a reduction in the number of accidents occurring during the year. The installation of "white fronts" upon the company's cars, has been an effective means of preventing collisions.

Discontinuance of Iowa Interurban

The Iowa Railway & Light Company has been authorized to discontinue its interurban line between Lisbon and Cedar Rapids, Iowa. By Aug. 1 the line will be dismantled according to Sutherland Dows, manager. Tracks in Mount Vernon will not be torn up.

Delaware & Hudson Subsidiaries Report

Operating revenues of the United Traction Company, Albany, N. Y., from all sources, during 1927, were $2,738,184; operating expenses $2,303,852; and taxes $172,500. Operating income was $261,832 compared with $349,515 in 1926, a decrease of $87,683. Operating revenues decreased $195,338, or 7 per cent, compared with the preceding year. Operating expenses decreased $67,055, or 3 per cent, and taxes decreased $40,600, or 19 per cent.

Among the items of decreased operating expenses were: maintenance of roadway, power plant, and substation structures, $3,415; cost of removing snow and ice, $27,564; cleaning and sanding tracks, $6,956; maintaining equipment (other than depreciation and retirements), $31,641; transportation expenses, $64,572; and injuries and damages (including public liability insurance), $46,382. These decreases were partly offset by increases in track and roadway labor, $18,135; track and roadway materials, $12,868; paving, $39,439; maintenance of electric distribution and transmission systems (other than structures), $1,929; depreciation of equipment, $1,094; equipment retirements, $21,438; power purchased, $4,501; and general and miscellaneous expenses, excluding injuries and damages and public liability insurance, $14,241.

Effective on July 1, 1927, the Public Service Commission authorized an increase in fare from 7 cents to 10 cents cash, with thirteen tokens for $1 (50 cents for school children).

Operating revenues of the Hudson Valley Railway during 1927 were $620,849; operating expenses $791,530; and taxes $46,500. There was an operating deficit of $217,181 for the year, comparable with a deficit of $64,759 in 1926. Operating revenues decreased $152,550, or 20 per cent, below the preceding year; operating expenses increased $4,222, or half of 1 per cent; and taxes decreased $4,350, or 9 per cent.

Effective on Dec. 31, 1927, the Public Service Commission authorized the abandonment of branch lines between Thomson and Greenwich and between Lake George and Warrensburg. Application has been made to the Public Service Commission for permission to abandon the line between Stillwater and Fort Edward, and depot line, belt line, and South and Knight Streets line in Glens Falls.

Operating revenues of the Capitol District Transportation Company, Inc., the bus operating subsidiary of the United Traction Company in Albany and vicinity, during 1927, were $583,708; operating expenses $583,856; and taxes $5,000. There was an operating deficit of $5,148 for the year, comparable with a deficit of $52,291 in 1926. Operating revenues increased $280,057, or 92 per cent; operating expenses increased $230,506, or 65 per cent; and taxes increased $2,408, or 93 per cent.

Four additional lines were established during the year. Effective on Aug. 8, 1927, the Public Service Commission authorized increased rates of fare to equal rates authorized for United Traction Company lines.

Rate Fixing—What Constitutes Fair Value

I. Montefiore Levy, of the New York Bar, and formerly Commissioner of Education, has an article "Rate Fixing—What Constitutes Fair Value," in the New York *Law Journal* for March 24. It is a very interesting review of the situation, considering the limitations of the space it occupies. As Mr. Levy points out, almost a generation ago the United States Supreme Court held that, while the people could fix the rates, the railroads are public utilities and, although their property is charged with a public use, the rate must be reasonable, so as not to violate the constitutional prohibition against confiscation of property without reasonable compensation. At first, there was a long line of cases trying to define what was reasonable compensation and, in order to do that, one necessarily had to decide first what the value of the property was, and then the question arose, at what value the property should be taken, its value at the time of its production or its value at the time of the controversy.

According to Mr. Levy, while the court has laid down the doctrine of fair value, it has prescribed no definite rule by which to ascertain that value. Several lines of inquiry have been suggested that may be pursued, but the court, limited by human judgment, has wrestled and is still wrestling with the problem. After citing many of the so-called key cases, among them McCardle vs. the Indianapolis Water Company, he says that "from the determination reached in the McCardle case it can be surmised that the tendency of the Supreme Court of the United States is to place emphasis on reproduction cost as a basis for determining 'fair value,' and that it is disposed toward liberality in deciding what would be a reasonable return on such fair value."

Voting Trust Agreement for Omaha

Holders of all outstanding common and preferred stock of the Omaha & Council Bluffs Street Railway, Omaha, Neb., have been asked by a committee composed of Albert Strauss and Marshall S. Morgan, New York, and Fred Hamilton and Louis S. Nash, Omaha, to deposit their stock so a voting trust may be created composed of John N. Shannahan, Sidney W. Noyes, Edwin N. Sanderson, Albert Strauss and Fred Hamilton.

The committee reports that 95 per cent of the bonds, which fell due last January, are now in its hands pursuant to an agreement to extend them three years in order to allow President Shannahan a free hand in working out his plans for rejuvenation.

Book Reviews

Car Builders' Cyclopedia

Simmons-Boardman Published Company, New York, N. Y. Twelfth edition. 1,200 pages. Price, $5 cloth; $7 leather.

This work is a complete summary of all details of rolling stock. Never before has the book been so completely revised nor more new material added than in this new 1928 edition, which is ready for delivery. It is the first edition of the Car Builders' Cyclopedia—the standard authority on steam railroad freight and passenger rolling stock—to be published since 1925. It, therefore, records the latest development in car design, maintenance practices and equipment.

The first edition of the Car Builders' Cyclopedia was published in 1879—49 years ago. It was an illustrated dictionary, which for the first time defined the proper terms or names of parts used in the construction of railway cars. Through the succeeding years, with the many changes and innovations in car design, the successive editions of the Car Builders' Dictionary, as it was first called, have faithfully recorded the new information and new developments.

The work is edited by Roy V. Wright, managing editor of the *Railway Age* and editor of the *Railway Mechanical Engineer,* assisted by R. C. Augur and compiled under the direction of the advisory committee of the American Railway Association, Division V, Mechanical.

The Behavior of Prices

By Frederick C. Mills, National Bureau of Economic Research, New York. 598 pages. Price, $7.

Business men and economists will find this book of the greatest interest. It is notable for the emphasis which is placed on the individual commodity. It shows the relation of the price movements of individual commodities to the movements of other individual price series. It also treats price series in combination. By turning to the commodity index the reader can locate all the references in the book to the specific commodity that interests him, and by following the page references can trace the variability of its price; its trend over a period of years; the length of its own business cycle; and how it acts during general price movements.

The objectives of the present study were, first, to secure a fuller understanding of the behavior of individual commodity prices and, secondly, to increase the knowledge of the working of the price system and of the interrelations between its component elements. No attempt has been made in presenting the results of this study to support a specific thesis. The investigation has been looked upon as part of a general attack upon the problem of charting the price system, defining its elements, tracing the connections between these elements, determining the nature of the changes which occur in the price system with the passage of time and with changes in general economic conditions, and of describing more exactly the part which the system of prices plays in economic processes. This view of the relation of the present study to the broad task of surveying the price system has conditioned the plans for the investigation and has determined the form in which the results appear.

The Road to Plenty

William Trufant Foster and Waddill Catchings. The Pollak Foundation for Economic Research. Boston, Houghton, Mifflin Company. 232 pages. Price, $2.

In the "Road to Plenty," the authors offer their solution for the "dilemma of thrift" which they pointed out and thoroughly discussed in their three previous books, "Money," "Profits" and "Business Without a Buyer." The new book is written for the layman. The theory which Messrs. Foster and Catchings have propounded in their earlier works is that economic depressions, with their accompanying unemployment, idle factories and capital are due to the reduction in consumer purchasing power, and that this reduced purchasing power is due, in turn, to the abstraction of both corporation and individual savings from the cycle of money flow between producer and consumer. This, then, is the dilemma, that the worker—who is also consumer—is urged to save, but by his savings brings about depression. He saves to his own ultimate disadvantage.

The cure for this condition, the authors believe, lies in increasing the construction of public works and production facilities at a rate sufficient to make up for the loss due to the abstraction of savings. Thus, by putting money into the hands of workers, the purchasing power always is kept even with productive capacity.

Obviously, if productive capacity, instead of being increased by spurts, were developed only at the same rate as the increase in consuming power, the economic swings would be avoided. Their proposal is that a mechanism be set up for holding productive and consumptive capacity in balance—to keep the consumptive power always large enough to absorb the goods the factories are able to produce. Their proposal, specifically is that the federal government collect data that will disclose at any time the relationship between productive and consumptive capacities and, when the latter tends to decline, to increase public works construction. Now we know where we are only when the depression is upon us. To serve a preventive purpose the data will need to be much expanded, and this is what Messrs. Foster and Catchings recommend.

Looking at their proposed remedy, it is patent that the problem is a complex one and that the solution will not be easy. There is the difficulty, first, of getting all the data; second, of knowing what the data mean; third, of setting up the mechanism for wise and speedy increase of public works construction. But, as the authors maintain, we shall not progress towards a solution unless we try.

National Electric Safety Code

Handbook Series No. 3 of the Bureau of Standards, fourth edition. Department of Commerce, United States Government Printing Office, Washington, D. C. 526 pages. Price, $1.

In the preparation and revision of the code the Bureau of Standards had the co-operation and assistance of many state industrial and public service commissions, municipal electrical inspectors, engineers of operating and manufacturing companies, committees of engineering societies and representatives of the electrical workers of the fire and casualty insurance interests. The revision was carried out under the rules of procedure of the American Engineering Standards Committee. The fourth edition contains but minor changes in the general substance of the rules. The regulations dealing with line construction incorporate some important changes. The rules of this part have been rearranged entirely. This new arrangement should increase the facility of reference and make more clear the intended effect of the requirements.

A new section, part 5, has been added dealing with radio installations. The code represents a growth and development which will necessarily continue. The code rules provide specifically for variations from particular requirements when circumstances warrant different practices. Sag and tension tables and curves are included in the appendices.

Utilities Commissioners Association

1927 Proceedings of the 39th Annual Convention, National Association of Railroad and Utilities Commissioners—New York, N. Y. 600 pages. Price, $5.

Full reports on valuation, public relations, public ownership, safety of operation, motor vehicles and others on up-to-date topics before the Dallas Convention of this association are printed in full in the 1927 Proceedings of the National Association of Railroad and Utilities Commissioners. The addresses of many speakers such as William A. Prendergast, chairman New York Public Service Commission and Lucius S. Storrs, managing director of the American Electric Railway Association, are of interest to bankers, lawyers, railroad executives and public utility managers. Special features are the addresses of John J. Esch, former chairman of the Interstate Commerce Commission, entitled, "The Age of Speed" and of Frederick A. Farrar, vice-president of the Electric Bond & Share Company, called, "Financial Problems of Public Utilities."

Personal Items

J. S. Harrison Has New Title in Jacksonville

J. S. Harrison, for more than a quarter of a century claim agent of the Jacksonville Traction Company, Jacksonville, Fla., is now known as general claims attorney. The general claims attorney began working for the Jacksonville Traction Company as secretary to the manager in 1899 and was made claim agent in 1902.

Mr. Harrison was born at Olustee, Fla. He attended the Florida University, which was then known as the Florida Agricultural College. He took a special course in law at the Florida Law School under Walter B. Clarkson, of Yale.

Changes in North Dakota Commission

At the reorganization meeting of the Board of Railroad Commissioners, North Dakota, held on April 1, Fay Harding was elected president. Among his present duties Mr. Harding will continue to handle the matters relating to the licensing of buses.

Ben C. Larkin has been appointed commissioner succeeding the late Frank Milhollan. Mr. Larkin has been chief elevator accountant for the commission since July, 1925. For many years he was active in public life in North Dakota and is a former Speaker of the North Dakota House of Representatives.

New Receiver of Detroit-Jackson Road Selects Staff

Following the appointment of John F. Collins, vice-president and general manager of the Michigan Electric Railway lines, as receiver for the Detroit, Jackson & Chicago Railway, he announced the following staff:

H. D. Sanderson, Jackson, chief engineer and manager for the receiver; Otto H. Degener, Jackson, secretary-treasurer; G. W. Quackenbush, Grand Rapids, traffic manager; R. C. Taylor, Albion, superintendent of equipment; R. Southard, Ypsilanti, general superintendent; R. W. O. Taylor, Jackson, purchasing agent.

Besides directing the management of the M. E. R. lines, Mr. Collins is president of the Southern Michigan Transportation Company and the Rapid Transportation Company, operating buses between Jackson and other Michigan cities. Electric railway and bus lines totaling 723 miles in length are administered by Mr. Collins from his central office in Jackson.

In commenting on the appointment of Mr. Collins, the *Citizen-Patriot* of Jackson said:

The appointment is an earned tribute to Mr. Collins' ability as an administrator. In the face of the most discouraging competition he has kept the M. E. R. system out of receivership, and through the organization and promotion of bus routes paralleling the electric lines has infused new hope into the interurban transportation business in Michigan. The bondholders of the D. J. & C. apparently have turned to him as a refuge in time of distress.

H. T. Connolly Heads Maryland Association

H. T. Connolly was elected president of the Maryland Utilities Association at the meeting in Baltimore on March 23. Mr. Connolly is general manager of the Washington, Baltimore & Annapolis Electric Railroad. He entered the service of that company twenty years ago, starting in as a substation operator. Later he was promoted to

H. T. Connolly

the position of foreman of substations. Three years thereafter, at the time the Washington, Baltimore & Annapolis acquired the old Annapolis Gas & Electric Light Company, later the Annapolis and Chesapeake Bay Power Company, Mr. Connolly was made superintendent of power and in 1922 he became manager of utilities. Two years later he was made superintendent of equipment and in June, 1925, was appointed general manager of the property. At that time James J. Doyle was elected president. Before Mr. Connolly's affiliation with the Baltimore organization he was in the electrical field, serving with the old Maryland Steel Company, now the Bethlehem Steel Company, at Sparrows Point, Md.

Mr. Connolly was born in Baltimore Dec. 29, 1888. He attended private schools in that city.

WILLIAM N. NEFF has been appointed general superintendent, in charge of operation and maintenance of way and structures of the entire Northwestern Pacific Railroad System. Since April 1 his headquarters have been at Sausalito, Cal.

H. V. Faber at Savannah, and B. T. Moore in Jacksonville

H. V. Faber, for two years assistant treasurer of the Jacksonville Traction Company, Jacksonville, Fla., has been transferred to the Savannah Electric & Power Company, Savannah, Ga., to act in the same capacity. At Savannah he succeeds Paul Fleming, who resigned to become associated with the Philadelphia & Reading Coal & Iron Company at Philadelphia.

Mr. Faber went to Jacksonville in July, 1926, from the treasurer's office of Stone & Webster, Inc., of Boston, to become assistant treasurer. He was at one time assistant treasurer of the Haverhill Gas & Light Company, Haverhill, Mass., and prior to that was traveling auditor for the parent organization. During the time the Hog Island shipyard was under the executive management of Stone & Webster he was cost accountant there. He was also treasurer of the Florida Public Utilities Information Bureau.

Benjamin T. Moore, formerly a traveling auditor for Stone & Webster, Inc., from the firm's office in Boston, has succeeded Mr. Faber at Jacksonville. Mr. Moore was at one time chief clerk of the Mississippi River Power Company. Later he was assistant treasurer of the Keokuk Electric Company, Keokuk, Iowa. In 1925 he was assigned to the auditing department at Boston.

P. A. MAXIMOV, president of the Soviet Electrotechnical Trust, has arrived in New York accompanied by B. I. Bukhovtsev, production manager of the trust, to make a study of the electrotechnical industry and of electric railways in the United States. The introduction of electrical power in industry, transportation and for lighting purposes is proceeding now on a scale never before known in Russia. Mr. Maximov expects to stay in this country about six weeks. Together with Mr. Bukhovtsev he will visit Schenectady, Boston, Chicago, Milwaukee and other industrial centers.

Obituary

HOMER M. PRESTON, railway operator and banker, died at his home near Jamestown, N. Y., on April 2. Mr. Preston was president of the Jamestown, Westfield & Northwestern Railway, the Jamestown Street Railway and the Jamestown Motor Bus Transportation Company. When Almet N. Broadhead, who controlled the Jamestown properties, died in 1925 Mr. Preston was elected president. While separate corporate structures have continued, the railway and bus lines have been operated under one general management. Mr. Preston had previously served as a director and vice-president of the Warren-Jamestown Street Railway and had been affiliated with the Southwestern Interurban and with the Union Traction Company.

Manufactures and the Markets

Chicago "L" May Buy 200 More Cars

Many improvements in service have been made by the Chicago Rapid Transit Company, Chicago, Ill., during the last five years. The company has added 205 new steel cars of the latest design to its equipment. It has lengthened station platforms on the Loop and on all the lines, and operated six-car and eight-car trains in the rush hours, where previously five-car and six-car trains were operated. It has built a large modern station at Quincy and Wells Streets, with convenient connection to the Loop station platform at Quincy and Wells Streets, and it has built the first unit of its new shops at Niles Center. Those are a few of the major improvements that have been made in the last few years for the better service of the public.

There are other improvements which the company would like to make. There is a pressing need for express tracks on the Garfield Park Branch between Marshfield and Laramie Avenue. The company would like to purchase 200 additional steel cars this year. The carrying out of these improvements would appear to be presaged on the success of the company's appeal for a change in rates, now pending, since as the company itself says that "the money to make such improvements must come from investors, and unless the company can show reasonable earnings on its investment, new capital cannot be obtained."

Danville and Crawfordsville Railway Proposed

Construction of an electric railway between Danville, Ill., and Crawfordsville, Ind., and a secondary line between Ridgefarm and Paris, Ill., giving the Illinois Traction System and the Terre Haute, Indianapolis & Eastern lines two connecting links, was discussed at a conference in Danville recently. D. W. Snyder, Jr., vice-president and general manager of the Illinois Traction, and G. K. Jeffries, Indianapolis, vice-president and general manager of the Terre Haute, Indianapolis & Eastern, met representatives of the cities interested in the plan to link the two railway systems. The Paris line discussion brought out that a belt line would be imperative around Terre Haute, where heavy freight trains are not allowed through the city, adding $1,000,000 to the project cost and the Ridgefarm-Paris line would mean another $800,000. Use of this route as the main line would require strengthening of the trackage between Danville and Ridgefarm and between Paris and Terre Haute, with 40 miles added to the route distance. Illinois Traction representatives favored the direct line, but added that a light freight line serving the Paris district might be advisable since it would cost less. The Crawfordsville line would involve an expense of between $4,000,000 and $5,000,000 since the Vermilion River would have to be crossed once and the Wabash twice.

Kansas City to Complete Rehabilitation

The Kansas City Public Service Company, Kansas City, Mo., will spend over $2,000,000 this year to complete the $6,600,000 rehabilitation program planned when the company was reorganized. The program of the construction department involves the laying of approximately 20 miles of tangent track and 27 new special work layouts. The work of this department will cost more than $1,000,000. It was scheduled to start March 1 and end in October.

The maintenance department will remodel 414 passenger cars during the year. Safety air equipment will be installed on 93 100-type cars, 47 400-type cars, and 14 1,000-type cars, or 154 cars in all.

The 1928 program includes the installation of ventilators, window wipers, safety air equipment, line breakers, back-up control on double-truck cars, air rectifiers, thermostatic heat control, economy meters, double folding doors and treadle-operated doors on rear platforms. Aside from the regular overhaul work, rearrangement of the seats, stanchions and railings will be made where greater aisle space is needed.

In addition to the foregoing expenditure, the equipment department was allowed more than $70,000 to cover other improvements, one important item of which is $60,000 for the installation of steel wheels. This will equip approximately 50 per cent of the cars with steel wheels. All of this money is above the normal maintenance expenditure of $663,000 for the year, making a total expenditure in the equipment department of approximately $1,620,000.

In the other departments, way and structures, electrical distribution, and coach garage, $220,000 was authorized for improvements, including an expenditure of $157,000 to cover the cost of building a new a.c. distribution bus at the Grand Avenue power station and re-arranging the a.c. cables between the power station and the substations.

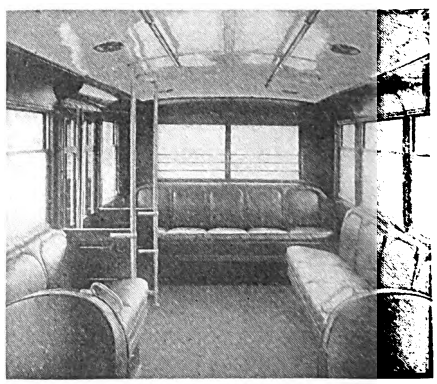
Trackless Trolleys for Prague

Trackless trolleys will be installed in Prague, Czechoslovakia, on a route where former street car service has been discontinued, it is announced by the president of the board of directors

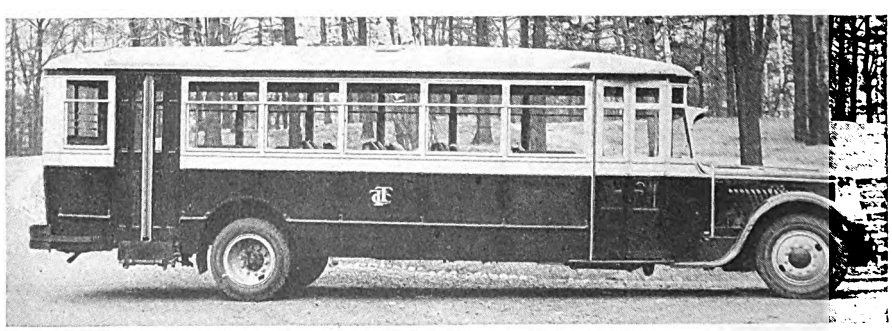
Toronto Buses Delivered

Fifteen Mack city type buses have been delivered to the Toronto Transportation Commission, Toronto, Canada. This is the first consignment of buses for use in Canada to be equipped with rear treadle operated doors, a product of the National Pneumatic Company.

As an extra precaution for the safety of passengers using the rear-exit treadle doors, each bus has been equipped with a rear-view mirror. The mirror is fastened to the outer window frame on the right side of the bus, giving the driver a full view of the rear exit door. The buses are equipped with 29-passenger bodies of wood frame construction, built by the Bender Body Corporation.



The seating arrangement of the Toronto buses allows ample standing room for the rush hours



One of the fifteen Mack treadle buses delivered to the Toronto Transportation Commission

of the Prague Electric Railway Administration. The new cars will be arranged so that they can turn aside 5 m. or almost 16½ ft. on either side of the trolley wires. If they prove successful it is expected that their use will be extended.

Space Applications for A.E.R.A. Convention Mailed to Members

This year the Cleveland Convention Committee of the American Electric Railway Association, of which Col. J. H. Alexander is chairman, has provided over 135,000 sq.ft. of desirable inside space and over 3,000 lin.ft. of track space for car displays. Diagrams of the show space layout at the 47th Annual Convention, together with applications in duplicate, were mailed from Association headquarters, via registered mail to all manufacturer company members on April 14.

The procedure followed in previous years of allowing a time of 30 days for filing space applications, will again be in force this year. Fred Dell, exhibit director, calls attention to the fact that all applications received at Association headquarters, 292 Madison Avenue, New York, up to the close of business on May 14, will be awarded space by the exhibit committee, which meets shortly thereafter to make the official assignments. Should any space remain vacant after the official assignment, it will be allotted in the order in which applications are received.

Attention is also called to the fact that in order to assist the commitee in making an intelligent space assignment, all questions on the application blank should be answered in detail. This is important and if the forms are filled in carefully exhibitors will save themselves some unnecessary annoyance in the way of additional correspondence to secure such information as asked for.

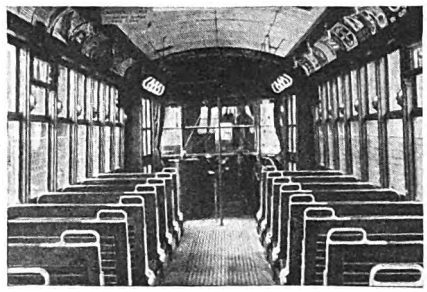
The exhibit this year promises to be larger than ever before. There will be some new companies which have not exhibited before, from both the railway and automotive field, and the products of these companies will bring added interest to the exhibit, which, it is agreed, is one of the largest and finest transportation exhibitions shown in the world today.

To secure a good location all who intend exhibiting are urged to get their applications in as promptly as possible. Each application is dated, time stamped and numbered in the order received and a careful check up of the list is presented to the exhibit committee when it meets to make the official allotment.

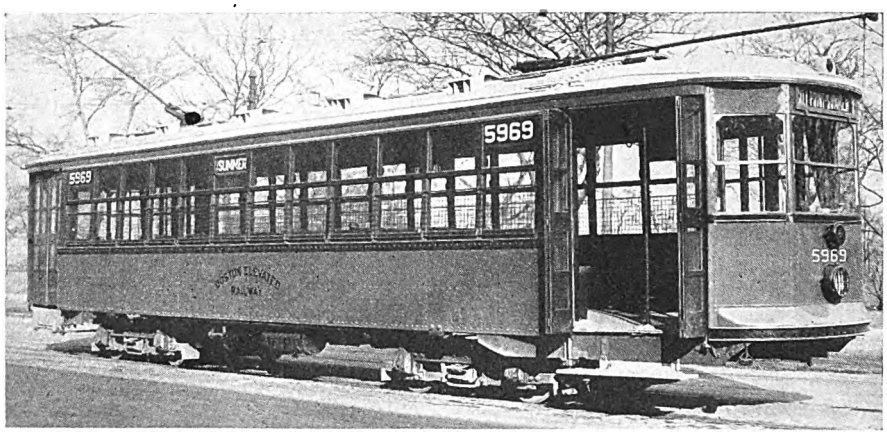
This is the one opportunity afforded manufacturers during the year to present to the practical railway man a comprehensive and intelligent display of old and new devices that are being offered and to bend his mind toward acquiring those products which will improve his service and consequently increase his income. Every manufacturer should at all times bear in mind that the annual convention and exhibit is the market place of the industry and that from the Association's standpoint its every activity is directed to the one end of prospering the industry so it can make necessary appropriations for the purchase of new equipment, new materials and supplies. Don't delay sending in your space application.

Cars Delivered to Boston Elevated Railway

The ten semi-steel cars being built for the Boston Elevated Railway, Boston, Mass., by the Laconia Car Company, Laconia, N. H., have been delivered. They are of the one-man, two-man double-end type, they have a total weight of 31,462 lb. with an over-all length of 45 ft. and a seating capacity of 48. Each car is equipped with four GE-264A inside-hung motors, GEK-71 control and Westinghouse air brakes with variable load attachment. Complete specifications were published in the Oct. 8 issue of the JOURNAL.



These one-man, two-man cars will seat 48 passengers



One of the ten semi-steel cars recently delivered to the Boston Elevated Railway

T. W. Casey Heads National Pneumatic Company

At a meeting of the executive committee of the National Pneumatic Company, held April 10, Harold Rowntree resigned as president of the company and was elected chairman of the board of directors. At the same meeting Thomas W. Casey, for many years vice-president of the company, was elected president to succeed Mr. Rowntree; P. R. Forman, who has been general manager, was elected vice-president and general manager, and Frank Johnson was re-elected secretary and treasurer.

Roller Bearings Being Tried in Green Bay

A Birney type street car equipped with roller bearings has been put into service by the Wisconsin Public Service Corporation in Green Bay, Wis. The new roller journal bearings are of the Melcher type now being supplied by the Railway Motors Corporation, DePere, Wis., for steam railroad cars. It is planned to keep a close record of the power used by this car and the cost of maintenance for the journal bearings. If the power is reduced 40 per cent as claimed, the economy may warrant the replacement of all present bearings.

Toronto Tests Lacquer

Toronto Transportation Commission, Toronto, Canada, has sprayed four cars with lacquer of four different manufacturers for the purpose of testing its durability as compared with enamel which is the standard material now used.

Foreign Traders to Talk on Latin-America

Five special trains will carry the bulk of the 1,500 delegates from all parts of the United States to the Fifteenth National Foreign Trade Convention to be held at Houston, Texas, on April 25, 26 and 27, next, announces O. K. Davis, secretary of the National Foreign Trade Council, in a statement of program and travel arrangements for the annual foreign traders gathering.

The principal theme of the convention will be trade with Latin America and the presence of business delegations is already assured from more than ten Latin American countries. In 1927 the total trade of the United States with Latin America was close to $2,000,000,000, slightly greater than that of England, France and Germany, the three principal competitors of the United States.

American Engineers to Join in World Conference

Engineering leaders from practically every part of the United States meeting at Washington, D. C., on March 22 formulated preliminary plans for the participation of engineers of the United States in the World Engineering Congress which will be held next year in Tokio. An American Committee to arrange for the part the engineers of the United States will play in the Congress was formally organized and officers elected.

The engineers went to the capital on a special train from New York and Philadelphia for the dinner and meeting. The following officers and committee chairman of the American Committee, which will arrange for the sending of a large delegation of American engineers to the Congress in Japan, were elected: Honorary chairman: Herbert Hoover; chairman, Elmer A. Sperry, New York; vice-chairman and chairman of the executive committee: John W. Lieb, New York; vice-chairman, Pacific Coast: C. E. Grunsky, San Francisco; C. E. Kettering (Middle West), Detroit; executive secretary, Maurice Holland. Executive committee members are: Gano Dunn, New York; George W. Fuller, New York; Maurice Holland, New York; Dugald C. Jackson, Cambridge, Mass.; Frank B. Jewett, New York; John W. Lieb, New York; J. H. McGraw, New York; O. C. Merrill, Washington, D. C.; Calvin W. Rice, New York; Charles F. Scott, New Haven, Conn.; Elmer A. Sperry, Brooklyn, N. Y.; W. E. Wickenden, New York. John W. Lieb leads the finance committee; D. C. Jackson the technical program committee; F. B. Jewett the transportation committee; O. C. Merrill the entertainment committee; J. H. McGraw, publicity; promotion and attendance, George W. Fuller; nominating committee, Gano Dunn.

German Firm to Construct Electric Locomotives

Krupp, the great German engineering firm, has decided to undertake the construction of electric locomotives. In conjunction with the firm of Garbe, Lahmeyer & Company, of Aachen, a new type of motor for electric traction has been developed. This is a commutatorless, compensated single-phase motor, said to combine the efficiency of the three-phase motor with the advantages of the single-phase system regarding the supply of current.

As the result of satisfactory tests with the new invention, two shunting locomotives were constructed for the I. G. Farbenindustrie, one of which is said to have given entire satisfaction at a coal mine in central Germany. The importance of this new development lies in the fact that the current can be drawn direct from the main transmission lines, thus doing away with the necessity of transformer stations which hitherto have been essential. According to Krupp's estimate this will mean a saving of approximately 30 per cent on the present cost of electrification. The patent is owned by Krupp's, which will manufacture the locomotives, and the motors will be supplied by Garbe, Lahmeyer & Company.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	April 10, 1928
Copper, electrolytic, cents per lb	13.925
Copper wire, cents per lb	16.00

Hungarian Electric Locomotives for Spain

The Ganz-Danubius Company and the Ganz Electrical Works of Budapest have just signed a contract with the Ferrocariles Vascongados of Spain for the delivery of nine electric locomotives and eleven electric rail motor cars, of which six are to be passenger and five freight cars.

TRACK AND LINE

Oregon Electric Railway, Portland, Ore., has filed an application to the Interstate Commerce Commission for authority to be substituted for the Linn County Logging & Lumber Railway in the proceeding on the latter's application for a certificate for the construction of an extension of its line in Linn County, Ore. The application states that the Linn County company has assigned its rights to the Oregon Electric, a subsidiary of the Spokane, Portland & Seattle Railway.

St. Louis Public Service Company will improve the Wellston loop facilities so that seventeen cars may be handled at one time. The improvements will cost approximately $95,000. One of the decided improvements will be that the St. Charles cars, which come into Wellston at Easton Avenue and stop for passengers in the very heart of traffic on the St. Louis-Kansas City highway, will now proceed to the loop to await their schedule time for departure, thus clearing Easton Avenue. The city limits and Wellston division of St. Louis will continue to use the loop.

Long Island Railroad, New York, N. Y., has been ordered by the Transit Commission to eliminate 31 grade crossings in Queens, N. Y., in accordance with the plan arranged with the state.

TRADE NOTES

Robert J. Deneen and Frederic Attwood were elected vice-presidents of the Ohio Brass Company at a meeting of the board of directors held Feb. 7, 1928. Mr. Deneen is in charge of the company's sales activities in the Chicago district, while Mr. Attwood is in New York in charge of the eastern sales district.

Watson-Stillman Company, New York, has appointed as manager of railroad sales, H. J. Hair, formerly sales engineer for the Whiting Corporation. He will be located at the main office of the Watson-Stillman Company, 75 West Street, New York City.

Gold Car Heating & Lighting Company, Brooklyn, N. Y., has appointed as sales engineer with headquarters at Brooklyn, H. W. Dillon, formerly sales engineer of Chicago Pneumatic Tool Company. J. P. Rapp, formerly with Standard Steel Car Company, has also joined the eastern sales department with headquarters in Brooklyn, N. Y.

Westinghouse Electric & Manufacturing Company has appointed Justin G. Smeby welding engineer at the South Philadelphia works. He is a member of the American Society of Naval Architects and Engineers and an officer in the U. S. Naval Reserve Force.

Canadian Ohmer, Ltd., Montreal, Canada, has been granted a Dominion charter for the purpose of acquiring the business of Canadian Taximeters, Ltd., and of marketing in Canada all products manufactured by Ohmer Fare Register Company of Dayton, Ohio. W. P. Kearney, Montreal, has been chosen president; H. B. Ohmer, Dayton, Ohio, vice-president and treasurer; M. W. Drayton, Montreal, second vice-president and secretary; R. H. Ohmer, assistant treasurer. These officers, together with R. L. Hubler, constitute the board of directors. A. J. Hopkins has been appointed general manager.

ADVERTISING LITERATURE

Vanadium Corporation of America, New York, N. Y., has issued a booklet "Automotive Springs," giving a description of the manufacture and requirements of springs.

International Steel Tie Company, Cleveland, Ohio, has published a bulletin descriptive of track paving on a production basis.

Ohmer Fare Register Company, Dayton, Ohio, has printed form number 850 giving information on the use of Ohmer fare registers.

Consolidated Car Heating Company, Inc., Albany, N. Y., has issued a folder entitled "At the Port of Albany," descriptive of the various products that it manufactures.

Not Enough Comparison of Maintenance Costs

COMPARISONS of maintenance costs on various properties give an opportunity to determine whether one's own practices are in line with those in use elsewhere, and whether possibilities have been overlooked for doing the work better or at lower cost. Of course such comparisons, to be of maximum value, must be considered along with those of service reliability. Any maintenance executive can cut down his costs for a time by deferring necessary work and sacrificing reliability. But when the records are studied over any extended period the shortcomings of such practices are bound to make themselves evident.

Maintenance costs are not interchanged among electric railway properties as generally as they should be. Maintenance men have not given the matter the attention it deserves, for a number of reasons. While the standard classification of accounts is almost always used the details are not always comparable. The physical conditions of properties vary widely and have a direct bearing on maintenance costs. Then all too often there is a lack of appreciation of the value of studying the other fellow's figures and methods. Even some of those who interchange data have not obtained the maximum benefit because of failure to analyze the figures and to effect needed changes in their maintenance methods that are obvious to an impartial observer.

The cost per unit is not in itself a conclusive measure of excellence. Either high or low figures, considered abstractly, mean little in themselves. Variations in accounting as between depreciation or renewal reserves and operating maintenance accounts cause some difficulty in making comparisons. Other causes of variations in costs are the age, type and state of repair of the cars; the supervision and shop facilities, and the operating characteristics of each company. For instance, the total cost of equipment maintenance for the properties in the Electric Railway Association of Equipment Men, Southern Properties ranges from $13.67 to $30.46 per 1,000 car-miles, while cost of labor for cleaning and inspection ranges from $6.59 to $17.38 per 1,000 car-miles.

On the other hand, costs that are out of line must not be waved aside with the general and time worn excuse of "local conditions." High figures should be considered the signal to look for expensive practices or those that are failing to give satisfactory results. Sometimes high maintenance figures are in no way a measure of the efficiency of the maintenance departments themselves but are traceable to operating practices and management policies that need correction. In that event the man responsible for maintenance may not be in a position to correct the difficulty directly, but he holds the key to opening up general questions of policy that affect directly his own performance. For these reasons he should seek rather than avoid the interchange of maintenance figures with other properties even though his own figures may seem to be high.

Regenerative Heating Shows Attractive Savings

RECOVERY of the energy that is wasted in the car resistors during acceleration with series-parallel control, and the energy which is stored in momentum and is absorbed in the brake shoes when the car stops, presents an opportunity for economy that has attracted many engineers. Regeneration of the kinetic energy of motion into electrical energy and its return to the distribution system is entirely possible, and it has been adopted with advantage on several of the heavy railroad electrifications. But for street cars and light interurbans recovery of this energy is not so simple. The series motor, which is universally used in this class of service, is not readily adaptable to serve as a generator for feeding back energy to the line.

A substitute proposition which has been tried with some success at various times is the use of regenerated electrical energy for heating the cars. While in temperate climates this opportunity is available during the winter months only, the expenditure for heating is a very considerable portion of the energy used throughout the year, sometimes running as high as 8 to 10 per cent of the total. The regeneration of energy serves an additional purpose in that it directly relieves the brake shoes of a portion of the work they are ordinarily called on to do. This makes possible either a higher braking rate or less wear on the shoes and wheels, so that even in the summer when the heat is not needed the use of dynamic braking, with the motors acting as generators, is advantageous.

Various difficulties are involved in the dynamic braking system. The rate of braking must be controlled, and since the voltage of the motors falls off rapidly as the speed is reduced, the resistance in the circuit must be changed continually as the car comes to rest. According to an article by A. W. Baumgarten, appearing in this issue, these problems have been successfully met in the installation which has been made in the experimental car of the Chicago & Joliet Railway. Both manual and automatic control are used through remote-controlled contactors, making the system flexible. Duplicate sets of resistors are installed, so that the heat can be used inside the car or discharged to the atmosphere beneath it. The heat released during acceleration is also utilized along with that produced during braking. With both together and without any external source the car was heated to a temperature of 60 deg. during winter weather. For a

This is the issue in April that is devoted essentially to maintenance and construction subjects

Digitized by Google

short period in the early morning, prior to going out on the run, additional heat from the line was used, but this was turned off while the car was in service.

As a measure of the value of this method, Mr. Baumgarten estimated that the cost of heating a car with standard electric heaters is $501 per season, while with the regenerative system it is $200—a saving of $301, after making allowance for all charges on the extra equipment. This will be augmented by savings in the electrical distribution system, bringing the total up to some $400, according to the author. Such a saving is well worth making, if the motors are of sufficient capacity to stand the additional service, and if it does not involve any great complication in apparatus or impose added duties upon the operator.

Putting Truck Overhaul on a Production Basis

PLACING car truck overhauling on a production basis is advantageous, particularly for the larger electric railways. With them, the quantity of this work makes it necessary to prepare definite schedules for overhauling, which must be adhered to closely. One of the greatest problems is that of cutting down non-productive hours. The work may be classified into dismantling, repairing or replacing worn parts, assembling and testing. When several men work on the same truck, one will interfere with another. This results in waiting and unproductive time. If replacement parts are not at hand the workman must wait for the material or leave his place to get it.

Unless there is the necessary labor-saving equipment production will slow up at the end of the working period, due to physical fatigue of the men. Material handling equipment is needed, as most of the parts are heavy and hard to place with the accuracy needed to insure good performance. The various operations must follow progressively and without delay, else one man may interfere with others who are to follow him. Order and system are essential, and the work should be laid out so that the various operations become standardized. Each man can then become an expert in his particular duties, and the work will be done better and quicker due to greater familiarity and skill.

An outstanding example of constructive planning and systematizing of truck overhaul is found in the new Coney Island Shops for the Brooklyn-Manhattan Transit Lines, an article on which appears in this issue. One is impressed particularly with the number of one-man jobs into which the work is divided. One man removes the heavy parts with the aid of an overhead crane. Another does the cleaning in a room provided with chemical and rinsing tanks. A third man cuts off rivet heads holding parts to be replaced, and so on. There is no crowding of workmen or materials. Only a single job is done on a truck frame at one time and there are enough trucks ready to be worked on so that a man can proceed from one to the next without waiting. Free stores adjacent to the work are kept stocked with all parts needed. Balanced production makes it easy to order material far enough in advance to assure its being on hand when needed. Proper routing of work and the group arrangement cuts down rehandling and lost time.

An important factor in the success of this method is the design of the shop building, which was planned with quantity production in view. All tools and equipment needed are available and there is close supervision. Attention is given to constructive planning and scheduling. With such provisions the force necessary to carry on the work is surprisingly small. The reduction in labor costs and in the elimination of lost time will pay a handsome return on the necessary investment in spare trucks and parts.

Bus Maintenance Calls for New Standards

DEVELOPMENT of bus mechanisms has been along entirely different lines than those through which the street car has progressed. Going back to the early days, the horse car was about the simplest vehicle that could be devised for its purpose. Its working parts were few and rugged. Nearly all of them could be built by a blacksmith and repaired by him. Naturally the transition to electric drive at a period when the electric motor was still in its infancy resulted in the retention of a good deal of the same philosophy, and much of it remains in the present-day cars and in the mechanics who repair them. Parts are sturdy and rugged, but many of them lack refinement in detail. Clearances are large and a considerable variation is permissible in fitting. There is much hand work and many parts are not entirely interchangeable. This is particularly true after the car has been through the repair shop several times.

Contrast this with the development of the bus, which is a product of the automotive school. Based on quantity manufacture, the parts are turned out by automatic or semi-automatic machinery. They are correct to size within a few thousandths of an inch, whereas in railway practice allowable variations may be measured in sixty-fourths. The general use of anti-friction bearings, high grade alloy steels and finely finished surfaces in bus parts introduces new standards of workmanship and tolerances.

When it comes to repair work similar differences are noticeable. Many bus engine parts, for instance, are not reconditioned but are replaced with new ones, while railway parts are restored to their original condition as nearly as possible and returned to service. Naturally this wide departure in practice calls for workmanship of a radically different character. The bus maintenance man does more assembling and less repair work than his railway brother. But he must work within closer limitations, and must be, generally, a mechanic of an entirely different type.

Another Setback for Suburban Transit

IMPROVEMENT of transportation facilities for commuters from New Jersey, Westchester and Long Island to New York City has received another setback in Governor Smith's veto of the Mastick bill. This bill would have given official sanction of the state of New York to the studies of suburban transit now being made by the Port of New York Authority. Approval by the state of New Jersey already had been given. Despite a certain amount of objection on the part of New York City authorities, the State Legislature had passed the Mastick bill. The Governor, however, refused his signature, and there the matter rests.

Something must be done, and done quickly. No one denies that. The volume of suburban traffic into and out of New York City outgrew the transportation facilities years ago. The growth of traffic continues, but the expansion of facilities proceeds at a snail's pace. It is equally plain that a bi-state body is required to solve this problem. The flow of passengers from New Jersey

Digitized by Google

to New York City is greater than that from all the other suburbs put together. Attempts made several years ago by the North Jersey Transit Commission to solve the problem showed that one state cannot do it alone. Therefore the Port Authority, an existing agency of interstate character, was called upon for aid. The members of that body were willing enough to tackle the job, and New Jersey was willing to let them do it, but New York has balked. What the next move will be is problematical.

Opinions differ as to whether the Port Authority is the agency best qualified to handle the suburban transit problem. The Governor intimates that it has enough to do with bridges, railroad freight movement and port planning. On the other hand, much of the passenger traffic moves over the same rails as the freight. The railroad officials with whom the Port Authority has been dealing for several years are the ones who are responsible for passenger movement. The Port Authority is already familiar with many details of the suburban transit problem. Moreover, since the Port Authority is the only bi-state agency of its kind now in existence in the Metropolitan district, it would seem better to give it the job rather than to await the creation of an entirely new agency. By disapproving of this expansion of its activities, the Governor of New York has dealt a serious blow to hopes of early improvement in suburban transit facilities.

Track Cost Is Important Element in Considering Car Replacements

IN MOST discussions of the advantages of new electric railway equipment, consideration has been directed primarily to the probable reduction in car operating costs and the effect upon railway patronage and public relations. These are, of course, outstanding considerations. But in addition there is a definite relation between car design and the very important factor of track costs. Far too little attention seems to have been given to the possibility for making substantial reductions in track investment and maintenance costs through the use of lighter electric railway rolling stock, reductions in unsprung weight and general improvements which may result from the use of more effective springs designed to reduce the shocks and impacts transmitted from the moving car to the track structure.

Consideration of track costs, as we know them today, opens a broad field for speculation as to the economies possible by improved design of electric cars. Special work, in particular, accounts for heavy expenditures in both construction and maintenance. Anything which will reduce the impact of heavy cars pounding over crossings, switches and frogs is bound to result in substantial economies.

One great obstacle to an evaluation of the effect of car design upon track costs lies in the difficulty of measuring this relationship. Only after years of painstaking observation and experiment can even an approximation be obtained of the economies to be expected. Even then it would be hard to translate the effects of car weight and spring design into terms of track dollars. Not only does track in paved streets carry the cars for which it is intended, but it frequently carries heavy vehicular traffic as well. Any move toward lighter rails and foundations that might be made possible by improved cars would necessarily have to be made slowly and cautiously, since in large measure satisfactory track construction is developed through the empirical process of experience. It is at best, therefore, a slow proceeding. There is no question, however, but that the effect on track costs is an important factor that must be taken into consideration in judging the results to be expected from new cars.

Lightning Arresters Require Regular Inspections

WITH the arrival of the summer months come frequent electrical storms and the attendant danger to electric railway equipment. While all power equipment and nearly all cars have some form of lightning protection, it must be maintained properly if it is to serve its purpose at the critical moment. It is particularly important, therefore, that protective apparatus not only be inspected prior to the season of thunderstorms, but also that a regular inspection schedule be adopted and rigidly followed. It is necessary, too, that a type of arrester adequate to the service in which it is used be installed and the proper method of testing be employed.

Some knowledge of what happens in the electrical circuit when static electricity makes itself evident is necessary to an intelligent program of lightning arrester maintenance. Accumulated static electricity in the clouds either strikes the system directly or releases bound charges, the second being the more frequent occurrence. Another source of danger is the internal disturbance. The discharge of energy from inductive circuits of motors at the time of switching often punctures the insulation. Few railway men appreciate that the arresters are protecting their equipment from such charges as well as from lightning.

The type of arrester to be selected depends on the severity of discharges from which protection is needed. The electrolytic or aluminum cell arrester is the most effective, although the spark-gap porcelain-inclosed type is favored in sections of the country where lightning storms are not severe, because of its lower first cost and simple maintenance. Whatever type of arrester is used on a car, it should be protected from rain and wheel wash. It is most essential that it provide a direct path from trolley to ground. If electrolytic arresters are kept in service all winter they should be installed inside the car to prevent freezing.

Every arrester requires regular inspection and maintenance, especially during the summer. Spark-gap arresters should be examined after every electrical storm and any damaged units replaced. Carborundum blocks of the multipath type need periodical inspecting, and gap settings for the higher-voltage carborundum arresters, which use a small gap in series with the block, need checking.

With the electrolytic arrester a regular routine of inspection should be adopted and adhered to rigidly. A small current flow is needed to maintain a film on the cell plates. On this account the cells must be charged frequently and kept in balance, particularly if of the three-cell type. The arresters themselves need testing at least once a month during the summer. For this purpose a testing set such as that devised in New Orleans and described in this issue is of value. It is good practice to take the arresters apart for storage in the winter, wash the plates and the jar and throw away the used electrolyte and oil.

Lightning arresters are very necessary pieces of equipment, but improper installation and lack of maintenance can nullify the protective value of any type.

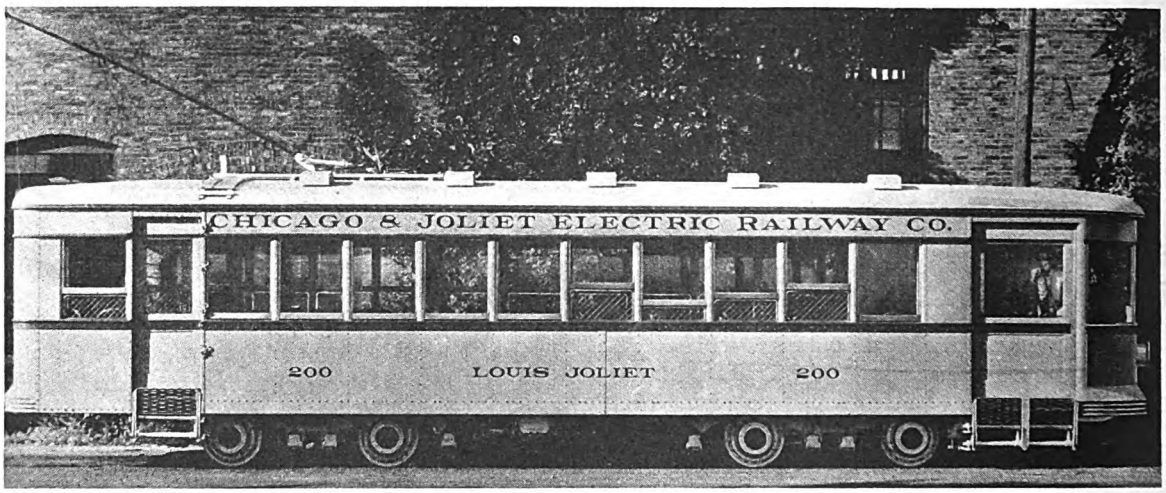
Energy from Dynamic Braking

Cuts Heating Costs

System of heating using regenerated energy along with that wasted in acceleration succeeds in Blackhall car. Manual control superimposed on automatic lends flexibility without interference with regular air braking

By A. W. Baumgarten
Division Engineer Chicago & Joliet Electric Railway, Joliet, Ill.



The heating tests were made on the car "Louis Joliet," which was exhibited at last year's A.E.R.A. convention

ELECTRIC heat in railway cars has long been considered the most desirable, but its cost has sometimes been considered prohibitive, particularly where the average winter temperature is less than 40 deg. F.

For this reason the Chicago & Joliet Electric Railway has for many years used fuel heaters in its city and interurban cars. Within the last few years a number of railway properties, such as the United Railways & Electric Company of Baltimore, the Twin City Rapid Transit Company, the Pittsburgh Railways, and others, have tried several plans of utilizing the waste energy of motor rheostats for car heating. Naturally, this afforded considerable reduction in heating costs, for the only additional cost is an investment in inclosed resistors which can be installed safely within the car. However, except in very mild climates, additional heaters using power from the trolley are needed in conjunction with motor rheostatic heating. With no additional heaters, in colder weather the operator would be tempted to run on resistance points to maintain a comfortable temperature in his car.

Some years ago the writer conceived the idea of utilizing waste energy of starting resistance losses for car heating, together with the much greater waste energy of braking. This necessitated the design of a dynamic braking system whereby the driving motors would become generators so that energy therefrom could be dissipated through the same motor rheostats. Although dynamic braking was not new the automatic control and use of this waste energy for car heating had not previously been used to any extent.

Same Contactors Used for Acceleration and Braking

This dynamic braking and heating scheme has been incorporated in the motor control of the new light-weight worm-drive car of the Chicago & Joliet Electric Railway that was exhibited at the Cleveland convention of the American Electric Railway Association last October. This car was put in regular city service in February.

Both motor acceleration and dynamic braking are controlled with standard remote contactors and a standard master controller. Only three additional contactors are needed for the dynamic braking. In braking and heating the contactors are actuated by an automatically controlled sequence drum that is interlocked with the motor controller and brake valve. This dynamic braking sequence drum automatically cuts out heater resistance as the car speed decreases. Its rate of movement is controlled by a current-limiting relay carrying the main generated current. This current-limiting relay prevents overloading of
